Abstracts

Program Abstracts from The GSA 2022 Annual Scientific Meeting, "Embracing Our Diversity. Enriching Our Discovery. Reimagining Aging."

Abstracts are arranged numerically by session and in the order of presentation within each session.
Abstracts are published as received.

SESSION 1000 (PAPER)

ALZHEIMER'S DISEASE AND RELATED DEMENTIAS (HS)

C. DIFFICILE INFECTION AS A MAKER FOR DYSBIOSIS IS LONGITUDINALLY ASSOCIATED WITH COGNITIVE DECLINE AND DEMENTIA

Nicholas Resciniti, *University of Southern California, Los Angeles, California, United States*

Disruption of the gut microbiome (dysbiosis) is associated with cognitive decline and dementia; however, there is a lack of findings demonstrating how dysbiosis is longitudinally associated with cognitive outcomes. This study aimed to quantitatively assess whether there is an association between Clostridium difficile infection (CDI) as a marker for dysbiosis and cognitive decline and dementia. We used 6,147 older adults from the Health and Retirement Study and the Centers for Medicare and Medicaid Services from 1999-2012. Outcome variables included cognitive scores (0-27) and dementia (8 or less). The exposure was time-varying ICD-9 CDI. Generalized estimating equation were used for the main analysis. Having at least one CDI infection was associated with -2.85 (B = -2.85; 95% CI: -4.43, -0.26) at 2000 (baseline) and at 2002 (B = -2.85; 95% CI: -4.43, -0.26), 2004 (B = -2.85; 95% CI: -4.43, -0.26), 2006 (B = -2.85; 95% CI: -4.43, -0.26), and 2008 (B = -2.85; 95% CI: -4.43, -0.26), after adjusting. Those having at least one CDI had 6.62 greater odds (OR = 6.62; 95% CI: 1.68, 26.05) of dementia at 2000 and was associated with time points 2002 (OR = 4.12; 95% CI: 1.48, 11.52) and 2004 (OR = 2.57; 95% CI: 1.14, 5.81). This study indicated that those with a CDI had a greater cognitive decline and a greater probability dementia. These findings provide evidence that dysbiosis has a larger impact on cognitive outcomes closest to the initial disruption and is less impactful further on.

DECIPHERING RACIAL AND ETHNIC DISPARITIES IN DEMENTIA AND COGNITIVE FUNCTION: A POLYSOCIAL SCORE APPROACH

Chenkai Wu[1], Yongjing Ping[2], Xi Chen[3], Michelle Odden[4], and Matthew Prina[5], *1. Duke Kunshan University, Kunshan, Jiangsu, China (People's Republic), 2. Duke-NUS, Singapore, Singapore, 3. Yale University, New Haven, Connecticut, United States, 4. Stanford University, Stanford, California, United States, 5. King's College London, London, England, United Kingdom*

The burden of dementia has been increasing rapidly in the US and huge racial/ethnic disparities exist. We examined whether social environment, measured in a comprehensive way (polysocial score approach), could modify the racial and ethnic differences in dementia. Data are from the Health and Retirement Study; 12,836 adults aged at least 65 years were included in the analysis. We assessed cognitive function by a modified version of the telephone interview for cognitive status. We included 24 social factors from five categories (economic stability, neighborhood environment, education, community/social context, and healthcare system) and used forward stepwise regression to screen for important ones. Polysocial score was created using 11 social factors and was classified as low (< 25), intermediate (25-31), and high (32+). We used the multivariable Poisson regression to estimate the incidence rate of dementia by three polysocial score categories and evaluate the interaction between race/ethnicity (non-Hispanic white, non-Hispanic Black, and Hispanic) and the polysocial score. Higher polysocial score is associated with a lower dementia rate in the overall sample and each racial/ethnic group. We found an additive interaction between race/ethnicity and polysocial score categories. In the low polysocial score group, Whites and Hispanics had substantially higher dementia rates than non-Hispanic Blacks (difference was 20.3 and 15.8 per 1,000 persons-years, respectively). These differences significantly attenuated and were no longer significant in the high polysocial score group (4.9 and 5.5 per 1,000 persons-years, respectively). The polysocial score approach offers a new opportunity to explain the racial/ethnic disparities in cognitive function among older adults.

FUNGAL INFECTIONS, USE OF ANTIFUNGAL AGENTS, AND THE RISK OF ALZHEIMER'S DISEASE

Arseniy Yashkin, Igor Akushevich, Anatoliy Yashin, Galina Gorbunova, and Svetlana Ukraintseva, *Duke University, Durham, North Carolina, United States*

Alzheimer's Disease (AD) is a complex neurodegenerative disorder leading to progressive cognitive decline and death. Accumulating evidence suggests that common adult infections, such as recurrent fungal infections, may play a major role in AD development. In this study we used administrative claims data, 1991-2017, from a 5% sample of U.S. Medicare beneficiaries age 65+ to study the potential relationship between fungal infections, use of antifungal drugs and AD onset. In unweighted analysis using the Cox model, we found that after accounting for demographic and health-related differences, the presence of fungal infections, independent of treatment increased the risk of AD [Hazard Ratio(HR):1.98; 95% Confidence Interval(CI):1.89-1.92]. The strength of the effect did not change when the population was restricted to Medicare beneficiaries with Medicare Part D (prescription drug) coverage in 2006+ (HR:1.99; CI:1.97-2.01). We then split the latter group into yearly split-episode data and calculated the medication possession ratios (MPR) of three major groups of antifungal agents: imidazole, triazole and polyenes and re-estimated our models. Although the effect associated with fungal infection did not change, higher MPRs of imidazole (HR:0.61; CI:0.48-0.76) and especially triazole (HR:0.37; CI:0.24-0.58) were found to be protective. In contrast, higher MPRs of polyenes were associated with increased risk (HR:1.32; CI:1.08-1.63). In summary, fungal infections were found to be strongly associated with AD risk with the effect being strongly modified by use of common antifungal treatments. More research is required to better define the biological mechanisms engendering these associations.

GENETIC ARCHITECTURE OF ALZHEIMER'S DISEASE RISKS

Abanish Singh[1], Konstantin Arbeev[2], Anatoliy Yashin[2], and Igor Akushevich[2], *1. Duke University School of Medicine, Durham, North Carolina, United States, 2. Duke University, Durham, North Carolina, United States*

More than 6 million people in the US live with Alzheimer's disease (AD) and related-dementia. There is a racial disparity in the prevalence of disease. However, its full genetic architecture and complex biological mechanisms are not yet understood. This study aimed to identify AD's full genetic architecture. Hypothesizing that a large part of AD could be due to the complex interplay of multiple genes that may influence it directly or through comorbidity-risks, we performed a series of race-stratified GWASs on AD outcome and an array of correlated comorbidity-risks -- ADRD, depression, ischemic-stroke, cerebral-hypoperfusion, heart-failure, and cerebral-thromboembolism -- derived from Medicare records of HRS dataset's White and Black samples. We prioritized AD GWAS signals based on their co-associations with comorbidity-risks. In White samples, we observed well-known genome-wide significant AD associations with SNPs in APOE, TOMM40 genes. In addition, we identified that 19 genic-region SNPs from the top 25 SNPs were mapped to 13 genes and that at least 5 genes were known for their association with AD or other neuropathic, neurological disorders. About one-third associations were replicated in Black samples. From the top 25 SNPs in Black samples, each of the 16 genic-region SNPs was mapped to a unique gene, which included 6 genes that were known for their association with other neurological, neuropathic, or psychiatric disorders. The genes resulted from the two races differed. These findings suggest that AD may result from a complex interplay of multiple genes, comorbidity-risks, and other brain-related disorders, which may differ for the two races.

GEOGRAPHIC DISPARITIES IN INCIDENCE AND MORTALITY OF ALZHEIMER'S DISEASE

Igor Akushevich[1], Arseniy Yashkin[1], and Julia Kravchenko[2], *1. Duke University, Durham, North Carolina, United States, 2. Duke University School of Medicine, Durham, North Carolina, United States*

Our estimates showed that geographic patterns of incidence rates extracted from Medicare data and mortality rates calculated using Multiple-Cause-of-death data are significantly different. The significant gap in mortality rates between the East and West parts of the U.S. present in death certificate data is not observed when Medicare data is used. In addition, high incidence rates of Alzheimer's Disease (AD) identified in the stroke-belt states when using Medicare data is not fully reproduced when death certificates are used. Therefore, we used 5%-Medicare data linked to the National Death Index to resolve this inconsistency in findings using both types of data for the same individuals. We found that the excess rates of AD in the stroke-belt states cannot be attributed to higher proportions of vulnerable populations as the associated differences hold across race- and gender-specific subgroups: 1,717 (1,704-1,731) vs. 1,280 (1,275-1,286) for Whites; 2,052 (2,017-2,086) vs. 1,821 (1,795-1,848) for Blacks; 1,538 (1,520-1,556) vs. 1,156 (1,140-1,164) for males; and 1,878 (1,861-1,894) vs. 1,383 (1,376-1,391) for females. We evaluated the sensitivity and specificity for having AD as an underlying cause of death in all these regions and developed a predictive model that predicts occurrence of AD in death certificate based on information in individual Medicare records. Our findings show that underrepresentation of AD in death certificates is a strong contributor to geographic disparities in AD mortality. Predictive quality of occurrence of AD in death certificates can be improved by advancing the predictive model and using a broader set of predictors from Medicare records.

SESSION 1010 (SYMPOSIUM)

ANTECEDENTS, OUTCOMES, AND CORRELATES OF METABOLIC HEALTH IN OLDER AGE: A MULTIDISCIPLINARY PERSPECTIVE

Chair: Johanna Drewelies Co-Chair:
Elisabeth Steinhagen-Thiessen Discussant: Jeremy Walston

Metabolic syndrome (MetS) is a cluster of risk factors for cardiovascular disease associated with reduced physical fitness, higher disease burden, and impaired cognitive functions in late life. Thus investigating antecedents, outcomes and correlates of metabolic health is a priority in order to promote healthier lifestyles and successful aging. This symposium compiles four empirical interdisciplinary studies that examine the role of metabolic health/risk on different timescales. Employing advanced modeling approaches to data obtained in large-scale studies, these reports will shed light on potential antecedents, correlates, and consequences thereof. First, Kalyani and colleagues will report data from the SPRING (Study of Physical Resilience IN Geriatrics) study on the interrelation between metabolic syndrome, glucose intolerance, and physical resilience.Second, Buchmann and colleagues examine the association of the metabolic syndrome and Lipoprotein(a) finding that hormonal aspects and in particular menopausal alterations seem to moderate theassociation between MetS and Lp(a). Third, Demuth and colleagues show how metabolic health is related to specific DNA methylation age acceleration as derived from five different epigenetic clocks, namely PhenoAge, and GrimAge. Fourth, Duezel and colleagues examine the neural correlates of metabolic risk in a sample of older adults finding that lower metabolic risk is linked to greater GMI in the prefrontal cortex. Conjointly, findings demonstrate the multifaceted nature of metabolic risk across adulthood and across different timescales. Walston will critically discuss the contributions from an aging perspective and discuss implications for future research.

ASSOCIATIONS AMONG LATENT FACTORS OF METABOLIC LOAD, BRAIN VOLUME, AND COGNITION IN HEALTHY AGING

Sandra Duezel[1], Johanna Drewelies[2], Ulman Lindenberger[3], Elisabeth Steinhagen-Thiessen[4], Ilja Demuth[5], and Simone Kühn[3], *1. Max-Planck-Insitute for human developement, Berlin, Berlin, Germany, 2. Humboldt University Berlin, Berlin, Berlin, Germany, 3. Max Planck Institute for Human Development, Berlin, Berlin, Germany, 4. Charité - Universitätsmedizin Berlin, Berlin, Berlin, Germany, 5. Charité Universitätsmedizin Berlin, Berlin, Berlin, Germany*

Metabolic syndrome (MetS) refers to risk factors for cardiovascular disease associated with reduced physical fitness, higher disease burden, and impaired cognitive functions. Available evidence indicates that metabolic functioning is related to brain structure at the level of specific indicators, such as hypertension and voxel-based morphometry, respectively. However, attempts to relate metabolic load to brain morphology at the construct level using structural equation modeling are scarce. Here, we used confirmatory factor analysis to: (a) examine level and change associations among latent factors of metabolic risk, regional grey-matter integrity (GMI), and cognition; (b) test whether these associations differ by sex. Analyses were based on a sample of 1,100 healthy adults (52% female) aged 60 to 88 years from the Berlin Aging Study II, and included MRI data for a sub sample of 341 (37 % female) individuals. Metabolic risk was defined by waist circumference, triglycerides, fasting blood glucose, and high-density lipoprotein; regional GMI by mean diffusivity, magnetization ratio transfer ratio, and VBM-based volume estimates; and cognition, represented by the three latent constructs episodic memory, working memory and fluid intelligence. Initial analyses indicate that individuals with lower metabolic risk show greater GMI in prefrontal cortex. Also, we found that greater prefrontal GMI was associated with higher fluid intelligence and working memory in men only. Additionally, we investigated the effects of previous levels of metabolic risk and cognition on subsequent changes in both domains over time. We highlight the benefits of latent factors for establishing brain-behavior relations, and discuss putative physiological substrates of individual differences in GMI.

LP(A) AND METABOLIC SYNDROME IN OLDER PEOPLE

Nikolaus Buchmann[1], sabine schipf[2], Till Ittermann[2], Elisabeth Steinhagen-Thiessen[3], Ilja Demuth[4], and Marcello Markus[5], *1. Charité - University Medicine Berlin, Berlin, Berlin, Germany, 2. Institute for Community Medicine, University Medicine Greifswald, Germany, Greifswald, Mecklenburg-Vorpommern, Germany, 3. Charité - Universitätsmedizin Berlin, Berlin, Berlin, Germany, 4. Charité Universitätsmedizin Berlin, Berlin, Berlin, Germany, 5. Department of Internal Medicine B, University Medicine Greifswald, Greifswald, Germany, Berlin, Mecklenburg-Vorpommern, Germany*

Background: Although an inverse association between type II diabetes mellitus and Lipoprotein (a) [LP(a)] has already been well researched, there is sparse data on the association between metabolic syndrome (MetS) with Lp(a). MetS is highly prevalent in older people and insulin resistance in MetS might link Lp(a) with MetS. Thus, we analyzed the association between Lp(a) with MetS in two large cohorts the Berlin Aging Study II [BASE-II] and the Study of Health in Pomerania [SHIP-0]

Methods: Complete cross-sectional data was available for 5,743 BASE-II and SHIP-0 participants (48.7% men; age 58 [20-85] years). MetS was defined according to modified criteria of the AHA/NHLBI 2009 definition. The association between MetS with Lp(a) was examined by median regression adjusted for age, sex and study and models were stratified by gender and menopause.

Results: MetS was prevalent in 27.6% (n=1,573) participants. We found an inverse association between MetS with Lp(a) in the whole study sample (β=-11.9 [95% confidence interval (95% CI) -21.3 to -2.6]) as well as in men (β=-16.5 [95% CI -28.6 to -4.3]) and in postmenopausal women (β=-25.4 [95% CI -46.0 to -4.8]). In contrast to this, in premenopausal women a positive association between MetS and Lp(a) (β=39.2 [95% CI 12.3 to 65.9]) was evident.

Conclusion: Postmenopausal changes in hormone metabolism impact both MetS and Lp(a). With respect to the ongoing development of Lp(a)-lowering drugs, their use must be examined, particularly in old age and in subjects with MetS.

METABOLIC SYNDROME, GLUCOSE INTOLERANCE, AND PHYSICAL RESILIENCE

Rita Kalyani[1], Ravi Varadhan[1], Qian-Li Xue[2], Frederick Sieber[1], Philip Imus[1], Brian Buta[1], Karen Bandeen-Roche[3], and Jeremy Walston[2], *1. Johns Hopkins University School of Medicine, Baltimore, Maryland, United States, 2. Johns Hopkins University, Baltimore, Maryland, United States, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

When confronted with a major physical stressor, some older adults are able to recover to baseline with minimal changes, while others undergo irreversible declines. The ability to adapt and recover well from physical stress is called physical resilience and may be impeded by altered glucose-insulin dynamics. Among 55 participants in the pilot phase of the Study of Physical Resilience IN Geriatrics(SPRING), we examined associations between metabolic syndrome and/or diabetes status to physical resiliency recovery parameters after the clinical stressors total knee replacement and bone marrow transplant. These parameters included health outcomes, functional recovery, and pain in the weeks after the intervention. Additionally, we hypothesized that less resilient individuals would have abnormal glucose and insulin responses to a 75-gram oral glucose tolerance test at 0, 30, 60, 120 minutes and tested this in a subset (n=40) without known diabetes. Exploratory analyses of this pilot study will be presented during this session.

RELATIONSHIP BETWEEN METABOLIC HEALTH AND 5 EPIGENETIC CLOCKS IN THE BERLIN AGING STUDY II (BASE-II)

Ilja Demuth[1], Sandra Düzel[2], Valentin Vetter[3], Johanna Drewelies[4], Yasmine Sommerer[5], Elisabeth Steinhagen-Thiessen[3], Denis Gerstorf[6], and Lars Bertram[5], *1. Charité Universitätsmedizin Berlin, Berlin, Berlin, Germany, 2. Max Planck Institute for Human Development, Berlin, Berlin, Germany, 3. Charité - Universitätsmedizin Berlin, Berlin, Berlin, Germany, 4. Humboldt University Berlin, Berlin, Berlin, Germany, 5. University of Lübeck, Lübeck, Schleswig-Holstein, Germany, 6. Humboldt Universität zu Berlin, Berlin, Berlin, Germany*

The diagnosis of metabolic syndrome (MetS) relies on cut-off values for five cardiovascular risk factors, three of which must be met to make the diagnosis. While this approach has certain advantages in the clinical setting, it only allows a binary classification relying on cut-off values. Thus, individuals receiving the same MetS diagnosis may differ in terms of disease severity. We have recently developed a continuous measure of the metabolic load (MetL) that was calculated as a latent factor from indicators that are used to diagnose the MetS enabling a more differentiated assessment. DNA methylation age acceleration (DNAmAA) is a widely accepted biomarker of aging which can be derived from a variety of epigenetic clocks. However, it is still unclear which aspects of aging these biomarkers represent best. Aim of the current study was to evaluate whether and how the MetS and MetL relate to DNAmAA derived from five epigenetic clocks (7-CpG clock, Horvath's clock, Hannum's clock, PhenoAge, and GrimAge). MetS was diagnosed according to the AHA/IDF/NHLBI criteria (2009) and the latent MetL factor was extracted from a confirmatory factor analysis considering the same diagnostic parameters. DNAmAA estimated from PhenoAge and GrimAge were significantly associated with MetS (beta=0.036 and beta=0.063, both $p<0.05$) and MetL (both beta=0.009 and $p<0.05$) in regression analyses adjusted for age and gender including 1,100 participants from the follow-up assessments of the Berlin Aging Study II (BASE-II, mean age 75.6 ±3.8 years). The results will be discussed with respect to clinical relevance in the context of current literature.

SESSION 1020 (SYMPOSIUM)

BEHAVIORAL AND SOCIAL IMPACTS ON DAILY VARIABILITY IN HEALTH AND FUNCTIONING IN OLD AND VERY OLD AGE

Chair: Anna Jori Lücke Co-Chair: Oliver Schilling
Discussant: Scott Hofer

In recent years, research has shown that people experience substantial variability in domains such as cognition, health, or social interactions from day-to-day or even moment-to-moment. This variability carries relevant information above and beyond an individual's mean levels of functioning, revealing, for instance, potential risk factors for healthy aging. Thus, aging research increasingly examined such variations in older adults' daily lives, aiming to further the understanding of aging processes with insights into short- and long-term predictors of daily health and functioning. In this symposium, we introduce research using repeated daily life assessments from older participants to elucidate behavioral and social impacts on variations in working memory performance, pain and self-rated health, as well as social interaction quality. Luo et al. show that diverse daily activities were linked with higher working memory performance one the same day. Regarding long-term prediction, Schilling et al. found that patterns of alcohol consumption across two decades were only weakly predictive of subsequent short-term variability in daily working memory performance. Turning from cognitive functioning to health, Lücke et al. observed bidirectional links of variations in daily sleep quality with variations in daily pain and health perceptions across several days. Finally, Hülür et al. addressed the role of communication technologies for older persons' social interactions and found that daily social interaction quality differs with the interaction modalities. Scott Hofer will discuss the implications of the presented findings for our understanding of variability in everyday functioning in old age, considering challenges and opportunities for future research in this field.

LONG-TERM ALCOHOL CONSUMPTION AND STABILITY OF DAILY WORKING MEMORY PERFORMANCE IN OLD AGE

Oliver Schilling[1], Denis Gerstorf[2], Anna Jori Lücke[3], and Martin Katzorreck[4], *1. University of Heidelberg, Heidelberg, Baden-Wurttemberg, Germany, 2. Humboldt Universität zu Berlin, Berlin, Berlin, Germany, 3. Heidelberg University, Heidelberg, Baden-Wurttemberg, Germany, 4. University of Leipzig, Leipzig, Sachsen, Germany*

Mixed evidence of associations of alcohol consumption with cognitive aging suggested that low to moderate alcohol consumption predicts more favorable cognitive outcomes than abstinence, whereas higher consumption operates as risk factor for cognitive decline. Daily short-term fluctuations of cognitive performance have also been established as risk factor for subsequent cognitive decline. Bringing these two lines of research together, our study analyzed associations of long-term trajectories of alcohol consumption with ambulatory assessments (7 days, 6 beeps per day) of working memory (WM) performance in participants (N = 155, aged 66-69 and 86-89) followed-up from a long-term (>20 years) longitudinal aging study. Overall, the findings do not support the "risk-view", because long-term alcohol consumption patterns were not found to be predictive of either individual levels or intra-individual momentary fluctuations of WM performance. Follow-up analyses will examine the combined effects of alcohol consumption with further risk factors, such as long-term declines in health.

BIDIRECTIONAL LINKS OF DAILY SLEEP QUALITY AND DURATION WITH PAIN AND SELF-RATED HEALTH IN OLD AGE

Anna Jori Lücke[1], Cornelia Wrzus[2], Ute Kunzmann[3], Denis Gerstorf[4], Martin Katzorreck[5], Christiane Hoppmann[6], and Oliver Schilling[7], *1. Heidelberg University, Heidelberg, Baden-Wurttemberg, Germany, 2. Ruprecht Karls University Heidelberg, Heidelberg, Baden-Wurttemberg, Germany, 3. Leipzig University, Leipzig, Sachsen, Germany, 4. Humboldt Universität zu Berlin,*

Berlin, Berlin, Germany, 5. University of Leipzig, Leipzig, Sachsen, Germany, 6. University of British Columbia, Vancouver, British Columbia, Canada,
7. University of Heidelberg, Heidelberg, Baden-Wurttemberg, Germany

Sleep and physical well-being (e.g., pain, self-rated health) are closely linked, but the temporal ordering, especially regarding day-to-day variations, is not well understood. Furthermore, sleep quality and duration are only moderately correlated and may differ in their association with physical wellbeing. Using data from 123 young-old (66-69 years, 47% women) and 47 old-old adults (84-90 years, 60% women) who rated sleep quality and duration as well as pain and self-rated health on seven consecutive days, we examined bidirectional links between sleep and physical well-being. Supporting our hypotheses, results showed that after longer and better than usual sleep, participants reported better self-rated health; only better sleep quality significantly predicted lower pain. In turn, both lower pain intensity and increased self-rated health predicted better subsequent sleep quality, but not duration. We discuss conceptual and practical implications of our findings.

PERCEIVED QUALITY OF DAILY SOCIAL INTERACTIONS: THE ROLE OF INTERACTION MODALITY

Gizem Hueluer[1], Minxia Luo[2], Birthe Macdonald[2], and Carlotta Grünjes[1], *1. University of Bonn, Bonn, Nordrhein-Westfalen, Germany, 2. University of Zurich, Zurich, Zurich, Switzerland*

Older adults increasingly use digital technologies to communicate with others. In the present study, we examine the role of interaction modality (face-to-face, telephone, digital) for perceived quality of social interactions. We use data from 118 participants (age: M = 72 years, SD = 5, range = 65 to 94; 40% women), who reported on their social interactions over 21 days in an event-contingent experience sampling study. Relative to face-to-face interactions, participants reported feeling more accepted and calmer, but also less happy in telephone interactions. They perceived telephone interactions as more meaningful, but also as less pleasant. Relative to face-to-face interactions, participants felt less accepted, less close to their interaction partner, and less happy in digital interactions and they perceived digital interactions as less pleasant. In summary, our findings suggest that the modality of daily social interactions is related to their quality. We discuss implications of these findings for future research.

DAILY ACTIVITY DIVERSITY AND DAILY WORKING MEMORY IN COMMUNITY-DWELLING OLDER ADULTS

Minxia Luo[1], Robert Moulder[2], Laura Breitfelder[3], and Christina Röcke[4], *1. University of Zurich, Zurich, Zurich, Switzerland, 2. Institute of Cognitive Science, Colorado University Boulder, Boulder, Colorado, United States, 3. University Research Priority Program (URPP) Dynamics Of Healthy Aging, University Of Zurich, Zurich, Zurich, Switzerland, 4. University of Zurich, Dynamics of Healthy Aging & Center for Gerontology, Zurich, Zurich, Switzerland*

Research has shown that diverse activity engagement has positive effects on cognitive functioning in older age. However, it is unknown whether the positive effect holds within persons across days and across people. We examined daily within-person association between activity diversity and working memory in older age and effects of potential moderators therein. We examined 16-day smartphone-based ambulatory assessment data from 150 older adults (aged 65+). Participants reported their present activities and completed working memory tasks seven times per day. Within persons, higher daily activity diversity was positively associated with higher daily working memory. Moreover, the prior day's activity diversity led to that day's higher working memory, but not vice versa. We did not find any moderating effects of age, education, or fluid and crystallized intelligence. Our results strengthen the evidence on the beneficial effect of activity diversity on cognitive performance. Results are discussed in the context of cognitive reserve theory.

CAREGIVER HEALTH LITERACY AS A MODIFIABLE TARGET TO PROMOTE OLDER ADULT HEALTH

Rachel O'Conor, Morgan Eifler, Lauren Opsasnick, Laura Curtis, Julia Yoshino Benavente, Lee Lindquist, and Michael Wolf, *Northwestern University, Chicago, Illinois, United States*

Many older adults receive assistance in managing chronic conditions. Yet complicating the utility of caregiver support is whether caregivers have sufficient skills to aid in a patient's self-care. Health literacy (HL) is as an important determinant of older adults' health outcomes, but few studies have examined caregiver HL and patient outcomes. We interviewed 162 patient-caregiver dyads during an ongoing cognitive aging cohort study to examine associations between caregiver HL, measured using the Newest Vital Sign, and older adults' health outcomes. Physical function and mental health symptoms were assessed using PROMIS short form assessments. Patients' also self-reported emergency department (ED) visits and hospitalizations over the past 12 months. Chi-square and t-tests were performed, as appropriate. Patients were on average 73 years old and managing 4 comorbidities. The majority were female (70%), identified as Black (35%) or White (60%). Caregivers' mean age was 64 years; half were female (56%) and had limited HL (48%). Limited caregiver HL was associated with poorer physical function (M=43.0 (8.5) vs. M=46.0 (9.1), p=0.05), greater comorbidities (M=4.0 (1.9) vs M=3.3 (1.8), p=0.02) and more ED visits in the past year (36.7% vs. 19.3%, p=0.01). No differences by caregiver HL were observed for patients' mental health or hospitalization. Findings suggest that caregivers with limited HL are caring for medically complex patients, and further research should examine whether limited caregiver HL leads to poorer self-management of chronic conditions. The development of HL training for caregivers may better equip them to assist older adults and improve older adult health.

EXPLORING EXPERIENCES OF PAIN MANAGEMENT AMONG FAMILY CAREGIVERS OF COMMUNITY-DWELLING OLDER ADULTS WITH DEMENTIA

Hui Zhao[1], Pamela Kulbok[2], Ishan Williams[3], Carol Manning[2], and Rafael Romo[4], *1. James Madison University, Harrisonburg, Virginia, United States, 2. UVA,* *Charlottesville, Virginia, United States, 3. University of Virginia, School of Nursing, Charlottesville, Virginia, United States, 4. Dominican University of California, San Rafael, California, United States*

Pain is often under reported and under-treated in older adults with dementia. Formal caregivers receive training and resources to develop their pain management skills; yet family caregivers (FCGs), who bear the brunt of responsibility for pain management among community-dwelling older adults with dementia have largely been omitted from research. We conducted a qualitative descriptive study to gain a deep understanding of FCGs' experience in pain management. 25 adult FCGs of community-based older adults with dementia were living in central Virginia were interviewed. Participants were 29 to 95 years old, predominantly white, married, female, and high school graduates. Four themes emerged around exploring FCGs' pain management experience and each theme included sub themes: 1) Values: family caregivers make values-based decisions that rely on a diverse range of beliefs towards opioids and non-pharmacological approaches. 2) Barriers: pain management was hampered by patient-related factors (comorbidity, complexity of care) and FCG-related factors (lack of training and resources). 3) Support: FCGs perceived greater competence when well supported by professional caregivers (doctors, social workers) and family members. 4) Adaptation: FCGs employed many strategies to support themselves and build a sense of self-efficacy that can either inhibit or facilitate effective pain management for their loved-ones. Adaptation and support from professional or formal caregivers greatly improved FCGs' perception of competence in pain management, suggesting research and development of interventions targeting FCGs is warranted.

FACTOR STRUCTURE OF PRE-LOSS GRIEF-12 IN CAREGIVERS OF PEOPLE LIVING WITH DEMENTIA

JuYoung Park[1], and James Galvin[2], *1. Florida Atlantic University College of Social Work and Criminal Justice, Boca Raton, Florida, United States, 2. University of Miami School of Medicine, Miami, Florida, United States*

While several studies on post-loss grief have been conducted, little research has examined assessment and treatment for pre-loss grief in family caregivers of persons living with dementia (PLWD). A total of 699 caregivers of PLWD were recruited through relevant dementia associations. The recruitment e-mail provided information about the study and instructions on how to participate by a link to the online survey. Confirmatory factor analysis (CFA) was performed to test the fit of the data from the caregivers and to assess the factor structure of the Prolonged Grief-12 (PG-12) to evaluate pre-loss grief accurately by identifying relevant items and eliminating items that are not appropriate for caregivers of PLWD to assess pre-loss grief accurately. CFA was conducted via the Full Information Maximum Likelihood estimation method to test the unidimensional model of the PG-12 in the study population. The initial model was modified to develop a better-fitting model and to detect misfitting parameters in the PG-12 by deleting irrelevant items for caregivers of PLWD. The adjusted dementia-specific 10-item version (PG-10-D) had significantly improved fit indices with RMSEA = .064, CFI = .972, and GFI = .963. An overall assessment of fit indicated that the model adequately approximated the data. Factor loadings ranged from 0.53 to 0.85. This study suggests that the dementia-specific, unidimensional PG-10-D, modifying the original PG-12, may be useful and parsimonious in assessing and quantifying pre-loss grief in caregivers. Further research is required to establish psychometric properties, including factorial validity and reliability, factorial invariance analysis and further factor analysis.

POSITIVE ASPECTS OF CAREGIVING AND LOWER RISK OF FRAILTY AND SLEEP DISRUPTION IN THE NATIONAL STUDY OF CAREGIVING

Alexandra Wennberg[1], Loretta Anderson[2], Lenis Chen-Edinboro[3], Annachiara Cagnin[4], and Lorenzo Pini[5], *1. Karolinska Institutet, Stockholm, Stockholms Lan, Sweden, 2. University of Maryland, Baltimore, Reisterstown, Maryland, United States, 3. University of North Carolina Wilmington, Wilmington, North Carolina, United States, 4. Università degli Studi di Padova, Padua, Veneto, Italy, 5. University of Padova, Padova, Veneto, Italy*

Older adult caregivers have compounded risk for adverse health outcomes; however, evidence investigating the association between the spectrum of the caregiving experience and frailty has been limited. In the National Study of Caregiving, we examined the cross-sectional association between caregiving experiences and both frailty and sleep disruption outcomes among caregivers. We included 621 caregivers aged 65+ who completed a phone interview, including 36 items about caregiving. Using principal component analysis, we identified three caregiving components: general burden, financial burden, and positive emotions. Frailty was assessed via low energy, shrinking, weakness, reduced activity, and poor self-rated health. Sleep disruption was assessed with two questions regarding sleep interruption and trouble falling back asleep. In age- and sex-adjusted ordinal regression models, general burden was associated with frailty (OLO=1.21, 95% CI 1.12, 1.30) and trouble falling back asleep (OLO=1.08, 95% CI 1.00, 1.17); financial burden (OLO=1.15, 95% CI 1.02, 1.31) was associated with frailty. General (OLO=1.99, 95% CI 1.38, 2.88) and financial (OLO=1.98, 95% CI 1.25, 3.14) burden were associated with sleep interruption in the fully adjusted model. Positive emotions were associated with lower odds of both frailty (OLO=0.86, 95% CI 0.74, 0.99) and sleep interruption (OLO=0.75, 95% CI 0.58, 0.98). Caregiver burden was associated with greater risk of frailty in age- and sex- adjusted models and sleep interruption when further accounting for sociodemographic and health factors. Positive emotions of caregiving were associated with decreased risk of these outcomes.

SESSION 1040 (SYMPOSIUM)

CAREGIVER PARTICIPATION IN VIDEO VISITS: CHALLENGE OR OPPORTUNITY?

Chair: Megan Gately Co-Chair: Lauren Moo

Rapid expansion of telehealth in response to COVID revealed a digital divide for many patients, particularly older adults. Given the technical complexity of video visits (which may include downloading novel software and enabling a camera and microphone), video visits may be out of reach for older patients with less technological experience or with age and condition-related changes such as sensory loss or cognitive impairment. Involving caregivers in video visits (particularly technical set-up) may not only increase patient access but also enhance clinical care by allowing for collaboration with family. Caregivers may themselves benefit from video visits, given that video offers increased options for caregiver support. Though caregivers are often identified as critical components to older adults' accessing telehealth and may also benefit from telehealth services, caregivers' own technical needs are not well-understood. This symposium discusses caregivers' involvement in telehealth from multiple perspectives. The first presentation includes findings from a national clinician survey about caregivers' support role in occupational therapy video visits, including barriers and benefits (Gately et al). The second presentation includes findings from a regional survey of interprofessional clinicians about telehealth modalities to provide dementia family caregiver support during COVID-19 (Quach et al). The third presentation includes family caregivers' technology assistance requirements before and during a virtual, seven-session group skills training program, including benefits of individualized assistance (Moo et al). The fourth presentation includes caregiver perspectives about tele-geriatrics visits, highlighting caregivers' support role and enhancements of video versus phone (Boudreau et al).

CAREGIVER CONTRIBUTION TO OCCUPATIONAL THERAPY VIDEO VISITS

Megan Gately[1], Dylan Waller[2], Emily Metcalf[1], and Lauren Moo[1], *1. VA Bedford Health Care System, Bedford, Massachusetts, United States, 2. VA Portland Health Care System, Portland, Oregon, United States*

Caregivers' role facilitating older adults' participation in diverse health care services delivered using video telehealth (i.e., live sessions) is not well-understood. This study surveyed occupational therapy (OT) practitioners across Veterans Health Administration (VHA) about caregiver participation in VA Video Connect (VVC), VHA's videoconferencing platform. 293 OT practitioners participated in the survey, with 47% reporting that caregivers participated in VVC often. The foremost reported patient factors necessitating caregiver participation in video visits were patient lack of technical skills (76%) and cognitive impairment (72%). Barriers to caregiver participation in video visits included poor connectivity and caregivers' own age or health related impairments, while benefits included increased collaboration with family (87%). This study enhances our understanding of caregivers' participation in video telehealth, highlighting factors driving caregiver participation and suggesting strategies to optimize this service delivery format for older adults.

FACTORS INFORMING CLINICIAN CHOICE OF TELEHEALTH MODALITY TO SUPPORT DEMENTIA CAREGIVERS

Emma Quach[1], Emily Franzosa[2], Christine Hartmann[1], and Lauren Moo[1], *1. VA Bedford Health Care System, Bedford, Massachusetts, United States, 2. Icahn School of Medicine at Mount Sinai, New York City, New York, United States*

In summer 2020, 68 clinicians in the New England area caring for Veterans with dementia as part of a specialty team were surveyed regarding caregiver support services, with a 46% response rate (n=31). When faced with the need to abruptly discontinue in-person dementia support services, the majority of respondents offered caregivers support via telephone rather than video telehealth. Only 4 of 31 (13%) mentioned offering video visits for the first time to replace face-to-face visits. Clinician choice of modality largely reflected shifts among preestablished communication modalities/patterns and were influenced by clinician perception that older patients and their caregivers would prefer the telephone. Clinicians without experience using video telehealth with older adults were unlikely to offer video visits despite evidence that many older adults are willing and able to participate. Assessing caregiver wish/ability to participate in video visits may inform and shape clinician choice of telehealth modality.

TECHNICAL SUPPORTS TO BRIDGE THE DIGITAL DIVIDE FOR OLDER ADULTS PARTICIPATING IN TELEMEDICINE

Lauren Moo[1], Andrew Nguyen[2], Kendra Pugh[3], Jaye McLaren[3], Steven Shirk[3], and Maureen O'Connor[3], *1. VA Bedford Health Care System, Bedford, Massachusetts, United States, 2. Bedford VA Research Inc, Boston, Massachusetts, United States, 3. VA Bedford Healthcare System, Bedford, Massachusetts, United States*

Older adults' relative lack of technological literacy is a barrier to telemedicine, including participation in virtual caregiver support programs. Details of technology assistance required before and during a virtual, seven-session group skills training program for family caregivers were recorded. A majority of participants, all older adults, had difficulty using videoconferencing technology that ranged from finding meeting links in emails to difficulty with basic device use. Personalized support was provided to each caregiver as needed. None required any support by the final session. Those with initial technology challenges felt a sense of accomplishment and increased tech comfort by the end of the sessions. While some older adults had difficulty using telemedicine technology, they were eager to learn and educable with personalized help. Infrastructure to provide this personalized help is necessary to support older adults' desire to engage in telemedicine and to reduce the digital divide.

PERSPECTIVES OF CAREGIVERS OF RURAL, OLDER VETERANS ON TELEGERIATRICS CARE

Jacqueline Boudreau[1], Jennifer Conti[1], Meaghan Kennedy[1], Camilla Pimentel[2], William Hung[3], Lauren Moo[1], and Eileen Dryden[1], *1. VA Bedford Health Care System, Bedford, Massachusetts, United States, 2. VA Bedford Healthcare System, Bedford, Massachusetts, United States, 3. Icahn School of Medicine at Mount Sinai, New York, New York, United States*

Telemedicine is critical to extending healthcare's reach to rural older adults with complex medical needs, yet concerns remain about feasibility and acceptability for this population and their caregivers. We interviewed 30 rural Veterans ≥65 years old and/or their caregivers (n=21) about their experiences with video or telephone visits as part of an evaluation of Virtual Geriatrics, a network of Veterans Affairs tele-geriatric care hubs. Interviews were recorded, transcribed, and analyzed using rapid qualitative analysis. Caregivers deemed telemedicine a convenient option that prevented burdensome travel to remote specialists, facilitated caregiver involvement in visits, and matched quality of in-person visits. Caregivers often managed technology, enabling their loved one to participate in video visits. Telephone visits, while convenient, sometimes caused missed physical cues and hearing challenges which led providers to lean on caregiver communication. Our findings suggest telemedicine is feasible and acceptable for delivery for geriatrics care among rural adults and their caregivers.

SESSION 1050 (SYMPOSIUM)

COGNITION IN CONTEXT: INVESTIGATING THE ROLE OF BUILT, SOCIAL, AND NATURAL ENVIRONMENTS IN COGNITIVE AGING

Chair: Jessica Finlay Co-Chair: Philippa Clarke Discussant: Lilah Besser

While a growing body of evidence points to potentially modifiable individual risk factors for Alzheimer's Disease and Related Dementias (ADRD), the contexts in which people develop and navigate cognitive decline are largely overlooked. Geographic variation in ADRD rates suggest that environmental risk and protective factors may be important in cognitive aging and dementia caregiving. Community hazards are often heavily concentrated in underserved and underrepresented neighborhoods. This symposium aims to identify specific built, social, and natural environmental features associated with cognitive aging outcomes. The papers provide much-needed evidence on the role of neighborhoods and community networks for cognitive health and well-being among diverse older adults. First, Godina finds significant associations between neighborhood greenspace and microstructural indicators of brain health. Second, Westrick investigates the role of neighborhood disadvantage on long-term memory aging of older adults with and without a cancer diagnosis in later-life. Third, Finlay presents a new concept of Cognability to demonstrate which constellation of positive and negative neighborhood features may contribute most to healthy cognitive aging. Fourth, Nkimbeng identifies community networks and resources needed to inform dementia education and support care among African immigrants. Fifth, expert discussant Besser will share how these findings may inform upstream health promotion and reduce ADRD risk. She will discuss critical future research directions and methods to investigate environments of cognition. The symposium advances research assessing contexts of aging, and may inform public health and policy efforts to ameliorate community barriers and create more equitable opportunities to promote healthy aging in place.

NEIGHBORHOOD GREENSPACE AND GRAY MATTER MICROSTRUCTURAL INTEGRITY: THE HEALTH ABC STUDY

Sara Godina[1], C. Shaaban[2], Caterina Rosano[3], Howard Aizenstein[4], and Andrea Rosso[3], *1. University of Pittsburgh School of Public Health, Pittsburgh, Pennsylvania, United States, 2. Department of Epidemiology, University of Pittsburgh School of Public Health, Pittsburgh, Pennsylvania, United States, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 4. Department of Psychiatry, University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, United States*

Neighborhood greenspace is positively associated with cognition and macrostructural indicators of brain health. Microstructural damage may be a sensitive marker for dementia-related neurodegeneration that precedes such macrostructural changes. We aimed to examine cross-sectional associations between neighborhood (census tract) greenspace and gray matter (GM) microstructure in 265 community-sampled adults (mean age=83, 57% women, 39% Black). Linear mixed effects regression models tested associations between quartiles of percent greenspace derived from the normalized vegetation index and mean diffusivity (MD) quantified using magnetic resonance imaging with diffusion tensor. Greater greenspace was related to higher MD in 4 regions: left calcarine (Q3 vs. Q1 stβ=0.38, p=0.0348), left thalamus (Q2 vs. Q1 stβ=0.35, p=0.0443; Q3 vs. Q1 stβ=0.49, p=0.0061), and bi-lateral precuneus (left Q2 vs. Q1 stβ=0.46, p=0.0096; right Q2 vs. Q1 stβ=0.36, p=0.0385). The relationship between greenspace and cognition may be through paths other than GM microstructure; future research should explore other potential mechanisms.

DOES NEIGHBORHOOD DISADVANTAGE ALTER MEMORY AFTER A CANCER DIAGNOSIS? A US HEALTH AND RETIREMENT STUDY

Ashly Westrick[1], Monica Ospina-Romero[2], Philippa Clarke[1], and Lindsay Kobayashi[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. University of Wisconsin, Madison, Wisconsin, United States*

We aimed to determine the influence of neighborhood socioeconomic status (NSES) on long-term cancer-related memory decline of older adults. Incident cancer diagnosis and memory were assessed in the U.S. Health and Retirement Study (N=15,074, 1998-2016). Proportion of female-headed households with children, households with public assistance income, people with income below poverty, and proportion 16+ years unemployed was categorized into NSES tertiles. Linear mixed-effects models compared the standardized memory trajectories by cancer status and NSES. Cancer-free individuals living in more disadvantaged neighborhoods had worse mean memory function at age 75 and steeper memory declines than participants from less disadvantaged neighborhoods. An incident cancer diagnosis was associated with an acute memory drop at diagnosis for those living in the least disadvantaged neighborhoods. Cancer survivors had better memory prior to but not after diagnosis compared to cancer-free individuals across NSES. These findings could inform future interventions to promote cancer survivor's long-term aging.

COGNABILITY: AN ECOLOGICAL THEORY OF NEIGHBORHOODS AND COGNITIVE AGING

Jessica Finlay[1], Esposito Michael[2], Kenneth Langa[1], Suzanne Judd[3], and Philippa Clarke[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2.*

Washington University in St. Louis, St. Louis, Missouri, United States, 3. University of alabama at Birmingham, Birmingham, Alabama, United States

This paper presents a new theoretical concept, Cognability, which aims to conceptualize how supportive an area is to cognitive health among aging residents. Cognability incorporates a both positive and negative neighborhood features related to physical activity, social interaction and cognitive stimulation in later life. We analyzed data from the Reasons for Geographic and Racial Differences in Stroke Study, a national sample of older Black and white US adults (n=21,151; mean age at assessment=67; data collected 2006–2017). Generalized additive multilevel models examined how cognitive function varied by neighborhood features. Access to civic and social organizations, recreation centers, fast-food and coffee establishments, arts centers, museums, and highways were significantly associated with cognitive function. Race-, gender-, and education-specific models did not yield substantial improvements to the full-model. Cognability advances ecological theories of aging through an innovative "whole neighborhood" approach. Findings may inform community interventions and policy to support healthy aging in place.

FACTORS INFLUENCING WHERE AFRICAN IMMIGRANTS PLAN TO SEEK CARE FOR A RELATIVE WITH DEMENTIA

Manka Nkimbeng[1], Wynfred Russel[2], Tetyana Shippee[1], and Joseph Gaugler[1], *1. University of Minnesota, Minneapolis, Minnesota, United States, 2. African Career Education And Resources Inc. (ACER), Brooklyn Park, Minnesota, United States*

Many African immigrants did not hear about dementia until they migrated to the United States, which limits understanding of the disease and awareness of community resources. We examined the relationship between being a caregiver, care recipient country of residence, and seeking care using data from 152 African immigrants. Most participants (90%) were caregivers, 12% of the care recipients resided in Africa, and 59% reported that they would seek care within the formal health system. After controlling for age, gender, income and participant place of birth, caregivers were more likely (aOR: 2.31, 95% CI 0.37, 13.39) to seek care from community networks alone, as were those providing care to a recipient in Africa (aOR: 1.94, 95% CI 0.56, 6.71), but these were not statistically significant. These findings which trend toward preferences for seeking care through informal community networks (friends, religious organizations etc.), can inform dementia education and outreach for this community.

SESSION 1060 (SYMPOSIUM)

COVID-19 RECOVERY: LESSONS LEARNED AND POLICY ACTIONS FOR THE FUTURE

Chair: Christine Mueller Discussant: Kirsten Corazzini

Focusing on Covid-19 recovery, this symposium will feature a selection research studies that highlight lessons learned that are applicable across the continuum of care for older adults, their families and care partners. The collection of presentations bring perspectives from local to global. Each of the presenters will highlight implications for health and aging policy.

IMPACT OF COVID-19 MITIGATION POLICIES: LESSONS LEARNED FROM US AND MIDDLE-HIGH INCOME COUNTRIES

Preeti Zanwar[1], Vinod Joseph KJ[2], Zaliha Omar[3], Flavia Santos[4], Evguenii Zazdravnykh[5], Patricia Heyn[6], and Arokiasamy Perianayagam[7], *1. Jefferson College of Population Health, Philadelphia, Pennsylvania, United States, 2. International Institute for Population Sciences, Mumbai, Maharashtra, India, 3. School of Health Sciences, Fujita Health University, Toyoake, Aichi, Japan, 4. University College Dublin, Dublin, Dublin, Ireland, 5. National Reserach University, International Center of Health Economics, Policy, and Management, St. Petersburg, Leningrad, Russia, 6. Center for Optimal Aging, Marymount University, Fairfax Station, Virginia, United States, 7. National Council of Applied Economic Research, New Delhi, Delhi, India*

The COVID-19 pandemic has been a natural global epidemiological experiment unique to our century and a massive shock to older adults and to systems that care for them. There was a lack of a global unified plan to mitigate and control the spread of COVID-19. Several middle-or-high income nations struggled to control the viral spread resulting in increased mortality due to a combination of lack of public health measures and existing disparities which were magnified during the pandemic. The purpose of this review by a team of international experts is to (1) to examine reasons for the varied COVID-19 responses within U.S. and among other middle-or-high-income countries and the emergence of variants and vaccine inequities, and (2) to examine the country specific burden of cultural/structural/political determinants on access to care and mortality among older adults in various settings.

INFECTION PREVENTION CHALLENGES AND OPPORTUNITIES IN SMALL LONG-TERM CARE FACILITIES

Carolyn Ham, *Washington State Department of Health, Shoreline, Washington, United States*

Small, individually owned long-term care facilities experienced unique challenges to accessing infection prevention knowledge and resources during the COVID-19 pandemic. Three data sets were analyzed: 1) Multi-state qualitative interviews with public health and regulatory staff in spring 2021; 2) Online survey of Washington state adult family home providers on infection control knowledge and practices in fall 2020; 3) Non-regulatory Infection Control Assessment and Response evaluations conducted between March 2020 and January 2021. Consistent findings across datasets were ongoing difficulty obtaining personal protective equipment (PPE), inability to implement isolation precautions and high vulnerability to staffing shortages. Small facilities showed strengths in consistency of leadership and engagement with public health outreach. Facility size is a key factor in infection prevention disparities for older adults living in residential care. Promising policy interventions are prioritization of small facilities for PPE distribution and increasing the availability of public health infection prevention expertise.

PREDICTORS OF NURSING HOME COVID-19 CASES: A COMMUNITY VULNERABILITY APPROACH

Matthew Peterson[1], and Larry Lawhorne[2], *1. UNCW College of Health and Human Services, Wilmington, North Carolina, United States, 2. Wright State University, Fairborn, Ohio, United States*

This study examined facility and community factors that were related to incident COVID-19 cases in nursing facilities. N=12,473 US nursing facilities were included in this study. Data from June 2020 - January 2021 from several sources were combined to create a dataset that included facility and community factors. Results indicated that higher staff shortages, poorer facility rating, for-profit ownership, proportionally more Medicaid and non-white residents were all significantly associated with higher COVID case rates over 8 months (all $P < 0.0001$). Community level predictors of higher cases included urban setting and higher Social Vulnerability Index (SVI). SVI was the strongest predictor of COVID case counts. This study assists in determining critical facility and community factors that predict increasing COVID burden in nursing facilities. Particularly, SVI is an important factor in determining facility and public health policy, and for targeting resources in large scale health crises such as the COVID-19 pandemic.

IMPACT OF SOCIAL ISOLATION ON OLDER ADULTS IN NURSING HOMES DURING THE PANDEMIC LOCKDOWN: INFORMING POLICY

Rebecca Koszalinski[1], Diana Sturdevant[2], Patsy Smith[2], Julie Myers[3], Debara Yellseagle[2], Brenda Olmos[2], and Molly Netter[2], *1. OUHSC, Oklahoma City, Oklahoma, United States, 2. University of Oklahoma HSC, Oklahoma City, Oklahoma, United States, 3. University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, United States*

Purpose: Describe outcomes of an equity-centered community design (ECCD) project examining the impact of COVID-19 restrictions and social isolation on nursing home (NH) owners, administrators, community leaders, clergy, and urban homeless shelter staff. • Methods: 3-phase, ECCD project. Key informants (KI) were recruited through snowball sampling if experienced in caring for older adults (OA) in NH, in the community, or were engaged in spiritual care of OA.• Results: Perceptions of fear, anger, frustration, sadness, and concern. Categories of Lost Communication and Socialization Strategies, Lost Freedom, Residents' Dying Alone and Inability to Pause to Grieve, Helplessness and Hopelessness, Inability to Take Time to Grieve, and Behavior Changes. KI offered New Ways of Communicating, and interventions and solutions were generated in Phase III.• Implications. Understanding of Stakeholder experiences and perceptions is important to achieving inclusive, equity-centered solutions. Future policy decisions must consider what matters most to those most directly impacted by those decisions.

SESSION 1070 (SYMPOSIUM)

ESPO AND ACADEMY FOR GERONTOLOGY IN HIGHER EDUCATION SECTION SYMPOSIUM: TEACHING STRATEGIES FOR INTEGRATING DIVERSITY IN AGING EDUCATION PRACTICES

Chair: YanJhu Su Co-Chair: Shan Qu Discussant: Joann Montepare

This symposium intends to echo one of the core values for the GSA 2022 Annual Scientific Meeting — embracing diversity. In an increasingly humanistic society, addressing and accommodating diversity is a constant topic in the field of education. Diversity includes many different factors: race, ethnicity, gender, sexual orientation, socioeconomic status, ability, age, religious or political beliefs. There is no longer just one type of student in the classroom. Therefore, it is very important to adjust our teaching methods to accommodate the diverse backgrounds of students and to help students understand their different fellow classmates. In accordance with the AGHE gerontological education competencies, these authors will provide insightful teaching strategies for integrating diversity in aging education practices. The first speaker will introduce a new pedagogy in promoting learning in diverse classrooms — Sharestart. The second speaker will focus on building community-based partnerships to promote diverse, intergenerational service-learning opportunities for interprofessional gerontology students. The third speaker will discuss their experience on fostering connections across generations in the LGBTQ+ community through intergenerational conversations. The fourth speaker will present humanist values on understanding aging diversity. Finally, the fifth speaker will discuss curriculum mapping as a strategy to teach diversity in gerontology programs.

SHARESTART: A NEW PEDAGOGY TO PROMOTE LEARNING IN DIVERSE CLASSROOMS

YanJhu Su, *University of Massachusetts Boston, Boston, Massachusetts, United States*

Diverse classrooms are nightly valued. The role of teachers is not limited to imparting knowledge. Nor are students only limited to gaining knowledge from their teachers. In this symposium session, the speaker would like to introduce a new pedagogy — Sharestart, which is specifically designed for comprehensive student learning. This pedagogy was proposed by a senior high school teacher in Taiwan. It is a long-term and stable teaching method that integrates a diversity of abilities by enabling students to self-learn, read, think, discuss, analyze, summarize, express and compose in every class session. In this symposium presentation, the speaker will introduce the core values of Sharestart pedagogy, discuss the advantages and disadvantages, and present an application scenario applying the Sharestart pedagogy.

REDUCING AGEISM IN THE LGBTQ+ COMMUNITY THROUGH INTERGENERATIONAL CONNECTION

Carrie Andreoletti, Christina Barmon, Andrea June, and Michael Bartone, *Central Connecticut State University, New Britain, Connecticut, United States*

Intergenerational interaction has the potential to reduce ageism and increase feelings of generativity in both younger and older adults. To expand aging education beyond our aging and gerontology classes, we collaborated with our campus LGBT Center and community partners to host several intergenerational conversations between younger and older LGBTQ+ adults and allies. The goal was to foster connection across the generations in the LGBTQ+ community through discussions of topics of mutual interest (e.g., ageism, identity & language). Participants in the LGBTQ+ conversations reported that they valued the opportunity to talk with members of the community from different generations and that the conversations changed their views of one another in a positive way. We will discuss the strengths and challenges of our program, ideas for future programs and research, and suggestions for integrating discussion of LGBTQ+ aging into the classroom.

BUILDING COMMUNITY-BASED PARTNERSHIPS TO PROMOTE DIVERSE, INTERGENERATIONAL SERVICE-LEARNING OPPORTUNITIES

Jason Garbarino, and Janelle Sarnevitz, *University of Vermont, Burlington, Vermont, United States*

The next generation of healthcare providers require experiential learning opportunities which incorporate participation from historically marginalized, diverse populations. A longstanding interprofessional gerontology service-learning program with a measured ability to positively influence student perspectives working with older adults while reducing rates of social isolation among older participants, underwent recent changes in the recruitment of older adults to ensure increased participation from historically marginalized populations. Building partnerships with community-based organizations serving BIPOC, LGBTQ+, and rural older adults played an integral role in building a more diverse participant group for shared, intergenerational learning. Opportunities for student reflection via group debriefs and individual, written reflections promote a greater understanding and preparedness to work with diverse older adult populations.

UNDERSTANDING AGING DIVERSITY THROUGH HUMANIST VALUES OF AGING: LOVE, HOPE, PEACE, AND STEWARDSHIP

Stephen Fogle, *University of Nebraska at Omaha, Omaha, Nebraska, United States*

Humanist values of aging are relevant for understanding diversity in gerontological education because they are manifested across all cultures and ages. This paper proposes attention to four humanist values of aging: Love, Hope, Peace, Stewardship. This paper seeks opportunities for students to understand aging diversity in half century context: from traditional frames of race and sexuality to global conversations on language and geography. Drawing from stories about older adults this paper gathers diverse opportunities for understanding of humanist values of aging. Selections strive toward expanding representation of aging diversity and accessibility for students. Teaching with stories of love, hope, peace, and stewardship as humanist values of aging matches AGHE initiatives for incorporating humanities into gerontological education and opens opportunities for recognizing diversity representation in our society for all ages. Understanding aging diversity through stories of older adults engaged with humanist values of aging promises enriching educational experiences for lifelong learning.

CURRICULUM MAPPING AS A STRATEGY TO TEACH DIVERSITY IN GERONTOLOGY PROGRAMS

Darren Liu[1], and Betty Burston[2], *1. West Virginia University, Morgantown, West Virginia, United States, 2. University of Nevada Las Vegas, Nevada, Las Vegas, Nevada, United States*

Curriculum mapping is a process where instructors, program leaders and other instructional designers come together to prepare learning objectives for students throughout a learning journey. The concepts of diversity may be introduced at all levels of a gerontology curriculum. A curriculum that desires to integrate diversity education is especially imperative as it needs to be built upon a guiding principle of a didactic program within which its individual courses, learning objectives, and assessments all together serve the same purpose. This presentation provides insight to the curriculum mappings for diversity education in gerontology programs. While the current programs introduce diversity topics such as race, racism, implicit bias, etc., how and when each topic being introduced in bringing about maximum learning outcomes may be related to a well thought out curriculum mapping. Specifically, this session will go over a few examples of methods for the mappings of diversity topics in different courses.

SESSION 1080 (SYMPOSIUM)

FORGING AND SUPPORTING INTERGENERATIONAL CONNECTIONS: THE BREADTH OF INTERGENERATIONAL SCHOLARSHIP

Chair: Cal Halvorsen Co-Chair: Ling Xu Discussant: Amy Eisenstein

Research on intergenerational connections is wide ranging, highlighting the various ways that people from across the life course interact for mutual and community benefit. Intergenerational connections occur through both formal (e.g., community service programs) and informal (e.g., family interactions) means. Studies have shown that intergenerational connections can lead to an assortment of physical, social, psychological, and interpersonal health and well-being outcomes for younger and older people alike. This symposium will highlight the breadth of research on intergenerational connections, bringing together scholars who have used primary and secondary data to better measure, understand, and support them. The first presentation will report the results of a randomized controlled trial in Tarrant County, Texas that trained college students to connect with older adults experiencing cognitive impairment through reminiscence and digital storytelling. The second presentation will describe how intergenerational transfers of emotional and instrumental support relate to self-rated health among older Chinese adults living in Honolulu while considering the roles of gender and resilience. The third presentation will address an important question within intergenerational scholarship—how to measure intergenerational connections—by reporting the results of the newly developed and validated Intergenerational Contact survey among an online sample of younger and older adults. The fourth presentation will describe the pilot-year evaluation of the Gen2Gen Innovation Fellowship, a cohort model that supports and connects leaders of intergenerational initiatives throughout the U.S. To conclude, our discussant will place these diverse studies into context and note places for continued innovation in intergenerational scholarship to better inform the field.

REMINISCENCE AND DIGITAL STORYTELLING TO IMPROVE WELL-BEING OF OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Ling Xu[1], Noelle Fields[2], Kathryn Daniel[1], Brooke Troutman[3], and Daisha Cipher[2], *1. University of Texas at Arlington, Arlington, Texas, United States, 2. The University of Texas at Arlington, Arlington, Texas, United States, 3. Air Force Academy, Air Force Academy, Colorado, United States*

To address the growing concern about loneliness and diminished well-being among persons with cognitive impairment, an intergenerational intervention based on reminiscence and digital storytelling was offered by trained college student volunteers to older adults living in the community. A randomized controlled trial was used to assess the effects of the intervention. Younger and older adult participants were randomly paired and assigned to reminiscence (n=20) or control (social wellness, n=16) groups. Data were collected at baseline, mid-intervention, and at the end of the intervention. Friedman tests for non-normally distributed outcome variables and one-way repeated measures ANOVA for normally distributed outcome variables were conducted. Results showed that emotional loneliness, total social and emotional loneliness, quality of life, and positive affect significantly improved among older adults in the reminiscence group, especially between baseline and posttest. Results suggest that weekly intergenerational engagements with young adults benefit older adults with psychological well-being.

INTERGENERATIONAL TRANSFERS AND HEALTH IN CHINESE OLDER ADULTS: DO RESILIENCE AND GENDER MATTER?

Sizhe Liu[1], Wei Zhang[2], Keqing Zhang[2], and Bei Wu[3], *1. Shanghai University of Finance and Economics, Shanghai, Shanghai, China (People's Republic), 2. University of Hawaii at Manoa, Honolulu, Hawaii, United States, 3. New York University, New York, New York, United States*

Emotional and instrumental supports from adult children have been shown to increase positive outcomes among older adults. In this study, we examined the association between intergenerational transfer and self-rated health as well as the mediating and moderating roles of resilience and gender, respectively, using data from Chinese older adults in Honolulu (N=400). We found that the impact of emotional and instrumental support varied by gender. Further, we found that resilience significantly mediated the positive effect of provided economic support on health of older men (resilience mediated 25.1% of the total effect) as well as the positive effect of received emotional support on health of older women (resilience mediated 35.3% of the total effect). Our study highlights the importance of considering resilience and gender differences when examining intergenerational transfers and health among Chinese older adults. The design of a culturally tailored policy would help promote the health of Chinese older adults.

MEASURING GENERATIONAL DIFFERENCES IN INTERGENERATIONAL CONTACT WITH A NEWLY VALIDATED SCALE

Shannon Jarrott[1], Shelbie Turner[2], and Karen Hooker[3], *1. The Ohio State University, Columbus, Ohio, United States, 2. Weill Cornell Medical College, Pitman, New Jersey, United States, 3. Oregon State University, Corvallis, Oregon, United States*

2. Intergenerational contact influences attitudes about aging, but measures vary in breadth, depth, and psychometrics. We developed and validated the Intergenerational Contact survey of key contact dimensions using online samples. Here, we address: how do young and older adults differ in location and ratings of intergenerational contact? Young (n=433) and older adults (n=286) reported intergenerational contact settings and rated 18 items regarding contact (e.g., "I have something to offer younger/older adults.") with family and non-family members. Neighborhoods were a common setting for interacting with family and non-family members of different ages. Young adults reported higher negative contact (p<.001) and lower positive contact (p<.001) with related and unrelated older adults than older adults reporting having with younger adults. Developmental theory may partially explain these differences; we address next steps to explore how differences may affect interest in or avoidance of intergenerational contact, associated impacts, and potential interventions.

PILOTING AN INTERGENERATIONAL ECOSYSTEM: THE GEN2GEN INNOVATION FELLOWSHIP AND RESULTS FROM YEAR 1

Cal Halvorsen[1], Eunice Lin Nichols[2], and Janet Oh[2], *1. Boston College, Allston, Massachusetts, United States, 2. Encore.org, San Francisco, California, United States*

Intergenerational service has a long history in the U.S., highlighting the positive health and well-being outcomes of bringing the generations together. In recent years, private foundations have increased their focus on intergenerational initiatives, yet the creation of an "intergenerational ecosystem" that is designed to spark, grow, and support new intergenerational initiatives has not been nationally tested. In response, Encore.org launched the Gen2Gen Innovation Fellowship in 2020 to pilot and hone a 9-month fellowship model that supports a diverse group of leaders of intergenerational initiatives. To assess the impact of the Fellowship, we employed a mixed-methods approach with subjective and objective data sources, including interviews and monthly and post-Fellowship surveys. Among the first cohort of 15 Fellows, results suggest that the cohort-style model encouraged peer-to-peer support and that the Fellowship positively influenced their intergenerational efforts. We conclude by describing lessons learned to inspire future efforts to strengthen the intergenerational ecosystem.

SESSION 1090 (PAPER)

GLOBAL RESEARCH IN DEMOGRAPHY AND HEALTH OUTCOMES, MIGRATION, AND DISCRIMINATION

COHORT EFFECTS IN MULTIMORBIDITY AMONG OLDER US ADULTS: DIFFERENCES BY RACE/ ETHNICITY AND NATIVITY

Nicholas Bishop[1], Steven Haas[2], and Ana Quiñones[3], *1. University of Arizona, Tucson, Arizona, United States, 2. Penn State, University Park, Pennsylvania, United States, 3. Oregon Health and Science University, Portland, Oregon, United States*

Multimorbidity (≥ 2 co-occurring chronic health conditions) affects > 50% of US adults aged 65 and older. Building on emerging work suggesting greater risk of multimorbidity in more recent cohorts of aging Americans, we examine heterogeneity in cohort-patterns of multimorbidity by race/ethnicity and nativity. Observations were drawn from the Health and Retirement Study (1998–2018) including adults aged 51 and older across 7 birth cohorts (born < 1924, 1924–1930, 1931–1941, 1942–1947, 1948–1953, 1954–1959, and 1960–1965). Multimorbidity was measured using a sum of 9 possible chronic conditions (heart disease, hypertension, stroke, diabetes, arthritis, lung disease, cancer, high depressive symptomatology, and cognitive impairment). Linear mixed models adjusting for age, period, and cohort effects tested whether cohort-specific multimorbidity risk varied for US-born White, US-born Black/African American, US-born Hispanic/Latino, and foreign-born Hispanic/Latino older adults. 30,607 adults contributed 158,727 total observations, grand mean age was 65.40 (SD=10.07), and mean multimorbidity was 2.18 (SD=1.60). US-born Black/African Americans had the greatest multimorbidity burden regardless of cohort. US-born Hispanic/Latinos experienced the highest cohort-related increases in multimorbidity, followed by US-born Black/African Americans. For example, compared to US-born Hispanic/Latinos born 1931–1941, US-born Hispanic/Latinos born 1954–1959 had 1.03 (CI: 0.78;1.28) more expected chronic conditions. Foreign-born Hispanic/Latinos had the smallest cohort-related increases in multimorbidity. Our results document heterogeneity in rising rates of multimorbidity across cohorts, suggest that US-born minority adults in Baby Boom cohorts may be at especially high risk of multimorbidity, and confirm protective effects of immigrant status among Hispanic/Latino older adults.

DOES DISCRIMINATION MODERATE THE RELATIONSHIP OF AGE, GENDER, AND RACE WITH HEALTH OUTCOMES IN OLDER ADULTS?

Meghan Hendricksen[1], Jeffrey Stokes[2], Sarah Forrester[3], and Beth Dugan[2], *1. Marcus Institute for Aging Research, Roslindale, Massachusetts, United States, 2. University of Massachusetts Boston, Boston, Massachusetts, United States, 3. University of Massachusetts Medical School, Worcester, Massachusetts, United States*

Discrimination and experiences of prejudice are a social determinant of health, with potential consequences at the individual, interpersonal, and systemic levels. This study aimed to investigate the relationship between discrimination experienced by older adults and health outcomes. Data were drawn from 13,290 participants from the Health and Retirement Study, who completed the Leave Behind Questionnaire in 2012 or 2014. Logistic regressions were conducted to examine relationships between age, gender, and race/ethnicity and self-reported health (SRH), risk of stroke, and heart attack. Interaction terms were tested for everyday discrimination and age, gender, and race/ethnicity, then for health discrimination and age, gender, and race/ethnicity. Results found associations between age, gender, and race and SRH, stroke, and heart attack. Everyday discrimination moderated the association between gender and risk of heart attack, where differences in men and women's risk of heart attack were exacerbated at higher levels of discrimination. Similarly, everyday discrimination moderated the association between race and risk of heart attack, where differences in white and non-white participant's risk of heart attack were exacerbated at higher levels of discrimination. Experiences of discrimination in healthcare moderated associations between gender and both SRH and heart attack. Reduction in experiences of discrimination in all settings, but especially in healthcare, should be a top priority. Future work in the field of research around discrimination and health outcomes should address the mechanisms that are a product of historical systemic racism, ageism, and misogyny that impact the everyday lives of older adults, people of color, and women.

HOPELESSNESS AMONG MIDDLE-AGED AND OLDER ADULTS: A COMPARISON OF NATIVE WHITES, NATIVE MINORITIES, AND IMMIGRANTS

Man Guo, Yi Wang, and Kara Carter, *University of Iowa, Iowa City, Iowa, United States*

Sense of hopelessness is closely linked to poor physical/mental health and elevated suicidal risk. The aging and immigration processes put middle-aged and older immigrants at a greater risk of feeling hopeless. However, we know little about hopelessness among this population. This study asks two questions: do middle-aged and older immigrants have higher levels of hopelessness compared to native-born Whites and native-born ethnic minorities? If so, what factors contribute to such differences? Data was from the 2018 psychosocial assessment of the Health and Retirement Study (N = 5,534). ANOVA was used to compare levels of hopelessness among three groups of middle-aged/older adults (50 yrs+): native-born Whites (n =3,603), native-born minorities (n = 1,209), and immigrants (n = 722). Linear regressions were used to examine the association between nativity/race and hopelessness, with five sets of explanatory variables (i.e., SES, health, social support, social engagement, and neighborhood characteristics) entered in the models individually and then collectively. The findings showed that middle-aged/older immigrants had the highest levels of hopelessness, followed by native minorities, and then native Whites. Controlling for each set of the explanatory variables respectively reduced the group differences between native Whites and native ethnic minorities, but not between Whites and immigrants. When controlling for all the explanatory variables, the levels of hopelessness no longer differed significantly between immigrants and native Whites. Findings suggest that immigrants' multiple disadvantages in personal, family, and social lives may contribute to their heightened levels of hopelessness.

Interventions are sorely needed to protect against hopelessness for this population.

MIGRATION ACROSS THE LIFE COURSE AMONG OLDER ADULTS FROM PUERTO RICO

Maricruz Rivera-Hernandez, *Brown University School of Public Health, Worcester, Massachusetts, United States*

The prior literature regarding migration among Hispanics to US states has largely focused on younger migrants and often excluded people from Puerto Rico (e.g., Hispanic Paradox; Bostean, 2013). However, older Puerto Ricans appear to be moving to the US mainland (US Census Bureau, 2020, 2021). Therefore, the primary objective of this research was to examine migration among Medicare beneficiaries from Puerto Rico. Using data from Medicare, our results showed that migration trends among Medicare beneficiaries from Puerto Rico have increased over the past decade, including those with special needs. There were 5,593 (1%) Medicare beneficiaries who migrated in 2009 compared to 12,382 (~2%) beneficiaries who migrated in 2018. Among those who migrated, 3,679 were 65 and older in 2009 compared to 8,805 in 2018. The majority of older adults who moved to US states were female (59%), about 75 years old and were enrolled in Medicare Advantage. Destination states among Medicare beneficiaries from Puerto Rico included Florida, New York and New Jersey (comparable to those reported for the general population of Puerto Rico in the US Census). This research has policy implications. Although people from Puerto Rico have different reasons for migrating, those with long term care needs may have multiple varying reasons to move to the mainland. However, migration to the US may have additional challenges for people with high needs (Mellgard et al., 2019). For instance, Medicare coverage/network may not transfer to the US and plan switching/disenrolling may not be a straightforward process for people leaving Puerto Rico.

TELEPHONE FRAUD AGAINST OLDER ADULTS IN CHINA: EVIDENCE FROM THE CHINA HEALTH AND RETIREMENT LONGITUDINAL STUDY

Rong-Fang Zhan[1], Elias Mpofu[2], and Cheng Yin[1], *1. University of North Texas, Corinth, Texas, United States, 2. University of North Texas, Denton, Texas, United States*

Background: Falling victim to telephone fraud is a devastating crisis for older adults because they can lose their life savings, adversely affecting their well-being. This study aimed to identify risk factors associated with telephone fraud among Chinese older adults. Method: A case-control study was conducted using the fourth wave of the 2018 China Health and Retirement Longitudinal Study data on older adults 60 years and above (N = 445 with telephone fraud experience; 9,994 with no fraud and other fraud experience). Control variables for the logistic regression analysis included the individual's demographics of gender, residential location, marital status, and educational level.

Results: Older adult males (OR = 1.424, 95% CI = 1.156-1.755, p = 0.001), urban residence (OR = 2.257, 95% CI = 1.706-2.986, p < 0.001), urban-rural integration zone (OR = 2.322, 95% CI = 1.654-3.260, p < 0.001), received higher education [OR = 1.704, 95% CI = 1.211-2.397, p = 0.007]), and higher pension classification (OR = 1.352, 95% CI = 1.220-1.500, p < 0.001) were associated with increased risks of telephone fraud.

Conclusion: Telephone fraud affects older adults in China at the upper rather than lower end of the socio-economic gradient, suggesting vulnerability from their use of digital technologies compared to those on the lower ladder of the socio-economic gradient. Findings highlight the need for fraud education of older adults with access to the digital broad band to reduce their risk for telephone fraud.

SESSION 1100 (SYMPOSIUM)

HEALTHY LEISURE: ADVANCING UNDERSTANDING OF LEISURE DECISIONS, ACTIVITIES, AND HEALTH CONSEQUENCES

Chair: Claire Smith Co-Chair: Soomi Lee Discussant: Allison Bielak

Leisure activities promote healthy aging, yet aging poses new challenges to engagement in active, meaningful, health-promoting leisure. This stalemate wherein people need to but struggle to engage in healthy leisure as they age calls for further research describing what healthy leisure entails, decision processes predicting it, and long-term consequences over the lifespan. This symposium brings together five rigorous studies aimed at understanding diverse aspects of leisure – how adults make daily leisure decisions, the health-promoting or demoting consequences of specific leisure activities as a person ages, and unique challenges faced by vulnerable populations. Paper 1 describes how daily energy and affect conjointly influence the types and variety of leisure activities midlife adults choose. Paper 2 identifies specific leisure activities that protect against cognitive decline in older adults, with consideration of vulnerable subgroups (illiterate, rural residents). Paper 3 investigates how seven leisure activities longitudinally predict cognitive impairment in older adults and differences by life course SES. Paper 4 identifies social interactions with friends as a key aspect of healthy leisure that longitudinally associates with cognitive function in older adults. Paper 5 focuses on a vulnerable population, older breast cancer survivors, and examines whether participating in cognitively stimulating leisure activities is associated with cognitive function (vs. non-cancer controls). These papers use different samples and datasets to describe the nature, causes, and consequences healthy leisure by specific population groups. The discussant, Dr. Allison Bielak will integrate key findings from these studies, discuss their theoretical and methodological contributions, and consider opportunities for future research.

DECISIONS, DECISIONS: CHARACTERIZING WORKERS' DAILY DECISION PROCESSES DURING LEISURE TIME

Claire Smith, and Soomi Lee, *University of South Florida, Tampa, Florida, United States*

Decisions during adulthood set the foundation for healthy aging, but descriptions of healthy and unhealthy decision processes are missing. We extracted latent profiles of daily decision resources (energy and affect) and linked them to daily leisure activity. Diary data was collected from working adults (N=83; Mage=37 years) over the ten workdays (N=693).

We identified three daily decision profiles consistent with the Decision Triangle – (1) logical (energetic, unemotional), (2) automatic (less energetic, unemotional), and (3) visceral (unenergetic, highly emotional) – and one additional profile, (4) mild visceral (moderately unenergetic, moderately emotional). Daily logical decision-making related to more "want" leisure activities (i.e., aligned with desires/interests) and the greatest variety in leisure activities. Automatic engaged in the most chores. Visceral engaged in the fewest social activities and least variety in leisure activities. Our findings advance understanding of specific decision processes during leisure, which may have consequences for health and well-being as a person ages.

SOCIAL INTERACTION WITH FRIENDS AND COGNITIVE FUNCTION: BENEFITS OF SPENDING TIME TOGETHER AND GIVING A HELPING HAND

Sae Hwang Han[1], Yee To Ng[2], and Julia Tucker[3], *1. University of Texas at Austin, Austin, Texas, United States, 2. UT Austin, Ann Arbor, Michigan, United States, 3. The University of Texas at Austin, New Braunfels, Texas, United States*

Despite the burgeoning literature linking social integration and cognitive function, studies that focus on the potential cognitive benefits associated with friendships are limited. Using eight waves of nationally representative data from the Health and Retirement Study (1998-2012), we investigated whether two distinct forms of social interaction with friends—(1) getting together for a chat/social visit and (2) providing informal helping to friends—were associated with cognitive function (assessed with a modified version of the Telephone Interview for Cognition Status) among individuals aged 50 and older (person N = 29,951) over a 14-year observation period. Multilevel models revealed robust evidence for within-person linkages between both forms of social interaction with friends and better cognitive function. The study findings are discussed in the context of declining social interaction with one's friends reported over the past several decades in the United States, which are partly driven by increasing leisure trends characterized by in-home entertainment.

IMPACT OF LEISURE ACTIVITIES ON COGNITION IN OLDER BREAST CANCER SURVIVORS AND NONCANCER CONTROLS

Cassidy Doyle[1], Brent Small[1], Arielle Schwarzberg[1], Tim Ahles[2], Judith Carroll[3], and Jeanne Mandelblatt[4], *1. University of South Florida, Tampa, Florida, United States, 2. Memorial Sloan Kettering Cancer Center, New York, New York, United States, 3. University of California, Los Angeles, Los Angeles, California, United States, 4. Georgetown University, Washington, District of Columbia, United States*

Older adults represent the largest segment of cancer survivors and may be particularly susceptible to poor cognitive outcomes. This project examines the impact of leisure activities on cognitive performance in non-metastatic breast cancer survivors and healthy controls from the Thinking and Living with Cancer (TLC) Study. Additionally, this project investigates if genetic polymorphisms (APOE, COMT, BDNF) limit the benefits of leisure activities on cognitive performance. A battery of neuropsychological tests was used to create composite scores for learning and memory (LM) and attention, processing speed, and executive functioning (APE). Leisure activity participation was associated with better LM and APE composite scores. Age differences in LM and APE were not statistically significant among the most active participants. Regarding genetic polymorphisms, persons with APOE-ε4 exhibited greater cognitive performance benefits compared to non-ε4 carriers. Future research should examine the extent to which leisure activities can buffer longitudinal declines.

LEISURE PARTICIPATION AND COGNITIVE IMPAIRMENT AMONG HEALTHY OLDER ADULTS IN CHINA

Wei Zhang[1], Qiushi Feng[2], Joelle Fong[2], and Huashuai Chen[3], *1. University of Hawaii at Manoa, Honolulu, Hawaii, United States, 2. National University of Singapore, Singapore, Singapore, 3. Xiangtan University, Xiangtan, Hunan, China (People's Republic)*

Leisure participation is beneficial to various health outcomes. This study examined a comprehensive list of leisure activities in relation to incidence of cognitive impairment among healthy older adults (65+) in China. Using data from the 2002-2018 Chinese Longitudinal Healthy Longevity Survey, we found that most of the leisure activities were protective of cognitive decline and three leisure activities (watching TV, doing housework, and playing cards/mah-jong) stood out as the most important ones. Additionally, our results revealed subgroup variations in the association between leisure participation and cognitive function: Leisure activities such as reading newspapers/books (not significant for the illiterate), gardening (not significant for the illiterate), and regular exercise (not significant for the rural residents) had different effects across different demographic social groups. Our findings suggest that intervention programs designed to prevent cognitive decline for older adults should consider subgroup and cultural variations in order to yield the best outcomes.

LEISURE ACTIVITIES AND COGNITIVE IMPAIRMENT: HOW IS IT MODIFIED BY LIFE COURSE SES AND AGE AMONG CHINESE OLDER ADULTS?

Rongjun Sun, *Cleveland State University, Cleveland, Ohio, United States*

Recent research shows that not only do life course socioeconomic status and engaging in leisure activities have independent effects on cognitive performance of older adults, but also there are significant interaction effects between them. What is less clear is whether these effects, both separate and interactions between them, vary by age among older adults. We use data from the Chinese Longitudinal Healthy Longevity Survey 2005-2014 and a Generalized Linear Mixed Model to examine these relationships. Results show that engaging in leisure activities is significantly associated with cognitive impairment even into very old ages (85+), although such associations are partially absorbed by life course SES. Furthermore, interaction effects of leisure activities and life course SES are also detected across all age groups, although they vary by specific activities. Virtually all interaction effects point to one direction: individuals of higher life course SES enjoy extra benefits from engaging in leisure activities.

SESSION 1110 (SYMPOSIUM)

CHARTING THE POST-COVID-19 COURSE IN NURSING HOMES THROUGH STAKEHOLDER ENGAGEMENT AND ADVOCACY

Chair: Thomas Caprio Discussant: Brian Lindberg

Nursing homes sustained a disproportionate number of negative effects from the COIVD-19 pandemic including strained resources, significant decline in workforce capacity, high prevalence of infections and mortality among older adults, and a need for ongoing support and timely information related to COVID-19 vaccination and boosters. The HRSA-funded Geriatric Workforce Enhancement Programs (GWEPs) have responded to the growing need to support nursing homes in the recovery phase of the COVID-19 pandemic. Several of these GWEPs undertook new efforts under supplemental federal funding to conduct outreach and partner with nursing home stakeholders including direct care workers, residents, families, and community-based organizations to address gaps in education and training, to promote age-friendly care, and to address social determinants of health. In this symposium GWEPS from different geographic areas share their experiences in developing nursing home focused interventions, engaging feedback to refine curricula, and identify areas to advocate for future policy considerations to support and enhance nursing homes post-pandemic.

AGE-FRIENDLY CARE: A FRAMEWORK TO ADDRESS HEALTH DISPARITIES IN NURSING HOMES

Leland Waters[1], Diane Berish[2], Annie Rhodes[1], and Michele Bellantoni[3], *1. Virginia Commonwealth University, Richmond, Virginia, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States*

Three Geriatrics Workforce Enhancement Programs (Johns Hopkins, Penn State and Virginia Commonwealth) within Health and Human Services Region-3, implemented a project providing tailored educational content designed to meet the regional needs of nursing home staff, residents, and carepartners within the context of the COVID-19 pandemic. Semi-Structured, recorded focus groups were conducted with direct care workers, and family and resident counsels. All groups were interviewed about familiarity and comfort with the 3Ds (Dementia, Delirium, and Depression) as well as what mattered most to them as workers, residents and care partners. The overall goal was to enhance development of the nursing home workforce thus creating a meaningful clinical improvement in care. We aim to go beyond the improvement of routine clinical care and address the long-standing behavioral and mental health disparities observed in this resident population. Policy implications around education, engagement of workforce, resident, and carepartner voices will be discussed.

STRATEGIES FOR SUPPORTING NURSING HOMES IN THE PANDEMIC RECOVERY AND BEYOND

Marla Berg-Weger, *Saint Louis University - - St Louis, MO, Saint Louis, Missouri, United States*

Best practice strategies are needed to address current and ongoing COVID-19 challenges for nursing home (NH) staff, residents, and families, including vaccine-related issues and staff, resident, and family mental health. Saint Louis University and University of Iowa Geriatrics Workforce Enhancement Programs along with Show-Me ECHO have engaged NH, community, and clinician stakeholders to identify and prioritize gaps in education/support needs, target audiences, and delivery methods. We conducted interviews with stakeholders at all levels of NH staff, community professionals, family members, and professional organizations to identify and prioritize needs. Guided by these findings and advisory groups at partner organizations, the collaborative developed outreach and curriculum strategies targeted to prioritized needs. This presentation emphasizes strategies for stakeholder engagement, identifying education/support needs, and outreach to NH workforce and care partners, and experiences and lessons learned in increasing staff vaccination rates will be shared. Implications for future policy and advocacy are highlighted.

PROMOTING RESIDENT SAFETY THROUGH TRAINING FOR CERTIFIED NURSE AIDES, RESIDENTS, FAMILIES, AND OMBUDSMEN

Sarah Ross[1], Diana Cervantes[2], Jennifer Severance[3], and Janice Knebl[4], *1. University of North Texas Health Science Center, Fort Worth, Texas, United States, 2. UNTHSC, Fort Worth, Texas, United States, 3. UNTHSC-TCOM, Fort Worth, Texas, United States, 4. University of North Texas Health Science Center-TCOM, Fort Worth, Texas, United States*

Preventing COVID-19 infections and ensuring resident safety in the nursing home (NH) setting requires collaboration among NH leadership, staff, residents, and their advocates including families, caregivers, and nursing home ombudsmen. To address this multi-collaborative need, the University of North Texas Health Science Center Geriatric Workforce Enhancement Program developed training in two focus areas. The first focused on resilience training for Certified Nurse Aides (CNAs) with the United Way that addresses factors influencing well-being, economic stability, mental health, and other social determinants. The second focused on training residents, families, ombudsmen, and other resident advocates to become active partners with NH leadership and staff in the prevention and control of healthcare acquired infections. To ensure training reflects the needs and preferences of key NH stakeholders, we developed a Nursing Home Advisory Council in partnership with state Ombudsman Programs in Texas, Louisiana, and New Mexico.

ADDRESSING THE NEEDS OF NURSING HOMES USING MULTIPLE APPROACHES TO EDUCATION AND SUPPORT

Sam Cotton[1], Anna Faul[1], Pamela Yankeelov[1], Barbara Gordon[1], Justin Magnuson[2], Cris Henage[3], Jennifer Hubbard[4], and Ellen Roberts[5], *1. University of Louisville, Louisville, Kentucky, United States, 2. University of Louisville Trager Institute, Louisville, Kentucky, United States, 3. Assistant Director of Education and Training, Chapel Hill, North Carolina, United States, 4. UNC Chapel*

Hill School of Medicine, Chapel Hill, North Carolina, United States, 5. Division of Geriatric Medicine, UNC, Chapel Hill, North Carolina, United States

At the University of Louisville and University of North Carolina Geriatric Workforce Enhancement Programs (GWEPs), we have collaborated to develop and implement a multi-faceted program to training to address the pressing challenges within NHs and foster community. We have created a Project ECHOs series for NH administers and nursing staff to foster support, while providing education on critical topics including age-friendly healthcare, vaccine hesitancy and infectious disease control, and ways to address health disparities. Additionally, we have developed videos for CNAs and direct support staff. For NH residents and families, we are designing education and offering services to address the disparities related to mental health needs. The UofL and UNC GWEPs mission is to provide a more holistic approach to NH care and opportunities for support and community. Implications for changes in policy and future practice within NHs and the use of collaborative approaches will be discussed.

SESSION 1120 (SYMPOSIUM)

PHYSICAL ACTIVITY AT THE INTERSECTIONS OF AGING AND DISABILITY

Chair: Annalisa Na Discussant: Annalisa Na

Physical activity is beneficial for older adults to maintain health and help manage chronic diseases but relies on routine participation. Some older adults continue with physical activity behaviors as they age, whereas others are negatively affected by impaired functional abilities, physical disabilities, and unmet psychosocial needs. This symposium presents quantitative and qualitative data on physical and psychosocial factors that can influence physical activity among older adults with varying levels and types of physical abilities. The first presentation will focus on aging into the disability associated with knee osteoarthritis, the leading cause of mobility decline among older adults that generally onsets after the fifth decade of life. The second presentation will focus on aging with a disability, specifically how health perspectives evolve when aging with a spinal cord injury. The third presentation will highlight how the COVID-19 pandemic has influenced outdoor physical activity among older adults when indoor activities became limited. The fourth presentation shifts perspectives to clinicians, specifically physical therapists, to explore the needs for addressing physical activity in the clinic. The fifth presentation outlines a physical activity intervention program and its implementation for community-dwelling older adults. Together, these presentations will provide practical insights for designing a person-centered program to improve physical activity for older adults including those aging into disability or aging with disability.

IMPACT OF TOTAL KNEE ARTHROPLASTY ON PHYSICAL ACTIVITY

Annalisa Na[1], Olivia Rosenstein[1], Tony Chao[2], Chad Davenport[3], Karen Chapman[4], Ronald Lindsey[4], and Zbigniew Gugala[3], *1. Drexel University, Philadelphia, Pennsylvania, United States, 2. University Of Texas Medical Branch, Galveston, Texas, United States, 3. University of Texas Medical Branch, Galveston, Texas, United States, 4. University of Texas Medical Branch at Galveston, Galveston, Texas, United States*

Knee osteoarthritis (OA) pain often challenges the physical activity necessary for managing life-threatening chronic diseases. Standard severe knee OA treatment of total knee arthroplasty (TKA) and physical therapy (PT) is effective at improving pain and function but whether such benefits translate to physical activity is unclear. We enrolled 22 participants with severe knee OA scheduled for a TKA (Age,mean±SD=69.0±5.8y, female=63.6%) and assessed pain (i.e.,Numeric Pain Rating), physical function (i.e.,Knee Osteoarthritis Outcome Score), and physical activity (i.e.,activity monitors and journals for 7-days) before and 1-month, 3-month, and 6-month after TKA. Using paired-wise ANOVA, pre-to-postTKA pain and function improved but not physical activity. Using regression analyses, outpatient PT sessions during first two months post-TKA were positively related to 3- and 6-month physical activity (r=0.51-070, P=0.003-0.029). Standard TKA and PT for severe OA improved pain and function but not physical activity. However, early post-TKA PT and physical activity relationships are promising, warranting exploration.

PERSPECTIVES ON HEALTH AND AGING WITH SPINAL CORD INJURY: A QUALITATIVE DESCRIPTIVE STUDY

Laura Baehr[1], Kathleen Fisher[1], and Margaret Finley[2], *1. Drexel University, Philadelphia, Pennsylvania, United States, 2. Drexel Univeresity, Philadelphia, Pennsylvania, United States*

Age of spinal cord injury (SCI) onset and life expectancy have increased over the last half century, but minimal inquiry on health and aging lived experience perspectives are available. The objective of this study was to begin to examine this through a qualitative descriptive design. Nine group interviews were conducted with individuals living with SCI (n=24) 22-76 with injury duration 3-47 years. Participant descriptions on health and aging were thematically analyzed. Health maintenance was related to physical routine to prevent secondary health conditions, injury acceptance, and engagement with disability networks. Aging outlook was connected to fear of dependence and lack of education on aging with SCI. These findings demonstrate that clinicians and researchers should investigate issues beyond routine self-management to support life with SCI. Personal considerations based on life stage when injured warrants investigation. Advocacy for peer-support is imperative at all life stages given its positive impact on health.

OUTDOOR PHYSICAL ACTIVITY AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC

Justine Sefcik[1], Amina Panicker[2], Danielle Katsev[2], Annalisa Na[1], Sherry Greenberg[3], and Rose Ann DiMaria-Ghalili[4], *1. Drexel University, Philadelphia, Pennsylvania, United States, 2. Drexel Univeresity, Philadelphia, Pennsylvania, United States, 3. Monmouth University, Marjorie K. Unterberg School of Nursing & Health Studies, West Long Branch, New Jersey, United States, 4. Drexel University, College of Nursing and*

Health Professions, Philadelphia, Pennsylvania, United States

There is a gap in understanding how the current pandemic is affecting older adults' outdoor physical activity. This study aimed to explore older adults' perceptions of their outdoor physical activity during the current pandemic. A qualitative descriptive approach was taken with a conventional content analysis. Participants were primarily recruited through ResearchMatch. Eighteen community-dwelling older adults were individually interviewed from geographical locations across the United States; 61.1% female, 88.9% White, mean age 76.4 (range 68-92), 5 ambulated with a cane or walker. We identified an overarching theme of Benefits and Motivation in which older adults conveyed wanting to maintain and improve their health and used the outdoors to continue physical activity since indoor activities decreased during the pandemic. Walking was expressed as the most frequent outdoor physical activity. Implications of these findings will be discussed which include supporting community improvements to facilitate older adults' ease of maintaining a walking routine.

FROM KNOWING TO DOING: WHAT IS NEEDED TO SUPPORT PATIENTS IN CHANGING PHYSICAL ACTIVITY

Anne Thackeray[1], Tonua Hamilton[1], Janice Morse[1], Rachel Hess[1], Molly Conroy[2], and Julie Fritz[1], *1. University of Utah, Salt Lake City, Utah, United States, 2. University of utah, Salt Lake City, Utah, United States*

Physical therapists often treat pain and functional limitations associated with chronic musculoskeletal conditions common in aging adults. While patient report improvement after physical therapy, these results do not translate to sustained physical activity. This is a lost opportunity to support aging adults in adopting behaviors proven to improve quality of life and reduce comorbidity burden. We conducted semi-structured interviews with 30 physical therapists to understand how they support adoption of physical activity and identify what is needed to improve uptake. Physical therapists endorse physical activity as essential in the management of MSK conditions. Eliciting motivation, addressing psychosocial needs, and empowering patients to actively engage in solutions were identified as significant challenges in the effort to change physical activity. At the clinician level, physical therapists identified the need for improved skills in motivational interviewing and person-centered communication. Improved coordination with mental health providers and community resources were identified as environmental needs.

COACH2MOVE: THE STORY OF IMPLEMENTING A PERSON-CENTERED PHYSICAL THERAPY APPROACH IN CLINICAL PRACTICE

Ward Heij[1], Lieke Sweerts[2], Bart Staal[2], Philip van der Wees[2], Ria Nijhuis-van der Sanden[2], and Thomas Hoogeboom[2], *1. University of Utah, Salt Lake City, Utah, United States, 2. Radboud university medical center, Nijmegen, Gelderland, Netherlands*

Coach2Move is a person-centered physical therapy approach to promote physical activity among community-dwelling older adults, which consists of motivational interviewing and other motivational strategies. Coach2Move has been implemented in the Netherlands with 52 physical therapists and 294 patients in 16 practices. Implementation has led to better outcomes (increased physical activity, improved functional mobility, and lower levels of frailty) in fewer treatment sessions compared with usual care physical therapy treatment. Implementing was carried out using the following steps: 1) an e-assessment to determine the baseline level of knowledge regarding Coach2Move of the participating therapists; 2) two education days in Motivational Interviewing and Coach2Move specific motivational strategies; 3) three unique peer-assessment meetings and 4) a retest of the e-assessment one year later. We will discuss our rationale for selecting implementation strategies and which barriers and facilitators we have experienced in implementing successful scientific research in daily clinical practice.

SESSION 1130 (SYMPOSIUM)

PSYCHOSOCIAL RESILIENCE, FAMILY SUPPORT, AND COGNITIVE STATUS: FROM EVIDENCE TO ACTION

Chair: Hanzhang Xu Co-Chair: Bei Wu Discussant: Man Guo

Increasing evidence suggests the important role of social connections and family support in maintaining optimal cognitive status among older adults. This symposium includes four studies from China and the U.S with a focus on generating actionable evidence to inform the development of strategies that target psychosocial resilience and family support to promote cognitive health. Using data from the 2006, 2010, and 2014 waves of the Health and Retirement Study, the first study assessed the impact of social isolation on cognitive function, and how sleep disturbance mediated the association on cognitive decline. The study findings suggest addressing sleep disturbance might be a viable way to mitigate the negative effect of social isolation on cognitive function. Companion piece includes another HRS-based study that assessed the impact of loneliness on psychological resilience and cognitive health in later life. Findings from this study show loneliness is indirectly associated with baseline cognitive status and accelerated cognitive decline through deteriorating phycological resources. The third study used a prospective longitudinal design and applied group-based trajectory modeling to identify distinct family functions among 170 Chinese stroke survivors. Four family function trajectories were identified; healthy and stable family function was associated with better cognition and quality of life. Lastly, the fourth study aimed to use an experienced-based co-design approach to develop a cognitive training intervention to promote cognitive health in older Chinese immigrants in the U.S. This approach allows researchers to engage end-users early and to optimize the development of a culturally and linguistically relevant cognitive training intervention.

COGNITIVE TRAINING FOR OLDER CHINESE IMMIGRANTS IN THE US: AN EXPERIENCE-BASED CO-DESIGN APPROACH

Hanzhang Xu[1], Eleanor McConnell[1], John myers[2], and Bei Wu[3], *1. Duke University, Durham, North Carolina,* *United States, 2. Duke University School of Nursing, Durham, North Carolina, United States, 3. New York University, New York, New York, United States*

Older Chinese Americans face many socioeconomic barriers including limited English proficiency, low educational levels, and limited access to care. These socioeconomic disadvantages not only contribute to an increased risk of developing dementia but also worsen inequitable access to effective strategies to promote cognitive health. Cognitive training is shown to be beneficial to maintain or enhance cognitive function. However, most prior interventions were tested exclusively in non-Hispanic Whites. To address this gap, we aim to adapt empirically supported cognitive training activities into a culturally and linguistically relevant mHealth cognitive training intervention. The adaptation process of the cognitive training includes focus groups (n=6/group) with older Chinese Americans (3 groups) and adult children (2 groups) to adapt cognitive training components to our target population. We will then organize an experience-based co-design workshop to further refine the intervention. Engaging end-users early will optimize the development of a culturally and linguistically relevant cognitive training intervention.

SOCIAL ISOLATION, SLEEP DISTURBANCE, AND COGNITIVE HEALTH: A LONGITUDINAL MEDIATION STUDY

Xiang Qi[1], Yaolin Pei[1], Susan Malone[2], and Bei Wu[3], *1. New York University, New York City, New York, United States, 2. New York University, College of nursing, New York City, New York, United States, 3. New York University, New York, New York, United States*

Research indicates that social isolation is associated with dementia, but the role of sleep on this association is less known. We aimed to examine the impact of social isolation on cognitive function, and how sleep disturbance mediated the association. Data came from the 2006, 2010, and 2014 waves of the Health and Retirement Study. Participants aged 50+ who completed the Psychosocial and Lifestyle Questionnaire in 2006 were included (n=5,036). Measures include the Social Isolation Index, modified Jenkins Sleep Scale, and Telephone Interview of Cognitive Status. Cross-lagged panel models were used in the analysis. After controlling socio-demographics, lifestyle, and loneliness, social isolation predicted subsequent sleep disturbance (β=0.05; P<0.01), which in turn predicted worse cognitive functioning (β=-0.02; P<0.01). The reverse pathways from cognitive function to social isolation were also statistically supported. Public health initiatives could reduce sleep disturbance by facilitating social integration and participation in community activities, thereby protecting against cognitive decline.

LONELINESS AND ACCELERATED COGNITIVE DECLINE: MEDIATION EFFECTS OF RESILIENCE AND PURPOSE OF LIFE

Yaolin Pei[1], Xiang Qi[1], Sammy Wang[2], and Bei Wu[3], *1. New York University, New York City, New York, United States, 2. Rory Meyers College of Nursing, New York City, New York, United States, 3. New York University, New York, New York, United States*

Drawing from the Conservation of Resources Theory, we aim to understand the implications of loneliness on psychological resources (i.e., resilience and purpose in life) and cognitive health in later life. This study utilizes data (2006-2018) from the Health and Retirement Study to examine pathways, both direct and indirect through psychological resilience and purpose in life, from loneliness to cognitive trajectories over time. Respondents reporting higher levels of loneliness had worse initial cognitive function (β=-0.43; P<0.01) and accelerated cognitive decline (β=-0.05; P<0.01). Feeling lonely is associated with reduced resilience (β=-0.23; P<0.01) and purposed in life (β=-0.17; P<0.01) which, in turn, are associated with worse cognitive health. Finally, pathway analyses confirm that loneliness is indirectly associated with initial cognitive health and accelerated cognitive decline through deteriorating phycological resources. Positive psychological interventions can be beneficial by promoting resilience and purpose in life and subsequently improve cognitive health.

THE TRAJECTORY OF FAMILY FUNCTION OF STROKE SURVIVORS AND ITS IMPACT ON COGNITIVE IMPAIRMENT: A LONGITUDINAL STUDY

Juan Li[1], Zhijian Liu[2], Fanfan Li[2], Jing Wang[3], and Bei Wu[4], *1. Huashan Hospital affiliated to Fudan University, Shanghai, Shanghai, China (People's Republic), 2. Naval Military Medical University, Shanghai, Shanghai, China (People's Republic), 3. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 4. New York University, New York, New York, United States*

This study examined the trajectory of family function of Chinese stroke survivors and its impact on cognitive impairment.We conducted a prospective longitudinal study and assessed family function of 170 stroke survivors and their family caregivers by Family Assessment Device(FAD) during acute stage and at 3, 6 months after onset via face-to-face follow-ups interview in Nanjing, China from January to October, 2020.Group-based Trajectory Model was applied to analyze trajectories of family function. Family function deteriorated with time. Four patterns of FAD trajectory (A: dysfunction-deterioration-improvement; B: severe dysfunction-stable; C: healthy function-rapid deterioration; D: approximate healthy function-stable) were identified. Healthy and stable family function was associated with better cognition and quality of life (β=-0.216,p<0.05, β=-0.159, p<0.05, respectively). Future studies are needed to further explore the reason why family function deteriorated and the linkage between family function and stroke survivors' outcomes.

SESSION 1140 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

SYSTEMS BIOLOGY OF AGING

Chair: Timothy Rhoads

Program Overview: Aging is a complex process; numerous aspects of cell and animal physiology change with age and pinpointing a single causal mechanism has proven difficult. A systems-level approach, which attempts to integrate multiple perspectives of aging into a more cohesive understanding, addresses this challenge by leveraging the explosion in recent years of molecular and biological "big data." In this session, speakers will describe their efforts using systems biology approaches to achieve a multivariate assessment of the mechanisms of aging. Dr. Gladyshev will speak on recent work to understand the systemic mechanisms that underpin lifespan control. Dr. Levine moves the focus to epigenetic measures of aging, an emerging biomarker. Dr. Kane will describe efforts to examine frailty phenotypes and their biological underpinnings, as well as sexual dimorphism during aging in mice. Dr. Rhoads will describe the broad landscape of RNA processing, a mechanism with a recently described association with aging and delayed aging by caloric restriction, in multiple organisms and tissue contexts, as well as engagement of this mechanism during different aging interventions. Together our speakers advance our understanding of the multifactorial nature of aging biology and set the stage for the development of interventions that target all aspects of the aging process.

RNA PROCESSING MECHANISMS DURING AGING AND CALORIC RESTRICTION

Timothy Rhoads, Josef Clark, and Rozalyn Anderson,
University of Wisconsin-Madison, Madison, Wisconsin, United States

Caloric restriction (CR), a reduction in caloric intake without malnutrition, was first described in the 1930s and is a robust model to extend lifespan. While the specific mechanisms that produce delayed aging are still unknown, work has demonstrated the importance of metabolism – dysregulated mitochondrial metabolism is an aging hallmark, while CR upregulates energy metabolism. Crucially, transcriptional regulation plays a key role in implementing this metabolic program although details are still unclear. Splicing factors that are required for the beneficial effects of dietary restriction in nematodes have been identified, and large-scale exon usage changes have been observed across the metabolic network engaged by CR in various tissues from non-human primates, suggesting a translational mechanism that might contribute to how CR delays aging. We will discuss the landscape of RNA processing across multiple organism, tissue, and intervention contexts and provide a broad perspective of how RNA processing contributes to enhanced longevity.

INVESTIGATION OF BIOLOGICAL DETERMINANTS OF FRAILTY IN MALE AND FEMALE MICE

Alice Kane[1], Patrick Griffin[2], Matthew Arnold[3], Maeve McNamara[2], Daniel Vera[4], David Vogel[4], and David Sinclair[3], *1. Institute for Systems Biology, Seattle, Washington, United States, 2. Harvard Medical School - Blavatnik Institute, Boston, Massachusetts, United States, 3. Harvard Medical School, Boston, Massachusetts, United States, 4. Volo Foundation, Jupiter, Florida, United States*

Frailty is quantified as the accumulation of health deficits over an organism's lifetime and gives a measure of the overall health of an organism. Preliminary studies have found an association between frailty and some of the hallmarks of aging including inflammation and senescence. However, the molecular underpinnings of frailty, and whether the mechanisms of frailty are distinct from or overlap those of aging is unknown. Previously we developed clocks based on frailty assessments that accurately predict age and lifespan in older male mice. Here, we expand these clocks to predict age, lifespan and frailty itself in younger, and also female mice. Additionally, we incorporate molecular measures including blood cell composition, plasma metabolomics, PBMC DNA methylation and stool microbial diversity measures into the clocks. These clocks provide important tools for the field, and also provide an indication of the molecular underpinnings of frailty and sex differences in these.

SYSTEMS AGING AND REJUVENATION

Vadim Gladyshev, *Brigham and Women's Hospital, Boston, Massachusetts, United States*

What is aging? When does it begin? How to control lifespan? Can we rejuvenate organisms in addition to slowing down the aging process? There is no consensus on these questions, but recent developments in the field may allow to address these questions. In particular, DNA methylation of defined sets of CpG dinucleotides emerged as a critical and precise biomarker of the aging process. Multi-variate machine learning models, known as epigenetic clocks, exploit quantitative changes in the methylome to predict the age of bulk tissue with remarkable accuracy. Additionally, the first epigenetic aging clock that works at the level of single cells has been developed. Together with advances in genomics, transcriptomic longevity signatures and intervention strategies, these tools support quantification and manipulation of the aging process. Moreover, these tools may also be used to assess the possibility of age reversal. Several types of rejuvenation have been described, including the recently discovered process of early embryonic rejuvenation, culminating in ground zero, marking the beginning of organismal aging.

SYSTEM SPECIFIC AGING SCORES: A STATE OF THE ART AGING CLOCK BUILT USING AGING SCORES FROM DIFFERENT BODILY FUNCTIONS

Raghav Sehgal[1], Albert Higgins-Chen[1], Margarita Meer[2], and Morgan Levine[2], *1. Yale University, New Haven, Connecticut, United States, 2. Altos Labs San Diego Institute of Science, San Diego, California, United States*

Aging is a highly heterogeneous process at multiple levels. Different individuals, organs, tissues, and cell types are innately diverse and age in quantitatively different manners. Epigenetic clocks have been developed to capture overall degree of aging and typically report a single biological age value. However, single measures fail to provide insight into differential aging across organ systems. Our aim was to develop novel systems-specific methylation clocks, that when assessed in blood, capture distinct aging subtypes. We utilized three large human cohort studies and employed both supervised and unsupervised machine learning models by linking DNA methylation to lower dimensional vectors composed of system specific clinical chemistry and functional assays. In doing so, we were able to develop 11 unique system-specific scores–heart, lung, kidney, liver, brain, immune, inflammatory, hematopoietic, musculoskeletal, hormone, and metabolic. We observe that in independent data, the specific systems relate to meaningful outcomes–for instance the brain score is strongly associated with cognitive functioning;

musculoskeletal score is strongly associated with physical functioning; and the lung score is strongly associated with lung cancer. Additionally, system scores and the composite systems clock outperforms presently available clocks in terms of associations with a wide variety of aging phenotypes and conditions. Overall, our biological systems based epigenetic clock outperforms presently available epigenetic aging clocks and provides meaningful insights into heterogeneity in aging.

SESSION 1150 (SYMPOSIUM)

THE ART OF BALANCE: EMPOWERING DEMENTIA CARE PARTNERS TO OPTIMIZE THEIR WELLNESS, RESILIENCE, AND HEALTH

Chair: Tatiana Sadak Discussant: Soo Borson

By 2050, 140 million people will be living with dementia (WHO, 2021), most of whom will be cared for at home by family members, relatives, partners, friends, and neighbors, supplemented by help from paid caregivers. Because of their critical role in managing health and wellness for people living with dementia (PLWD), caregivers face unique stressors and challenges that can give rise to negative physical and mental health consequences. This symposium aims to strengthen our understanding about how to empower care partners to optimize health and wellness for themselves and PLWD in everyday living and during periods of health crisis. The first presentation characterizes behaviors care partners adopt that promote resilience in the face of dementia-related health crises (Zhou et al); the second describes facilitators and barriers to adoption of self-care behaviors that can promote resilience (Sadak et al). We then introduce a technology-enabled pilot intervention to strengthen care partners' self-care behaviors (Ishado et al.) and a physical activity intervention to promote maintenance of function (Li et al.). We conclude with a panel discussion of cross-cutting implications of these approaches for future research, clinical care, and policy.

DEMENTIA CARE PARTNER SELF-CARE: A FRAMEWORK TO ILLUSTRATE MECHANISMS OF FACILITATORS AND BARRIERS

Tatiana Sadak[1], Susie Cho[2], Emily Ishado[1], and Soo Borson[3], *1. University of Washington, Seattle, Washington, United States, 2. UW, Seattle, Washington, United States, 3. USC, Santa Ana, California, United States*

Dementia care partner (CP) self-care is an important intervention target to enhance resilience and reduce risk of negative physical and psychological outcomes, such as illness, functional decline, depression and anxiety. Yet few studies have explored CP perceptions of what helps vs prevents them from consistently engaging in self-care activities. This exploratory study examined data from 100 semi-structured CP interviews on the barriers and facilitators to self-care. Inductive thematic analysis identified multiple facilitators and barriers that can be characterized as actual (did affect self-care) or potential (would affect self-care). CP capacity to participate in self-care activities was influenced by internal (e.g. setting boundaries) or external (e.g. social support) factors. We developed a framework to illustrate these mechanisms and guide interventions for optimizing self-care behaviors.

MANAGING YOUR OWN WELLNESS: A PILOT INTERVENTION TO IMPROVE DEMENTIA CARE PARTNER SELF-CARE

Emily Ishado[1], Sarah McKiddy[1], Soo Borson[2], and Tatiana Sadak[1], *1. University of Washington, Seattle, Washington, United States, 2. USC, Santa Ana, California, United States*

Engagement in regular self-care activities could mitigate and reduce the risk of negative health outcomes in dementia care partners (CP), yet many report that they do not prioritize wellness-related activities for themselves. We conducted a pilot of a virtual technology-supported intervention with 19 dementia CP to evaluate usability, feasibility, acceptability, and preliminary effectiveness of cultivating daily self-care habits and creating a wellness routine based on personalized self-care goals. Case studies and inductive thematic analyses suggested that the intervention could help CP meet their self-care activity goals, improve their sense of well-being and capacity to provide care. After establishing the initial feasibility and usability of the intervention and the online goal-setting and tracking platform, we collaborated with scientists specializing in Human-Centered Design and Engineering to develop a prototype of a mobile application that will optimize portability, utility, and support testing of this intervention.

VALIDATING A BEHAVIORAL FRAMEWORK OF RESILIENCE IN DEMENTIA CARE PARTNERS: AN ABDUCTIVE THEMATIC ANALYSIS APPROACH

Yuanjin Zhou[1], Dilara Hasdemir[1], Emily Ishado[2], Soo Borson[3], and Tatiana Sadak[2], *1. University of Texas at Austin, Austin, Texas, United States, 2. University of Washington, Seattle, Washington, United States, 3. USC, Santa Ana, California, United States*

One barrier to developing resilience-enhancing interventions for dementia care partners is a lack of an objective measure to capture resilience-related behaviors. To validate a behavioral framework of resilience in dementia care partners for future measure and intervention, we conducted semi-structured interviews with 26 care partners who experienced challenges created by a health crisis of their care recipients. We used abductive thematic analysis to identify 14 resilience-related behaviors care partners adopted to recover from care challenges. These behaviors included four problem-response behaviors, three help-related behaviors, three self-growth behaviors, two compassion-related behaviors, and two learning-related behaviors. Twelve care partners reported full recovery from the effects of their challenging experiences. Ten care partners reported partial recovery in the face of PLWD's declining health and their own unmet needs, and four care partners felt not at all recovered. This finding suggests new intervention targets for enhancing care partner resilience.

INVESTIGATING PHYSICAL EXERCISE-RELATED MEDIATING VARIABLES IN THE RDAD-NW TRANSLATIONAL STUDY

Jingyi Li[1], and Barbara Cochrane[2], *1. University of Washington, Sammamish, Washington, United States, 2. University of Washington School of Nursing, Seattle, Washington, United States*

Declining physical function significantly worsens quality of life in dementia care dyads. Caring for people living with dementia (PLWD) at home is both physically demanding and emotionally stressful. Physical exercise is strongly recommended as a way of sustaining or improving overall function in dementia care dyads. However, little is known regarding the impact of home-based dyadic exercise interventions. We present results from a secondary analysis of data from a multicomponent translational study, Reducing Disability in Alzheimer's Disease – North West (RDAD-NW). We report results from an examination of the mediating role of exercise on the trajectory of change in physical function over time for both PLWD and their care partners.

SESSION 1160 (PAPER)

TRANSITIONAL CARE

CARE COORDINATION, HEALTH OUTCOMES, AND HEALTHCARE UTILIZATION AMONG ADULTS WITH MULTIMORBIDITY

Briana Mezuk[1], Weidi Qin[2], Linh Dang[2], and Rodlescia Sneed[3], *1. University of Michigan, School of Public Health, Ann Arbor, Michigan, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Wayne State University, Detroit, Michigan, United States*

Care coordination is a vehicle for improving patient-provider and provider-provider communication to improve outcomes and reduce unnecessary healthcare utilization, particularly for adults with multimorbidity. However, the clinical effectiveness of coordination at the population level remains unknown. This study examined the association between experiences of care coordination with subsequent health and healthcare outcomes among US adults over age 50. The analytic sample (n=695) included respondents from the Health and Retirement Study who had at least two chronic conditions, completed an Experimental Module on Coordinated Care in 2016, and were re-interviewed in 2018. Three domains of care coordination were examined as predictors: perceptions of coordination; using tangible supports (e.g., seeing a care coordinator); and using technical supports (e.g., patient portal). A range of outcomes related to health (i.e., self-rated health, functioning, pain) and healthcare (i.e., medication adherence, visits, hospitalizations, care satisfaction) were assessed in 2018. Weighted linear and logistic regression models, adjusted for demographic and socioeconomic characteristics, were fit for each lagged outcome. Higher engagement with tangible supports was positively associated with subsequent hospitalization (OR: 1.08, 95%CI: 1.01-1.15), greater pain (OR: 1.11 , 95%CI: 1.03-1.20), and marginally worse self-rated health (B=-0.02, p< 0.063). Better perceptions of coordination were also positively associated with care satisfaction (B=0.03, p< 0.020). Care coordination was not associated with functioning, adherence, or number of medical visits. Findings indicate the salience of tangible support for coordination among older adults with multi-morbidity, and that positive perceptions of coordination contribute to healthcare satisfaction.

PATIENT AND CAREGIVER PERCEPTIONS OF MOBILITY AFTER DISCHARGE FROM SKILLED NURSING FACILITIES TO HOME

Ayomide Bankole[1], John Preisser[2], Ying Zang[3], and Mark Toles[4], *1. University of North Carolina-Chapel Hill, Chapel Hill, North Carolina, United States, 2. University of North Carolina- Chapel Hill, Chapel Hill, North Carolina, United States, 3. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 4. UNC Chapel Hill, Chapel Hill, North Carolina, United States*

Functional outcomes of older adults in post-acute care is poorly understood. The purpose of this study was to describe skilled nursing facility (SNF) patient or caregiver perceptions of patient mobility and factors associated with patient mobility in 30 days after discharge from SNF to home. We conducted a secondary analysis of data from a stepped-wedge cluster randomized trial of the Connect-Home intervention set in 6 SNFs in North-Carolina. The sample included SNF patients (N=249) and their caregivers (N=249). In 30 days after discharge, SNF patients or their caregivers (as proxies) rated patient mobility using the Life-Space Assessment (LSA). LSA total-scores (range= 0-120), with higher scores indicating greater mobility. Linear mixed models, with random effects to adjust for clustering in SNFs, were used to describe associations between LSA total-score and patient, caregiver, and health-system factors. Participants were typically female (63%), White (74%), and average age of 76.3 years. In 30 days after discharge, LSA total-scores ranged from 0-90 with a mean score of 22 (SD=16.01). Most (85%) required caregiver and/or assistive devices to transfer inside and outside of their homes. In the mixed models, lower LSA scores were associated with older age [-0.232(0.108), p< 0.05], lower cognition score [1.182(0.384), p< 0.005], diagnosis of dementia [-6.863(3.057), p< 0.05], lower baseline mobility in the SNF [0.296(0.142), p< 0.05] and longer SNF stay [-0.200(0.068), p< 0.005]. Low LSA scores in this sample suggest the need for caregiver support to continue rehabilitation and promote functional ability at home. Studies are needed to augment transitional care and address these care needs.

PROVIDING INPATIENT CARE BEYOND HOSPITAL WALLS: GEOGRAPHIC FACTORS IN ACUTE HOSPITAL CARE AT HOME WAIVER PROGRAMS

Emily Franzosa[1], Ksenia Gorbenko[1], Abigail Baim-Lance[1], Gabrielle Schiller[2], Heather Wurtz[1], Sybil Masse[1], Katherine Ornstein[3], and Bruce Leff[4], *1. Icahn School of Medicine at Mount Sinai, New York City, New York, United States, 2. CUNY School of Public Health, Astoria, New York, United States, 3. Johns Hopkins, University, Baltimore, Maryland, United States, 4. Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

The Centers for Medicare and Medicaid Services' (CMS) Acute Hospital Care at Home waiver offers hospital-level reimbursement to provide acute hospital-level care in patients' homes for the first time. While this initiative may make acute care at home more financially viable for health systems, it also requires aligning Hospital at Home (HaH) operations with inpatient, rather than outpatient, regulatory requirements. We aimed to understand how participating HaH programs adapted to these requirements. We conducted semi-structured interviews with multiple leaders from 14 HaH waiver programs (n=18 clinical/medical, operational and program directors) varying in size, urbanicity, structure, and region, examining data through thematic analysis. Both urban and rural participants described geographic effects of waiver requirements. For instance, to ensure response to patient emergencies within 30 minutes, programs contracted with paramedic services to expand service areas, added program locations or moved primary locations to other system hubs. Programs maximized staff capacity across service areas by "leasing" staff from other home-based programs, focusing on urban hubs with more staff, balancing in-person visits with remote monitoring, and providing "hybrid" in-person/video appointments. However, travel time, length of acute care visits, staffing shortages, the need for new skills (e.g., acute care nurses, dietitians) and limited state scope of practice regulations, particularly for paramedics, limited the area and populations served. Adapting to waiver requirements required significant efforts to address staffing, logistical and regulatory challenges. Future waiver improvements should explicitly consider the unique resources needed to expand hospital-level care in geographically diverse ambulatory environments.

THE PARADOXICAL EXPERIENCES OF INFORMAL CAREGIVERS DURING THE TRANSITION FROM HOME TO A NURSING HOME

Lindsay Groenvynck[1], Bram de Boer[1], Audrey Beaulen[1], Erica De Vries[1], Jan Hamers[1], Theo van Achterberg4, Judith Meijers[1], and Hilde Verbeek[1], *1. Maastricht University, Maastricht, Limburg, Netherlands, 2. KU Leuven, Leuven, Vlaams-Brabant, Belgium*

The transition from home to a nursing home is a complex and emotional process, especially for older persons with dementia. The informal caregiver usually plays a central role in this care process, which is often fragmented. Therefore, this study aims to analyze the experiences of informal caregivers of older persons with dementia during this transition.An interpretative phenomenological design was used to analyze secondary data. In-depth interviews were conducted with informal caregivers, in the Netherlands, between February 2018 and July 2018. The study identified three, interwoven paradoxes influenced by the healthcare system and the healthcare professionals providing care. The first paradox described the initial negative emotions related to a nursing home move. Those emotions are a paradox to the feelings of relief and acceptance later in the transition process. The second paradox was related to a prospective need to postpone the transition for as long as possible and a retrospective need for a timely transition plan. The third paradox defines an internal struggle for the informal caregivers of wanting to remain involved while simultaneously experiencing a need for distance from care responsibilities. This study identifies a fine line between optimal and fragmented transitional care. The results can motivate informal caregivers to start planning the move. Similarly, it allows healthcare professionals to provide tailored support. Future research should focus on defining these paradoxes and their link with the healthcare system to determine if the transition from home to a nursing home can be optimized.

THE ROLE OF SUBJECTIVE AGE IN PREDICTING POST-HOSPITALIZATION OUTCOMES

Anna Zisberg[1], Nurit Gur-Yaish[2], Efrat Shadmi[3], Ksenya Shulyaev[3], Juliana Smichenko[3], and Yuval Palgi[3], *1. University of Haifa, Israel, Haifa, Hefa, Israel, 2. Oranim Academic College of Education, Tivon, Hefa, Israel, 3. University of Haifa, Haifa, Hefa, Israel*

Subjective age contributes to a range of health and functional outcomes in older adults. Most of the evidence comes from studies in community dwelling older adults. The current study explores whether younger subjective age serves as a protective factor against hospital associated physical, cognitive, and emotional decline. This paper is a secondary analysis of a subsample (N=250) from the HoPE-MOR (Hospitalization Process Effects on Mobility Outcomes and Recovery) study for which subjective age was assessed at the time of hospital admission and outcomes were measured one-month post-discharge. Psychological and physiological subjective age was measured as a person's report on the degree to which they feel older or younger compared to their chronological age on a 5-point Likert-type scale. Measures of independency in Activities of Daily Living, Life-space mobility, cognitive function and depressive symptoms, were based on participants' assessment at admission and one-month post-discharge. In a sample of acutely ill participants, age 77.5±6.6, those with younger psychological subjective age had a significantly lower odds for poorer mental (OR=0.66, 95%CI 0.45-0.97), functional (OR=0.62, 95%CI 0.43-0.90) and cognitive state (OR=0.60, 95%CI 0.36-0.98), and better life-space mobility (OR=0.67, 95%CI 0.47-0.95). Findings were significant after controlling for numerous demographic, functional, cognitive, emotional and chronic and acute health predictors. Physiological subjective age was not significantly related to post hospitalization outcomes. Psychological subjective age could serve as a relatively simple parameter to identify older adults who are at risk for poor hospitalization outcomes for consideration of inclusion in preventive in-hospital and post discharge interventions.

SESSION 1170 (SYMPOSIUM)

USING RESEARCH TO ADVANCE THE DEMENTIA-FRIENDLY COMMUNITY MOVEMENT AT THE LOCAL, NATIONAL, AND INTERNATIONAL LEVEL

Chair: Clara Scher Co-Chair: Emily Greenfield Discussant: Joseph Gaugler

It is estimated that more than 55 million people worldwide are living with dementia. To address the social and health needs of individuals living with dementia and their care partners, researchers, policymakers and advocates have championed dementia-friendly communities (DFCs) as a population-level response. DFCs promote the well-being of those living with dementia, empower all members of the community to celebrate the capabilities of persons with dementia, and encourage individuals living with dementia to engage in their communities. The objective of this symposium is to describe the ways in which research can help to advance the dementia-friendly movement at the local, national, and international levels. First, Scher & Greenfield will describe the dimensions of implementation of DFCs in Massachusetts with implications for program monitoring and process evaluation. Second, Epps & colleagues will discuss the process of developing a person-centered tool to evaluate the impact of dementia-friendly programs in faith-based communities. Third, Somerville & colleagues will present findings from a study of community and organizational factors related to dementia-friendly readiness in community-based senior centers. Finally, Sun & colleagues will discuss the barriers and facilitators to implementation of DFCs in the USA during the COVID-19 pandemic. Taken together, these studies demonstrate the utility of quantitative and qualitative research methodologies to elucidate how and to what extent DFCs are implemented. Findings have implications for examining the population health impact of DFC efforts, as well as for attending to issues of health disparities and aging equity in the uptake, implementation, and sustainability of DFC initiatives.

DIMENSIONS OF IMPLEMENTATION FOR DEMENTIA-FRIENDLY COMMUNITY INITIATIVES

Clara Scher, and Emily Greenfield, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

Dementia-friendly community (DFC) initiatives are a community-level approach to support individuals living with dementia and their care partners. DFC initiatives engage in a range of activities including raising awareness about dementia, enhancing local services, and advocating for inclusive public facilities and spaces. There is significant variation in the implementation of DFC initiatives worldwide which creates challenges for both process and outcomes evaluation. We used data from qualitative interviews with DFC leaders in Massachusetts to develop a framework to assess the implementation of DFC initiatives. Qualitative descriptive analysis yielded distinct dimensions such as robustness of multisectoral action teams, diversity of strategies for outreach to older adults, and degree of focus on coordinating care. Building on the tradition of using radar charts to evaluate DFC initiatives, we visualized the shape of implementation across the various dimensions. This framework can help to advance research, practice, and policy as part of the DFC movement.

DEVELOPING A MEASURE OF COMMUNITY-LEVEL DEMENTIA FRIENDLINESS IN FAITH COMMUNITIES

Fayron Epps[1], Alexis Bender[2], Janelle Gore[2], Grayson Gunn[1], Dana Markert[1], and Miranda Moore[1], *1. Emory University, Fairburn, Georgia, United States, 2. Emory University, Atlanta, Georgia, United States*

As the prevalence of dementia rises, modifying built and social environments of persons living with dementia (PLWD) becomes increasingly essential. Although there is a call to rigorously evaluate dementia-friendly community initiatives, no known comprehensive evaluation tools exist to assess small communities (churches and community centers). Therefore, we are developing a person-centered Dementia-Friendly Community Assessment tool. This tool will consist of new and validated scales to assess the level of dementia-friendliness among churches enrolled in a dementia-friendly congregation program based in African American communities. A draft of a theory-informed survey instrument is being shared with stakeholders (church leaders, caregivers, and PLWD) during focus groups who will provide feedback on their understanding and relevance of questions on the instrument. The tool will then be modified based on feedback and the final instrument will be piloted with broad church membership. Our aim is to enable programs to quantify their dementia-friendly community initiative's impact.

PERCEPTIONS OF DEMENTIA FRIENDLY COMMUNITY STAKEHOLDERS IN THE US: CHALLENGES AND STRATEGIES DURING COVID-19

Fei Sun[1], Ha-Neul Kim[1], Opur Fredrika[1], and Christian Conyers[2], *1. Michigan State University, East Lansing, Michigan, United States, 2. University of Michigan, Ann Arbor, Michigan, United States*

This study examines the challenges faced by Dementia Friendly Communities (DFC) during COVID-19 pandemic and the strategies used to address these challenges from the perspectives of DFC stakeholders in the U.S. Data were collected in 2020 through an online survey of 183 stakeholders (Mage =35.3, SD=8.8, 43.6% being female) involved who were in DFC design, implementation, or evaluation. Three challenges rated most critical by participants included limited funding (40.4%), difficulties to provide services due to policies to contain COVID-19 (35.7%), and lack of staffing (29.3%). Three rated most important strategies included seeking funding and government support (31.1%), developing partnerships and relationships with multiple sectors (29.1%), and recruiting persons with dementia and family caregivers as advocates (27.5%). Communities demonstrated resilience during the COVID-19 pandemic to implement DFC- related activities. To sustain DFC, enhancing national awareness, acquiring additional funding, and firm cogency from staff members, local/state government, and local communities are needed.

SENIOR CENTER INVOLVEMENT WITH DEMENTIA-FRIENDLY COMMUNITIES: COMMUNITY AND ORGANIZATIONAL FACTORS

Ceara Somerville[1], Clara Scher[2], Caitlin Coyle[1], Emily Greenfield[2], and Ayse Akincigil[2], *1. University of Massachusetts Boston, Boston, Massachusetts, United States, 2. Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

As local hubs for aging services, senior centers are well-positioned to engage in dementia-friendly community (DFC) work. Yet centers vary in their engagement, especially as the DFC concept has been introduced only recently in the US. Using a mixed-methods approach, we drew on data from a survey of senior centers in Massachusetts, the US Census, and qualitative interviews with senior center staff to examine factors associated with DFC engagement. Centers that reported greater engagement were in municipalities with higher proportions of older residents from vulnerable groups (e.g., adults ages 80+, limited English proficiency, with a disability, living alone). They also reported greater programmatic, social service, funding, and staff capacity. Qualitative findings elucidated how senior center leaders drew on intrapersonal, interpersonal, organizational, and community assets to support local DFC efforts. We discuss implications for policies and practices to cultivate senior centers and other community-based organizations as leaders and partners toward DFCs.

SESSION 1180 (PAPER)

AGING IN PLACE AND COMMUNITIES

A QUALITATIVE STUDY EXPLORING OLDER ADULTS' PERCEPTIONS, FACILITATORS, AND BARRIERS IN PLANNING FOR AGING AND FRAILTY

Erica Frechman[1], Cathy Maxwell[2], Mary Dietrich[3], Harleah Buck[4], Bethany Rhoten[5], and Amanda Davis[6], *1. Atrium Health Wake Forest, Concord, North Carolina, United States, 2. Vanderbilt University, Hermitage, Tennessee, United States, 3. Vanderbilt University, Nashville, Tennessee, United States, 4. Csomay Center for Gerontological Excellence, Iowa City, Iowa, United States, 5. Vanderbilt University School of Nursing, Nashville, Tennessee, United States, 6. Mercer University, Atlanta, Georgia, United States*

Aging in place is often a desired aspect of the aging trajectory but too often older adults and society in general, do not consider the factors involved in planning to make this a reality. Planning for aging and frailty entails a comprehensive life course approach to planning for one's aging process in five unique domains: communication/socialization, environmental, financial, physical care, and cognitive status. In order to promote upstream planning, there is a need to explore the lived experiences of older adults through understanding their viewpoints on planning, and what may promote or hinder this process. The purpose of this study was to explore how people perceive the concept of planning for aging and frailty and to identify facilitators and barriers involved in planning efforts. Using semi-structured questions, 20 community-dwelling older adults (aged 50-80) were interviewed. In-vivo coding and descriptive content analysis was utilized and revealed 17 codes within categories, including six codes and three categories in the perception domain (internal, external, future-oriented), seven codes and three categories in the facilitators domain (internal, external, systems), and four codes and two categories in the barriers domain (internal, systems). The depth of older adults' personal identities, life experiences, and the impact of societal influences emerged within the categories. Planning for aging and frailty is an unique concept that promotes planning through awareness and acceptance of the normal aging process. Future research through intervention development is needed to educate and empower older adults, optimize planning, and navigate barriers to planning.

COMMUNITY CONTEXT OF OLDER ADULT CARE: A CASE STUDY DURING THE COVID-19 PANDEMIC

Lisa Skemp, *Loyola University, Chicago, Chicago, Illinois, United States*

Introduction: Expectations for older adults (OA) to live in the community and prevent costly long-term care assume OAs' informal network members are available, able, and willing to fill this need. Yet, little is known about the processes whereby OAs construct care networks, especially during COVID-19.

Methods: A longitudinal case study of one OA male who participated in the ethnographic community Older Adult Care study in one urban Chicago neighborhood is described. The OA male described his network on three occasions: 2/2018, 1/2021 and 9/2021. The care networks were described by size, density, and transitivity. Data analysis was performed using the R programming language. Adjacency networks were constructed using the network package, then visualized using the sna package.

Results: The OA's network went from 23 members pre-pandemic in time one to 13 in time two and 8 members in time three. As network size contracted, the network density increased from 25% in time two to 46% at time three, indicating a more interconnected network. Clustering varied over time and was at its lowest in time 2 (27%) and increased by time 3 (67%). Friends and church connections were 72% of his network in time one, whereas 71% of his network were family and neighbors in time three.

Conclusions: Our OA's large, relatively disconnected social network tightened to fewer, more closely connected members during COVID-19 months. Contextual variables (environment, health guidelines, fear, pets) influenced the networks. It is essential to understand OA care networks to promote healthy aging in community.

EARLY DETECTION AND MANAGEMENT OF FRAILTY IN PRIMARY CARE: VALIDATION OF THE EFI-CGA WITH ELECTRONIC HEALTH RECORDS

Xiaowei Song[1], Grace Park[2], Barry Clarke[3], and Kenneth Rockwood[3], *1. Fraser Health, Surrey, British Columbia, Canada, 2. Fraser Health Authority, Surrey, British Columbia, Canada, 3. Nova Scotia Health, Halifax, Nova Scotia, Canada*

Background: Frailty is common in older adults and associated with many adverse outcomes. To promote early detection and management of frailty outside specialized geriatric services, we developed an electronic Frailty Index based on a Comprehensive Geriatric Assessment (eFI-CGA) in electronic health records. Here, we compare the eFI-CGA assessments between family physicians (FP) and geriatricians (GM).

Methods: Data from community-dwelling older adults were collected as part of the collaborative effort between Fraser Health and Nova Scotia Health to validate the eFI-CGA. The eFI-CGA was created following a standard procedure based on understanding deficit accumulation. A FP and a GM assessed each patient independently. Characteristics of the eFI-CGA were examined for each physician group using descriptive statistics and correlation analysis. FP-GM inter-rater reliability was tested using Cohen's Kappa.

Results: The first 30 cases were aged 80.8±5.2 years; 7% were women; with 12.9±2.8 years of education; 17% lived alone. Mild cognitive impairment or dementia was present in 20% participants. The mean clinical frailty scale (CFS) was 3 and the mean eFI-CGA was 0.20 by both FP and GM ratings. The CFS and eFI-CGA were closely correlated (r=0.76 for FP and r=0.71 for GM, p<.001). The eFI-CGA also showed an age correlation (r values >0.37, p values <.050). The average intraclass correlation coefficient was 0.79 for CFS and 0.90 for eFI-CGA (each p<.001).

Conclusion: Frailty data collected in primary care are highly comparable with geriatrician assessments. Ongoing work will test the generalizability of these findings using a larger sample with follow-up and outcomes evaluations.

PLAN: PREPARING AND LIVING FOR AGING NOW; A DESCRIPTIVE STUDY INVESTIGATING READINESS TO PLAN FOR AGING AND FRAILTY

Erica Frechman[1], Cathy Maxwell[2], Mary Dietrich[3], Harleah Buck[4], and Bethany Rhoten[5], *1. Atrium Health Wake Forest, Concord, North Carolina, United States, 2. Vanderbilt University, Hermitage, Tennessee, United States, 3. Vanderbilt University, Nashville, Tennessee, United States, 4. Csomay Center for Gerontological Excellence, Iowa City, Iowa, United States, 5. Vanderbilt University School of Nursing, Nashville, Tennessee, United States*

Population aging and the universality of the aging process offers individuals and society the opportunity to consider strategies to optimize older adults' well-being and proactively prepare across their aging trajectory. Understanding aging through a holistic lens is essential to promote healthy aging in light of the risk for increasing chronic conditions, frailty, and disability that affect older adults. Planning for aging and frailty encompasses five domains that entail change as individuals age (communication/socialization, environmental, financial, physical care, cognitive status), and provides foci for a proactive approach to planning across life course. The aims of this research were to examine the stages of change through the Transtheoretical Model within the domains of aging, experiences (personal & experiences with others), and associations between contextual factors and stages of change for readiness to plan for aging and frailty. Using a cross-sectional design, 252 community dwelling-adults (aged 50-80) completed a survey on planning for aging and frailty. Results revealed a distribution of stages of change in readiness across domains of planning for aging and frailty with highest levels of planning in the financial domain (68.7%), and lowest levels in cognitive domain (28.2%). Participants reported increased experiences with others compared to personal experiences. Factors most indicative of planning include: older age, marital status, living situation, social support, and vulnerability. Planning for aging and frailty is an innovative concept that takes a comprehensive approach to the aging process. Future study is needed to promote planning across one's life course and develop interventions focused on enhancing well-being.

SUBJECTIVE COGNITIVE DECLINE AS A PREDICTOR OF INCIDENT HOMEBOUND STATUS AMONG OLDER ADULTS

Julia Burgdorf[1], and Jennifer Reckrey[2], *1. Center for Home Care Policy & Research, VNS Health, New York, New York, United States, 2. Icahn School of Medicine, The Mount Sinai Hospital, New York, New York, United States*

In the US, over 2 million older adults are homebound, meaning they never or rarely leave their home. Being homebound increases risk for negative outcomes, including depression and mortality. Dementia diagnosis is a risk factor for becoming homebound, but over half of those with dementia do not receive a formal diagnosis. Subjective cognitive decline (SCD)—self-reported increase in memory loss over a given timeframe—is an early indicator of dementia that can be easily determined during routine medical encounters. SCD screening could be a valuable tool for identifying older adults at risk of becoming homebound—a critical first step towards supporting these individuals and their caregivers—but its predictive value is not yet known. We examined a nationally representative sample of 4,914 (weighted n=34,381,060) community-living older adults who responded to the 2016 and 2017 National Health and Aging Trends Study (NHATS). We modelled incident homebound status as a function of SCD using weighted, multivariable logistic regression while adjusting for older adult sociodemographic characteristics, health status, and caregiving support. In adjusted models, those who reported SCD experienced 43% greater odds of becoming newly homebound from 2016-2017 (aOR: 1.43; p=0.03). This relationship persisted among individuals without a formal dementia diagnosis (n=4,735); among these individuals, those who reported SCD experienced 50% greater odds of becoming newly homebound (aOR: 1.50; p=0.02). Findings suggest the potential value of SCD screening as an efficient method of identifying older adults who may benefit from resources that reduce the risk and/or mitigate the negative effects of becoming homebound.

SESSION 1190 (PAPER)

CARE AT HOME

CHARACTERIZING HOME AND COMMUNITY-BASED SERVICE ENROLLEES IN MINNESOTA'S MEDICAID WAIVER PROGRAM

Justin Blackburn[1], Sharon Baggett[2], Ellen Burton[3], and Yonda Snyder[4], *1. IU Richard M. Fairbanks School of Public Health at IUPUI, Indianapolis, Indiana, United States, 2. University of Indianapolis, Indianapolis, Indiana, United States, 3. University of Indianapolis Center for Aging & Community, Indianapolis, Indiana, United States, 4. Sage Squirrel Consulting, LLC, Bloomington, Indiana, United States*

Medicaid waivers allow states' provision of home and community-based services (HCBS), leading to variations in design and delivery. States monitor expenditures, but cannot easily anticipate growth. Understanding the needs of this population can aid in early identification and improve service delivery. We conducted a Partitioning Around Medioids cluster analysis of first-time enrollees in Minnesota's Elderly Waiver HCBS program during 2019 to identify trajectories of entry and characterize activities of daily living (ADL) and instrumental activities of daily living (IADL) needs at enrollment. Administrative data collected via long term care consultation assessments provided enrollment, ADL/IADL needs, living arrangements, and other clinically relevant information that was linked to other sources including Minnesota health care program enrollment and utilization, Minimum Data Set skilled nursing facility (SNF) assessments, and calls to the Senior LinkAge Line (SLL)—a free long-term care counseling service. Of 5,284 first-time enrollees, most had prior engagement with state programs—nearly two-thirds had called the SLL, 36% had a SNF stay, and 56% had prior Medicaid enrollment. We identified six clusters representing three levels of living arrangements and two levels of need: 1) lived alone, low needs (32%), 2) lived with others,

moderate needs (20%), 3) congregate living, moderate needs (14%), 4) congregate living, high needs (14%), 5) lived with others, high needs (11%), and 6) lived alone, high needs (9%). Lacking caregivers and prior Medicaid were possible exacerbating reasons for HCBS enrollment. The magnitude of the differences between clusters highlights the constellation of factors leading to enrollment in HCBS.

HOME HEALTH AIDE CONTINUITY AMONG HOME-BASED LONG-TERM CARE CLIENTS

Jennifer Reckrey[1], David Russell[2], Mei-Chia Fong[3], and Katherine Ornstein[4], *1. Icahn School of Medicine, The Mount Sinai Hospital, New York, New York, United States, 2. Appalachian State University, Boone, North Carolina, United States, 3. Visiting Nurse Service of New York, New York, New York, United States, 4. Johns Hopkins, University, Baltimore, Maryland, United States*

Many older adults with functional impairment rely on paid caregivers (e.g., home health aides) to remain living at home. Continuity in the provider of healthcare services is known to impact care-recipient outcomes in settings like primary care; however, limited quantitative research has explored variability in provider continuity among home-based long-term care services. We conducted a retrospective pooled cross-sectional study using a secondary analysis of managed long-term care and home care agency records in order to: 1) describe home health aide continuity among a population of older adults receiving Medicaid-funded home-based long-term care using the Bice-Boxerman index, and 2) identify factors associated with greater home health aide continuity using multivariate regression. Among 3,864 older adults who received claim-paid home health aides services between January 1, 2018 and March 10, 2020, average home health aide continuity scores were lower (i.e., worse continuity) as care hours increased: 0.71 among those receiving < 3 service hours/day (n=1221), 0.62 among those receiving 3-7 service hours/day (n=1622), and 0.41 among those receiving >7 service hours /day. Among those with the highest care hours (>7 hours /day), increases in the level of ADL impairment and cognitive impairment were significantly associated with decreases in continuity scores. While clients with the highest care needs are the most dependent on their home health aides and may benefit most from stable paid caregivers, home health aide continuity scores are the lowest among this group. Future work will explore the impact of home health aide continuity on long-term care-recipient health outcomes.

UNCOVERING PET OWNERSHIP BENEFITS, CHALLENGES, AND RESOURCES: A SURVEY OF PROFESSIONALS WORKING WITH OLDER ADULTS

Jessica Bibbo[1], Justin Johnson[1], Jennifer Drost[2], and Margaret Sanders[3], *1. Benjamin Rose Institute on Aging, Cleveland, Ohio, United States, 2. Geriatric Research Summa Health, Akron, Ohio, United States, 3. Northeast Ohio Medical University, Rootstown, Ohio, United States*

The human-animal bond can play a vital role in the lives of older adults, including those living with dementia. This study used the stress process model to identify the benefits, challenges, and resources associated with pet ownership professionals had encountered in their work with older adults (OA), persons living with dementia (PWD), and care partners (i.e., caregivers, CP). An interdisciplinary (e.g., social services, healthcare) sample (N=360, 89.97% female, Mage=53.22, SDage=11.84) completed an on-line survey addressing pet ownership issues encountered in their work. A conventional content analysis was conducted to analyze the open-ended items asking the benefits and challenges they had encountered, as well as whether and if they had seen pets shape the relationships between OA/PWD and CPs. The final open-ended item asked for any other experiences or thoughts they would like to share on the issue of pet ownership in older adulthood. Preliminary analyses indicated the central benefits of pet ownership for OA and PWD was companionship. Common challenges were providing basic pet care (e.g., feeding, managing waste) and the financial aspect of ownership. Results indicated that family/caregiver assistance was necessary to keep a pet in an OA/PWD's home and pets could be a source of caregiver burden. Pets provided OA a sense of purpose. Caring for the pet and the bond shared with the pet were also important resources for OA. Pets provided a focus of attention and were a source of engagement for PWD. Pets were a resource for the professionals to build rapport with their clients.

UNDERSTANDING SPENDDOWN TO MEDICAID IN ASSISTED LIVING: SURVEY RESULTS FROM PARTICIPANTS/REPRESENTATIVES IN MINNESOTA

Sharon Baggett[1], Ellen Burton[2], and Justin Blackburn[3], *1. University of Indianapolis, Indianapolis, Indiana, United States, 2. University of Indianapolis Center for Aging & Community, Indianapolis, Indiana, United States, 3. IU Richard M. Fairbanks School of Public Health at IUPUI, Indianapolis, Indiana, United States*

The state of Minnesota has seen substantial growth in the use of Medicaid in Assisted Living and wanted to better understand how applicants spend down to Medicaid in order to identify potential upstream interventions to prolong the spend down period. As part of a mixed methods research effort, 231 new Medicaid participants or their proxies, 167 in AL and 64 at home, completed a telephone survey on their services use prior to Medicaid application, prior planning or thinking of how to pay for services once personal resources were exhausted, and experience of spenddown once in AL. Reaching these eligible participants required a unique, multi-step outreach process; given the abilities of participants to respond, the majority of surveys were completed by proxies. Among those in AL, 40% reported planning in advance about how to pay for services once needed; 58% knew of government programs to assist and 80% reported their plan included applying to the programs at some time. Thirteen percent (13%) of those in AL reported getting help from the Medicaid waiver at the time of move in; another 25% said they paid for themselves for less than one year before getting state support. More than one-third (34%) who paid for their services for some period of time after move in said the period was shorter than expected; another 41% said about as expected, and for 25% the period was longer than expected. Open-ended comments indicate a move to memory care was a key factor in spend down to Medicaid.

YEARS WITH AND WITHOUT HOME-BASED SERVICES FOR THE 70+ POPULATION IN NORWAY: TRENDS OVER THREE DECADES, 1995–2019

Milan Chang Gudjonsson[1], Mona Michelet[2], and Bjørn Heine Strand[3], *1. Norwegian Institute of Public Health, Reykjavik, Iceland, 2. Vestfold Hospital Trust, Oslo, Oslo, Norway, 3. Norwegian Institute of Public Health, Oslo, Oslo, Norway*

Introduction: Life expectancy (LE) is increasing worldwide, while there is a lack of information on years of home-based formal care use among the aging population. The current study examined the trend of LE for formal care use among Norwegian older adults over three decades 1995-2016 in Norway.

Methods: A total of 25,263 participants aged 70+ were included in the Trøndelag Health Study (HUNT) survey 2 (1995-97), 3 (2006-08), and 4 (2017-19). Participants reported the use of formal care services including practical help and home nursing. The prevalence of both service uses was standardized to the Norwegian population by age, sex, and education using post-stratification weights. LE was estimated using National mortality data by age, sex, and education combined with the formal service use data using the Sullivan method to estimate expected years with and without basic services and nursing services in Norway.

Results: During 1995/97-2017/19, the service use decreased from 22.6% to 6.2% for practical help and 6.4% to 5.5% for receiving home nursing. LE at age 70 from 1995 to 2016 increased 3.4 years in men, and 2.4 years in women. Expected years receiving practical help decreased by 1.1 years (2.6 to 1.5 years) in men and 1.6 years (4.5 to 2.9 years) in women, while LE for home nursing increased from 0.7 years (0.7 to 1.4 years) in men and 1.3 years (1.4 to 2.7 years) in women.

Conclusions: Years receiving home nursing increased during 1995-2016, while years receiving practical help care decreased in the older Norwegian population.

SESSION 1200 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

CHROMATIN STATE AND MODIFICATIONS IN AGING

Chair: Simone Sidoli

Program Overview: In this symposium, the speakers will discuss how genomic stability and chromatin state are affected during aging using complementary perspectives, model systems and technology. Methods such as structural genomics, genome-wide mapping, super-resolution microscopy, mass spectrometry, and enzymology are utilized to describe hallmarks of aging in models such as C. elegans, mice, and 2D vs 3D human cell culture. Dr. Lakadamyali applies innovative super-resolution microscopy to visualize and quantify the spatial organization of chromatin with nanoscale spatial resolution in single cells, revealing how disordered patches at the nucleosomal level correlate with cell phenotype. Dr. Sen will present a multi-omics approach on murine models to reveal that aged cells organize a specific type of heterochromatin unable to self-interact over long distances. These findings expose that global chromatin alterations pose a barrier and promote a cellular state that is refractory to injury sensing and repair. Finally, Dr. Sidoli will describe how mass spectrometry is applied to investigate combinatorial histone modifications that benchmark regions of decondensed heterochromatin, and show the enrichment of unusual histone modifications in a cohort of centenarian patients.

MODELING REACTIVATED HETEROCHROMATIN USING AN AGING 3D CELL MODEL

Simone Sidoli, Stephanie Stransky, Ronald Cutler, Sarah Graff, and jennifer Aguilan, *Albert Einstein College of Medicine, New York, New York, United States*

Chromatin state and dynamics is modulated by chromatin interacting proteins, in particular histones and their post-translational modifications. We investigate the chromatin-bound proteome in aging to understand how DNA readout is misregulated in senescent cells. We focus on domains of reactivated heterochromatin, i.e. chromatin domains undergoing anomalous decondensation and decorated by histones co-modified with markers of condensed heterochromatin and active transcription. We optimize our mass spectrometry methods 3D cell models, and then apply them on B-cells retrieved from Ashkenazi Jews donors. In this cohort, we particularly focus on offsprings of exceptional longevity, i.e. individuals in their 70s with projected longer lifespan due to their centenarians ancestors. Preliminary data on 60 individuals revealed the enrichment of unusual histone modifications in the OPEL group, the group we utilize as indicator of projected longer lifespan. We have then applied biochemistry techniques to identify the role of these unusual modifications on chromatin readout.

THE DYNAMIC GENOME-CHALLENGES AND OPPORTUNITIES FOR HEALTHY AGING

Peter Adams, *Sanford Burnham, San Diego, California, United States*

Chromatin is a key determinant of cell phenotype and function. Therefore, chromatin stability over the lifespan is presumably a pre-requisite for maintenance of cell and tissue phenotype and function, and hence healthy aging and longevity. However, chromatin is not a static fixed structure, but is a dynamic and plastic "breathing" assembly. This dynamic chromatin likely represents a challenge for a cell to achieve phenotypic stability, healthy aging and longevity. As a dynamic and plastic entity, chromatin is prone to change or drift, a process likely exacerbated by intrinsic cellular processes and extrinsic/environmental influences. We have proposed that cells possess mechanisms of chromatin homeostasis, or chromostasis, that preserve chromatin integrity, suppress phenotypic instability and so slow the pace of aging. Implications of dynamic chromatin for healthy aging and longevity will be discussed.

SUPERRESOLUTION IMAGING OF CHROMATIN IN HEALTH AND DISEASE

Melike Lakadamyali, *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Super-resolution microscopy has been playing an instrumental role in providing new insights into how the genome is folded and packaged inside intact nuclei in single cells. I will present our work on using super-resolution microscopy to visualize and quantify the spatial organization of chromatin with nanoscale spatial resolution in single cells. Our work has revealed that at the nucleosomal level chromatin is a disordered fiber composed of groups of nucleosomes packaged at varying densities, which we named nucleosome clutches. Despite the heterogeneity of nucleosome clutch organization, the size and packing density of nucleosome clutches is cell-type specific and correlates with cell fate. Our recent results also show that nucleosome clutches and chromatin nano-structure can be remodeled via chemo-mechanical cues. In particular degenerative chemo-mechanical cues during disease lead to aberrant chromatin nano-structure and loss of mechano-epigenetic memory, potentially leading to alterations in cell phenotype.

EPIGENETIC MECHANISMS OF TISSUE AGING

Payel Sen[1], Na Yang[2], James Occean[2], Daniel Melters[3], Changyou Shi[2], Lin Wang[4], Simone Sidoli[5], and Yamini Dalal[3], *1. National Institute on Aging, NIH, Baltimore, Maryland, United States, 2. NIA, Baltimore, Maryland, United States, 3. NCI, Bethesda, Maryland, United States, 4. NIH, Bethesda, Maryland, United States, 5. Albert Einstein College of Medicine, New York, New York, United States*

Epigenetic alterations are one of the key hallmarks of aging. How epigenetic changes broadly affect euchromatin-heterochromatin balance, three-dimensional chromatin conformation, histone composition and global transcriptome in aging have not been addressed. Using murine liver as a model organ and an integrated multi-omics approach, we find that aged cells assume a repressed chromatin state characterized by condensed chromatin, broad heterochromatinization, global suppression of the transcriptome, and inability to self-interact over long distances. Our findings reveal that global chromatin alterations pose a barrier and promote a cellular state that is refractory to injury sensing and repair.

SESSION 1210 (PAPER)

COVID-19 I

FAMILY CAREGIVING FOR OLDER ADULTS IN LONG-TERM CARE DURING THE PANDEMIC: STRESS, SOCIAL SUPPORT, AND ADAPTATION

Geunhye Park, Erin Robinson, and Gashaye Melaku Tefera, *University of Missouri, Columbia, Missouri, United States*

Older adults residing in long-term care (LTC) are especially vulnerable to the COVID-19 pandemic. Federal and local health officials have issued strict visitation guidelines, including family caregivers. Given that family caregivers are essential in the well-being for older adults in LTC, these measures have had an enormous impact. As little is known about the experiences of family caregivers, the purpose of this study was to explore how the COVID-19 pandemic impacted family caregivers' roles, mental health, and adaptation. Semi-structured interviews (N=25) were conducted with family caregivers of older adults in LTC (Mean age= 59.7; 92% female) via phone/Zoom. An interview guide led the question asking process and participants were asked open-ended questions about the impact of COVID-19 related protocols on their caregiving, mental health, and sources of social support. Interviews were transcribed verbatim and analyzed in Nvivo, guided by Grounded Theory methods. The majority of participants (76%) identified as a child of their care recipient. Findings highlight that most participants experienced numerous changes to their caregiving tasks, such as assisting with activities of daily living (ADLs), limited monitoring for their loved ones, and a reduction of social support provided to the care recipient. Family caregivers also reported other changes in their roles that resulted in increased stress and mental health concerns. These concerns were discussed in detail, including ways in which family caregivers adapted to their new roles and managed their stress. Findings from this study will inform interventions geared to better support family caregivers, particularly during times of crisis.

FAMILY CAREGIVING IN LTC SETTINGS DURING THE PANDEMIC: COMMUNICATION CHALLENGES AND LEVERAGING TECHNOLOGY

Gashaye Melaku Tefera, Erin Robinson, and Geunhye Park, *University of Missouri, Columbia, Missouri, United States*

COVID19 related lockdown and protocols caused disruptions in family caregiving for older adults living in LTC settings. However, there is a paucity of research on the challenges and experiences of family caregivers in maintaining their caregiving role during the pandemic. Hence, this qualitative study explores family caregivers' communication challenges and the role technology played in performing their caregiving roles. One-on-one in-depth interviews (N=25) were conducted with family caregivers (Mean age= 59.7; 92% female; 76% child) via phone/Zoom. Interviews were transcribed and thematically analyzed using Nvivo12. Findings demonstrate that family caregivers of older adults in LTC settings experienced severe communication barriers with staff at those facilities in the early onset of the pandemic, including delays of important information about their care recipients. Participants highlighted high staff turnover, inadequate training, staff unfamiliarity with technology, and poor internet connections as perpetuating communication barriers. During this time, their older care recipients experienced visual and hearing impairments that affected their ability to communicate, as well as cognitive decline. Despite this, family caregivers were able to successfully utilize various forms of technology to continue providing care supports and social support to their loved ones. Although participants relied on phone calls and email communications, they also used other platforms including Zoom, FaceTime, Nixplay, and TextNow. Participants used devices including landline phones, cellphones, computers, tablets, Ipads, and walkie-talkies to execute their communication. Implications of this study suggest that improving access and utilization of technology in LTC settings can enhance family caregiving during unprecedented events like the COVID19 pandemic.

PREVALENCE AND PREDICTORS OF INCREASED VERBAL/PHYSICAL CONFLICT DURING COVID-19: CLSA FINDINGS

Gloria Gutman[1], Mojgan Karbakhsh[2], and Heather Stewart[3], *1. Simon Fraser University, Vancouver,* *British Columbia, Canada, 2. Simon Fraser University Gerontology Research Centre, Vancouver, British Columbia, Canada, 3. Simon Fraser University, Surrey, British Columbia, Canada*

Child and spousal abuse rates have been shown to increase during various types of disasters. This study sought to determine the prevalence and determinants of older adults' experiences of increased verbal or physical conflict (+VPC), as a proxy for elder abuse, during the COVID-19 pandemic. Data are from the Canadian Longitudinal Study on Aging (CLSA), a cohort study of 51,338 Canadians aged 45–85 at enrollment (2012-15) with follow-up every 3 years until 2033.. We analyzed data of participants aged 65 or above at follow-up1 who took part in a COVID-19 sub-study (n=24,306). Experiencing +VPC was the main outcome variable; explanatory variables included gender identity, sexual orientation, age group, race/ethnicity, educational attainment, marital status, household income, working status, living alone, social support availability, cohesion with community, self-rated physical and mental health, anxiety, depression, and previous history of elder abuse. The overall weighted prevalence of +VPC was 7.4%. Gay/bisexual men, 55-64 age-group, not living alone, low social support, poor social cohesion, low self-rated health, poor mental health, and past history of psychological or physical abuse were all significantly associated with +VPC. Weighted multivariable logistic regression revealed gender, not living alone, higher scores of depression and anxiety, and past history of psychological abuse to be independent predictors of +VPC. Implications for post-pandemic recovery and for prevention strategies during future disasters include targeted outreach programs for the most vulnerable group which includes males, persons age 55-64, those with self-rated poor mental health and/or history of elder psychological abuse.

THE IMPACT OF SOCIAL INEQUALITIES ON DIGITAL ENGAGEMENT OF OLDER ADULTS DURING THE COVID-19 PANDEMIC

Andraž Petrovčič[1], Darja Grošelj[1], Štěpán Žádník[2], Katja Prevodnik[3], and Bianca C. Reisdorf[4], *1. University of Ljubljana, Faculty of Social Sciences, Ljubljana, Ljubljana, Slovenia, 2. Masaryk University | Faculty of Social Studies, Brno, Jihomoravsky kraj, Czech Republic, 3. University of Ljubljana, Ljubljana, Ljubljana, Slovenia, 4. University of North Carolina at Charlotte, Charlotte, North Carolina, United States*

The COVID-19 pandemic has had profound implications on how older adults engage with the digital world. While there is converging evidence that during the pandemic the number of online newcomers has increased the most among older adults, digital inequalities have become even more condensed among the socially disadvantaged groups in this period. Importantly, such patters of age-related digital exclusion were not observed only in terms of self-reliant internet use but also in older adults' ability to access internet resources indirectly by asking others to act on their behalf – a practice known as use-by-proxy. Drawing on the van Dijk's resources and appropriation theory, we aim to understand which categorical and resource inequalities determine the direct and indirect forms of internet use among older adults during the pandemic. Therefore, in November 2021 a telephone survey (N = 701) was carried out among individuals aged 65+ in Slovenia. Three logistic regression models were fitted to explore the association between sociodemographic characteristics of respondents and their access to material and social resources with internet use as well as with availability and activation of use-by-proxy. The results suggested that both categorical and resource inequalities are predictors of internet use. Conversely, availability of use-by-proxy is strongly associated only with social resources, while use-by-proxy activation depends on material resources and household composition. Overall, we argue that social inequalities affect also the indirect forms of internet use in later life which means that the ability to compensate by help for digital inequalities is also stratified unevenly.

DEMYSTIFYING NIH PEER REVIEW: YOUR APPLICATION FROM SUBMISSION TO SCORE

Elia Ortenberg[1], Karen Roberto[2], Dana Plude[3], Janetta Lun[1], and Helena Gabor[4], *1. National Institutes of Health, Bethesda, Maryland, United States, 2. Virginia Polytechnic Institute & State University, Blacksburg, Virginia, United States, 3. National Institute on Aging/National Institutes of Health, Bethesda, Maryland, United States, 4. Center for Scientific Review/National Institutes of Health, Bethesda, Maryland, United States*

What happens to applications after they are submitted to the National Institutes of Health, and how can you better prepare for the process of peer review? The Center for Scientific Review (CSR) works closely with the 24 funding institutes and centers at the National Institutes of Health that provide funding support for projects of high scientific merit and high potential impact. CSR conducts the first level of review for the majority of grant applications submitted to the NIH, which includes 90% of R01s, 85% of Fellowships, and 95% of Small Business Innovation Research (SBIR) applications as well as many other research and training opportunity activities. In this capacity, CSR helps to identify the most meritorious projects, cutting-edge research, and future scientists who will advance the mission of the NIH: to enhance health, lengthen life, and reduce illness and disability. The purpose of this symposium is to provide an overview of 1) what happens to NIH applications before, during, and after peer review at CSR; 2) new and current peer review policies and practices that impact application submission; and 3) strategies for developing a strong NIH grant application. Peer review is the cornerstone of the NIH grant supporting process, and demystifying the process can help attendees understand what's inside the "Black Box" and the criteria used to identify the most meritorious applications.

AFTER REVIEW AND WAYS TO GET INVOLVED

Elia Ortenberg, *National Institutes of Health, Bethesda, Maryland, United States*

After the review meeting, the SRO prepares the Summary Statement, which is the primary outcome of peer review. Program staff and Advisory Councils at the Institutes use this official document to make decisions about which applications to fund. How can you best prepare for the next steps for your application? Understand the qualities of a competitive NIH application, talk to Program staff, and take advantage of the opportunity to become a peer reviewer yourself. From the field, apply the tips shared by applicants and reviewers about what they do and what they look for in a well-written application. Receiving the summary statement can be daunting and discouraging; but by de-mystifying the process and getting involved, you can help position your application towards maximum success.

THE PARTNERSHIP BETWEEN THE CENTER FOR SCIENTIFIC REVIEW AND THE NIH INSTITUTE

Dana Plude, *National Institute on Aging/National Institutes of Health, Bethesda, Maryland, United States*

The playing field for NIH funding is highly competitive, and having a great idea is only the start of the process. There are many funding mechanisms for early career investigators, trainees, and research institutions. Understanding about different application types, who to talk to about your application at different stages of development, finding the right review panel, and learning about the policies and procedures pertaining to review are important first steps in preparing an application. In recent years, the Center for Scientific Review has undergone changes and updated its structure, policies and practices to stay aligned with its mission. In this presentation, attendees will learn about the roles played by CSR and the NIH Institute as applications move from review to funding.

THE STUDY SECTION AND THE ROLE OF THE SCIENTIFIC REVIEW OFFICER

Janetta Lun, *National Institutes of Health, Bethesda, Maryland, United States*

Applications reviewed by the NIH Center for Scientific Review go through a process that starts with assignment to a review panel and ends with the generation of a priority score and a written evaluation (Summary Statement). This process is overseen by several key players, the most important being the Scientific Review Officer, who is the designated federal official overseeing all aspects of Level 1 review. Their role is to recruit and enlist expert reviewers to evaluate the scientific and technical merit of an application and assess its potential contribution and impact to the relevant research field. The goal of Level 1 review is to ensure that applications are expertly and fairly evaluated in accordance with the NIH policies of rigor, reproducibility, transparency and research integrity. In this presentation, attendees will learn about the how study sections are formed, how reviewers are involved and conduct their evaluations, and the guiding principles that underlie Level 1 review.

INSIDE THE REVIEW MEETING

Helena Gabor, *Center for Scientific Review/National Institutes of Health, Bethesda, Maryland, United States*

What happens to applications on meeting day? What do study section members discuss? Review of applications are evaluated for their scientific and technical merit, and this is reflected in the reviewers' written assessment of the project's overall impact. In addition, reviewers score five core criteria and additional review criteria as defined in the funding opportunity announcement. The panel's initial assessment determines which applications will be discussed in full at the meeting. For each that is discussed, reviewers briefly present the strengths and weaknesses of the application and discuss the factors that inform their overall assessment. At the end of the discussion, a final impact score is given by all eligible members of the panel, which is reported on the summary statement. Every application undergoes a similar process that ensures that fair and consistent consideration is applied to all applications. At the end of the presentation, attendees will learn how the foundation and pillars of the NIH peer review process are put into practice through scoring, discussion, and potential impact on the field.

SESSION 1230 (SYMPOSIUM)

DIFFERENCES IN THE EXPERIENCES AND BEHAVIORS OF OLDER ADULTS IN NSHAP DURING THE COVID-19 PANDEMIC

Chair: Louise Hawkley Discussant: Dawn Carr

This symposium uses data from the National Social Life, Health & Aging Project to examine how and for whom older adults' social relationships and experiences changed with the advent of the COVID-19 pandemic. Zhang et al. examine video call usage among older adults with hearing impairment and how this might mitigate loneliness. They find that although this population reported greater loneliness during the pandemic, video calls attenuated this relationship in a dose-response manner. Wilder et al. evaluate 2015 resilience and socioeconomic status as predictors of older adults' reports that the pandemic led to a positive change in their lives. Results revealed greater odds of reporting a positive impact of the pandemic for those with higher education, adjusting for resilience. Compernolle et el. assess differences by cognitive status in changes in mental health from pre- to during the pandemic. Higher 2015 cognitive functioning was associated with greater pandemic loneliness, with decreased pandemic emotional support partly explaining this association. Copeland & Liu investigate the role of 2015 personal networks in receiving instrumental and emotional support during the pandemic, finding that larger and denser pre-pandemic confidant networks each predicted higher odds of receiving various types of support during the pandemic. Wong et al. explore whether and for whom relationship quality changed since the pandemic started. Two-thirds of partnered respondents reported unchanged relationship quality, and Black respondents were more likely to report improved relationship quality. These investigations highlight sub-group differences in older adults' changes in experiences, behavior, and well-being since the pandemic began.

VIDEO CALLING REDUCES LONELINESS FOR HEARING IMPAIRED OLDER US ADULTS DURING THE COVID-19 PANDEMIC

Amanda Zhang[1], Kristen Wroblewski[2], Martha McClintock[2], Louise Hawkley[3], and Jayant Pinto[2], *1. University of Chicago Pritzker School of Medicine, Chicago, Illinois, United States, 2. University of Chicago, Chicago, Illinois, United States, 3. NORC at the University of Chicago, Chicago, Illinois, United States*

Older adults with hearing impairment (HI) experience communication challenges that may result in increased loneliness exacerbated by social distancing during COVID-19. Video-calling may mitigate isolation-related loneliness. We addressed this hypothesis in the National Social Life, Health, and Aging Project (NSHAP), a longitudinal, nationally representative study of home-dwelling older US adults. Hearing ability was determined by interviewer-rating and loneliness/video-calling use by self-report. Fewer older adults (≥55 years) with HI (n=221) reported regular use of video-calling during the pandemic vs. those without HI (n=2337) (14% vs. 30%, p<0.001). Older adults with HI reported greater loneliness during COVID-19 (p=0.031), with video calls mitigating this relationship through a dose-dependent effect in adjusted analyses (interaction p=0.001). Video-calling decreases HI-related loneliness, despite potential barriers those with sensory impairment face using this technology. Promoting greater adoption of video-calling could be a strategy to protect against HI-related loneliness in aging.

DOES RESILIENCE OR SES PREDICT OLDER ADULTS FINDING A SILVER LINING DURING THE COVID-19 PANDEMIC?

Jocelyn Wilder[1], diane Lauderdale[2], Laura Finch[3], and Louise Hawkley[3], *1. NORC, Chicago, Illinois, United States, 2. University of Chicago, Chicago, Illinois, United States, 3. NORC at the University of Chicago, Chicago, Illinois, United States*

The COVID-19 pandemic has stretched our limits physically, mentally, and economically; however, some older adults report that it led to a positive life change. We used data from the NSHAP COVID-19 supplement to understand whether resilience and SES (both measured in 2015-16) are predictors of older adults' likelihood of endorsing a positive change during the pandemic. Additionally, we examined whether resilience and SES predict specific positive changes described in open-ended responses. Higher education significantly predicted reporting a positive change during the pandemic. Adjusting for resilience (OR 1.0, p= 0.185), the odds of endorsing any positive change were 1.9 times higher for those with an associate degree (p=0.027) and 3.3 times higher for those with a bachelor's degree or higher (p<0.001) compared to those who did not complete high school. Specific positive change domains also differed by SES. Additional research is needed to understand how SES and benefit-finding contribute to well-being.

SOCIAL RESOURCES, COGNITION, AND MENTAL HEALTH DURING THE COVID-19 PANDEMIC

Louise Hawkley[1], Laura Finch[1], Linda Waite[2], and Ellen Compernolle[1], *1. NORC at the University of Chicago, Chicago, Illinois, United States, 2. National Opinion Research Center (NORC at Chicago), Chicago, Illinois, United States*

This study assesses the extent to which changes in mental health among older adults from pre- to during the pandemic varied by cognitive functioning and the role that decreases in social resources played in this association. We use data from the National Social Life, Health, and Aging Project (NSHAP)—a population-based panel study of older U.S. adults that has surveyed respondents every 5 years since 2005—and the NSHAP COVID-19 supplement, conducted between September 2020 and January 2021 (N=2,672). Results from linear regression models suggest that (1) higher cognitive functioning in 2015 was associated with greater loneliness (β=-0.03; p<.05) during the pandemic; (2) this association is explained in part by a decrease in emotional support during COVID-19 (β=0.94; p<.001); and (3) cognitive status did not moderate links between social resources with happiness nor loneliness. Results emphasize the importance of social resources for older adults' mental health, regardless of cognitive ability.

WHO GETS HELP? A NATIONAL LONGITUDINAL STUDY OF PERSONAL NETWORKS AND PANDEMIC SUPPORT AMONG OLDER ADULTS

Molly Copeland, and Hui Liu, *Michigan State University, East Lansing, Michigan, United States*

Personal networks are a key component in the provision of social support for older adults. Such support is particularly critical during the COVID-19 pandemic, when traditional avenues of social engagement or assistance are disrupted. Here, we use nationally representative data from the National Social Life, Health, and Aging Project that assesses older adults' pre-pandemic personal networks and receiving instrumental help and emotional support during the pandemic. We find that larger pre-pandemic confidant networks predict higher odds of receiving needed help and support, higher odds of receiving help and support more often than before the pandemic, and lower odds of being unable to get help. Denser pre-pandemic networks also predict higher odds of receiving instrumental help and support during the pandemic, while having a greater proportion of kin in pre-pandemic networks predicts higher odds of receiving pandemic help for non-white older adults only. Together, results suggest that features of older adults' pre-pandemic confidant network structure and composition can provide underlying conditions for receiving social support during the pandemic.

SESSION 1240 (SYMPOSIUM)

DIVERSE CONTEXTS, UNIQUE EXPERIENCES: IMPACT OF SOCIAL ISOLATION ON PSYCHOSOCIAL FACTORS AND COGNITION

Chair: Jess Francis

The aging population is not a monolithic group. Older adults' experiences of and behaviors within their social networks are as varied as their diverse backgrounds and lifestyles. Although the threat of social isolation is particularly salient among older adults, the psychosocial and cognitive impact can differ along demographic and socioeconomic lines. The objective of this symposium is to highlight how different older adults are effected by their social network characteristics and structure, and how they mobilize their psychosocial resources to protect against loneliness, depression, and threats to cognition. First, Hong & Mejia examine how older men and women compare in their use of information and communication technology (ICT) as each influenced the experience of loneliness during the COVID-19 pandemic. Francis & Brauer also look at ICT use as they assess demographic and socioeconomic differences in social isolation, perceived mattering, and Facebook use among single older adults who are childless and live alone. Oh & Chopik explore uncoupled older adults along demographic lines in a 10-year longitudinal study of single people, their perceptions of change, satisfaction with singlehood, and major life events. Further exploring the theme of well-being during the COVID-19 pandemic, Cooper, Ajrouch, & Antonucci assess cognition, depressive symptoms, and their association with race among a sample of Whites, Blacks, and Arab Americans. Finally, Lee & Colleagues round out this symposium by sharing results of their study in which they examine the coping styles of non-Hispanic Whites and non-Hispanic Blacks and the impact on cognition.

SOCIAL ISOLATION, LONELINESS, AND MATTERING AMONG OLDER ADULT FACEBOOK USERS FROM DIVERSE BACKGROUNDS

Jess Francis, and Simon Brauer, *University of Michigan, Ann Arbor, Michigan, United States*

Older adults who are childless and live alone are at risk for social isolation and loneliness. Studies show Facebook communication to be associated with feelings of mattering – the feeling that we are significant to others - a protective psychosocial resource. Despite being at similar stages in life, older adults, their technology use, and their experience of social isolation can vary greatly. This study explores how older adults from different demographic and socioeconomic backgrounds use Facebook and how that use is associated with perceptions of mattering, loneliness, and social isolation. This study employed online survey methodology among a sample of older adult Facebook users (n = 517; Mage=70; 50% Female; 92% White). Preliminary results show significant differences among income level, age, and gender regarding Facebook communication and mattering among older adults who are childless and live alone. We discuss our full results in tandem with qualitative data from our sample.

NAVIGATING LIFE UNCOUPLED: CHANGES IN SINGLEHOOD SATISFACTION IN RESPONSE TO MAJOR LIFE EVENTS

Jeewon Oh[1], and William Chopik[2], *1. Syracuse University, Syracuse, New York, United States, 2. Michigan State University, East Lansing, Michigan, United States*

Experiencing challenging events without a partner who can be supportive can be hard and change perceptions of the singlehood experience. We conducted growth curve analyses predicting intercepts and slopes of singlehood satisfaction from ten major life events (MLEs). Single people (N = 5,191; Mage= 46.98, 60.1% women) were followed longitudinally over 10 years (2008-2017) and provided information on MLEs and singlehood satisfaction. People were fairly satisfied with singlehood (Mintercept=6.52/10), and satisfaction increased over time (Mquadratic slope=.01). Some difficult events (e.g., becoming ill and losing parents) were associated with declines in singlehood satisfaction. However, responses to MLEs were overall complex—unemployment was related to lower levels of satisfaction but unrelated to changes in satisfaction. Seemingly positive events (e.g., buying a house, getting a job) were also related to lower levels of satisfaction. Results for each MLE will be discussed in line with additional qualitative data on single people's perceptions of change.

COPING STYLES AND COGNITIVE FUNCTION IN OLDER NON-HISPANIC BLACK AND WHITE ADULTS

Ji Hyun Lee, Ketlyne Sol, Afsara Zaheed, Emily Morris, Lindsey Meister, Jordan Palms, Alexa Martino, and Laura Zahodne, *University of Michigan, Ann Arbor, Michigan, United States*

Coping styles refer to cognitive and behavioral patterns used to manage the demands of stressors. This study aimed to characterize associations between coping styles and cognitive functioning across non-Hispanic Black and non-Hispanic White older adults. Cross-sectional data comes from the Michigan Cognitive Aging Project (N=457; 53% non-Hispanic Black). Coping styles are measured with COPE inventory. Global cognition was a composite of five cognitive domain factor scores derived from a comprehensive battery. Results show that Black older adults reported more emotion-focused coping than Whites, but there were no differences in problem-focused coping. Less emotion-focused and greater problem-focused coping were each more strongly associated with better global cognition among Black older adults, who showed disproportionately worse cognitive performance in the context of less adaptive coping. Coping style may be a particularly important psychosocial resource for cognitive health among Black older adults who may have less access to compensatory resources than Whites.

SOCIAL RESOURCES AND STRATIFIED EXPERIENCES OF ICT USE AND LONELINESS DURING THE COVID-19 PANDEMIC

Sungjae Hong, and Shannon Mejía, *University of Illinois at Urbana-Champaign, Champaign, Illinois, United States*

Limits to in-person social interaction increased the risk of loneliness during the Covid-19 pandemic. This study examines how gender and previous information communication technologies (ICT) experience could stratify how ICT-mediated social interactions related to loneliness during the COVID-19 pandemic. We employed National Health & Aging Trends Study data collected in 2018 and 2020-2021 (N=2,962; 27% age 85+; 57% women; 77% white) to examine how the email and video call use before and during the COVID-19 pandemic was associated with loneliness and how the degree of impact differed by gender and previous ICT experience. In total, 35% reported feeling lonely some days or more frequently during the COVID-19 pandemic. Preliminary analysis showed older adults using video calls during the COVID-19 pandemic were 1.24 times more likely to report loneliness. This association was stronger among men than women and those who did not use ICT preceding the pandemic than those who used.

DEPRESSION, SOCIAL RELATIONS, AND COGNITIVE HEALTH DURING THE COVID-19 PANDEMIC

Jasmine Cooper[1], Toni Antonucci[1], and Kristine Ajrouch[2], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Eastern Michigan University, Ypsilnati, Michigan, United States*

This study examines cognitive abilities, number of people in a social network, and presence of depressive symptoms among the "youngest old", "middle old", and "oldest old", by ethnicity. A sample of 600 people; 200 Blacks, 200 Whites, and 200 non-white Arabs were recruited for the survey. Those with missing data were omitted from analysis, which left 435. Data were collected via a computer assisted telephone survey. Data were analyzed using two-way ANOVAs. We found significant effects on cognition by ethnicity f(2,430)=2.71, p<0.05 and age group f(2,430)=11.24, p<0.001. There was a significant effect of the number of people in social networks on cognition across all groups f(2,430)=10.4, p<0.01. The presence of depressive symptoms was not a mediator. There was no significant interaction between ethnicity and age group, or ethnicity and social network structure.

SESSION 1250 (PAPER)

EDUCATION, CARE, AND WELL-BEING

In this sessions, various ways aging education in the classroom and beyond can be tailored to support care-focused activities to enhance well-being are discussed.

INFORMAL STUDENT CAREGIVERS: BALANCING CAREGIVING RESPONSIBILITIES AND ACHIEVING ACADEMIC SUCCESS

Gretchen Tucker[1], Dana Bradley[2], Roberto Millar[3], Claudia Thorne[4], and Christin Diehl[5], *1. University of Maryland, Baltimore, Columbia, Maryland, United States, 2. University of Maryland, Baltimore County, Baltimore, Maryland, United States, 3. The Hilltop Institute, Baltimore, Maryland, United States, 4. Coppin State University, Baltimore, Maryland, United States, 5. The Hilltop Institute, Baltimore, Maryland, United States*

According to the American Association for Retired Persons (AARP), there are five million student caregivers in the United States. Seven out of ten student caregivers say their caregiving roles affect their academic achievements. An informal (unpaid) student caregiver may provide care for a spouse, family member (excluding child care), friend, or neighbor. Student caregivers often encounter obstacles in balancing their caregiving responsibilities while trying to achieve academic success. The goal of this mixed method study is to understand the experiences of informal (unpaid) student caregivers. The aim of this study was to expand on a pilot study to increase our understanding of what challenges students face while being a caregiver and what resources are most helpful to reach their academic goals. The study was a mixed methods study consisting of a survey, which was sent to both undergraduate and graduate students, followed by one-on-one interviews with students who wanted to provide additional information about their experiences. Data was collected from two universities in the Baltimore metropolitan area, one of which is a designated historically black university and the other a minority serving university. We present findings from this research with a focus on identifying challenges and opportunities for universities to serve informal student caregivers from diverse backgrounds. More broadly, this research will contribute to the universities' understanding of student caregivers and help identify new resources to assist students in achieving their academic goals while being a caregiver.

INFUSION OF AGE-FRIENDLY PRINCIPLES INTO CURRICULA USING INTERACTIVE MODULES

Sherry Greenberg[1], Shayle Adrian[2], and Riad Twal[2], *1. Monmouth University, Marjorie K. Unterberg School of Nursing & Health Studies, West Long Branch, New Jersey, United States, 2. Seton Hall University, South Orange, New Jersey, United States*

This presentation highlights the development of Age-Friendly care interactive modules to prepare the future healthcare workforce to care for older adults in Age-Friendly Health Systems. To date, there is a gap in the educational preparation of nurses, advanced practice nurses, and other health professionals to work in Age-Friendly Health Systems upon entry into practice. This project, funded by a faculty innovation grant at Seton Hall University, provides undergraduate and graduate nursing and interprofessional students with the background knowledge to care for older adults in Age-Friendly Health Systems. The aim of this project was to develop five interactive modules to embed in undergraduate and graduate nursing and interprofessional curricula focusing on the provision of care to older adults using the evidence-based 4Ms Framework: What Matters, Medication, Mentation, and Mobility. Faculty collaborated with instructional designers in development of the modules using Articulate 360 to embed them in curricula. The first module focuses on the background of the Age-Friendly Health Systems movement, how health systems may become an Age-Friendly Health System, and the evidence for the 4Ms Framework. The second module focuses on assessment and act on strategies related to What Matters to older adults including advance care planning strategies. The third module covers crucial information related to Medication such as avoiding potentially inappropriate medications, deprescribing, and antibiotic stewardship. The fourth module focuses on Mentation and covers assessment and act on strategies for depression, delirium, and dementia. The fifth module focuses on Mobility such as promoting mobility and decreasing fall risk.

TEACHING MEDICAL STUDENTS TO INCORPORATE THE 4MS OF AGE-FRIENDLY HEALTH SYSTEMS ACROSS THE CONTINUUM OF CARE

Jennifer Severance[1], and Sarah Ross[2], *1. UNTHSC-TCOM, Fort Worth, Texas, United States, 2. University of North Texas Health Science Center, Fort Worth, Texas, United States*

High quality and equitable health care for older adults involves patient-centered approaches that can improve the patient's engagement, decision-making, and health outcomes. To educate future health professionals about patient-centered care across the continuum of care, a HRSA-Geriatric Workforce Enhancement Program created a four-week online elective course for third and fourth-year medical students using the Age-Friendly Health Systems 4Ms framework. Faculty identified geriatric tools and best practices in the 4M's areas of What Matters, Mobility, Mentation, and Medication to develop self-directed asynchronous learning modules. Students were instructed on incorporating the 4Ms into patient assessments, care planning, interprofessional practice, and process improvement in different settings of care. Assignments included quizzes, case studies, discussion forums, and a patient experience interview with an older adult or caregiver. At course completion, students self-assessed their knowledge and skills and rated the course materials and assignments using five-point Likert-type items. Ninety-six students participated in the course between July 2020 and March 2022. Ninety-eight percent of respondents (n=80) felt the assignments were helpful, and 100% agreed the course improved their knowledge about Age-Friendly Health Systems and different care settings and processes. Also, 100% felt the content was applicable to their future practice and 96% would recommend the course. Qualitative thematic analysis of open-ended questions showed preferences for interactive elements, such as case presentations and guided interviews with older adults, as well as ways to improve student engagement. Educating students about Age-Friendly Health Systems can prepare future health professionals for collaborative patient-centered geriatrics care across a variety of settings.

THE RESPONSIBLE DESIGNER: USING A HUMAN-CENTERED DESIGN APPROACH TO CREATE AN ASSISTIVE TECHNOLOGY FOR AD

Kimberly Mitchell, and Xiaopeng Zhao, *University of Tennessee, Knoxville, Tennessee, United States*

Our interdisciplinary team of designers, computer scientists, and engineers have begun the development of a low-cost social robot called FRED (the Friendly Robot to Ease Dementia). FRED has a conversational capability which will allow the device to be used as assistive companions for people with AD, engaging conversation, assisting with reminders, playing simple games and music, and relieving caregivers of some of their responsibilities. FRED was created using 3-d printing technology and a single board computer based on raspberry Pi. Interaction between human and the system was implemented using the Mycroft open-source voice assistant. The overall cost of the robot is estimated to be less than $300, rendering it possible for wide distribution among the public. Our presentation will share results from our participatory focus group which helped assist in the design and interactions of FRED. This human-centered design approach included neurologists, healthy older adults, as well as ADRD patients and their caregivers. A common language of important terms (e.g., feedback, interface, training, cognitive assessment) to aid in initial conversations were implemented. A thinking-aloud protocol was adopted once we had a prototype of FRED, where users were able to express freely any problems and/or concerns during interaction. Insights from the thinking-aloud results were used to improve the user interface design to enable the users and robot to interact and collaborate in an effective, natural way. Feedback from the focus group were carefully documented and the results will be shared during our presentation.

GERIATRIC PRACTICE LEADERSHIP INSTITUTE—AN INTERPROFESSIONAL TEAM APPROACH USING THE IHI AGE-FRIENDLY MODEL

Janice Knebl[1], Jennifer Severance[2], Sara Murphy[2], Kathlene Camp[2], James Roach[3], and Thomas Fairchild[4], *1. University of North Texas Health Science Center-TCOM, Fort Worth, Texas, United States, 2. UNTHSC-TCOM, Fort Worth, Texas, United States, 3. TCU - Neeley School of Business, Fort Worth, Texas, United States, 4. UNTHSC, Fort Worth, Texas, United States*

According to the Institute of Medicine, immediate steps must be taken to educate and train both the current and future health care workforce to work collaboratively in addressing the diverse needs of the growing older adult population.1 Most healthcare professionals had very little education or clinical training in the care of older adults nor the most effective ways to work as a clinical team. The Geriatric Practice Leadership Institute (GPLI) is a collaboration between two universities providing inter-professional teams of early and mid-career professionals the skills and knowledge needed to leverage leadership skills to effectively work within interdisciplinary teams to provide age-friendly care to older adults. The GPLI incorporates the Institute for Healthcare Improvement (IHI) Age-Friendly Health Systems 4Ms' Framework into the training. The GPLI is an on-line, team-based program which engages 5-7 teams each session. Module topics include Age-Friendly Health Systems, organizational culture, leading self, leading inter-professional teams, and quality improvement. Additionally, teams select and completes a quality improvement project based on the Age-Friendly Health Systems 4Ms and submits a final report and presentation. The teams are also assigned a coach for support. Continuing education credits and a micro-credential are available to participants. The GPLI has trained over 175 health care professionals during the past 7 years with teams representing ambulatory to emergency responder organizations. The GPLI has been funded by the Health Resources and Services Administration (HRSA) Geriatrics Workforce Enhancement Program grant (numberU1QHP2873), which currently covers all costs for participants.

SESSION 1260 (SYMPOSIUM)

ELECTIONS MATTER: AGING POLITICS AND POLICY IN THE BIDEN ERA

Chair: Edward Miller Co-Chair: Janelle Fassi Discussant: Marc Cohen

The 2020 election of Joe Biden to the presidency has shifted the foundations of the American political system after four years of conservative policy leadership. Combined with a slim Democratic majority in Congress, the policies, priorities, and proposals of the Biden administration have important ramifications for all spheres of American life. Nowhere is this clearer than with older Americans who disproportionately supported Donald Trump's reelection but are among those who benefit most with enactment of the Democratic party agenda. Between 2010 and 2050 the proportion of the U.S. population aged 65 years or older is projected to increase from 13% to 20%. Population aging creates opportunities and challenges for older adults, their families, and society in general. The Biden administration has chosen to meet these challenges, in part, by seeking to expand the social safety net. By contrast, the Trump administration largely supported Republican priorities to draw back on the federal government's commitment to programs intended to support an aging population. This panel examines aging politics and policy during the first two years of the Biden administration. It reports on older adults' voting patterns and the role of issue framing in limiting public support for proposals such as Medicare for All. It analyzes provisions in the American Rescue Plan Act and Build Back Better Bill to bolster formal care and services for older adults, as well as federal actions to support family caregivers. Edward Miller serves as panel chair; Janelle Fassi serves as co-chair and Marc Cohen as discussant.

ENHANCING FEDERAL REVENUE FOR HOME AND COMMUNITY-BASED SERVICES UNDER THE AMERICAN RESCUE PLAN ACT

Edward Miller[1], and Lisa Beauregard[2], *1. University of Massachusetts Boston, Boston, Massachusetts, United States, 2. Massachusetts Executive Office of Elder Affairs, Boston, Massachusetts, United States*

The American Rescue Plan Act (ARPA) includes a one year 10 percentage point increase in the Federal Medical

Assistance Percentage for Medicaid-funded home and community-based services (HCBS). The goal is to strengthen state efforts to help older adults and people with disabilities live safely in their homes and communities rather than in institutional settings during the COVID-19 pandemic. This presentation provides a detailed description and analysis of this provision, including issues state governments need to consider when expending the additional federal revenue provided. It also draws lessons from the Affordable Care Act's Balancing Incentive Program to suggest insights for the potential of ARPA to promote further growth in Medicaid HCBS programs. The presentation concludes by highlighting the importance of instituting strategies and processes for maximizing enhanced federal matching funds under ARPA in preparation for subsequent availability of substantial additional federal resources targeting Medicaid HCBS under other proposed initiatives.

WHAT WAS IMPORTANT TO OLDER VOTERS IN THE 2020 ELECTION? A LOOK AT COVID-19, MISINFORMATION, AND POLICY

Elizabeth Rickenbach[1], Janelle Fassi[2], and Kevin Doran[3], *1. St. Anselm College, Manchester, New Hampshire, United States, 2. University of Massachusetts Boston, Goffstown, New Hampshire, United States, 3. st. Anselm, Manchester, New Hampshire, United States*

High older voter turnout rates, a growing aging population, and organizations that serve the interests of older adults have historically contributed to the importance of older adults for elections. Since 2010 older voters have tended to vote Republican, with White older adults typically preferring Republican candidates, and Black and Hispanic older voters typically preferring Democratic candidates. In the 2020 election, the 65+ group of voters showed the same Republican candidate favorability but followed a slow downward trend from recent elections. Grounded in a demographic, economic, and generational context, and considering theory and research from gerontology, political science, psychology, and sociology, this presentation will explore older voter turnout and candidate choice in the 2020 presidential election. The focus will be on considering past trends and public polling data to examine three key issues in relation to the behavior of older voters in 2020: COVID-19, presidential candidate platforms, and misinformation and the media.

MEDICARE AND THE DYNAMICS OF US HEALTH REFORM POLITICS

Michael Gusmano[1], and Alan Monheit[2], *1. Leigh University, Bethlehem, Pennsylvania, United States, 2. Rutgers University School of Public Health, Piscataway, Massachusetts, United States*

Since the 2020 election, President Biden and Congressional Democrats have largely abandoned proposals for creating a "Medicare for All" system or adding a "public option" to the Affordable Care Act (ACA) marketplaces. This reflects a lack of sufficient enthusiasm, within the Congress or the public, for either option. These options are viewed by many current Medicare beneficiaries as a potential threat to their existing benefits. Indeed, framing the ACA and other efforts to expand insurance coverage as a threat to Medicare has become something that health reform opponents have done routinely since the 2010 midterm election. We will apply behavioral economics principles including loss aversion, hyperbolic discounting, and status quo bias, to explain why it has been easy to demonize reform options such as these. In addition to presenting data from public opinion polls, we will examine how Congressional and other party leaders have framed these choices for the public.

THE IMPLICATIONS OF THE BUILD BACK BETTER BILL FOR AGING HEALTH POLICY

Pamela Nadash, *University of Massachusetts Boston, Boston, Massachusetts, United States*

The Build Back Better Bill passed by the U.S. House of Representatives (HR 5376) included ambitious healthcare and long-term care provisions that would have greatly benefited older people, although the Bill itself represents a considerable scaling down of the Biden Administration's original proposals. This presentation reviews key provisions of the Bill that would impact older people: paid family and medical leave, efforts to strengthen the direct care workforce, and investments in home and community-based services. In addition, the Bill expanded Medicare coverage to include hearing, dental, and vision coverage, and expanded tax credits for the medical expenses associated with family caregiving. Although the House bill failed to make it through the Senate intact, some of the provisions are likely to have staying power. This presentation reviews the Bill's progress and assesses implications for future efforts to expand access to these benefits.

FEDERAL ACTIONS TO SUPPORT FAMILY CAREGIVERS UNDER THE BIDEN ADMINISTRATION

Eileen Tell, *ET Consulting, LLC, Belmont, Massachusetts, United States*

Family caregivers are the glue holding together the delivery and financing of long-term care. Replacing family care with paid care would cost roughly $470 billion each year. But family caregivers are struggling. They face many challenges – most notably the financial stress and the need for services and supports. Other challenges include lack of respite care, need for caregiver training, and lack of access to quality paid workforce. In order to address these challenges, Congress authorized the RAISE Family Caregiving Advisory Council. The RAISE (Recognize, Assist, Include, Support and Engage) Family Caregivers Act directs the Secretary of Health and Human Services to develop a national family caregiver strategy. This session presents the findings of two years of focus groups and interviews with family caregivers and hundreds of stakeholder organizations that support them, providing concrete input to the Biden administration on how to deliver on the broad objectives of the RAISE Act.

SESSION 1270 (SYMPOSIUM)

ENGAGING ADULTS LIVING WITH COMMUNICATION CHALLENGES IN RESEARCH: EXAMPLES AND PRACTICAL TIPS

Chair: Natalie Douglas Discussant: Roger O'Sullivan

This symposium contends that the engagement of older adults living with a variety of communication challenges in research about interventions designed to support them results in better translation and adoption of research findings. While engaging older adults in research often takes time, effort, and systematic tools, the benefits have been recognized by multiple stakeholders including policy makers, funding agencies, practitioners, older adults, and their families. Adults living with communication challenges may have difficulty expressing or comprehending language; however, that does not preclude their engagement in research activities, especially when this research involves interventions that concern them. This symposium will illustrate three exemplars of engaging adults living with communication challenges in research activities across international initiatives. First, qualitative data from 25 interviews from a project designed to engage persons living with stroke-based aphasia in friendship programming with be discussed. Then, mixed methods data from a community-based approach to support adults living with stroke-based aphasia, mild cognitive impairment, and traumatic brain injury will be described including the process of developing and using a multi-stakeholder advisory board. Finally, involving adults living with Frontotemporal Lobar Degeneration (FTLD) in research with a focus on building trust, staying connected between meetings, being transparent about expectations and applying a narrative approach will be described. Our discussion led by Dr. Roger O'Sullivan will focus specifically on the ethical implications of engaging adults living with communication challenges in research.

GENERIC AND TAILORED INTERVENTIONS FOR COMMUNITY OLDER ADULTS WITH CHRONIC COGNITIVE COMMUNICATION DISORDERS

Ladan Ghazi Saidi, *Universoty of Nebraska at Kearney, Kearney, Nebraska, United States*

Many Community-Dwelling Older Adults (CDOA) live with debilitating chronic cognitive and communication disorders including Aphasia, Mild Cognitive Impairment, and Traumatic Brain Injury, and no longer receive healthcare services. This portion of the symposium will discuss why engaging CDOA and their caregivers with developing and selecting interventions for their cognitive communication disorders is important. Further, we discuss a community-based approach to make generic as well as tailored speech-language pathology services available to CDOA free of charge. The process of developing and using a multi-stakeholder advisory board of clinicians, researchers, CDOA, as well as a diverse advisory board of caregivers will be described, and challenges will be discussed. Further, we will present and discuss some relevant data.

INVOLVING PEOPLE WITH A FRONTOTEMPORAL DEMENTIA DIAGNOSIS IN DEMENTIA RESEARCH

Martina Roes[1], Marie-Marleen Heppner[1], Sonja Teupen[2], Jan Oyebode[3], Claus Heislbetz[4], Vanaditz Goetz[5], Lara Pivodic[6], and Lauren Massimo[7], *1. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 2. German Center For Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 3. Bradford University, Bradford, England, United Kingdom, 4. Hans-Weinberger-Akademie der AWO e.V., Muenchen, Bayern, Germany, 5. Hans-Weinberger Akademie der AWO e.V., Muenchen, Bayern, Germany, 6. Vrije universiteit Brussel, Ixelles, Brussels Hoofdstedelijk Gewest, Belgium, 7. University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Frontotemporal Lobar Degeneration (FTLD) is a form of dementia that is characterized by prominent and gradual changes in behavior and language, whereas memory is relatively preserved (therefore different from Alzheimer dementia). In our FTD project we analyze care services for people with FTLD in Germany and we are working together with persons with FTLD and their partners as patient advisors. Our presentation will reflect on how we communicate (e.g. easy Language), how we communicate with the dyads (e.g. balance within the dyads), how we prepare for and engage during meetings as well as how this influences our research project. In summary, building trust and staying connected between meetings, being transparent about expectations and applying a narrative approach seems to be a way to successfully involve people with FTLD and their partners as advisors in dementia research.

FRIENDSHIP IN APHASIA

Natalie Douglas, *Central Michigan University, Mount Pleasant, Michigan, United States*

People living with aphasia (PLWA) have identified friendship as a key area of need, and any programs or interventions designed to support this priority should have the input of PLWA at the forefront. This portion of the symposium will outline steps that were taken to engage PLWA in the development of evidence-informed interventions and programming to support friendship for PLWA, despite the challenges PLWA face in communication. The process of developing and using a multi-stakeholder advisory board of clinicians, researchers, PLWA, and family members will be described. Data highlighting key themes from interviews of PLWA, their significant others, and their friends will be presented including reciprocity, persistence, and communication strategies. Finally, communication techniques to engage PLWA in research activities as informed by PLWA themselves, clinicians, and researchers will be provided.

SESSION 1280 (PAPER)

FALLS AND BALANCE RECOVERY

CHRONIC PAIN AND CIRCUMSTANCES OF FALLS IN COMMUNITY-LIVING OLDER ADULTS

Yurun Cai[1], Suzanne Leveille[2], Ling Shi[2], Ping Chen[2], and Tongjian You[2], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. University of Massachusetts Boston, Boston, Massachusetts, United States*

Chronic pain is a risk factor contributing to mobility impairment and falls in older adults. Little is known about the patterns of fall circumstances among older adults with pain. This prospective cohort study described frequencies of fall circumstances (i.e., location, activities, and self-reported causes of falls) and examined the relationship between chronic pain and fall circumstances among 765 community-dwelling older adults (mean age=78.1, 63.9% women) in the MOBILIZE Boston Study. Pain severity, fall occurrence, and fall circumstances were recorded using monthly calendar postcards and fall follow-up interviews during a 4-year follow-up. Descriptive analyses summarized frequencies of fall circumstances. Generalized estimating equation (GEE) models examined the relation between monthly pain ratings and circumstances of the first fall in the subsequent month. Among 1,829 falls, 965 (52.8%) falls occurred indoors and 804 (44.0%) falls occurred outdoors, 60 (3.2%) falls with missing location information. Commonly reported activities and causes of falls were walking (915, 50.0%), slips/trips (943, 51.6%), and inappropriate footwear (444, 24.3%). GEE models suggested that compared to fallers without pain, fallers with moderate-to-severe pain had around twice the likelihood of reporting indoor falls (adj. OR=1.93, 95%CI:1.32-2.83), falls in living/dining rooms (adj.OR=2.06, 95%CI:1.27-3.36), and falls due to health problems (adj.OR=2.08, 95%CI:1.16-3.74) or feeling dizzy/faint (adj.OR=2.10, 95%CI:1.08-4.11), but they were less likely to report falls while going down stairs (adj.OR=0.48, 95%CI:0.27-0.87) or falls due to slips/trips (adj.OR=0.67, 95%CI:0.47-0.95) in the subsequent month. Future studies may investigate whether better pain management and tailored fall prevention in elders with chronic pain could lead to fewer falls.

DOES PERTURBATION-BASED BALANCE TRAINING ON COMMERCIAL TREADMILLS IMPROVE BALANCE RECOVERY IN OLDER ADULTS?

Justin Whitten[1], Bryant Oleary[2], Dawn Tarabochia[2], and David Graham[2], *1. Montana State University, BOZEMAN, Montana, United States, 2. Montana State University, Bozeman, Montana, United States*

Background: Perturbation-based training (PBT) is a balance training method that causes a trip like event requiring a rapid step response to regain balance. There are numerous examples in the literature demonstrating the effectiveness of PBT but the need to use an expensive treadmill in a scientific laboratory limits the general applicability of PBT as a community-based intervention. A possible solution is to rapidly stop the treadmill belt during walking using the e-brake as the perturbation event. Importantly this could be performed on a commercially available, lower cost treadmill. Therefore, the purpose of this study was to evaluate the effectiveness of a commercial treadmill during PBT.

Methods: Seventeen participants completed either 9 weeks of PBT or conventional balance training based on ACSM guidelines. During an initial and final testing session participants balance recovery performance was evaluated. Participants were released from a forward static lean angle and asked to recover with a single step, during this test their movement was recorded and subsequently used to determine the Margin or Stability pre- and post-training. Participants were tracked for 6 months following the intervention and falls were recorded on a weekly basis. Results and Summary: There was no difference in balance recovery performance between groups following the training intervention and there was no difference in fall rate between groups in the 6-month follow-up period. We conclude that overall using the e-brake of a commercial treadmill is ineffective as a PBT strategy as it elicits no greater benefit than conventional exercise training.

PREVENTING FALLS WITH PERTURBATION-BASED BALANCE TRAINING: HOW LARGE ARE THE HIP JOINT CONTACT LOADS, AND ARE THEY SAFE?

David Graham[1], Justin Whitten[2], Bryant Oleary[1], Rod Barrett[3], and Dawn Tarabochia[1], *1. Montana State University, Bozeman, Montana, United States, 2. Montana State University, BOZEMAN, Montana, United States, 3. Griffith University, Gold Coast, Queensland, Australia*

Perturbation-based training (PBT) is a balance training method presenting a high-challenge to balance which is extremely effective when compared to conventional training approaches. Common PBT methods use rapid treadmill belt translations with varying numbers of perturbations (20-1400 perturbations over 1-8wks). Importantly, the joint loads experienced during a stumble may be high enough to feasibly fracture bone (up to 12.7 Body Weights). However, the contact loads experienced during PBT are unknown. Because of increasing the prevalence of PBT it is necessary to specifically evaluate the range of joint loads experienced during PBT. Twelve participants completed a single PBT session of 24 perturbations. During both training and testing, participants movements were measured using a motion capture system which tracks body movements and records the forces under the feet. Hip joint contact loads were determined using Computational Musculoskeletal Modelling utilizing open-source software OpenSim. These techniques estimate the magnitude and pattern of force development of individual muscles and subsequently estimate the internal loads experienced by the hip joint.Hip joint contact loads were 4.90 ± 1.27 BW which is substantially lower that those previously reported by Graham et al. (2016) and Bergman et al. (2004) and is lower than the 5.5BW spontaneous fracture load boundary estimated by Schileo et al. (2014). Comparing the initial perturbation to the final perturbation revealed a 22% reduction in contact loads. We conclude that PBT performed using rapid translations on a treadmill are likely safe but suggest caution for individuals with poor bone mineral density or reduced neuromuscular function.

PREVIOUS FALLS AND FEAR OF FALLING ON FUNCTIONAL LIMITATIONS: A LONGITUDINAL STUDY

Kehan Liu[1], Wenting Peng[1], Christina Miyawaki[2], Chunxiao Li[1], Yu Zheng[1], Siyuan Tang[1], and Minhui Liu[1], *1. Central South University, Changsha, Hunan, China (People's Republic), 2. University of Houston, Houston, Texas, United States*

Previous falls and fear of falling (FoF) are risk factors that affect older adults' daily activities. However, it remains unclear about their combined effects on functional limitations. Using Round 1 (R1) and Round 2 (R2) data from the National Health and Aging Trends Study, we examined whether falls and FoF in R1 independently and jointly predict functional limitations in R2 and the moderating role of demographic factors in this relationship among community-dwelling older adults aged 65 years and older. Previous falls and FoF were ascertained by asking participants whether they had fallen down in the last year and worried about falling in the last month. Functional limitations included any difficulties with mobility, self-care, or household activities. Poisson regression models were used to analyze data. Of 5,956 participants, 16.4% had falls only, 14.3% had FoF only, 14.5% had both, and 54.8% had neither. In the full adjusted model, those who experienced concurrent falls and FoF had a higher risk of functional limitations than those without falls and FoF (Mobility: Incidence risk ratio, IRR=1.44, 95% CI: 1.33-1.57; Self-care: IRR=1.29, 95% CI: 1.20-1.38; Household tasks: IRR=1.32, 95% CI: 1.21-1.44), as well as those with falls only (Mobility: IRR=1.32, 95% CI: 1.21-1.44; Self-care: IRR=1.26, 95% CI: 1.17-1.35; Household tasks: IRR=1.18, 95% CI: 1.08-1.29) and FoF only (Mobility: IRR=1.38, 95% CI: 1.27-1.51; Self-care: IRR=1.26, 95% CI: 1.17-1.35; Household tasks: IRR=1.31, 95% CI: 1.20-1.43). The findings suggest that strategies to improve falls and FoF together could potentially help prevent functional limitations.

THE VALUE OF BALANCE CONFIDENCE IN OLDER ADULT FALL RISK ASSESSMENT

Tiffany Hughes[1], Edmund Ickert[2], Garrett Kellar[2], Lucy Kerns[2], and Cara Berg-Carramusa[2], *1. Youngstown State University, Beaver, Pennsylvania, United States, 2. Youngstown State University, Youngstown, Ohio, United States*

Fall risk assessment traditionally focuses on objective physical performance. Balance confidence, a subjective measure of physical function, may provide important information to better predict fall risk and guide assessment and intervention strategies. This study examines the associations of balance confidence congruency with physical performance measures and fall occurrence. One-hundred-fifty-five community-dwelling adults aged 60 and over completed a comprehensive fall risk assessment including physical performance tests (timed up and go, 4-stage balance, 30-second chair stand, and 4-M gait speed), activities-specific balance confidence (ABC) scale, and self-reported falls in the past year. Four groups were created based on congruency between balance confidence (low vs. high) and each physical performance measure or overall fall risk category (at fall risk vs. not at fall risk, based on the STEADI tool kit). Poison regression analyses, adjusted for age and gender, tested the association between group membership and number of falls in the past year. Participants with high balance confidence and at fall risk based on 4-stage balance performance (Estimate=0.88, $p < 0.001$), or high balance confidence and at fall risk following the STEADI screening algorithm (Estimate=0.69, $p = 0.003$) were at increased risk of more falls compared to participants in the group with high balance confidence and not at fall risk. These results suggest that older adults who overestimate their balance relative to their physical performance may be at increased fall risk, and that participant subjective reporting of physical performance should be paired with objective physical performance measures to better identify older adults at fall risk.

SESSION 1290 (SYMPOSIUM)

GENERATIONAL TRANSMISSION OF SOCIAL RELATIONS: FINDINGS FROM MULTIPLE US LONGITUDINAL STUDIES

Chair: Rita Hu Co-Chair: Toni Antonucci Discussant: Shevaun Neupert

This symposium provides diverse findings documenting the long reach of social relations over generations. Ali and Rohner examine data from 41 adult offspring showing that recalled perception of rejection of parents during childhood are associated with fewer positive caregiving behaviors and social interactions with their now aging parents. Using three waves of longitudinal data over 23 years, Manalel, Cleary & Antonucci examine changes in composition, proximity, and contact frequency in social relations among 193 participants who were 8-12 years old at wave 1 (1992). Findings indicate increased diversity from wave 1 to 2 and increased stability from Wave 2 to 3, reflecting normative life transitions. Gender and race differences were also evident. Suitor, Gilligan, Frase & Stepniak examine 725 adult (aged 30-60) children's experience of their mother's advice concerning experienced depression and whether these differ by race, age, and gender. While there were no age differences, men, regardless of race and black daughters receiving advice had higher levels of depression but this had little effect white daughters. Finally, Hu and Antonucci use the Social Relations Study to examine the longitudinal association between social ties and self-esteem. They examined 553 people who were 13-77 at Wave 1 in 1992. Findings indicate that network closeness matters with increases in weak and close, but not closest network size related to increase in self-esteem 23 years later. In sum, this symposium offers multiple and diverse perspectives of generations in social relations and their association with well-being over the life span.

THE LONGITUDINAL ASSOCIATIONS BETWEEN SOCIAL NETWORK STRUCTURE AND SELF-ESTEEM

Rita Hu, and Toni Antonucci, *University of Michigan, Ann Arbor, Michigan, United States*

Based on the convoy model of social relations, the current study used Latent Growth Curve Modeling to examine the associations between overall network, closest, close and weak social tie trajectories across the lifespan and self-esteem later in life. Participants (N = 553) aged 13 to 77 in Wave 1 (1992) were surveyed again in 2005 (Wave 2) and 2015 (Wave 3). The overall network size increased significantly across the lifespan ($\beta = 0.56$, SE = 0.01, $p < 0.001$). The closet tie size trajectories were not significantly associated with self-esteem 23 years later. The growth of the close tie size was not significantly associated with self-esteem later. Weak-tie size growth was also significantly associated with higher self-esteem later ($\beta = 0.14$, SE = 0.00, $p < 0.05$). The findings highlight social network's effects on self-esteem across the lifespan, as well as the critical role weak social ties play in development.

AS YOU SOW, SO SHALL YOU REAP: ADULTS' MEMORIES' EFFECT OF PARENTAL ACCEPTANCE REJECTION IN CHILDHOOD ON AGING PARENTS

Sumbleen Ali, and Ronald Rohner, *University of Connecticut, Storrs, Connecticut, United States*

Little is known how adults' memories of parental acceptance-rejection in childhood influence their behavior toward their aging parents. Grounded in interpersonal acceptance-rejection theory (IPARTheory), this study attempts to better understand how early parent-child relationships affect adult offspring who provide care to their parents in later life. Data were collected from 41 adult offspring. Findings revealed that adults who felt rejected by their parents in childhood reported fewer positive caregiving behaviors toward their now aging parents, were less satisfied with social activities with their parents, spent less time with them or visited them less frequently, and revealed less overall concern for their aging parents. Results were consistent with IPARTheory's expectations that if parents reject their children, then parents place their own dependent old age at the risk of counter rejection: As you sow, so shall you reap. Such findings may help researchers, clinicians, and practitioners better understand the well-being of aging adults.

DEVELOPMENT OF SOCIAL CONVOYS: TRAJECTORIES OF CONVOY STRUCTURE AND COMPOSITION FROM CHILDHOOD THROUGH ADULTHOOD

Jasmine Manalel[1], Jennifer Cleary[2], and Toni Antonucci[2], *1. Hunter College, New York, New York, United States, 2. University of Michigan, Ann Arbor, Michigan, United States*

This study examines stability and change in social convoys from childhood to adulthood and variation in trajectories of convoy characteristics by gender and race. Multilevel models for convoy structure and composition were estimated using longitudinal data spanning 23 years. Respondents included a sample of 193 children aged 8 to 12 in Wave 1 (1992) who were surveyed again in their 20s (Wave 2) and 30s (Wave 3). Changes in composition, proximity, and contact frequency were observed at each wave. Between Waves 1 and 2, changes reflected age-normative trends toward network diversification typical of the transition to adulthood. Between Waves 2 and 3, changes were consistent with those expected as young adults settle into stable roles. We also identified convoy characteristics that differed between men and women and between Black and White individuals, emphasizing the importance of personal characteristics to fully understand form and function of social relations across the lifespan.

"DID I ASK FOR YOUR ADVICE?": EFFECTS OF ADVICE FROM PARENTS ON ADULT CHILDREN'S DEPRESSIVE SYMPTOMS

J Jill Suitor[1], Megan Gilligan[2], Robert Frase[1], and Catherine Stepniak[1], *1. Purdue University, West Lafayette, Indiana, United States, 2. Iowa State University, Ames, Iowa, United States*

Studies of intergenerational relations typically conceptualize advice as a positive dimension of exchanges between parents and adult children. In contrast, we suggest that advice may often be a source of interpersonal stress and thus have detrimental effects on psychological well-being. Further, we suggest that these effects vary by race and gender. To address these questions, we use data from 725 adult children regarding advice from mothers, collected as part of the Within-Family Differences Study. Multilevel regression analyses revealed that the impact of receiving advice varied by the combination of gender and race. Among sons, receiving advice predicted higher depressive symptoms, regardless of race. However, receiving advice predicted depressive symptoms among Black but not White daughters. Taken together, these findings question whether advice is a positive dimension of intergenerational interaction and suggest that mothers' advice may have a negative impact on adult children's depressive symptoms, particularly for sons and Black daughters.

SESSION 1300 (SYMPOSIUM)

GRAY DIVORCE: AN INCREASINGLY COMMON PATH TO UNCOUPLING IN LATER LIFE

Chair: Torbjörn Bildtgård

Late life divorce is rapidly increasing in large parts of the Western world, in what has been described as a "gray divorce revolution". In the US the incidence of gray divorce doubled between 1990 and 2010, in Sweden it has more than doubled since the millennium and in Israel it has almost doubled since 1996. Still, gray divorce remains rather invisible both in family sociology, which mainly focuses divorce at earlier ages, and in gerontology, which still tends to view widowhood as the single path to late life uncoupling. This symposium introduces current research on gray divorce and addresses a range of questions, such as: Why do people divorce late in life? How does gray divorce affect later life, including economy, health, support networks and relationships to adult children? How do cultural values shape gray divorce? What is the difference between his and her gray divorce? The presenters represent different countries (the US, Israel and Sweden) and approach the topic of gray divorce with both quantitative and qualitative data.

THE EXISTENTIAL CONTEXT OF GRAY DIVORCE

Torbjörn Bildtgård[1], and Peter Öberg[2], *1. Stockholms University, Stockholm, Stockholms Lan, Sweden, 2. University of Gävle, Gävle, Gavleborgs Lan, Sweden*

In later years divorce rates for older people has increased in many parts of the Western world in what has been described as a "grey divorce revolution". In Sweden divorce rates for people 60+ have more than doubled since the millennium. The purpose of this paper is to study the reasons older people attribute to their late life divorce. Qualitative interviews were carried out with Swedish men and women aged 62–82 who after the age of 60 had divorced from a cross-gender marital or non-marital cohabiting union (n=37). The interviews covered themes regarding the divorce process, including reasons for divorce, experiences of divorce and life as a grey divorcee. The results were analysed using principles from Grounded Theory. The results revealed four different types of divorce narratives: 1) Incompatible goals for the third age, 2) Personality change caused by age related disease, 3) A last chance for romance, and 4) Enough of inequality and abuse. A central insight generated by the study was the importance attributed to the particular existential conditions of later life in the divorce decisions. The results are discussed in relation to theories of the third age as a time of self-fulfillment, where the partner can either be part of or an obstacle to that project.

THE DAWN OF A SOCIETY OF DIVORCEES: CHANGING PATTERNS OF LATE LIFE CIVIL STATUS

Peter Öberg[1], and Torbjörn Bildtgård[2], *1. University of Gävle, Gävle, Gavleborgs Lan, Sweden, 2. Stockholms University, Stockholm, Stockholms Lan, Sweden*

Half a century ago Lopata used the concept "society of widows" to describe the gendered reality of late life singlehood, where widowed women were excluded from coupled social life, depended on a community of other widows for social integration, and refrained from initiating new relationships due to "sanctification" of their former husbands. We use Swedish, American and EU census data 1970-2020 and a national survey to Swedes 60-90 years old (n=1225; response rate 42%) to illustrate a substantial change in the demographic landscape of late life civil status. More people enter later life as divorcees or become divorced at a high age. Among Swedes 60+ divorcees outnumber widowed people, and the incidence of late life divorce has more than doubled since the millennium in what has been called the "grey divorce revolution". Many other Western countries follow the same demographic trend, posing important questions about the transformation of unmarried later life. We conclude by proposing the concept "society of divorcees" for this new demographic landscape of late life singlehood, argue that research is needed to capture this new reality, and discuss the implications of this change for access to social support later life.

ADULT CHILD PROXIMITY AND REPARTNERING AMONG PARENTS AFTER GRAY DIVORCE

Susan Brown, I-Fen Lin, and Kagan Mellencamp, *Bowling Green State University, Bowling Green, Ohio, United States*

The rise in gray divorce is spurring growth in repartnering, which occurs more frequently after divorce than widowhood. Roughly 40% of men and 25% of women form a co-residential union following gray divorce. Drawing on the 1998-2014 Health and Retirement Study, we assessed whether parent-adult child proximity (living within 10 miles) was associated with men's and women's repartnering after gray divorce. Men's relationships with their children tend to erode following gray divorce, and thus we anticipated that the association between proximity and repartnering was negligible. In contrast, women's ties to adult children are largely resilient following gray divorce, which led us to expect that having a child nearby reduced chances of repartnering. Our analyses revealed that both men and women with a proximate child less often repartnered than those with no children nearby. Repartnering seemingly functions as an alternative means to "doing family" for those lacking nearby children.

THE MEANING OF FAMILYHOOD FOR GRAY DIVORCE IN ISRAEL

Chaya Koren[1], Yafit Cohen[2], Naor Demeter[2], and Michal Egert[2], *1. University of Haifa, Haifa, Hefa, Israel, 2. School of Social Work University of Haifa, Haifa, Hefa, Israel*

Israel is a society that values familyhood alongside self-determination. Gray divorce rates in Israel are low, yet they have nearly doubled since 1996 from 2% to 3.65%. Little is known about grey divorce in modern societies and even less in societies located between tradition and modernity such as Israel. Deriving from data analysis, our aim is to present the meaning of familyhood for gray divorce in Israel from the experiences of individuals and couples who divorced at age 60+ and their adult children, using a life course perspective. 72 in-depth qualitative interviews were audio recorded and transcribed verbatim with divorced men, women, and their adult children, analyzed as individuals, dyads, and family units based on principles of dyadic interview analysis. Findings include three themes: (a) The value of familyhood as a divorce delay. (b) Between couplehood dissolution and familyhood preservation. (c) Gray divorce shaping a new familyhood. Implications are discussed.

RELIEF, REGRETS, AND REINVENTION: LIFE AFTER GRAY DIVORCE

Jacquelyn Benson[1], Landon Olivia[2], Allison Donehower[2], and Caroline Sanner[3], *1. Washington University in St. Louis, Columbia, Missouri, United States, 2. University of Missouri, Columbia, Missouri, United States, 3. Virginia Tech, Blacksburg, Virginia, United States*

"Gray divorce," or divorce which occurs in later life, is rapidly becoming more common in the United States. The purpose of this grounded theory study was to examine the lived experience of getting divorced in mid to later life. Data address the following research questions: 1) What are the divorcees' expectations for the process of divorce and post-divorce life? 2) How do life phase factors and family relationships shape the divorce experience? Participants included 41 heterosexual men and women who legally divorced at the age of 55 or older and between 1-7 years from the time of the interview. Participants divorced from first and higher order marital unions. They included self-identified initiators, non-initiators, and co-initiators of the divorce. Results suggest that gray divorce is a complex experience marked by shifting feelings of ambivalence and certainty that are influenced by such factors as health and social networks, especially family.

SESSION 1310 (PAPER)

HOSPICE AND MEDICAL AID IN DYING PRACTICES: EXAMPLES FROM STATES AND NATIONALLY

A NATIONWIDE EXAMINATION OF MEDICARE PART B UTILIZATION DURING HOSPICE ELECTION

Thomas Christian[1], and Michael Plotzke[2], *1. Abt Associates, Cambridge, Massachusetts, United States, 2. Abt Associates, Saint Louis, Missouri, United States*

This research characterizes trends in two hospice-specific modifiers: (1) "GV" indicating services for the terminal/related conditions by an attending physician not an employee of the hospice and (2) "GW" indicating physician services unrelated to terminal/related conditions. We identified Part B (carrier/physician supplier) claims during hospice elections in Federal Fiscal Year (FY)2020, and replicated an Office of Inspector General (OIG) approach calculating potentially "questionable" Part B claims, where the physician and diagnosis codes match between the hospice and Part B claims (without a GW modifier listed). Using logistic regression, we calculated adjusted odds ratio (AOR) and 95% confidence intervals (CI) to characterize this billing. Overall, $372.8 million in physician services occurred during hospice elections in FY2020. Of this, two-thirds ($247.8 million) included a GW modifier, one-quarter ($86.5 million) a GV modifier, $2.2 million both modifiers, and $40.8 million neither modifier. Replicating the OIG methodology, we calculated $19.4 million (5.2%) as "questionable". Beneficiaries electing hospice for 180+ days were three times more likely (95% CI 2.99-3.12) to have questionable billing as a beneficiary electing hospice 14-29 days, and facility residents were more likely to have questionable billing, relative to beneficiaries in their own homes. Questionable billing rates were also highest in the northeastern quadrant of the country. Lastly, we found ten percent of physicians accounted for almost three-quarters of all questionable billing. CMS should further monitor physician services during hospice to maintain the integrity of the benefit and ensure beneficiaries receive adequate care.

AN EXAMINATION OF MEDICATION UTILIZATION DURING MEDICARE HOSPICE ELECTION: A NATIONAL STUDY

Thomas Christian[1], and Michael Plotzke[2], *1. Abt Associates, Cambridge, Massachusetts, United States, 2. Abt Associates, Saint Louis, Missouri, United States*

In addition to drugs received through the Medicare hospice benefit, each year Medicare hospice beneficiaries receive nearly $700 million in medications through Medicare Part D. Little is known about the nature of these medications. To explore this issue, we identified all beneficiaries who were enrolled in Part D and elected hospice during Calendar Year (CY) 2020. We cross-walked hospice dates of service to Part D medication fill dates. We also collected information on drugs hospices themselves provided and voluntarily reported on hospice claims. Nationally, 1.2 million out of 1.8 million beneficiaries had some drugs provided, through hospice alone (406,423), Part D alone (412,810), and also from both sources (348,659). Medications from Part D tended to be more expensive, upwards of $40 per fill, compared to medications from hospices, which were about $15 per fill or less. Moreover, we found that 98,561 of beneficiaries (8.4%) received the exact same drug from both sources. Across diagnoses, the daily rates of pre-hospice Part D utilization were nearly identical to Part D utilization after electing hospice, and there was no relation to prior Part D use and hospice election duration. Categorically, the greatest amount of Part D expenditures during hospice are for diabetic therapies ($100.2 million), followed by anticoagulants ($97.8 million) and bronchodilators ($57.2 million). CMS should continue to monitor the provision of medications during hospice to maintain the integrity of the benefit and to ensure beneficiaries receive adequate care.

CHALLENGES ASSOCIATED WITH AND LESSONS LEARNED FROM AGGREGATING MEDICAL AID IN DYING DATA IN THE UNITED STATES

Molly Nowels, and Elissa Kozlov, *Rutgers School of Public Health, Piscataway, New Jersey, United States*

Nine U.S. jurisdictions have legal Medical Aid in Dying (MAID) and produce publicly available data on the use of MAID. We performed a retrospective observational cohort study of MAID data from Oregon, Washington, California, Colorado, Washington DC, Vermont, Hawaii, New Jersey, and Maine. We investigated the total number of deaths from self-administered lethal medications, number of prescriptions for MAID written, characteristics of MAID users and requesters, and challenges of aggregating these data. Over the last 22 years of publicly available data from all states or jurisdictions that have legalized MAID, demographics data was collected for 1,949 people who died by MAID. Persons using MAID were more likely to be non-Hispanic white (95.6%), have some college education (72.2% vs. 26.2%) and a cancer diagnosis (74.0% cancer, 10.9% neurological illness, 15.1% other). Patients who died from MAID prescription ingestion were more likely to have insurance (88.9% insured vs 11.1% uninsured or unknown). Aggregating data came with multiple challenges including states collecting data on different populations (deaths vs prescriptions), with different variable categories, and for different time intervals for reports. More research is needed to better understand why MAID is currently being accessed by an overwhelmingly white, educated, and insured population. This research also highlighted the need for a national research agenda on Medical Aid in Dying. As more states plan to adopt MAID legislation, having standardized data collection elements will help to elucidate how these policies are being implemented and accessed.

HOSPICE UTILIZATION AMONG MEDICAID-ONLY AND DUALLY ELIGIBLE DECEDENTS IN CONNECTICUT

Julie Robison[1], Deborah Migneault[2], Noreen Shugrue[3], Doreek Charles[3], Bradley Richards[4], Dorothy Wakefield[3], Ellis Dillon[3], and Dawn Lambert[4], *1. UConn Health, Center on Aging, Farmington, Connecticut, United States, 2. UCONN Health, Farmington, Connecticut, United States, 3. University of Connecticut, Farmington, Connecticut, United States, 4. State of Connecticut, Hartford, Connecticut, United States*

Individuals with Medicaid as their health care payer source may be either "Medicaid-only," or "dually eligible," i.e., qualifying for both Medicaid and Medicare. Medicare included hospice as a full Medicare benefit in 1982; Hospice is an optional Medicaid benefit for states; Connecticut added the Medicaid hospice benefit in 2010. This study explores hospice use in Connecticut's Medicaid program by comparing hospice use and length of hospice enrollment by Medicaid-only vs. dually eligible and by diagnosis for decedents who died between 2017 and 2020 and had a hospice-appropriate diagnosis. This analysis of 2,990 Medicaid-only and 24,881 dually eligible decedents finds that dually eligible decedents had a significantly (p<.001) higher rate of hospice use (48.1%) compared to Medicaid-only decedents (29.9%). Medicaid-only decedents received hospice for a median of 12 days vs. 13 days for the dually eligible (p=.12). Dually eligible decedents consistently received hospice more often than Medicaid-only decedents across all diagnoses (cancer (p<.05) circulatory (p<.001), dementia (p<.001), respiratory (p<.001) and stroke (p<.001)). Dually eligible decedents had significantly more days of hospice than Medicaid-only decedents for subgroups with a circulatory (p<.05) or stroke (p<.05) diagnosis, but Medicaid-only decedents with a dementia diagnosis had more days of hospice than their dually-eligible counterparts. Additional multi-variate analysis will demonstrate how other factors, like age, may account for differences. Recommendations include encouraging physician use of hospice screening tools and developing education interventions with physicians and patients to increase understanding of the availability and benefits of hospice with particular focus on Medicaid-only patients.

RURAL HOSPICE SOCIAL WORK: SUPPORTING PRACTITIONERS IN END-OF-LIFE WORK WITH LIMITED RESOURCES

Brandi Felderhoff[1], Angela Alvarado[2], and Valerie Alvarez[3], *1. Texas Woman's University, Denton, Texas, United States, 2. Kindred at Home, Hospice Division, Dallas, Texas, United States, 3. Perimeter Behavioral Hospital, Arlington, Texas, United States*

Rural areas and the agencies, including hospice, that serve them face immense challenges in terms of accessibility, and service delivery. Small hospices face an enigmatic combination of higher operating costs and lower reimbursement payments, forcing higher caseloads on staff, and straining already limited available resources. Multiple cost benefit studies indicate that Medicare hospice reimbursement rules are well suited to the expense structure of large volume hospices, usually in urban, population dense areas; however, it is not clear that they apply as abundantly to smaller volume, rural hospices. This study sought to garner a deeper understanding of the roles and challenges required for rural hospice social work practice. Individual interviews with 9 rural hospice social workers across organizations in Texas and New Mexico were conducted. A maximum variation sampling technique was used to purposefully sample social workers from hospice agencies in areas deemed as rural by the Association of Rural Communities in Texas, with fewer than 200,000 occupants in their counties. Using emergent thematic analysis, key themes materialized including the challenge of dual relationships, required tasks beyond the scope of practice, issues of autonomy, and meeting them (patients/families) where they are at. Results demonstrate the complexities of rural hospice social work practice, the culture of rural communities, and the need for research into evidence-based intervention strategies specific to rural hospice social work, that will guide practitioners through navigating these challenging conditions.

SESSION 1320 (SYMPOSIUM)

EXPERIENCES OF LESBIAN, GAY, BISEXUAL, TRANSGENDER, AND/OR QUEER (LGBTQ) OLDER ADULTS WITH SERVICE PROVIDERS

Chair: Rajean Moone Co-Chair: Barbara Gordon
Discussant: Rajean Moone

Many lesbian, gay, bisexual, transgender, and/or queer (LGBTQ) older adults have experienced a lifetime of oppression and discrimination that often results in significant health, economic, and social disparities in comparison to their peers. Historically labeled as illegal, immoral, and/or sick, LGBTQ older adults often fear, hide, and distrust health care and other social services providers. This symposium will highlight contemporary research on the experiences and perceptions of LGBTQ older adults in relation to service providers. The first presentation will contextual factors that influence the healthcare utilization of LGBTQ middle-aged and older adults. The second presentation will explore older adult couples' experiences of minority stress with service providers and effects on their relationships. The third presentation will explore explore the beliefs, experiences, and needs related to housing and housing discrimination in LGBTQ older adults living in coastal North Carolina. The fourth presentation will explore panel data of older LGBTQ adults residing in the U.S South and examine the effects of access to an LGBTQ affirming provider on health service utilization and aging outcomes.. The final presentation will explore the association between increased awareness, understanding, and belief in the Undetectable equals Unstransmittable campaign and having an LGBTQ affirming care provider. The symposium will conclude with a discussion on policy and practice impacts for aging services and health care providers.

EXPLORING HOUSING AND HOUSING DISCRIMINATION FOR LGBT OLDER ADULTS IN COASTAL NORTH CAROLINA

Noell Rowan[1], and Haley Norris[2], *1. University of North Carolina Wilmington, Wilmington, North Carolina, United States, 2. Liberty Senior Living, Wilmington, North Carolina, United States*

This study explored the beliefs, experiences, and needs related to housing and housing discrimination in LGBT older adults living in coastal North Carolina. Surveys were administered to staff (N = 138) of various types of older adult living communities (including long term care, public housing, and specific units of care including memory care and skilled nursing) to understand the status of discrimination, any integrative activities and human diversity/cultural sensitivity training offerings for staff. Findings indicate that nearly 80% of the participants received no training in the specific needs of LGBT communities and less than 10% provided inclusionary marketing/advertisement. No prior studies to date have been conducted on housing needs or discrimination of LGBT older adults within this coastal region. Implications include extensive need for cultural sensitivity education to plan for and improve housing experiences for LGBT older adults.

LGBTQ+ AFFIRMING CARE AND UNDETECTABLE=UNTRANSMITTABLE: EVIDENCE FOR OLDER GAY AND BISEXUAL MEN IN THE US SOUTH

Ellesse-Roselee Akre (she/her)[1], Tara McKay[2], Jeff Henne[3], Adam Conway[2], Isabel Gothelf[2], and Nitya Kari[2], *1. Geisel School of Medicine at Dartmouth, Lebanon, New Hampshire, United States, 2. Vanderbilt University, Nashville, Tennessee, United States, 3. The Henne Group, San francisco, California, United States*

One of the most significant innovations in HIV prevention is the use of HIV treatment to prevent HIV transmission. This information has been disseminated as the "Undetecta ble = Untransmittable" (U=U) message. Despite evidence of effectiveness, U=U awareness, belief, and understanding remain limited in some communities. In this study we examine whether having an LGBTQ affirming healthcare provider increases U=U awareness, belief, and understanding among midlife and older gay and bisexual men in the US South, an understudied and underserved population and region where new HIV infections are increasing. We use data from the Vanderbilt University Social Networks Aging and Policy Study (VUSNAPS) on sexual minority men aged 50 to 76 from four Southern US states collected in 2020-2021. We find that only one in four men report prior awareness of U=U, but awareness is higher among HIV-negative and HIV-positive men who have an LGBTQ-affirming provider. Having an affirming provider significantly increases U=U belief and understanding, improves risk perception accuracy, and increases the likelihood of having ever tested for HIV among HIV-negative men. Improving access to LGBTQ affirming healthcare may improve U=U awareness, belief, and understanding, which could help to curb HIV transmission in the US South.

LGBTQ+ OLDER ADULT COUPLES' EXPERIENCES OF MINORITY STRESS BY SERVICE PROVIDERS

Sara Bybee[1], Kristin Cloyes[2], Kathi Mooney[3], Katherine Supiano[1], Brian Baucom[4], and Lee Ellington[5], *1. University of Utah, Salt Lake City, Utah, United States, 2. Oregon Health & Science University, Portland, Oregon, United States, 3. University of Utah College of Nursing, Salt Lake City, Utah, United States, 4. University of Utah Department of Psychology, Salt Lake City, Utah, United States, 5. University of Utah and Huntsman Cancer Institute, Salt Lake City, Utah, United States*

This study explored LGBTQ+ older adult couples' experiences of minority stress with service providers and effects on their relationships. Twelve LGBTQ+ cancer patient-partner couples (N = 24) completed surveys assessing demographics, stress, and health, and participated in dyadic semi-structured interviews. Descriptive statistics summarized demographic characteristics. Interview data were content analyzed to identify sources of minority stress. Participants were aged 50.9 years on average (SD = 9.9, R =32-70), mostly white (21, 87.5%), and had been together for 19.1 years (SD = 9.9, R = 9-44). Common minority stress sources included derogatory language, belittling comments, heteronormativity, and cisnormativity in routine healthcare, cancer care, and legal services. Couples attributed relationship strength and durability as mitigating negative effects of stress; they described feeling closer, stronger, and more confident in their relationships. Some couples denied experiences of minority stress by service providers and these couples ascribed their equitable care to their geographic location.

EFFECTS OF DISCRIMINATION/VICTIMIZATION ON HEALTHCARE UTILIZATION VIA HEALTHCARE BARRIERS

Krystal Kittle[1], Kyungmin Kim[2], Karen Fredriksen Goldsen[3], and Kathrin Boerner[4], *1. University of Nevada Las Vegas, Las Vegas, Nevada, United States, 2. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea, 3. University of Washington, Seattle, Washington, United States, 4. University of Massachusetts Boston, Boston, Massachusetts, United States*

Aging lesbian, gay, bisexual, and transgender (LGBT) adults are a health disparate population with unique healthcare challenges. Using data from the Aging with Pride: National Health, Aging, Sexuality/Gender Study (NHAS; N = 2,560), we examined contextual factors that influence the healthcare utilization of LGBT middle-aged and older adults. Causal indirect, direct, and total causal effects based on counterfactuals were computed to assess mediational links between discrimination/victimization and healthcare utilization via healthcare barriers. Discrimination/victimization had an indirect effect on health screenings via fear accessing health services both inside and outside of the LGBT community, financial barriers to care or medication, and being uninsured. Discrimination/victimization also had an effect on routine checkups and having a regular provider, via fear seeking health services outside of the LGBT community, financial barriers and being uninsured. Findings can be utilized in LGBT cultural competency trainings for health and human service providers serving aging LGBT people.

PROMOTING HEALTHY AGING THROUGH LGBTQ+ AFFIRMING CARE

Harry Barbee, Tara McKay, Nathaniel Tran, and Judy Min, *Vanderbilt University, Nashville, Tennessee, United States*

This study examines variation in health service utilization and aging outcomes among older LGBTQ+ adults by access to an LGBTQ+ affirming health care provider. Primary survey data (n=1128) come from the Vanderbilt University Social Networks, Aging, and Policy Study, a panel study of older LGBTQ+ adults residing Alabama, Georgia, North Carolina, and Tennessee. Respondents with an LGBTQ+ affirming health care provider were more likely to seek preventative care, including routine checkups, colorectal screenings, flu shots, and HIV tests. Respondents with an LGBTQ+ affirming health care provider also reported higher control over their mental health and lower levels of cognitive decline. Overall, this study suggests that increasing access to LGBTQ+ affirming care could reduce health disparities among aging LGBTQ+ populations.

SESSION 1330 (SYMPOSIUM)

MISSION AND VISION OF THE MULTISITE VA ELIZABETH DOLE CENTER OF EXCELLENCE (EDCOE) FOR VETERAN AND CAREGIVER RESEARCH

Chair: Ranak Trivedi

Enabling Veterans to remain safely in their homes is a Department of Veterans Affairs (VA) priority. Informal caregivers play a critical role in supporting Veterans with functional impairments through their own efforts and the use of home and community-based services (HCBS). The Elizabeth Dole Center of Excellence (EDCoE) for Veteran and Caregiver Research was created in 2018 as part of the VA Choose Home Initiative to expand VA capacity to deliver integrated, Veteran- and caregiver-partnered, data-driven approaches to care through a set of complimentary projects. The EDCoE is a virtual center, with its multi-disciplinary team spread across the country at 5 different VA Medical Centers. The team also collaborates with other VA caregiver researchers. Finally, the EDCoE is closely networked with national, regional, and local operational partners, allowing for rapid dissemination of findings. In this symposium, we will first discuss the mission and vision of the EDCoE. We will then discuss multiple projects that are led through the EDCoE. Paper 1 (San Antonio) will identify measurement gaps to guide monitoring and improving HCBS. Paper 2 (Miami/Canandaigua) will describe a national survey of 8000+ Veterans and 3500+ caregivers. Paper 3 (Palo Alto) will describe caregivers' barriers to accessing VA and non-VA HCBS. Paper 4 (Salt Lake City/Canandaigua) will describe the results of latent trajectory analyses of administrative data to identify groups of Veterans who use different combinations of HCBS and institutional services. Our results are used by VA operational partners and policymakers to improve services for Veterans and informal caregivers.

UNMET NEEDS AND PERCEIVED BARRIERS TO ACCESSING HCBS AMONG CAREGIVERS OF VETERANS OF ALL ERAS

Ranak Trivedi[1], Victoria Ngo[2], Trevor Lee[3], Marika Humber[3], Rashmi Risbud[4], Shreya Desai[5], Josephine Jacobs[2], and Dolores Gallagher-Thompson[6], *1. Stanford University, Palo Alto, California, United States, 2. VA Palo Alto Health Care System, Menlo Park, California, United States, 3. VA Palo Alto Health Care System, Palo Alto, California, United States, 4. University of California, Davis, Davis, California, United States, 5. Veterans Affairs Palo Alto Health Care System, Menlo Park, California, United States, 6. Stanford University, Stanford, California, United States*

VA has several HCBS to offset caregiver burden, facilitate caregiving, and enhance Veterans' home-based care, but they remain underutilized. We aimed to describe: the unmet psychosocial and HCBS needs of caregivers, barriers to accessing services, and gaps in available programs. Twenty-three caregivers participated in a 1-hr semi-structured interview (62.9□13.5y; 74.0% women; 47.8% White; 17.4% Hispanic; 65.2% spouses). Caregivers provided 7.3 hrs of daily care (SD=5.5 hrs, Range=1-24); most had provided care for 1+ year. Barriers to accessing HCBS included: a) disagreement with Veterans regarding service preferences and needs; b) lack of awareness of VA and non-VA programs; c) delays in obtaining services; and d) emotional toll of caregiving on personal health and relationship with the Veteran. The VA may need to invest in advertising existing services, develop strategies to match caregivers with available services when needed, and enhancing mental health and relationship quality for Veterans and caregivers.

CAREGIVER-SPECIFIC QUALITY MEASURES FOR HCBS: STAKEHOLDER PRIORITIES AND ENVIRONMENTAL SCAN

Lauren Penney[1], Erin Finley[2], Julie Parish Johnson[1], Jacqueline Pugh[3], Luci Leykum[1], and Polly Noel[1], *1. South Texas Veterans Health Care System, San Antonio, Texas, United States, 2. VA Greater Los Angeles Healthcare System, Los Angeles, California, United States, 3. South Texas Veterans Health Care system, San Antonio, Texas, United States*

Although informal family caregivers are increasingly recognized for their essential role in helping older and/or medically-complex adults live in the community for as long as possible, their priorities and perspectives have not been well-integrated into assessments of home- and community-based services (HCBS). Our aim was to identify measurement gaps to guide quality monitoring and improve HCBS. Caregiver concerns and quality measurement priorities were identified during a multi-level stakeholder engagement process (34 Veterans, 24 caregivers, and 39 facility leaders, clinicians, and staff) across four VA healthcare systems. We conducted an environmental scan and scoping review of national quality measure sets for HCBS, comparing caregiver-specific items against stakeholder-identified concerns and priorities. Only five of eleven non-VA measure sets and three of four VA measure sets included caregiver-specific items; these did not encompass the full range stakeholder-identified concerns and priorities. Measures that emphasize caregivers can help healthcare systems monitor and improve HCBS quality.

MEASURING UNMET NEEDS OF HIGH-NEED, HIGH-RISK AMERICAN VETERANS AND THEIR CAREGIVERS USING A PROSPECTIVE SURVEY

Stuti Dang[1], Sandra Garcia[2], Richard Munoz[3], Polly Hitchcock Noel[4], Marianne Desir[1], Jared Hansen[5], Benjamin Brintz[6], and Orna Intrator[7], *1. Miami Veterans Affairs Healthcare System, Miami, Florida, United States, 2. University of Miami, Miami, Florida, United States, 3. Florida International University, Miami, Florida, United States, 4. South Texas Veterans Health Care System, San Antonio, Texas, United States, 5. VA Salt Lake City, Salt Lake City, Utah, United States, 6. VA Salt Lake City Health Care System, Salt Lake City, Utah, United States, 7. Canandaigua VA Medical Center, Canandaigua, New York, United States*

Success in delaying long term institutionalization (LTI) depends on creating means to adequately support each Veteran's needs. To better understand the unmet needs of Veterans, we identified a random sample of 20,000 Veterans from five VA sites. Veterans were stratified into low-, moderate- or high-risk tiers using a measure of predicted 2-year probability of LTI. Veterans and their caregivers were asked to complete separate surveys to assess demographic, physical, psychological, and social domains, unmet needs, and experience with HCBS and caregiver support programs. Responses were received between July-Dec 2021 from 8056 Veterans (80.3+/-9.8y; 94.0% men; 82.6% White; 8.9% Hispanic) and 3579 caregivers (71.1+/-13.1y; 75.1% women; 80.5% White; 15.1% Hispanic; 57.1% spousal) responded by mail (96%) or online (4%). Both Veterans and caregivers endorse complex Veteran unmet needs spanning medical, psychological, and social domains. Survey results will be used to inform HCBS policy to support aging Veterans and their caregivers.

GERIATRIC AND EXTENDED CARE TRAJECTORIES AND TRANSITIONS AMONG VETERANS WITH LONG-TERM CARE NEEDS

Erin Bouldin[1], Benjamin Brintz[2], Jared Hansen[3], Randall Rupper[1], Rachel Brenner[1], Orna Intrator[4], Bruce Kinosian[5], and Mary Jo Pugh[1], *1. University of Utah, Salt Lake City, Utah, United States, 2. VA Salt Lake City Health Care System, Salt Lake City, Utah, United States, 3. VA Salt Lake City, Salt Lake City, Utah, United States, 4. Canandaigua VA Medical Center, Canandaigua, New York, United States, 5. University of pennsylvania, Philadelphia, Pennsylvania, United States*

We aimed to identify clusters of geriatric and extended care services used by Veterans, describe transitions between clusters, and identify factors influencing transition. We explored services across the continuum of care from clinic to home-based and institutional care services. Analyses include 104,837 Veterans Health Administration (VHA) patients 65 years and older, and used VHA and Centers for Medicare & Medicaid Services (CMS) data from FY15-FY17. Using latent class and latent transition analyses, we identified 5 latent classes: 1) No Services, 2) CMS Services, 3) Home-Centered Interdisciplinary Care, 4) Personal Care Services, and 5) VHA-CMS Care Continuum. Veterans most commonly transitioned from the CMS Care Continuum class to No Services. Veterans also frequently transitioned into the VHA-CMS Care Continuum class over time. Identifying service patterns can inform service delivery, program development, and future resource allocation to better meet aging Veterans' needs.

SESSION 1340 (SYMPOSIUM)

NOVEL APPROACHES TO MINIMIZE SOCIAL ISOLATION AND MAXIMIZE PARTICIPATION IN OLDER ADULTS WITH DEMENTIA

Chair: Juleen Rodakowski Discussant: Juleen Rodakowski

Older adults experiencing cognitive decline, including those with Alzheimer's disease and related dementias, are at-risk for social isolation and participation restrictions, especially given the COVID-19 pandemic. Previously examined research has primarily focused on reducing problematic behaviors and remediating cognition for individuals with cognitive impairments. In this symposium, we will discuss novel intervention approaches and under-studied aspects of lifestyle behaviors that minimize social isolation and maximize participation for older adults with Alzheimer's disease and related dementias. Information presented in this symposium is intended to inform future intervention research to achieve an optimal quality of life for those with cognitive impairments. The first presentation will describe an analysis of lifestyle behaviors and cognition in an older population. The second presentation will discuss the development of an intergenerational, active music intervention that is delivered virtually to individuals with dementia and their caregivers. The third presentation will describe the effects of an adaptive horseback riding program that is becoming increasingly prevalent and improves the quality of life of persons living with Alzheimer's disease and related dementia.

ADAPTIVE HORSEBACK RIDING: AN INNOVATIVE PROGRAM FOR IMPROVING THE QUALITY OF LIFE OF PERSONS LIVING WITH DEMENTIA

Beth Fields, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

More than 5 million Americans living with Alzheimer's disease and related dementia (ADRD) have likely experienced forced social isolation due to the COVID-19 pandemic and subsequent stay-at-home mandates and public closures. Forced social isolation negatively impacts the quality of life of persons living with ADRD by worsening behavioral and psychological symptoms. Given continued pandemic restrictions and poor outcomes, now is the time to develop and support programs designed to improve quality of life through meaningful interactions that occur in natural environments. This symposium will introduce 'Riding in the Moment', an adaptive riding program that improves the quality of life of persons living with ADRD. Program participants are provided a safe, social, and supportive natural environment where they can ride, groom, and care for horses. The experiences constructed from Riding in the Moment seek to impact the current public health crisis by reducing social isolation for a growing and vulnerable population.

DEVELOPING A MUSIC PROGRAM ON ZOOM FOR OLDER ADULTS WITH DECLINING COGNITION: A PROGRAM DEVELOPMENT REPORT

Jennie Dorris[1], Heather DiCicco[2], James Becker[1], and Juleen Rodakowski[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. BriTE Wellness Inc, Pittsburgh, Pennsylvania, United States*

The coronavirus pandemic upended in-person programming for older adults with cognitive decline, presenting an urgent need to explore options to offer virtual programming. This program development report describes the adaptation of a music program for older adults with memory loss from in-person to a digital format. The objective was to develop a music program that was both engaging for the older adults, acceptable for the music instructor, and clearly defined for future research and implementation. This report describes the content of the music program and the systematic process of its development, including stakeholder interviews, acceptability surveys, fidelity reviews, and the developed instructor manual. With these structures in place, future research could begin to discern if digital music programming can support older adults in the same way that has been demonstrated in-person, potentially offering a new way to support the cognitive and social needs of a vulnerable population.

DECLINE OF AN ONLINE COGNITIVE COMPOSITE ASSOCIATED WITH MODIFIABLE LIFESTYLE FACTORS

Chao-Yi Wu, Kirsten Wright, Nathan Hantke, and Jeffrey Kaye, *Oregon Health & Science University, Portland, Oregon, United States*

Voluntary, self-administered online assessment platforms have gained popularity in monitoring cognition and lifestyle behaviors. This study used the AARP Staying Sharp online brain health assessment platform to estimate the progression of a cognitive composite and correlate it with six modifiable lifestyle behaviors (physical activity, diet, sleep, stress, social activity, and brain engagement) in 147,939 participants (68.6 ± 7.0 years old; 70% female). A cognitive composite was created using attention, immediate and delayed recall, and working memory tasks and lifestyle behaviors were collected by self-report. A lower frequency of exercise (p=0.01), a higher frequency of sitting (p=0.03), a lower frequency of getting in touch with family and friends (p=0.04), and the inability to manage stress (p=0.02) were associated with a decline in the online cognitive composite. A self-administered online assessment platform may be useful in informing lifestyle modification interventions for risk reduction of cognitive impairment and dementia.

SESSION 1350 (SYMPOSIUM)

PROMOTING HEALTHY AGING OF WORLD TRADE CENTER RESPONDERS

Chair: Katherine Ornstein Co-Chair: Fred Ko

By 2030 the majority of World Trade Center (WTC) rescue and recovery workers (general responders) will be aged 65 and over and at risk for age-related conditions and consequences. Despite the US government's commitment to support WTC responders who have exposure-related health conditions (e.g., cancers, PTSD), little research to date has focused on age-related issues in this population. Because WTC responders were exposed to high levels of toxicants and intense psychological trauma in the emergency response and cleanup following the 2001 WTC disaster—hazards that can accelerate the aging process – they are likely at increased risk for premature aging and associated age-related syndromes (e.g., functional decline, falls). An improved understanding of how aging affects the health of WTC responders is critically important to improving their clinical care, health outcomes, and overall quality of life. In this symposium we will present 3 studies that have shed light on the aging of WTC responders. First, we assess frailty among responder using a frailty phenotype. In the next study we examine the extent of polypharmacy among WTC responders and associated factors. Finally, we examine trajectories of frailty in this population over 2 decades of follow up using a validated clinical frailty index. This work represents the first examination of frailty and aging among WTC responders and will be an area of growing research as the population ages.

FRAILTY TRAJECTORIES AMONG WORLD TRADE CENTER GENERAL RESPONDERS

Fred Ko[2], Katherine Ornstein[1], Nicolo Foppa Pedretti[2], Elena Colichino[2], ghalib Bello[2], and William Hung[2], *1. Johns Hopkins, University, Baltimore, Maryland, United States, 2. Icahn School of Medicine at Mount Sinai, New York, New York, United States*

As the WTC cohort ages, it is important to examine whether there are differences in frailty trajectories over time in the cohort and examine clinical risk profiles of subpopulations with different trajectories. We used longitudinal data collected annually from the WTC data center and included all individuals with 3+ Clinical Frailty Index (FI) measurements after 9/11 to examine frailty trajectories using latent class growth mixture models. These patterns of change of Clinical-FI all showed an increasing trend over time, but there were three distinct patterns with different rates of increase. These were associated with distinct profiles of characteristics including sociodemographic, occupational and exposure level. WTC responders with higher age, working in construction, and higher-intermediate WTC level of exposure had higher rate of increase of Clinical-FI over time. While WTC responders with younger age, working in protective environment, and with higher education had lower rate of increase of Clinical-FI over time.

FRAILTY AND AGE-RELATED CONDITIONS AMONG WORLD TRADE CENTER GENERAL RESPONDERS

Katherine Ornstein[3], Fred Ko[1], Amy Park[1], Ahmad Sabra[1], Katelyn Ferreira[1], William Hung[1], Roberto Lucchini[2], and Erin Thanik[1], *1. Icahn School of Medicine at Mount Sinai, New York, New York, United States, 2. Florida International University, Miami, Florida, United States, 3. Johns Hopkins, University, Baltimore, Maryland, United States*

As WTC exposure may precipitate frailty, we examined patterns of frailty in the general responders cohort. We used two methods to assess frailty: a Clinical Frailty Index (FI) developed using a deficit accumulation approach utilizing clinical assessments performed during routine annual visits to a WTC clinical program in New York City; and a frailty questionnaire (5-point FRAIL scale) collected from a subsample of responders. Using a Clinical FI cutoff score of 0.25, over 25% of the 7,679 participants, median age 58.3 years (IQR 9.3), who had any visit to the WTC clinical program from 2017 to 2019, were frail. In a subsample of 100 participants with additional frailty assessment (FRAIL scale), we found that 27% were pre-frail, 5% were frail, 14% had recent falls, 9% had ADL dependencies; 34% had mild cognitive impairment. These data suggest that frailty and its related conditions are prevalent among the cohort despite younger age.

POLYPHARMACY AND FRAILTY AMONG WORLD TRADE CENTER GENERAL RESPONDERS

William Hung[1], Ghalib Bello[1], Fred Ko[1], Ahmad Sabra[1], Erin Thanik[1], Roberto Lucchini[2], and Katherine Ornstein[3], *1. Icahn School of Medicine at Mount Sinai, New York, New York, United States, 2. Florida International University, Miami, Florida, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States*

Polypharmacy in older adults is associated with increased risk of adverse events such as falls, adverse drug reactions and functional decline. WTC responders suffer from conditions related to WTC exposure and are at higher risk of polypharmacy. We examined patterns of medication use among WTC general responders aged 50 and over who had at least one visit from 2017 to 2019 (n=7,679); 56.1% took 5+ medications and 22.5% took 10+ medications. Factors associated with polypharmacy (taking 5+ medications) include age (OR 1.08, p<0.001), female sex (OR 1.33, p<0.001), obesity (1.90, p<0.001), fair/poor self-rated health (OR 1.32, p<0.001) and limitations on performing moderate activity (OR 1.52, p<0.001). Frailty, as measured by the deficit count in the Clinical Frailty Index, is associated with polypharmacy after adjusting for other covariates (OR 1.23, p<0.001). Addressing polypharmacy by improving medication use may yield health benefits for this rapidly aging population at risk for adverse outcomes.

SESSION 1370 (SYMPOSIUM)

SIGMA PHI OMEGA PRESIDENTIAL SYMPOSIUM: ITS ROLE IN ADVANCING THE FUTURE OF GERONTOLOGISTS AND HEALTH PROFESSIONALS

Chair: Diane Martin Co-Chair: Katarina Friberg Felsted

Sigma Phi Omega, The International Academic Honor and Professional Society in Gerontology (aka Sigma Phi Omega), was established in 1980 to recognize excellence of those who study gerontology and aging, and the outstanding service of professionals who work with or on behalf of older persons. The formation of this society provided a much-needed link between educators, practitioners, and administrators in various settings where older persons are served. Through the efforts of the international office and executive board officers, Sigma Phi Omega builds avenues to further their members' academic and professional gerontological excellence. The goals of Sigma Phi Omega are achieved primarily through activities of local chapters at higher education institutions worldwide. Sigma Phi Omega chapters serve as links within their respective communities to promote interaction between gerontology educators, students, alumni, and local professionals. This international organization has a laser focus on excellence within gerontology and health professions education. In this session, the first presentation will provide the history of Sigma Phi Omega and its outreach efforts; the second presentation will focus on the future goals of Sigma Phi Omega to expand its role as an international honor society in preparing gerontologists, service providers and health professionals working with or on behalf of older adults; and the third presentation will focus on the SPO Chapters and their relationship with the piloted Gerontological Society of America Student Chapters.

SIGMA PHI OMEGA CHAPTERS AND THEIR COLLABORATION WITH THE PILOTED GSA STUDENT CHAPTERS

Marilyn Gugliucci, *University of New England College of Osteopathic Medicine, Biddeford, Maine, United States*

Networking is the action or process of interacting with others to exchange information and develop professional or social contacts. The newly piloted GSA student chapters are encouraged to build relationships that can lead to networking and collaboration. While it is important to maintain a unique Sigma Phi Omega institutional chapter identity, the GSA student chapters also focus on the field of aging within a Higher Education Institution. Sigma Phi Omega collaborating with GSA Student Chapters is mutually beneficial in expanding learning, exploring new ideas, building professional connections, creating innovative projects, and gaining insights to other opportunities for professional and personal growth. This session will provide guidance on how to foster collaboration and growth for each of these chapters while honoring respective chapter missions, requirements, and educational experiences.

SIGMA PHI OMEGA'S FUTURE

Diane Martin, *University of Maryland, Baltimore Graduate School, Baltimore, Maryland, United States*

Sigma Phi Omega (SPO) is well established within the United States but as The International Academic Honor and Professional Society in Gerontology, it is time to intentionally expand globally in preparing gerontologists, service providers, and health professionals in the field of aging. This session will build on the platform provided by Dr. Katarina Friberg Felsted, Sigma Phi Omega immediate past president, and encourage discussion with and among attendees on ideas and creative approaches for advancing Sigma Phi Omega at colleges and universities worldwide. Broad input and feedback for mapping the future of Sigma Phi Omega across the national and international arenas provides opportunities and prospects that advances the fields of gerontology and geriatrics. The key is upholding Sigma Phi Omega's mission and vision that supports aging through the work our members do with or on behalf of older adults.

SIGMA PHI OMEGA: HISTORY AND ITS OUTREACH EFFORTS

Katarina Friberg Felsted, *University of Utah, Salt Lake City, Utah, United States*

Sigma Phi Omega, The International Academic Honor and Professional Society in Gerontology (aka Sigma Phi Omega), was established in 1980 to recognize excellence of those who study gerontology and aging, and the outstanding service of professionals who work with or on behalf of older persons. Its mission and vision was thoughtfully crafted to support the endurance and outreach of Sigma Phi Omega within the United States and globally. This session will share the structure and function of Sigma Phi Omega and its accomplishments. This foundation is an essential platform for the launching of the organization's strategic plan as we move forward in the field of aging.

SESSION 1380 (SYMPOSIUM)

STIGMA IN THE CONTEXT OF ALZHEIMER'S DISEASE AND RELATED DEMENTIAS (ADRD) WITHIN RURAL AND UNDERSERVED POPULATIONS

Chair: Elizabeth Rhodus Co-Chair: Steffi Kim Discussant: Fayron Epps

Stigma in the context of Alzheimer's disease and related dementias (ADRD) is associated with a higher prevalence of depression, anxiety, social isolation, and poorer caregiver health. This is particularly true for underserved and rural communities; however, little is known about the sources of stigma and implications of stigma within these communities. This symposium explores sources of stigma along with implications of stigma in rural and/or underserved communities and introduces novel interventional considerations for addressing stigma. The first presentation by Rhodus and colleagues highlights implications of stigma in rural Appalachian communities as it relates to ADRD healthcare service and research participation. Next, Sabat and colleagues present findings of a recent intervention program, "Respite for All," specifically, implications of this program for caregivers' perception of stigma, as well as the person living with ADRD. This symposium also includes presentations focused on Alaska Native (AN) experiences with stigma and ADRD. Kim discusses findings of a community-based participatory research project using mixed-method to explore structural stigma in rural communities and needed initiatives for familial care partners. To conclude the program, Crouch and Rosich present results of a grounded theory, exploratory study aimed to understand the cultural practices and values that compose AN Elder beliefs and perceptions of ADRD, including stigmas. This symposium will conclude with a discussion on how researchers may begin to integrate approaches to address stigma in rural and underserved communities in order to enhance care utilization and quality of life for older adults caring for and living with ADRD.

STIFLED UTILIZATION OF DEMENTIA-RELATED HEALTHCARE SERVICES DUE TO STIGMA IN RURAL APPALACHIA

Elizabeth Rhodus[1], Allison Gibson[1], David Gross[2], Rob Sprang[1], Kelly Parsons[1], Julia Johnston[1], and Gregory Jicha[1], *1. University of Kentucky, Lexington,*

Kentucky, United States, 2. St. Claire Healthcare, Morehead, Kentucky, United States

Residency in rural Appalachia is linked with heightened morbidity and mortality due to a myriad of conditions, many of which are associated with increased risk and prevalence of Alzheimer's disease and related dementias (ADRD). Despite this, access to and utilization of dementia-specific healthcare services in the region are limited. This study presents community-based stigma associated with enrollment in healthcare clinical research offered in rural Appalachia. Additional data from focus groups with care partners of people with memory impairment in rural Appalachia discuss implications of stigma in their communities. Findings elaborate on recruitment challenges associated with terminology, such as caregiver and dementia, as well as availability of diagnosticians. This study illustrates unique characteristics needed for community-based education programs tailored to the culture and customs of rural regions in order to increase utilization of healthcare for older adults at risk or living with ADRD.

SOURCES OF STIGMA AND THEIR IMPACT ON ALASKA NATIVE ADRD CAREGIVERS' WELLBEING

Steffi Kim, *University of Minnesota, Minneapolis, Minnesota, United States*

Challenges such as isolation, scarce resources, and limited knowledge of the disease are often the result of stigmatizing experiences from multiple systemic sources. No studies have investigated the impact of sources of stigma on the quality of life in Alaska Native (AN) ADRD caregivers. This exploratory, mixed-method study within a community-based participatory research framework assessed the experience of family stigma among 40 AN caregivers of people with ADRD across Alaska by administering a measure of systemic stigma and describes the impact of stigmatizing experiences on AN caregivers' quality of life to develop preliminary data-driven stigma-reducing initiatives. AN caregivers completed the Family Stigma – Alzheimer's Disease Scale (FS-ADS), assessing caregiver stigma, layperson stigma, and structural stigma. Quality of Life was assessed with the Goodness of Life for Every Alaska Native (GLEAN) scale. Preliminary data on structural stigma and its impact on caregiver quality of life will be presented.

THE RESPITE FOR ALL PROGRAM DECREASES STIGMA AND CAREGIVERS' ANXIETY WHILE INCREASING THEIR CONFIDENCE

Steven Sabat[1], Abigail Howell[1], and Daphne Johnston[2], *1. Georgetown University, Washington, District of Columbia, United States, 2. First United Methodist Church, Montgomery, Alabama, United States*

Feelings of burden and stigma are associated with social isolation (Adelman, et al., 2014) which is considered a public health concern (Brodaty & Donkin, 2009; Tatangelo, et al., 2018a). The stigma associated with a dementia diagnosis, care partners' burden, and diminishing financial resources have been found to be significant contributors to increased social isolation (Lee, et al., 2021; Sun, et al., 2021; Hung, et al., 2021). Care partners report significant anxiety in connection with behavioral manifestations of dementia attracting negative attention (McHugh, et al, 2012; Sanders, et al, 2008) or judged by the general public (Lee, et al., 2021), and those with high levels of grief commonly report experiencing social isolation (Sanders, et al, 2008). The Respite For All program for people living with dementia has led to decreases in stigma and caregivers' anxiety while increasing their confidence. We will discuss the nature of this program and present supporting data.

TOWARD EQUITABLE AND DESTIGMATIZING DEMENTIA: ALASKA NATIVE POPULATIONS AND CULTURALLY BASED INTERVENTIONS

Maria Crouch[1], and Rosellen Rosich[2], *1. Yale School of Medicine, New Haven, Connecticut, United States, 2. University of Alaska Anchorage, Anchorage, Alaska, United States*

Alaska Native (AN) people's incidence and prevalence of Alzheimer's Disease and Related Dementias (ADRD) are projected to disproportionately increase in contrast to the U.S. population. This is alarming given that AN peoples experience health disparities exacerbated by prejudice, stigma, and systemic and structural inequalities. Twelve semi-structured interviews with AN Elders assessed the culturally derived meanings of memory function, loss, decline, and disease. Qualitative analyses observed eight culturally grounded themes and five interrelated and nested subthemes elucidating both the resilience and the stigmas, racism, and barriers faced by AN peoples: (1) Historical Trauma; (2) Oppression; (3) Distrust of Western Medicine; (4) Social Justice; and (5) Walking in Two Worlds. En masse historical and contemporary oppression, particularly within Western medicine, both contextualizes the present and points to the ways in which the strengths, wisdoms, and balance inherent in AN culture are imperative to the holistic health and healing.

SESSION 1390 (PAPER)

DEPRESSION, DEMENTIA, AND OUTCOMES

ALZHEIMER'S DISEASE AND COMORBIDITIES: A COMPLEX INTERPLAY IN THE CONTEXT OF AGING

Konstantin Arbeev, Olivia Bagley, Arseniy Yashkin, Hongzhe Duan, Vinit Nalawade, Igor Akushevich, Svetlana Ukraintseva, and Anatoliy Yashin, *Duke University, Durham, North Carolina, United States*

There is evidence on high prevalence of comorbidity in people with dementia and on associations between comorbidities and progression of Alzheimer's disease (AD). Comorbidities accumulate with age and age is also a major risk factor for AD. Repeated measurements of comorbidity provide possibilities for gaining more knowledge about dynamic interconnection between comorbidities and AD development in the context of aging. We constructed the comorbidity index (CMI) for participants of the Health and Retirement Study aged 66+ years using data on onset of diseases from linked Medicare service use files (6,830 participants, 3,829 females, 3,001 males). We performed the joint analysis of longitudinal measurements of CMI and data on onset of AD and survival since onset of AD using the approach (the stochastic process model) that allows decomposing the overall association of trajectories of CMI with respective time-to-event outcomes into several aging-related characteristics represented by the model's components and evaluated indirectly from the data. We found that, overall, CMI is significantly ($p< 0.0001$) associated with increased risk of onset of AD and decreased survival chances for persons with AD and that this association can be decomposed into associations of AD outcomes with different aging-related components with differentiated impact of genetic and non-genetic factors (such as APOE, polygenic scores, sex, birth cohort). In particular, age patterns and time trends in such components contribute to trends in AD prevalence so that taking into account the age dynamics and time trends in comorbidities (represented by CMI) is essential for forecasting future trends in AD prevalence.

PROGRESSIVELY LOWERED STRESS THRESHOLD FOR BEHAVIORAL SYMPTOMS OF DEMENTIA: A DYNAMIC STRUCTURAL EQUATION MODEL

Carolyn Pickering[1], Maria Yefimova[2], Danny Wang[1], Christopher Maxwell[3], and Rita Jablonski[4], *1. The University of Alabama at Birmingham, Birmingham, Alabama, United States, 2. Stanford Health Care, Stanford, California, United States, 3. Michigan State University, East Lansing, Michigan, United States, 4. University of Alabama at Birmingham, Birmingham, Alabama, United States*

The progressively lowered stress threshold model suggests that due to impairments in coping, persons living with dementia have a reduced threshold for stress and respond with more behavioral symptoms of dementia as stress accumulates throughout the day. While the propositions of the model have not been evaluated, this model serves as the basis of non-pharmacological interventions for behavioral symptom management aimed at modifying the environment to reduce stressors. These interventions have mixed success, which may be due to traditional longitudinal measurement models that don't account for the dynamic temporal nature of behavioral symptoms. This paper evaluates the progressively lowered stress threshold conceptual model as an explanation for behavioral symptoms of dementia and tests several of its hypothesized propositions using an intensive longitudinal design. A sample of N=165 family caregivers completed brief daily diary surveys for 21 days (n=2841) reporting on behavioral symptoms of their care recipients. Dynamic structural equation modeling was used as the analytic technique to examine the impact of caregiver and care recipient environmental stressors on the diversity of behavioral symptoms of dementia (number of different symptoms) to account for the nested data structure and autoregressive relationships. Results show direct relationships between environmental stressors and diversity of behavioral symptoms of dementia that same day and the following day. Findings provide support for the progressively lowered stress threshold model. Further, findings suggest an extension to the conceptual model is warranted given evidence of an exposure/recovery trajectory and the lagged effects of stress exposure on behavioral symptoms of dementia presentation.

SYMPTOM BURDEN AND QUALITY OF LIFE FOR NURSING HOME RESIDENTS WITH DEMENTIA: UPLIFT TRIAL EARLY DATA

John Cagle[1], Jessica Orth[1], Todd Becker[1], Peiyuan Zhang[2], Mary Ersek[3], Wanzhu Tu[4], Alex Floyd[5], and Kathleen Unroe[6], *1. University of Maryland, Baltimore, Baltimore, Maryland, United States, 2. University of Maryland Baltimore, Baltimore, Maryland, United States, 3. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 4. Indiana University School of Medicine, Indianapolis, Indiana, United States, 5. Indiana University, Indianapolis, Indiana, United States, 6. Indiana University Center for Aging Research, Regenstrief Institute, Inc., Indianapolis, Indiana, United States*

Communication difficulties in nursing home (NH) residents with dementia make valid assessment of symptoms and quality-of-life (QOL) challenging. Thus, researchers and clinicians frequently rely on proxy-based measures. The End-of-life Dementia-Comfort Assessment in Dying (EOLD-CAD) and two single-item QOL measures (7-point item; 5-point item) have been used in several studies, though evaluation of their psychometric properties is limited. We used baseline data from an ongoing multi-site randomized trial (UPLIFT) to describe symptoms and QOL and examine the measures' validity and reliability in 138 residents with moderate to severe dementia living at 16 facilities. Descriptive data and assessments of convergent validity and inter-rater reliability are provided. Based on assessments by 134 staff and 45 family, physical symptoms, physical distress, and emotional distress were reported as infrequent by staff and family; indications of well-being were more frequently observed. Median QOL was the same for staff and family observers (4="Life is so-so" [7-point item]; 3="Fair" [5-point item]). Inter-observer assessments of resident QOL (staff vs. family) were correlated (7-point item: $r=0.47$, ICC=.643; 5-point item: $r=0.48$, ICC=.645, $p<.05$ for all). Seven of 18 EOLD-CAD symptoms were significantly positively correlated. ICC values varied between high or moderately high: shortness-of-breath (ICC=.74), choking (ICC=.65), gurgling (ICC=.81), agitation (ICC=.51), fear (ICC=.46), crying (ICC=.65), peace (ICC=.57), and care resistance (ICC=.68) ($p<.05$ for all). Choking and gurgling were the most prominently reported symptoms by both groups.Early findings provide a contemporary assessment of QOL and symptoms among NH residents with dementia. Measurement properties affirm general reliability and validity of study instruments.

SESSION 1400 (PAPER)

DIVERSITY, EQUITY, AND INCLUSION IN FORMAL AND FAMILY CARE PROVISION

"A GLARING OMISSION": BARRIERS TO INCLUDING LONG-TERM CARE RESIDENTS' VOICES IN THE NEWS MEDIA

Laura Allen[1], Dana Bradley[2], and Liat Ayalon[3], *1. Bar-Ilan University, Edgewood, Kentucky, United States, 2. University of Maryland, Baltimore County, Baltimore, Maryland, United States, 3. Bar Ilan University, Israel, Ramat Gan, HaMerkaz, Israel*

News media stories on residential long-term care (LTC) are mostly negative in tone, and the increase in news coverage of residential LTC during the COVID-19 pandemic intensified the pessimistic tone with panicked and accusatory reporting. Although there has been an increase in the amount of news coverage on residential LTC over the last two years, the perspectives of the residents themselves have been largely overlooked and excluded. The aim of this study is to identify and understand the barriers and embedded institutional logics in the news reporting process of LTC that prevent residents from being included and interviewed. Using a purposive sampling strategy, the researchers conducted 26 semi-structured interviews with LTC administrators (n=7), journalists on the topics of aging and LTC (n=7), and older residents living in LTC settings (n=12) in the United States. Thematic analysis is applied to the data to qualitatively extract the guiding logics frameworks of each stakeholder group. Findings are grouped into the following four themes: (1) residents are not considered "experts" by reporters and are therefore not a prioritized source of information; (2) facility administrators fear for the facility's public image & reputation and do not enthusiastically cooperate with inquiring reporters; (3) facilities were in physical lockdown for several months during the COVID-19 pandemic, and (4) residents feel forgotten and unheard. Implications of this study point to the social exclusion of older residents living in LTC and reductive reporting that fails to capture their nuanced and dynamic lived experiences.

IMPROVING SERVICES TO LGBTQ+ OLDER ADULTS: NEEDS OF MICHIGAN LONG-TERM CARE PROVIDERS

Anne Hughes, Linda Keilman, and Leo Kattari, *Michigan State University, East Lansing, Michigan, United States*

Long term care (LTC) providers need information about providing competent care to LGBTQ+ older adults. Providers who are not educated can inadvertently provide biased care. Our research identified preferences for education among providers of LTC services in Michigan (MI). In this descriptive cross sectional study we used an online survey to collect data from MI facilities (N= 429). Survey items included facility characteristics, diversity training history, perceived need for training on LGBTQ+ older adults, barriers to training, interest in additional training on LGBTQ+ older adults and LTC, and training preferences. Results were obtained from 71 facilities. Thirty-seven percent of responses came from direct care workers, 63% from administrators. There was good support for diversity training, with 24% stating diversity training was “somewhat important” and 74% stating it was “very important”. A majority (63%) had had some diversity training in the past year. Most (72%) endorsed the need and desire for more training on LGBTQ+ aging. More content on transgender older adults and concerns such as room assignments, dementia, and use of pronouns were identified. Barriers to training included: cost, availability of trainers with the appropriate expertise, ability to reach large numbers of employees, staff turnover, bias and ignorance among staff and residents, and need to provide rationale for this type of training. Most endorsed a mixed type of training and a training length between 1 and 3 hours. Diversity training is critical to LTC and needs to be expanded to include needs of the aging LGBTQ+ community.

OLDER BLACK LESBIANS' NEEDS AND EXPECTATIONS IN RELATION TO LONG-TERM CARE FACILITY USE

Meki Singleton[1], Mary Anne Adams[2], and Tonia Poteat[3], *1. University of Southern California, Los Angeles, California, United States, 2. ZAMI NOBLA: National Organization of Black Lesbians on Aging, Atlanta, Georgia, United States, 3. University of North Carolina Chapel HIll, Chapel Hill, North Carolina, United States*

The older adult sexual minority (SM) population encompasses a vast array of individuals from diverse backgrounds. However, there is a dearth of gerontological research that focuses on the experiences of SM subgroups, particularly older Black lesbians. The purpose of this study was to explore older Black lesbians’ needs and expectations in relation to the utilization of long-term care (LTC) facilities. We conducted secondary data analysis using data from 14 focus groups (n=100) that discussed health and aging with older Black lesbians. Transcriptions were analyzed in NVivo 12 using content analysis and structural coding. Three major themes were identified in relation to needs and expectations for LTC facility use: (1) consideration of or plans established to utilize a LTC facility, (2) concern for care facility environment, and (3) a desire to build one’s own community instead of LTC use. Within these themes, prominent topics included having to rely on LTC due to a lack of family or social support, the possibility of being isolated and stifling their lesbian identity and creating communities of mutual support to avoid facility-based care. These findings illustrate how older Black lesbians are planning for a potential need for LTC, their concerns about utilizing LTC, and alternative approaches to avoid LTC use. There remains a continued need for LTC communities that are inclusive and supportive of SM older adults as well as more SM-only communities where older adults can live openly and authentically.

RACIAL AND ETHNIC DIFFERENCES IN PARTICIPANT EXPERIENCE OF HOME- AND COMMUNITY-BASED SERVICES

Howard Degenholtz, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

It is widely recognized that racial and ethnic minorities experience lower quality of care and worse health outcomes across a wide range of health services and long-term care settings. However, less is known about racial and ethnic differences in home and community-based services (HCBS). This study used the HCBS version of the Consumer Assessment of Health Providers Survey (CAHPS) to examine participant experience of care in a large, statewide Medicaid program. The CAHPS-HCBS is a validated measure of quality of HCBS that supplements measures of health outcomes and provides policy makers with critical data on system performance. As part of a larger evaluation of Pennsylvania’s transition to Managed care for users of HCBS, representative samples of older adults were interviewed before and after the program was implemented. This study takes advantage of the phased implementation of managed care to estimate the causal effect of the program on differences in participant experience by racial and ethnic group. In general, non-Hispanic whites rated their overall satisfaction with HCBS lower than non-Hispanic Black and Hispanic people. The implementation of Managed care was associated with improvements in non-Hispanic Black and Hispanic ratings of personal care and service coordination, but not that of non-Hispanic whites. One implication of these findings is that managed care organizations can have positive impact on participant experience. The CAHPS-HCBS instrument is publicly available and can be used by state agencies to monitor racial and ethnic disparities in participant experience.

UNDER THE SAME ROOF: GRANDPARENTAL CO-RESIDENCE AND CO-PARENTING PATTERNS IN MODERN CHINESE FAMILIES

Shuai Zhou[1], Chang Liu[2], and Xue Bai[2], *1. The Hong Kong Polytechnic University, Hung Hom, Kowloon, Hong Kong, 2. The Hong Kong Polytechnic University, Hong Kong, Hong Kong*

This study aimed to examine the role of grandparental co-residence in shaping coparenting patterns in the Chinese family context. Using a sample of 5,795 children (Mean age = 6.74 years; SD = 3.82) from the China Family Panel Studies 2012-2018, we offered a novel typology of six coparenting patterns based on daytime and nighttime childcare information: a) grandparental care only (15.4%); b) grandparent-parent coparenting (10.9%); c) parental care only (44.5%); d) grandparent-private coparenting (4.2%); e) parent-private coparenting (16%); and f) private care only (e.g., paid nanny, nursery schools/kindergartens, and others, 9.1%). Fixed-effects multinominal logistic regression was applied to investigate the effects of grandparental co-residence on daytime and nighttime childcare, and on daily coparenting patterns over time, controlling for a set of child and parental characteristics and family conditions. Grandmother co-residence contributed to both daytime and nighttime grandparenting, while grandfather co-residence increased the likelihood of grandparenting and private care during the daytime. In terms of daily coparenting, grandmother co-residence was associated with increased probability of grandparent-parent coparenting as well as grandparent-private coparenting, while grandfather co-residence merely increased the likelihood of parent-private coparenting. It also found that child's experience of separation with mother during the last year and mother's employment were two key determinants of coparenting behavior in Chinese families. Findings suggest that co-residing grandparents, particularly grandmothers, may function as a kind of supplementary care resource in response to the lack of maternal childcare resulted from migration and labor force participation.

SESSION 1410 (SYMPOSIUM)

EARLY-LIFE EDUCATION AND COGNITIVE AGING: DOES CONTENT, LOCATION, AND HISTORICAL CONTEXT MATTER?

Chair: Jacqui Smith Discussant: Laura Zahodne

Life course and cognitive aging theories about the sources of subgroup and individual differences in susceptibility to cognitive impairment frequently highlight the significance of early-life education, defined in research by total years of school and highest degree. A more nuanced approach could shed light on why and for whom education matters for brain aging processes. For example, one year of school in the 1930s may not be the same as one year in the 1960s, or in different school types and states in this historical period. In addition, post- high school training and degrees differ in content. Each paper in this symposium uses early-life education history and late-life cognitive data from the Health and Retirement Study (HRS). Speakers discuss what guided their selection of specific education content, location, contexts and analytic strategy. Williams-Farrelly asks how individuals characterized by privileged high school educational experiences in the period from 1930 to the 1960s benefited in terms of social mobility and later-life cognitive functioning. Nkwata, in contrast, focuses on early-life education experiences that potentially limit the skills acquired together with exposure to family adversity and stress. Yu utilizes sequence analysis to identify and examine the association between late-life cognition and variations in patterns of K-12 education defined by duration and order of racial/ethnic composition. Walsemann and colleagues ask if state-level differences in the timing and implementation of school desegregation policies explain Black-White disparities in the transition to cognitive impairment in the US South. The session concludes with an integrative discussion by Zahodne.

SOCIOECONOMIC PRIVILEGE IN CHILDHOOD AND LATER LIFE COGNITION

Monica Williams-Farrelly, *University of Michigan, Ann Arbor, Michigan, United States*

Prior studies have demonstrated the effects of early socioeconomic status on later life cognition; yet the degree to which this effect operates directly, or indirectly through adult factors, is not well documented. Drawing from accumulation theories, we use longitudinal data from the Health and Retirement Study and its Life History Mail Survey (N=11,761) to examine the extent to which childhood socioeconomic privilege protects against later life cognitive decline and whether this effect is direct or indirect through measures of adult socioeconomic position. Analyses reveal that, among childhood privilege measures, consistent attendance in private school, participation in college preparation, foreign language, and multiple clubs in high school were most protective of later life cognition. The effect of cumulative childhood privilege on later life cognition is both direct and indirect through increased wealth and education credentials and the strength of this relationship is particularly robust for those demonstrating upward social mobility.

EARLY-LIFE EDUCATIONAL EXPERIENCES, TOXIC STRESS, AND RISK OF NEUROCOGNITIVE IMPAIRMENT AMONG US ADULTS OVER AGE 50

Allan Nkwata, *University of Michigan, Ann Arbor, Michigan, United States*

Increasing evidence suggests that the risk of cognitive impairment in later life in the US has been declining in recent years. However, factors associated with this decline are not fully understood. This study aims to examine whether educational history, including college attainment and adverse childhood experiences (ACEs) are associated with neurocognitive impairment (NI) among midlife and older US adults. We will use data from the Health and Retirement Study (HRS) along with information on respondents' early educational experiences collected in the 2015 and 2017 HRS Life History Mail Survey to examine whether school context, educational content, academic ability, and ACEs are associated with NI. We will farther explore ACEs as potential modifiers/ mediators of the relationship between educational history and NI in our sample. Multivariable logistic regression models will estimate odds ratios (ORs) and 95% confidence intervals (CI) with adjustment for demographic factors, socio-economic status (SES) and lifestyle factors.

TRAJECTORIES OF K-12 SCHOOLS IN THE 1930S-1960S AND COGNITIVE AGING: VARIATION BY RACIAL COMPOSITION

Wenshan Yu, and Jacqui Smith, *University of Michigan, Ann Arbor, Michigan, United States*

Besides information about the highest degree, little information about early-life education is available in population surveys. We identified K-12 education trajectories among older adults in the Health and Retirement Study and examined their association with cognitive function. Drawing on 2017 Life History Mail Survey (n = 4,325), we used sequence analysis to determine and classify trajectories of school majority race. We identified five clusters: 1) mostly White schools (n = 3,027), 2) mostly Black schools (n = 673), 3) mostly Hispanic schools (n = 499), 4) partly missing on majority race (n = 267), and 5) mostly Mixed-race schools (n =113). Adding the cluster variable significantly improved the model regressing cognitive function on race, gender, number of years in schools, birth cohort, number of years since starting schools, and school locations (F=12.066, p<0.001). Future research should study heterogeneity of K-12 education using information other than the highest degree.

STATE-LEVEL DESEGREGATION EFFORTS IN THE U.S. SOUTH POST-BROWN AND DEMENTIA RISK AMONG BLACK AND WHITE OLDER ADULTS

Katrina Walsemann[1], Mateo Farina[2], and Jennifer Ailshire[2], *1. University of Maryland, College Park, Maryland, United States, 2. University of Southern California, Los Angeles, California, United States*

Although education is a key protective factor against dementia, older U.S. adults experienced vastly different educational contexts. One of the most consequential legal decisions impacting educational contexts was Brown v. Board of Education, which declared ‘separate but equal’ schools unconstitutional. School desegregation in the U.S. South was inconsistent, however, and many states delayed implementation for years. State resistance to school desegregation created school environments for Black children that were stressful and discriminatory. Thus, state variation in exposure to school desegregation may serve to differentiate individuals in their risk for dementia. Our project links historical data on state-level school desegregation efforts to the Health and Retirement Study, a nationally representative sample of U.S. adults over 50. We determine if state-level variation in the timing and completeness of school desegregation explains Black-White disparities in transition to cognitive impairment and dementia among older adults who attended school in the US South post-Brown.

SESSION 1420 (PAPER)

EDUCATION AND INNOVATION IN HEALTH PROFESSIONS

In this session, gerontology educators describe varied ways to engage students in health professions programs in aging-focused training and teaching efforts.

A MIXED METHOD APPROACH TO UNDERSTANDING NURSING STUDENTS' SELF-EFFICACY TO CARE FOR OLDER ADULTS IN GHANA

Diana Abudu-Birresborn[1], Martine Puts[2], Lynn McCleary[3], Vida Yakong[4], Charlene Chu[2], and Lisa Cranley[2], *1. University of Toronto, New York, New York, United States, 2. University of Toronto, Toronto, Ontario, Canada, 3. Brock University, St. Catharines, Ontario, Canada, 4. University for Development Studies, Tamale, Northern, Ghana*

To identify students’ motivation, gaps, and opportunities to design effective teaching strategies, it is necessary to examine nursing students' understanding of their self-efficacy to care for persons 60+ years. A mixed-method approach was employed. In phase 1, 170 second-and third-year nursing students from two public Nursing Colleges in Ghana were recruited. A cross-sectional survey included the General Self-efficacy to Care for Older Adults’ scale (GSE-COA), the Kogan’s Attitudes towards Old Peoples scale, and the Knowledge about Older Patients Quiz. Data were analyzed using descriptive statistics in SPSS IBM 26. The results of phase 1, informed the selection of students for phase 2. In phase 2, 17 students were purposefully selected for in-depth semi-interviews. Qualitative data were analyzed using thematic analysis. Both results were then integrated, interpreted, and presented jointly. Students’ mean age was 21yrs (SD=3.73), with 91 (54%) females. Most students 140 (71.0%) had lived with/were currently living with an older adult. The majority 164 (97%), had higher scores for GSE-COA (mean= 107, SD=14.29), indicating high self-efficacy. Qualitative results showed that students’ high self-efficacy was due to their familiarity with older adults at home and their perceived competence in routine nursing care. Students who demonstrated a high sense of self-efficacy were confident and perceived caring for older adults as a duty and responsibility, had experience/exposure to and were comfortable working with older adults. The findings demonstrate an opportunity to design effective teaching strategies to develop and sustain students’ interest and motivation in the care for older adults in Ghana.

CROSS-DISCIPLINE COLLABORATIVE INTERNSHIPS TO REDUCE FEAR OF FALLING CONTRIBUTE TO AGE-FRIENDLY INITIATIVES

Andrea June, and Allison Seifert, *Central Connecticut State University, New Britain, Connecticut, United States*

The Age Friendly University (AFU) initiative provides a vision to inspire institutions of higher education to respond to the interests and needs of an aging population to promote well-being and quality of life. At Central Connecticut State University (CCSU), we have utilized multiple strategies to engage collaborators within our university and our community to further age-inclusive efforts. The purpose of this presentation is to describe the ongoing collaboration, through the Matter of Balance program, with the Connecticut Healthy Living Collective, an emerging hub of state, regional and local agencies and organizations dedicated to healthy aging in communities throughout our state. The Matter of Balance program is an empirically supported community-based treatment to reduce fear of falling among older adults. We will first discuss the pilot internship program offered within the Department of Psychological Science that trained students as program facilitators which was cut short in Spring 2020 due to COVID 19. We will then describe "Version 2.0" of the collaboration which was offered in the Spring 2022 semester. This time, it was grounded in a gerontology internship course that expanded to include research, faculty, and student collaboration with the Department of Physical Education and Human Performance. In addition to providing these overall descriptions, the presenters will review the strengths and challenges of each approach, share results about the students' experiences, and highlight the multidimensional value this intentional effort offers.

FIRST-YEAR OCCUPATIONAL THERAPY STUDENTS KNOWLEDGE OF AGING; SUGGESTIONS FOR CURRICULUM REQUIREMENTS

LaVona Traywick[1], Brittany Saviers[2], Terry Griffin[3], and Teressa Brown[1], *1. Arkansas Colleges of Health Education, Fort Smith, Arkansas, United States, 2. University of Central Arkansas, Conway, Arkansas, United States, 3. Kansas State University, Manhattan, Kansas, United States*

There is a rising shortage of allied healthcare professionals, including occupational therapists, to meet the current and expected needs of the senior adult population. To educate occupational therapy students, there are national standards that all programs have to meet. Inconsistency occurs because there is not a set national curriculum. It is assumed that students will enter their respective occupational therapy programs with a base knowledge of aging due to prerequisite requirements. With IRB approval, that assumption was measured over four consecutive years at one prominent OT program. 192 first-semester occupational therapy students were administered the Facts on Aging Quiz along with additional questions regarding birth year and anticipated employment. Results showed that first-year occupational therapy students' knowledge of aging was poor (67.9% mean) regardless of their age or population work preference. Only 11.5% stated geriatrics was their preferred population with which to work; most students stated pediatrics. Statistical tests indicated a trend of decreasing mean scores of the cohorts. If this trend of decreasing gerontological literacy exists in occupational therapy, other health care disciplines may be experiencing similar fates. It appears there is a considerable gap between the needs of society and the knowledge base/desired population work preference of those entering healthcare education. Strategies to address that gap need to be addressed to prepare occupational therapy students and other health care practitioners to best meet the needs of the current population. Based on these study results, more emphasis needs to be placed on gerontological literacy for new occupational therapy students.

PREPARING THE NURSING WORKFORCE TO CARE FOR OLDER ADULTS IN THE 21ST CENTURY

Deborah Brabham, *Florida State College at Jacksonville, Jacksonville, Florida, United States*

Nurses entering the workforce may have limited education in gerontological nursing. Therefore, many nurses are unprepared to provide quality care to older adults. An unprepared nursing workforce could negatively influence older adults' health outcomes. This study aimed to determine differences in senior nursing students' knowledge, attitudes, and perceived competency about older adults based on enrollment in a bachelor of science in nursing degree (BSN), associate's degree nursing (ADN), and practical nursing (PN) program that offers geriatric content in curricula. Albert Bandura's social cognitive, triadic reciprocal determinism model provided the theoretical framework to underpin this research study. A non-experimental, descriptive survey design included a convenience sample of students enrolled in a BSN, ASN, and PN program. A total of 178 students participated in the study. Palmore Facts on Aging Quiz 2, Kogan's Attitudes Toward Old People Scale, and the Hartford Geriatric Nurse Competency tool was used to collect data. From the results, it is clear that students enrolled in BSN, ADN, and PN programs demonstrated limited knowledge about facts on aging. Students' attitudes toward older adults were positive, and a correlation was found between knowledge and attitudes. Students perceived competency about older adults was high but purely subjective. Students' preference to work with older adults post-graduation in the PN group was higher than students in the BSN and ADN groups. These findings underscore the need to systematically design an evidence-based curriculum inclusive of geriatric content across (BSN, ADN, and PN) programs to prepare the nursing workforce to care for older adults.

STEPS TOWARD RAISE: CO-DESIGN OF COMPETENCY-BASED EDUCATION TO ENGAGE FAMILY CAREGIVERS AS PARTNERS

Jasneet Parmar[1], Sharon Anderson[2], Wendy Duggleby[1], Michelle Lobchuk[3], Elisabeth Drance[4], Tanya L'Heureux[5], Johnna Lowther[6], and Kim Crowder[1], *1. University of Alberta, Edmonton, Alberta, Canada, 2. Faculty of Medicine & Dentistry University of Alberta, Edmonton, Alberta, Canada, 3. University of Manitoba, Winnipeg,, Manitoba, Canada, 4. University of British Columbia, Vancouver, British Columbia, Canada, 5. Department of Family Medicine, University of Alberta, Edmonton, Alberta, Canada, 6. Caregivers Alberta, Edmonton, Alberta, Canada*

Meeting the needs of a growing population of older people living with complex conditions is highly dependent on healthcare providers partnering with family caregivers (FCGs). FCGs provide 90% of the care yet are marginalized within healthcare systems. Educating healthcare providers to support FCGs is a necessary step towards addressing the inconsistent system of supports for diverse FCGs throughout variable care trajectories. Current research suggests that co-design benefits stakeholders, produces superior outcomes, and facilitates moving knowledge efficiently into healthcare practices. Currently, moving best practices into healthcare is a time-consuming process (10-17 years). This presentation will discuss a feasible three-phase co-design process that included 120 multilevel interdisciplinary stakeholders including FCGs, educators, researchers, not-for-profit and healthcare providers/leaders, educational designers, and policy influencers/makers: 1) Developing relationships and insights; 2) Translating insights into education design; and 3) Planning the implementation, spread, and scale-up. The research tools used included literature reviews, qualitative and survey research on specific topics, consultations (symposia, modified Delphi process, co-design meetings), and mixed methods evaluation. Three modules, Foundational, COVID-19, and Advanced have been developed. Learners report high satisfaction, relevance, and significant knowledge gains upon completion. This successful education co-design required three critical elements: 1) an engaged co-design team led by people knowledgeable about healthcare and FCGs; 2) team access to collaborators/staff with the appropriate theoretical, research, and facilitation skills; and 3) an educational design team to bring stakeholders' ideas to life. Leveraging stakeholders' insights are a critical step towards the RAISE act goal of educating healthcare providers to include FCGs as partners-in-care.

SESSION 1430 (SYMPOSIUM)

EMPOWERING BEHAVIOR CHANGE TO SUPPORT BRAIN HEALTH AMONG OLDER ADULTS

Chair: Sarah Lock Co-Chair: Duke Han

This symposium will provide highlights from the Global Council on Brain Health's (GCBH) body of work on behavior change. This work is focused on developing a better understanding of (a) how to persuade and motivate people to engage in sustained healthy behaviors, (b) how to change policies within local communities to support individuals' ability to make healthy choices, and (c) how to optimize conditions for brain health so all can thrive. The GCBH is an independent collaborative of scientists, clinicians, scholars, and policy experts convened by AARP to provide evidence-based advice on what people and professionals can do to maintain and improve brain health. The Council translates scientific research into actionable recommendations aimed at helping to drive behavior change in individuals across communities and cultures. Experts were brought together to build consensus around a range of factors at the individual and societal level that influence individual behavior and decision-making. This presentation will also draw upon lessons learned from the field of health promotion and examples from communication campaigns around heart health will be discussed as they relate to brain health. Nationally representative surveys, fielded by AARP Research including diverse respondents of adults 40+ and health care professionals diagnosing and treating dementia, found that misperceptions and stigma about dementia are commonplace and hinder efforts to address brain-healthy behaviors. Physicians who used to treat dementia patients, now themselves living with dementia, discuss how championing change, providing hope and refuting stigma can even help those living with a dementia diagnosis.

HEART-HEALTHY LIFESTYLES REDUCE THE RISK OF COGNITIVE DECLINE

Sarah Lock[1], and Kristine Yaffe[2], *1. AARP, Washington, District of Columbia, United States, 2. University of California, San Francisco, San Francisco, California, United States*

The Global Council on Brain Health (GCBH) convened experts from around the world to examine the impact of cardiovascular risk factors on brain health. GCBH issue experts carefully considered how high blood pressure, diabetes and stroke, as well as lifestyle choices such as diet and exercise, influence brain health in adults age 50 and over. The GCBH concluded that the best evidence to date shows us "what's good for the heart is good for the brain." Their consensus puts powerful tools in the hands of adults wanting to protect their brain as they age. The GCBH adopted 10 recommendations for individuals to incorporate into their lives to keep heart and blood vessels healthy and reduce the risk for cognitive decline and dementia. These recommendations and 16 practical tips are provided in the final report. Liaisons from numerous civic and nonprofit organizations with expertise in heart and brain health helped develop these recommendations for adults 50+ and their health care providers.

BOTH HEALTH CARE PROFESSIONALS AND PATIENTS HARBOR MISPERCEPTIONS ABOUT DEMENTIA

Laura Mehegan, and David Parkes, *AARP, Washington, District of Columbia, United States*

Healthcare providers underestimate the willingness of adults to engage in a healthier lifestyle to potentially slow the progress of the disease and the willingness of patients to participate in research. Few adults recognize the impact lifestyle modifications have on the risk for cognitive decline and dementia, but some significant differences exists among perceptions amongst diverse communities. While most adults are willing to modify selected brain-healthy behaviors, relatively few currently engage in brain-healthy behaviors all or most of the time. Numerous discrepancies exist between the realities of dementia and overall feelings about a diagnosis. Among the more startling findings is 48% of adults believe they will likely have dementia — far more than will actually develop it. Health care providers substantially overestimate the worry that adults age 40 and older would feel if they had dementia. While one in five adults (19%) said they would feel ashamed or embarrassed if they had dementia, a staggering seven in 10 providers (69%) said their patients would feel ashamed or embarrassed. These negative perceptions by healthcare providers carry over into the interactions they have with patients when dealing with cognitive function. Nine in 10 adults age 40 and older (91%) want to be told of a dementia diagnosis, but only 78% of providers said they always tell patients the truth. There is a recognition by everyone that early diagnosis is beneficial, but most adults over 40 are not aware there are treatments available for dementia. More than half of adults do not know that dementia cannot be cured.

PHYSICIANS LIVING WITH DEMENTIA CHAMPION CHANGE, PROVIDE HOPE AND REFUTE STIGMA

Arnold Beresh,[1] Brenda Roberts,[2] Lisa Dedden Cooper,[3],
1. National Council of Dementia Minds, White Lake, Michigan, United States
2. National Council of Dementia Minds, Elwell, Michigan, United States
3. AARP Michigan, Owosso, Michigan, United States

This section of the symposium will show how to empower behavior change amongst the medical profession and the people they serve. Health care professionals who were diagnosing and treating dementia patients who are now themselves living with dementia will share insights into what needs to change by sharing "What I Wish I Knew Then." We have asked three people from the National Council of Dementia Minds to join us for the symposium. Dr. Arnold Beresh, Brenda Roberts, and Lisa Cooper to speak on What I Wish I Knew Then. This part of the presentation is designed to provoke discussion on how best to engage doctors to support better brain health for older adults in the future.

SESSION 1440 (SYMPOSIUM)

ESPO AND BUTLER-WILLIAMS SCIENTIFIC SYMPOSIUM: CAREER DEVELOPMENT TO PROMOTE DIVERSITY, DISCOVERY, AND AGING

Chair: Kalisha Bonds Johnson Co-Chair: Brianna Morgan Discussant: Patricia Jones

The NIA's Butler-Williams Scholars Program and GSA's ESPO Section are united in providing career development opportunities in a manner that promotes leadership, diversity, and inclusivity. This year's theme challenges our emerging scholars to embrace diversity and discovery while thinking—or rethinking—about the perspectives of older adults. Disparities in health associated with race/ethnicity, experience, sociocultural and socioeconomic factors, as well as access to and provision of health care are chief concerns of our aging population. GSA's early career professionals and 2021 alumni of the prestigious NIA Butler-Williams Scholars Program address these issues. Dr. Matthew Farina will present on the importance of identifying life course pathways in understanding the lived experiences of older adults from underrepresented racial groups. Dr. Kacie Deters will discuss how both demographics and genetic factors contribute to cognitive performance. Dr. Mirna Arroyo-Miranda will present findings on social isolation and cognition in Hispanic/Latino older adults. The final speaker, Dr. Jamaine Davis will present on the genetic factors that may contribute to dementia in African American older adults. The featured talks by rising stars deepen our understanding of the influence of diversity and key discoveries so we can reimagine aging research.

DIFFERENCES IN LIFE COURSE PATHWAYS TO DEMENTIA INCIDENCE FOR BLACK AND WHITE OLDER AMERICANS

Mateo Farina, *University of Southern California, Los Angeles, California, United States*

Black Americans are 2-3 times more likely to have dementia than White Americans. Studies have evaluated how differences in exposures to life course risk factors, such as level of education, may be contributing to this disparity. When using this approach, substantial reductions in cognitive health inequality across race were accounted for, but not completely explained. However, this research assumes an underlying similarity in life course pathways to cognitive impairment risk across race groups. We used longitudinal data from the Health and Retirement Study (2000-2016) to evaluate life course pathways to dementia risk across race groups. We find substantial differences across race groups. Dementia risk for older black adults is greatly shaped by southern birth and education. For older white adults, adulthood factors such as wealth, health behaviors, and cardiometabolic conditions has a greater role. Our findings support calls for a closer examination of within group analysis among minoritized populations.

VARIABLE PREDICTORS OF COGNITIVE PERFORMANCE WITHIN ETHNIC/RACIAL GROUPS USING A COMPUTERIZED COGNITIVE BATTERY

Kacie Deters, *University of California, Los Angeles, Inglewood, California, United States*

The Computerized Cognitive Composite (C3) may provide an efficient assessment of early cognitive impairment to inform early interventions and screening criteria for Alzheimer's disease clinical trials. The C3 battery, which includes the CogState Brief Battery, has components assessing memory, reaction time and aspects of executive function. The battery has little demand for spoken language and may reduce the sociocultural biases of traditional paper-and-pencil tests. The goal of this project was to determine demographic and genetic predictors of cognitive performance on the C3 battery across different ethnic/racial groups. We examined 4,026 cognitively normal participants (self-identified non-Hispanic Black, Asian, or White; Hispanic) at baseline visit from the Anti-Amyloid Treatment in Asymptomatic Alzheimer's Disease (A4) clinical trial. Linear models were performed to examine the association of C3 and years of age, years of education, gender/sex, and Apolipoprotein E (APOE) genotype, within ethnic/racial group. We found variation in demographic and genetic risk factors that predicted cognitive performance within ethnic/racial groups. These findings highlight the importance of within group analysis to identify risk factors for cognitive impairment.

UNDERSTANDING CULTURAL DIFFERENCES OF SOCIAL ISOLATION AND ITS EFFECTS ON COGNITIVE FUNCTION OF HISPANICS/LATINOS

Mirna Arroyo-Miranda[1], Andrea Ochoa-Lopez[2], and Luis Medina[2], *1. University of Houston (Collaborative on Aging Research and Multicultural Assessment), Houston, Texas, United States, 2. University of Houston, Houston, Texas, United States*

Social isolation negatively impacts cognitive health. Although the mechanism is not fully understood, cultural values such as familismo, may help partially explain this susceptibility. Our work sought to understand how cultural differences in objective and perceived social isolation affect cognitive performance of Hispanic/Latinos (H/L) compared to non- H/L Whites. In our first study, using the TARCC dataset, objective covariates of social isolation (i.e. marital status, number of children, number of siblings, living situation), significantly explained a higher percentage of the variance in composite cognitive scores of H/Ls, compared to non-H/L Whites. In our second study, using the HABS-HD dataset, personal and health characteristics influenced the effect of perceived social isolation on cognitive status among older adults. Furthermore, compared to non-H/L Whites, fewer factors accounted for greater variance in cognition of H/Ls. Results suggest enhancing social connectedness of H/L older adults could be a modifiable factor for prevention of cognitive decline.

A MOLECULAR LENS FOCUSED ON UNDERSTANDING ALZHEIMER'S DISEASE HEALTH DISPARITIES

Jamaine Davis, *Meharry Medical College, Nashville, Tennessee, United States*

Alzheimer's disease (AD), the most common cause of dementia in older adults, disproportionally affects African Americans (AA) with an incidence rate as much as three times higher, compared to other racial/ethnic groups. Multiple factors contribute to this racial disparity however, an in-depth understanding of the biological or genetic contributions does not exist. Compelling evidence indicate that genetic variants of the lipid transport protein, ABCA7, is more strongly associated with AD in African Americans. To understand how ABCA7 contributes to AD on the molecular level, we used a combination of structural and cell biology techniques. Our results suggest that the ABCA7 variant (T319A) reported to confer risk in AA, may contribute to AD by reducing the levels of phosphoinositol bisphosphate (PIP2), a phospholipid reported to be decreased in the AD brain. These results provide a framework for targeting mechanisms that increase PIP2 levels as an effective strategy mitigating AD disparities.

SESSION 1450 (SYMPOSIUM)

GIVING AND GETTING ACROSS THE GENERATIONS: NEW INSIGHTS INTO INTERGENERATIONAL TIES

Chair: Deborah Carr Discussant: Deborah Carr

Population aging raises debates about who will care and provide for older adults, while shifting economic and family patterns suggest that young adults may require ongoing support from their (grand)parents. These five papers use diverse methods and data to shed new light on upward and downward intergenerational exchanges. Fingerman and colleagues use data from a small racially diverse sample of young adults (ages 18 to 29) providing care to grandparents. They document psychological benefits yet potentially harmful life course disruptions (e.g., education). Wiemers and co-authors use the Health and Retirement Study Core and COVID-19 Module to document how adult children's transfers of time, money, and coresidence changed in response to the COVID-19 pandemic. Minoritized and lower SES older adults were less likely to receive help from family members, due to children's constraints. Whitworth documents disparities in the types of support college students receive from midlife parents, using the Panel Study of Income Dynamics Transition to Adulthood Supplement. Higher SES parents tend to provide financial support, whereas lower SES parents provide coresidence. Silverstein et al. use multigenerational data from Longitudinal Study of Generations. They find religiosity of parents during the offspring's adolescence affects their cognitive and behavioral religiosity in later life. Avni uses cross-national attitudinal data from the International Social Survey Programme (ISSP) and finds that Americans believe family should be responsible elder care, whereas Israelis and Germans believe the government should provide care. The discussant highlights implications of the study results for research and policies regarding intergenerational relations.

CAREGIVING FOR AN OLDER RELATIVE IN YOUNG ADULTHOOD

Karen Fingerman[1], Shiyang Zhang[1], Zexi Zhou[1],
Yee To Ng[1], Kira Birditt[2], and Steven Zarit[3], *1. The University of Texas at Austin, Austin, Texas, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Pennsylvania State University, Pittsburgh, Pennsylvania, United States*

Caregivers are typically viewed as midlife or older individuals, but nearly 25% of self-identified caregivers are young adults (aged 18 to 29). We report findings from a small study of Hispanic/Latinx, African American, and Asian American young adult caregivers, using: quantitative and open-ended assessments and weekly diary surveys. We assessed caregiving tasks young adults provide, rewards, and detriments of providing care. In open-ended responses, young adults described their caregiving roles as emotional as well as hands on, and reported filling in for other caregivers who could not help. They reported goal disruptions (e.g., education, romantic ties) associated with caregiving, but felt they were repaying debts to their grandparents through caregiving. Diary data document vicissitudes in weekly caregiving experiences and well-being. Discussion focuses on the unique implications of caregiving ties between young adults and their grandparents when the grandparent incurs physical or cognitive health impairments.

TRACING THE RELIGIOUS LIFE COURSE: INTER- AND INTRAGENERATIONAL SOURCES OF LATER-LIFE RELIGIOSITY IN BABY BOOMERS

Merril Silverstein, Joonsik Yoon, RianSimone Harris, and Woosang Hwang, *Syracuse University, Syracuse, New York, United States*

The development of religiosity in later life has its origins in earlier phases of the life course, yet few studies have investigated the contribution of early religious exposure to religious beliefs and behaviors in old age. This investigation uses multigenerational data from the Longitudinal Study of Generations taken from 385 baby boom children, 16-26 years of age, and their parents in 1971, and follows the children's religious orientations into midlife and old age. Guided by intergenerational transmission and path dependency perspectives, we found that parents' religious intensity in 1971 strengthened their children's cognitive and behavioral religiosity in later life as mediated by children's early and midlife religiosity. Our results demonstrate both intergenerational transmission followed by temporal stability in religious belief and practice. Evidence suggests that parental influence creates religious momentum in their children that carries from adolescence/young adulthood through the unfolding of their lives into old age.

CROSS-NATIONAL DIFFERENCES IN ATTITUDES TOWARD FAMILY AND GOVERNMENTAL SUPPORT FOR ELDER AND CHILD CARE

Elinore Avni, *Boston University, Boston, Massachusetts, United States*

Population aging in wealthy western nations has raised concerns about who will provide care to older adults. At the same time, the rise of single parenthood and dual-career families has heightened the need for childcare. As governments and families face challenges in meeting these dual needs, this study compares responses to the question of "who should primarily provide" eldercare and childcare across three countries: the US, Germany and Israel. Analysis of 2012 International Social Survey Programme data reveals that while persons in the US endorse family as care providers to both older adults and children, Israelis endorse government as eldercare providers yet family as the source of childcare provision. German respondents prefer both government and family as childcare providers, yet believe the government should provide eldercare. The paper discusses how cross-national differences in attitudes toward care are associated with cultural and socio-economic characteristics, and highlights implications for policy and practice.

FINANCIAL AND TIME HELP FROM ADULT CHILDREN DURING THE COVID-19 PANDEMIC

Emily Wiemers[1], I-Fen Lin[2], Janecca Chin[2], and
Anna Strauss[1], *1. Syracuse University, Syracuse, New York, United States, 2. Bowling Green State University, Bowling Green, Ohio, United States*

Pandemic-induced challenges to health and economic well-being for older adults likely increased the need for help from adult children, disrupted the help children provided for needs unrelated to COVID-19, and changed interactions among time help, financial help, and shared housing. This paper uses data from the Health and Retirement Study Core and COVID-19 Module to assess whether adult children's transfers of time, money, and coresidence with parents responded to the pandemic-related challenges older adults faced. Because of unequal health and economic impacts of the pandemic, non-White and less-educated older adults, and those living in areas hard-hit by the pandemic may have been less likely to receive help from family members, their children may have been less able to substitute financial support for time or in-kind help, and older adults may have experienced greater disruptions in existing help arrangements so we examine differences by socioeconomic status, race-ethnicity, and local pandemic severity.

MID-LIFE PARENTS' MATERIAL SUPPORT OF CHILDREN IN COLLEGE: A TYPOLOGY AND VARIATION BY SOCIOECONOMIC STATUS

Tanya Whitworth, *Boston University, Boston, Massachusetts, United States*

Many imagine the "typical" college student to be 18-22 years old, attending a four-year institution, living on campus, and receiving financial support from parents. This perception does not align with actual patterns. While some parents facilitate this "traditional college experience" for their children, others substitute co-residence for or combine co-residence with financial support; still others provide no material support at all. Using a diverse sample of U.S. college students from the Panel Study of Income Dynamics Transition into Adulthood Supplement (n = 1,579), this paper demonstrates variation in material support provided by parents. I employ a latent class approach to categorize students into assistance "types," and then use multilevel multinomial logistic regression models to predict assistance types from parents' socioeconomic status (SES). Lower SES parents have a higher probability of providing co-residence, while higher SES parents have a higher probability of providing financial support to students living away from home.

SESSION 1460 (SYMPOSIUM)

RECOMMENDATIONS TO IMPROVE NURSING HOME QUALITY: A DISCUSSION OF THE 2022 NASEM REPORT

Chair: Jasmine Travers

Every year approximately four million persons receive care in approximately 15,000 nursing homes across the U.S. The costs of this care exceed $168 billion per year and are projected to grow to $274 billion by 2024. Nursing homes have long been plagued by problems with quality of care.In 1986, the Institute of Medicine released, Improving the Quality of Care in Nursing Homes, a landmark report that fundamentally changed the nation's approach to nursing home operation and regulation. However, three decades later, significant challenges with nursing home quality remain, many of which were brought to light during the COVID-19 pandemic. As a result, in 2020, the National Academies of Sciences, Engineering, and Medicine (NASEM) convened a panel of 17 experts in nursing home care to examine our nation's approach to nursing home care, including clinical care, staffing, financing and payment, and regulation, with the goal of making recommendations for improving the quality of care in today's nursing homes and ensuring the safety and well-being of nursing home residents and staff. Expert members represented areas of diversity, policy, regulation, education, technology, quality measurement and reporting, and clinical practice. The release of this report is April 2022.In this symposium, four committee members will present the main findings and recommendations from the forthcoming and highly-anticipated report, with a particular focus on care delivery, workforce, quality assurance & policy, and equity. During this session, an emphasis will be placed on how the presented recommendations can be incorporated into policy and practice.

LAYING THE REPORT FOUNDATIONS: A CONCEPTUAL MODEL OF NURSING HOME QUALITY OF CARE

Debra Saliba[1], Mary Ersek[2], and Marilyn Rantz[3], *1. UCLA & GLAHS VA, LOS ANGELES, California, United States, 2. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 3. University of Missouri Sinclair School of Nursing, Columbia, Missouri, United States*

The committee began its work by developing a conceptual model for achieving resident-centered care. The model draws on existing evidence about the multiple dimensions of resident quality of life and the complexity of nursing home care and environments. Dr. Debra Saliba, a professor in UCLA's Borun Center and Los Angeles VA GRECC with expertise in long-term care policy and delivery, will describe this model and how it guided the committee's recommendations. She also will discuss how each presentation fits within the model's domains

ACHIEVING QUALITY PATIENT-CENTERED CARE IN THE NURSING HOME SETTING

Colleen Galambos, *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, United States*

In 1987, The Nursing Home Reform Act was enacted as part of the Omnibus Reconciliation Act of 1987 (OBRA 87). At that time, the Health Care Finance Administration (now Centers for Medicare and Medicaid Services) issued comprehensive regulations and survey processes to "ensure that residents of nursing homes receive quality care that will result in their highest practicable physical, mental, and social well-being." Despite this landmark legislation, nursing homes struggle to provide quality care, and are additionally challenged by natural disasters and pandemics. This presentation will report on recommendations that examine, structures, policies, and care models that promote change and innovation, with a focus on safety, environmental modifications, patient centered approaches, and quality care. Dr. Colleen Galambos, a professor at University of Wisconsin-Milwaukee, with expertise in nursing home care delivery and quality improvement will present the care delivery recommendations from the NASEM report.

EXPOSING THE REALITIES OF THE WORKFORCE IN NURSING HOMES

Christine Mueller, *University of Minnesota, Roseville, Minnesota, United States*

For decades, staffing in nursing homes has been highlighted as being inadequate and directly affecting the quality of care received by residents. The COVID-19 pandemic, occurring during the committee's deliberations, further highlighted and exacerbated the multiple workforce challenges in nursing homes. The committee's recommendations related to the nursing home workforce will be presented. Dr. Christine Mueller, a professor at University of Minnesota and with expertise in staffing and quality of care, will discuss strengthening the workforce to meet complex and varied resident needs that align with the committee's recommendations.

ACHIEVING EQUITABLE QUALITY OF CARE FOR NURSING HOME RESIDENTS

Jasmine Travers, *NYU, New York City, New York, United States*

Inequities in care delivery within nursing homes are pervasive across the United States. Racial and ethnic minority residents disproportionately reside in nursing homes of poorer quality, lower staffing, and fewer resources when compared to their White counterparts. Dr. Jasmine Travers, a health services researcher at New York University and with expertise in disparities and long-term care, will present on recommendations to achieving equitable quality of care for nursing home residents.

SESSION 1480 (SYMPOSIUM)

LEVERAGING COMMUNITY-BASED KNOWLEDGE TO ADDRESS THE NEEDS OF OLDER ADULTS FROM RACIAL/ETHNIC MINORITY POPULATIONS

Chair: Catherine Garcia Co-Chair: Su-I Hou

Racially and ethnically minoritized older adults constitute the fastest-growing demographic in the United States. Yet, they are largely underrepresented in population-based studies of aging despite NIH policies encouraging inclusion since the mid-1980s. The resulting and continued exclusion of racially and ethnically diverse populations in aging research limits efforts to elucidate and better understand the determinants of health and healthy aging to improve the lives of minoritized older adults, their families, and/or communities. To enhance the inclusion of racially and ethnically minoritized older adults in recruitment, survey development, analysis, and dissemination efforts, this symposium focuses on leveraging community-based knowledge that centers the lived experiences of community members that are needed to improve health outcomes and equitable changes, especially with the ongoing COVID-19 pandemic. The first paper in this symposium highlights how Community-Based Participatory Advocacy is used in the Dine community, which includes working with indigenous older adults and decolonizing methodologies to facilitate community healing. The second paper focuses on developing culturally informed instruments to collect data on dementia care needs and resources among African immigrants. A third paper focuses on critical lessons learned in Project RAMA that provided crucial insights for a new initiative focused on Hispanic immigrant families affected by rheumatoid arthritis in Washington, DC, including recruiting through embedded community clinics and integrating community needs into the study design. The final paper discusses the meaningful inclusion of Asian American older adults regarding their demographic diversity and prioritizing engagement of community members and community-based organizations in the survey research process.

LEARNING FROM ELDERS: WORKING WITH INDIGENOUS INTERGENERATIONAL MENTORS TO ADDRESS COMMUNITY NEEDS

Karen Kopera-Frye, Karen John, and Robynn Frank, *New Mexico State University, Las Cruces, New Mexico, United States*

Tribal Critical Race Theory (Brayboy, 2005) supports the use of decolonizing methodologies such as Community-Based Participatory Research when collaborating with Indigenous communities. This paper highlights the underlying processes in working with a Dine community on an intergenerational health project. COVID had culturally disruptive effects, e.g., social isolation, on New Mexico's Dine community. This project describes what can be best thought of as Community-Based Participatory Advocacy (Kopera-Frye, John, & Frank, 2021). Navajo students interviewed 13 area chapter elders on how COVID has impacted the community, particularly with Indigenous Ways of Knowing (IWOK). Thematic analysis indicated themes of loss, stress and social isolation, and health worker effects. Resilience was indicated in response to positive outcomes from COVID including a collaboration and coming together of community. Open dialogue workshops are ongoing to facilitate community healing from COVID. The results highlight the critical necessity of starting with the community elders and using decolonizing methodologies.

A COMMUNITY-UNIVERSITY PARTNERSHIP TO ASSESS AFRICAN IMMIGRANT FAMILIES' EXPERIENCES WITH DEMENTIA

Manka Nkimbeng[1], Christina Rosebush[1], Kwame Akosah[1], Hawking Yam[1], Wynfred Russel[2], Elizabeth Albers[3], Tetyana Shippee[1], and Joseph Gaugler[1], *1. University of Minnesota, Minneapolis, Minnesota,* *United States, 2. African Career Education And Resources Inc. (ACER), Brooklyn Park, Minnesota, United States, 3. University of Minnesota School of Public Health, Minneapolis, Minnesota, United States*

African immigrants are a fast-growing segment of the U.S. Black population, but the dementia care needs and resources of this population are not fully understood. We will describe the process of developing culturally informed instruments to collect data on dementia care needs and resources among African immigrants. Working together with a diverse project advisory board, a guide was developed and used to conduct community conversations about experiences with dementia/memory loss. Qualitative findings from these conversations were used to inform the development of a survey for quantitative data collection. Despite the challenges of conducting research during a global pandemic, having trusting relationships with a partnering community organization and project advisory board facilitated the successful development of instruments to conduct preliminary dementia care research in an underserved population. We anticipate that survey results will inform interventions that increase education, outreach, and access to dementia care and caregiving resources for this population.

THE TIES THAT RECRUIT, RETAIN, AND BIND: ENGAGING HISPANIC IMMIGRANT FAMILIES IN THE TIME OF CRISIS

Jielu Lin[1], Anna Wilkinson[2], and Laura Koehly[1], *1. National Institutes of Health, Bethesda, Maryland, United States, 2. University Of Texas School of Public Health, Austin, Texas, United States*

In 2008, we launched Project RAMA (Risk Assessments for Mexican Americans) in Houston, Texas, seeking to understand how multigenerational Mexican immigrant families communicate about familial risk for complex disease. Several lessons were learned. First, our community advisory committee endorsed research goals. Second, we listened to the community with regards to immigration concerns and structural racism. Finally, in the summer and fall of 2008, Hurricane Ike struck the region. Because our team provided support and resources to families in need, we had a higher participation rate post-disaster. Pausing recruitment and postponing assessments led us to unexpectedly discover a long-term intervention effect that was not originally hypothesized. These lessons guide a new initiative focused on Hispanic immigrant families affected by rheumatoid arthritis in Washington DC. We discuss how we address challenges in the on-going project during the Covid pandemic, including recruiting through embedded community clinics and integrating community needs into study design.

COMMUNITY-ENGAGED STRATEGIES FOR RECRUITMENT OF ASIAN AMERICAN OLDER ADULTS

Lan Đoàn[1], Simona Kwon[2], Chau Trinh-Shevrin[1], and Stella Yi[1], *1. NYU Grossman School of Medicine, New York, New York, United States, 2. NYU School of Medicine, New York, New York, United States*

Asian Americans one of the fastest growing older adult populations in the U.S., and are emerging as a high-need, lower-income population. Inclusion of Asian Americans in research is critical given anti-Asian rhetoric and hate crimes targeting Asian American older adults and because Asian Americans are the fastest growing racial/ethnic group in the U.S. We focus on recruitment strategies used during the implementation of 11 primary collection data efforts, including national and regional community health resources and needs assessment surveys, launched during the COVID-19 pandemic (starting May 2020). Unique recruitment challenges included the heterogeneity of language, culture, and sociodemographic characteristics of participants, digital literacy, and survey fatigue. Effective recruitment facilitators included: prioritizing community engagement at all research stages; aligning the research purpose with community priorities; recruitment through community-based organizations and bilingual community health workers; translating survey instruments; and regularly scheduled meetings with community-based organizations to discuss the survey progress.

SESSION 1490 (SYMPOSIUM)

LIFE AFTER LOSS: EMERGING INSIGHTS ON GRIEF ADJUSTMENT AND HEALTH IN LATE LIFE

Chair: Emily Mroz Co-Chair: Sara Hackett Discussant: Deborah Carr

Recent scholarship recognizes that grief adjustment is not a staged, linear process. In late life, the loss of close others is common and dynamic. However, little is known about the ‘ripple effects’ from loss experiences. As people are living longer, it is important to gain insight regarding how loss is processed, carried, and used for self-direction. This symposium responds to GSA’s 2022 meeting theme of “Reimagining Aging” by presenting emerging research which reimagines grief adjustment across diverse populations. To begin, Sara Hackett, PhD will share her work on the continuing bonds of older conjugally bereaved women and how they shape perceptions about repartnering. Following, Emily Mroz, PhD will present on affective sequences in final memories from past spousal loss and demonstrate how sequences predict future caregiving confidence in these widowed older adults. Danielle McDuffie, MA will add to this rich discussion by shedding light on predictors of bereavement and grief outcomes specific to Black adults. Last, Holly Prigerson, PhD will outline unmet psychological needs of family caregivers of patients who die in ICU settings and present her work on EMPOWER, an intervention aimed to reduce psychological distress and foster caregiver adjustment across the loss experience in this setting. Stephanie Wladkowski, PhD, our discussant, will tie these perspectives together, facilitating an important dialogue regarding classic and newly-considered impacts of grief in late life. Further, she will discuss how through more closely examining peoples’ experiences during and after loss, we can recognize late-life bereavement as shaping self-perceptions, relationships, and mental health.

THE GUIDING POWER OF LOSS REFLECTION: FINAL MEMORIES AND FUTURE CARE

Emily Mroz, *Yale University, New Haven, Connecticut, United States*

The life story framework emphasizes that past loss experiences guide current attitudes and behaviors. Final memories from the death of a spouse promote post-loss meaning-making. Through reliable narrative analysis, this study delineates positive and negative affective sequences in final memories from spousal loss in older adults ($N = 65$; $Mage = 81.59$). It also examines reported confidence in successfully caring for another seriously ill close other the future. Results demonstrate that 62% of participants narrated their final memories with affect, and 38% told semantic, affectively neutral narratives. Additionally, those who narrated positive or neutral final memories exhibited more confidence in future caregiving than those who narrated negative memories, t = 2.24, p < .05. As care systems are increasingly reliant on family members to provide car for the seriously ill, links between past loss experiences, current caregiving confidence, and future care mastery emerge as areas of research prioritization.

CONTINUING BONDS OR UNBREAKABLE VOWS?: CONJUGALLY BEREAVED WOMEN'S PERCEPTIONS ABOUT REPARTNERING

Sara Hackett, *University of South Florida, Tampa, Florida, United States*

The death of a romantic partner is regarded as one of life's most traumatic events. Despite established benefits from repartnering, women are typically less likely to repartner than men. Women oftentimes live longer than men and carry their grief into old age, but little is known about their integration of their loss into their lives going forward. Twenty conjugally bereaved women (Mean age = 78) participated in one 90-minute semi-structured interview to discuss their grief and their perceptions of their futures without their deceased partner. Thematic analysis revealed that participants viewed the deceased as an integral member of their present-day social convoy. Furthermore, participants expressed that they were averse to entering new romantic relationships because of either allegiance to the deceased, hesitancy about their age, or disinterest in caregiving for a subsequent partner. By exploring the reasons behind women's resistance to repartnering, interventions may be developed to better support them.

PSYCHOLOGICAL RESPONSES TO IMPENDING AND PAST LOSS OF A LOVED ONE

Holly Prigerson, *Weill Cornell Medicine, New York City, New York, United States*

Psychological responses to an impending or recent death have received minimal attention in the research literature. I will present data to demonstrate the high levels of psychological distress (e.g. symptoms of peritraumatic stress, anxiety, depression and grief) reported by caregivers of a loved one with a life-threatening illness. I will report on studies that have examined how grief symptoms change over time, or not, as in the case of symptoms of Prolonged Grief Disorder (PGD) – a new addition to the Diagnostic and Statistical Manual of Mental Disorders -5-Text Revision (DSM-5-TR). A case will then be made for addressing psychological struggles of caregivers of patients who are dying in the intensive care unit (ICU). I will then present a conceptual model and manual of our psychosocial intervention (EMPOWER), which we designed to reduce symptoms of PGD and posttraumatic stress disorder (PTSD) by targeting symptoms of experiential avoidance and promoting adaptive coping.

HOW DO INTERPERSONAL FACTORS AFFECT GRIEF AMONG BLACK MIDDLE- TO OLDER-AGED ADULTS?

Danielle McDuffie, *The University of Alabama/ Durham VAMC, Tuscaloosa, Alabama, United States*

This talk will explore: 1) the conceptual importance of select interpersonal factors inherent to Black culture and bereavement, and 2) the impact of these factors on grief in a Black bereaved sample. 103 Black adults aged 45+ were administered items assessing cultural (communalism, experienced racial violence) and bereavement-specific (expectancy and suddenness of loss, closeness to the deceased, anger) factors. Using linear regressions, closeness (p<.001), suddenness (p=.020), anger (p<.001), and communalism (p<.001) predicted reported levels of grief. This study identifies factors which substantially dictate the experienced levels of grief of bereaved Black adults in the latter half of life. With cultural factors notably impacting the Black bereavement experience, individuals seeking to work with this population must adopt strategies to keep bereaved Black adults connected to their communities throughout their loss. Resources to support Black adults in maintaining healthy continuing bonds with the deceased through abrupt or unsettling losses also appear paramount.

SESSION 1500 (SYMPOSIUM)

LIVED EXPERIENCES OF OLDER CHINESE IMMIGRANTS IN AFFORDABLE HOUSING DURING THE PANDEMIC: STRESS AND RESILIENCE

Chair: Kexin Yu Co-Chair: Iris Chi Discussant: Fei Sun

Older immigrants in affordable housing have unique sets of challenges during the COVID-19 pandemic posed by limited English proficiency and resources. The aggregated living condition could increase their risk of being exposed to the contagious disease. This symposium reports empirical findings of the social Network of Immigrant Chinese older adults in affordable Housing Environment (NICHE) project, which focused on the influence of COVID-19 on underprivileged Chinese older immigrants. We conducted 27 semi-structured interviews with foreign-born older Chinese immigrants (mean age 78.1, 69.23% female) in an affordable housing in Los Angeles to learn about their lived experiences and coping strategies during the COVID-19 pandemic. The first presentation focused on the changes in older Chinese immigrants' social life after the onset of the pandemic and aimed to understand the pandemic's impact on their depressive symptoms and loneliness. The second presentation describes older Chinese immigrants' perceived pandemic-related stressors and resilience across phases of the pandemic, including at the beginning, after they got vaccinated, and the rising of delta variant. The participants explained what supportive services had been helpful and what support they wished they could have over the past two years in the pandemic. The third presentation reports the experience of being discriminated against during the pandemic, the Chinese older adults' attitudes towards these discriminatory events, and coping strategies. Together, these three presentations will depict the lived experience of Chinese immigrants over two years during the pandemic and discuss intervention strategies and policy considerations for preparing for future crisis like the COVID-19 pandemic.

SOCIAL NETWORK AND MENTAL HEALTH OF OLDER CHINESE IMMIGRANTS IN AFFORDABLE SENIOR HOUSING DURING THE COVID-19 PANDEMIC

Kexin Yu[1], Jiaming Liang[2], Yi-Hsuan Tung[2], Mutian Zhang[3], Luyan Yang[2], Shinyi Wu[2], and Iris Chi[2], *1. Oregon Health & Science University, Palo Alto, California, United States, 2. University of Southern California, Los Angeles, California, United States, 3. University of Southern California, Los Angele, California, United States*

Chinese older immigrants who live in senior housing communities are at high risks of experiencing discrimination and social isolation during the COVID-19 pandemic. This study examines how and to what extent the pandemic has affected this population's social network and mental health. Participants reported a decrease in social contact with their family and friends. Before the pandemic, many paid regular visits back to the home country and could not do so in the past two years. The loss of connection left some feeling despaired and expressed uncertainty on whether they could ever go back "home" before death. Participants also reported being in a low mood and feeling bored constantly. Participants reported resilience generated from their religious beliefs, having neighbors as role models, and wisdom learned from past life experiences. Knowledge produced in this project can inform the planning for responding to future crises in affordable senior housing.

STRESS AND RESILIENCE ACROSS PHASES OF COVID-19: A QUALITATIVE STUDY WITH OLDER CHINESE IMMIGRANTS

Yi-Hsuan Tung[1], Kexin Yu[2], Jiaming Liang[1], Shinyi Wu[1], and Iris Chi[1], *1. University of Southern California, Los Angeles, California, United States, 2. Oregon Health & Science University, Palo Alto, California, United States*

The COVID-19 pandemic has challenged older Chinese immigrants' lives in physical, psychological, social, and spiritual aspects. This study employed a socioecological perspective of resilience to examine how older Chinese immigrants perceived and navigated through pandemic-related adversities. We conducted a time-bound retrospective qualitative investigation to capture participants' lived experiences between December 2019 to August 2021. Three phases of the pandemic-related adversities were identified, including uncertain threats and psychological impacts at the beginning, unmet needs and fatigue at 2nd and 3rd wave of infections, and benefit-risk balance after vaccinated. Despite adversities, the integration of strengths, opportunities, and social services at the individual, interpersonal, and neighborhood levels allows participants to appraise and individualize their problem-focus coping (e.g., risk mitigation), selective engagement (e.g., maintaining habits through other means), or emotion-focus coping strategies (e.g., acceptance). Findings highlight the importance of personal and community resources in fostering resilient responses.

DISCRIMINATION AND COPING AMONG OLDER CHINESE IMMIGRANTS DURING THE COVID-19 PANDEMIC: A QUALITATIVE STUDY

Jiaming Liang[1], Kexin Yu[2], Yi-Hsuan Tung[1], Choi Ha Li[1], Shinyi Wu[1], and Iris Chi[1], *1. University of Southern California, Los Angeles, California, United States, 2. Oregon Health & Science University, Palo Alto, California, United States*

Discriminatory events against Asians, especially Chinese, became rampant during the COVID-19 pandemic. It is difficult for older Chinese immigrants to effectively protect themselves from racism-related attacks due to their personal and social disadvantages. This study explored older Chinese immigrants' experience of discrimination and coping strategies, as well as factors that influence their perceptions, attitudes, and coping preferences. Among 27 interviewees, 11 experienced discriminatory incidents themselves or known people around had been discriminated against during the pandemic. Thematic analysis revealed negative psychological impact of discrimination risk or experience. Most participants tended to adopt disengagement coping styles, such as avoidance, rationalization, and reducing social participation. Three primary influencing factors are: (1) perceived unkindness from government and public opinions; (2) concern for own health; (3) limited acculturation. Our findings suggest needing efforts to protect the safety of older Chinese immigrants, and raise their awareness and ability to defend themselves from racism and discrimination.

SESSION 1510 (SYMPOSIUM)

NORTH AMERICAN CONTEXTS USING COMPUTERIZED NETWORKS TO IMPROVE CARE DELIVERY FOR OLDER ADULTS

Chair: Gregory Alexander

Evidence shows that technology provides a means to improve communication and quality of care, through greater efficiencies in information management. However, research demonstrates that technology use does not consistently improve care. Therefore, there is a continuing need globally to evaluate and discuss the impact of technology in clinical care, especially in settings where older people have higher care needs. The panel includes five interdisciplinary experts with backgrounds in care delivery systems for older adults, engineering, informatics, health systems, quality improvement, mobile health, medicine, and nursing from the U.S. and Canada. This expert panel has three objectives: 1) Describe informatics research initiatives using computerized networks to improve care delivery for older adults, 2) Contrast information technologies used to manage information in health systems caring for older adults, and 3) Explain opportunities to improve health information technology systems used in care delivery for older adults.

THE ASSOCIATION BETWEEN NURSING HOME IT MATURITY AND UTIS AMONG LONG-TERM NH RESIDENTS

Gregory Alexander, *Columbia University, New York, New York, United States*

Prof. Alexander will present a study linking national nursing home (NH) health information technology (HIT) to quality. This research explores relationships between NH HIT maturity and UTIs examined during a repeated cross-sectional study over 4 consecutive years (2013-2017). HIT maturity represents the diversity of technology use in NHs. Researchers conducted bivariate and multivariate regressions using MDS 3.0 resident assessments and post stratified survey weights controlling for NH characteristics. Our sample included 816 NHs. These NHs had 219,730 regular NH resident assessments within 90 days of a survey, representing 80,322 unique NH residents. Of these assessments, 4.1% recorded a UTI. In the multivariate analyses, administrative HIT capabilities was associated with lower odds of UTI (AOR: 0.906, 95% CI: 0.843, 0.973), controlling for covariates. Integration of administrative HIT systems may relieve the burden of tracing UTIs, data documentation and record retrieval affording NH staff time to focus their efforts on clinical care.

WHAT IS THE DIGITAL MATURITY OF LONG-TERM CARE HOMES IN ONTARIO? A SURVEY PROTOCOL

Ramtin Hakimjavadi, *University of Ottawa, Ottawa, Ontario, Canada*

Ramtin Hakimjavadi will discuss the barriers and facilitators of implementing a health information technology (HIT) maturity survey in the Canadian context. Alongside Dr. Liddy's team, he is supporting the adaptation of the survey into a Canadian context, followed by a pilot study to distribute the survey to select nursing homes. Drawing from this work, Mr. Hakimjavadi will highlight the barriers and facilitators associated with the process of implementing the HIT maturity survey. Expected challenges include adjusting the survey format for respondents with limited resources, identifying a central contact within each nursing home, optimizing the survey user interface to limit response burden, and developing recruitment strategies to increase response rate. These challenges and the strategies to overcome them, impressions of the current state of HIT in Ontario nursing homes, and proposed action items to trend digital maturity in these settings over time will be discussed.

A NATIONAL SNAPSHOT OF INFORMATION SHARING DURING CARE TRANSITIONS BETWEEN HOSPITALS AND SNFS

Julia Adler-Milstein, *University of California, San Francisco, San Francisco, California, United States*

Prof. Adler-Milstein will present national survey results about skilled nursing facilities (SNFs) information sharing with referring hospitals. The survey, which garnered a 53% response rate, found significant gaps in information sharing. Of 471 hospital-SNF pairs, 64 (13.5%) reported excellent performance on 3 dimensions of information sharing (completeness, timeliness, and usability), whereas 141 (30.0%) were at or below the mean performance. Having a hospital clinician on site at the SNF was associated with more complete (odds ratio, 1.72; P = .03), timely (odds ratio, 1.76; P = .02), and usable (odds ratio, 1.64; P = .04) information sharing. Hospital accountable care organization participation was associated with more timely information sharing (odds ratio, 1.88; P = .02). Despite significant federal investment in hospital health IT infrastructure, we conclude that hospitals are not tailoring information sharing processes to ensure that SNFs receive timely, complete, and usable information.

ECONSULT IMPROVES ACCESS TO SPECIALIST ADVICE FOR PRIMARY CARE PROVIDERS

Celeste Fung[1], and Clare Liddy[2], *1. University of Ottawa, Department of Family Medicine, Ottawa, Ontario, Canada, 2. University of Ottawa, Ontario, Ontario, Canada*

Dr. Liddy will present an overview of the Champlain BASE™ eConsult service, with a focus on its implementation in long-term care (LTC). eConsult is a secure web-based tool that enables providers to communicate electronically with specialists concerning a patient's care. Evaluation of over 100,000 cases has consistently demonstrated positive impacts on access to care: PCPs receive responses in a median of 0.9 days, and two-thirds of cases are resolved without the patient needing a face-to-face specialist visit. A cross-sectional analysis of eConsult cases sent from LTC settings in 2018 demonstrated similar response times and referral avoidance to the larger sample (a median response time of 0.6 versus 0.9 days; proportion of cases resolved without a specialist visit 70% versus 67%). These findings, coupled with eConsult's proven success at improving access to and equity of care, demonstrate the importance of supporting eConsults expansion.

BARRIERS AND FACILITATORS FOR ECONSULT: IMPROVING ACCESS TO SPECIALIST ADVICE IN LONG-TERM CARE

Celeste Fung, *University of Ottawa, Department of Family Medicine, Ottawa, Ontario, Canada*

Long-term care (LTC) residents continue to receive most of their specialist care outside of the home. These visits present significant risks and burdens for residents. Such risks can be mitigated by eConsult, which facilitates timely, resident-specific, and practical recommendations between primary care providers (PCPs) and specialists to support clinical decision making, reduce unnecessary transfers, and positively impact resident care and quality of life. During focus groups in LTC homes where eConsult is used, PCPs, senior leadership, and a nurse champion recognized eConsult as having great value for residents, especially those with challenges travelling outside of the home. However, they also described LTC homes as under resourced, with minimal IT infrastructure and coupled with time constraints present barriers to eConsult adoption in LTC. Enabling factors (engaging clinician champions, establishing delegates, integration into existing workflows) similarly identified as supporting eConsult implementation more broadly were discussed.

SESSION 1530 (PAPER)

SUPPORTING DIRECT CARE PROVIDERS

BETTER NP PRACTICE ENVIRONMENTS REDUCE HOSPITALIZATION DISPARITIES AMONG DUALLY ENROLLED PATIENTS

Jacqueline Nikpour[1], Heather Brom[2], Aleigha Mason[1], Jesse Chittams[1], Lusine Poghosyan[3], and Margo Brooks Carthon[1], *1. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 2. Villanova University M. Louise Fitzpatrick College of Nursing, Villanova, Pennsylvania, United States, 3. Columbia University, New York, New York, United States*

Adults dually-enrolled in Medicare and Medicaid experience twice as many hospitalizations and higher rates of ambulatory care-sensitive conditions (ACSCs) – such as coronary artery disease [CAD] and diabetes, compared to Medicare-only patients. Nurse practitioners (NPs) are well-positioned to address care needs of dually-eligible patients, yet NPs often work in unsupportive clinical practice environments. The purpose of this study was to examine the association between the NP primary care practice environment and disparities in all-cause hospitalizations between dually-eligible and Medicare-only patients with ACSCs. Using linked secondary cross-sectional data from the Nurse Practitioner Primary Care Organizational Climate Questionnaire (NP-PCOCQ) and Medicare claims files, we examined 189,420 patients with CAD and/or diabetes (19.1% dually-eligible, 80.9% Medicare-only), cared for in 470 practices employing NPs across four states (PA, NJ, CA, FL) in 2015. After adjusting for patient and practice characteristics, dually-eligible patients in poor practice environments had the highest odds of being hospitalized compared to their Medicare-only counterparts (OR 1.60, CI: 1.49-1.71). In mixed practice environments, dually-eligible patients had approximately 48% higher odds of a hospitalization (OR 1.48, CI 1.31-1.68), while in the best practice environments, dually-eligible patients had approximately 37% higher odds (OR 1.37, CI 1.21-1.57, p < .001). As policymakers look to improve outcomes and reduce costs among dually-eligible patients, addressing a modifiable aspect of care delivery in NPs' clinical practice environment is a key opportunity to reduce hospitalization disparities. Yet further efforts are needed to address remaining disparities by meeting patients' health-related social needs, such as poverty and access to care.

CARE WORKERS' ADMINISTRATIVE BURDEN IN SWISS NURSING HOMES: A MULTICENTER CROSS-SECTIONAL STUDY

Dietmar Ausserhofer[1], Waltraud Tappeiner[2], Heike Wieser[2], Lauriane Favez[3], and Franziska Zúñiga[3], *1. College of Healthcare Professions Claudiana, Bozen-Bolzano, Trentino-Alto Adige, Italy, 2. College of Healthcare Professions Claudiana, Bolzano, Trentino-Alto Adige, Italy, 3. University of Basel, Basel, Basel-Stadt, Switzerland*

Apart from 'direct' resident care, care workers in nursing homes also perform tasks that are related to organizational or management activities. 'Indirect' care activities, such as administrative tasks, are often considered as burdensome, as they increase overall workload and keep care workers away from caring for their residents. So far, there is little investigation on care workers' administrative burden. The multicenter cross-sectional Swiss Nursing Homes Human Resources Project (2018) study included a convenience sample of 118 Swiss nursing homes and 2207 care workers (i.e., registered nurses and licensed practical nurses). Care workers completed questionnaires assessing the administrative burden, staffing and resource adequacy, leadership ability, implicit rationing of nursing care and care worker characteristics and outcomes. For the analysis, we applied 2-level binomial generalized linear mixed models. Overall, 73.91% (n=1561) of care workers felt strongly or rather strongly burdened, with one third (36.6%, n=787) reporting to spend 2h or more during a "normal" day performing administrative tasks. Ratings ranged from 42.6% (n=884; ordering supplies and managing stocks) to 75.3% (n=1621; filling out the patient's medical record). One out of four care workers (25.5%, n=561) intended to leave the profession, whereby care workers reporting higher administrative burden (OR=1.24; 95%CI: 1.02-1.50) were more likely to leave the profession. This study provides first insights on care workers' administrative burden in nursing homes, which can inform the development of interventions to reduce the workload related to 'indirect care activities' and to improve care workers' job satisfaction and retention in the profession.

EMBRACING SPIRITUALITY IN THE WORK OF FRONTLINE NURSING HOME STAFF

Ruth Palan Lopez[1], Meghan Hendricksen[2], Ashley Roach[3], Anita Hendrix Rogers[4], and Susan Mitchell[2], *1. MGH Institute of Health Professions, Sharon, Massachusetts, United States, 2. Marcus Institute for Aging Research, Roslindale, Massachusetts, United States, 3. OHSU, Portland, Oregon, United States, 4. University of Tennessee Martin, Parsons, Tennessee, United States*

Good end-of-life care for nursing home (NH) residents and their families provides for spiritual support, however, the role that spirituality plays in the work of NH staff has not been well described. To understand more about spirituality and NH staff, we examined interview data generated from the Assessment of Disparities and Variation for Alzheimer Disease Nursing Home Care at End of Life (ADVANCE) study, a large qualitative study conducted in 14 NHs to examine differences in end-of-life care for residents with advanced dementia. We examined semi-structured interview data from nurses (Registered Nurses and Licensed Practical Nurses) (n=45) and certified nursing assistants (CNAs) (n=25) who described the role of spirituality or God in response to questions around their experience caring for residents with advanced dementia. Data were analyzed using the constant comparative method. Most participants were female (93%). Thirty-four identified as Black, 29 as white, and 7 as other racial groups. The average age was 47.8 years, and the average years of experience was 16.2 years. Participants reported several religious affiliations including Baptist (23); Agnostic/Atheist (2), Catholic (7), Methodist (4), Muslim (1), Other/Unaffiliated/Refused (18), Pentecostal (4), and Christian (9). We found that for many nurses and CNAs, God played an important role in their work including providing meaning and purpose, providing them with resilience to cope with frequently losing residents that they consider "family." The voices of the participants were powerful and provide important insights into potential strategies to retain and support these essential, front-line providers.

STRATEGIES TO ADDRESS COVID-19 VACCINE HESITANCY AMONG OHIO NURSING HOME STAFF

Miranda Kunkel, Robert Applebaum, and Matt Nelson, *Miami University, Oxford, Ohio, United States*

Background: Nursing home staff members unvaccinated against COVID-19 pose an ongoing public health risk considering their frequent contact with older adults, a population especially vulnerable to the virus. In order to address vaccine hesitancy and foster vaccine confidence effectively among nursing home staff, evidence-based health communication strategies are necessary.

Methods: Using a dataset composed from three sources of Ohio nursing home data, the research questions guiding this study are as follows: 1) What is the relationship between engaging in various strategies to address vaccine hesitancy and vaccination rates among staff?; 2) Does hiring infection preventionists affect vaccination rates among staff? Multivariable linear regression techniques were used to assess all variables.

Results: Peer counseling and providing time off to the staff for vaccination statistically significant strategies to reduce vaccine hesitancy among staff. Compared to facilities that did not engage in peer counseling, those that did saw an average increase of 3.6% of their staff vaccinated. Compared to facilities that did not provide time off to their staff for vaccination, those that did saw an average increase of 4.2% of their staff vaccinated. Discussion: Peer counseling should be pursued as a viable strategy for fostering vaccine confidence among nursing home staff and further studied in more diverse populations. Implications for nursing home staff acceptance of facility-wide initiatives will be discussed.

STRATEGIES TO IMPLEMENT AGE-FRIENDLY CARE FOR OLDER ADULTS ACROSS CONVENIENT CARE CLINICS

Heba AlDossary[1], Anna Bender[2], Megan Foradori[2], Anne Pohnert[3], Robin Hughes[2], Sherry Greenberg[4], and Mary Dolansky[5], *1. Frances Payne Bolton School of Nursing at Case Western Reserve University , Cleveland, Ohio, United States, 2. Case Western Reserve University, Cleveland, Ohio, United States, 3. CVS Health MinuteClinic, Woonsocket, Rhode Island, United States, 4. Monmouth University, Marjorie K. Unterberg School of Nursing & Health Studies, West Long Branch, New Jersey, United States, 5. Frances Payne Bolton School of Nursing at Case Western Reserve University, Cleveland, Ohio, United States*

A growing proportion of the population in the United States are older adults, and they are frequent users of convenient care clinics. This is particularly true for older adults from systematically marginalized communities who may be at greater risk for chronic health conditions and unmet healthcare needs. These trends render convenient care clinics critical sites to reimagine the provision of care for older adults. To improve the quality of care the CVS MinuteClinic implemented the Institute of Healthcare Improvement's Age-Friendly Health Systems 4Ms Framework (assessing What Matters, Medication, Mentation, and Mobility). Research to evaluate two interventions (reflective learning and virtual clinic participation) to improve healthcare providers' (HCP) uptake of the 4Ms was implemented. After the interventions, HCPs were provided a self-administered online survey to capture qualitative reports of reflections on learning and implementing the 4Ms. A total of 32 providers from both groups completed the survey. Using a codebook thematic analysis approach, facilitators and barriers for implementation were identified as were HCPs' innovative approaches to consistently and effectively implement the 4Ms. Facilitator themes were the presence of resources (e.g., peer coaches) and the perceived value of the 4Ms model. Barrier themes included time, documentation issues, workflow challenges, HCP stress, and HCP comfort. Innovation themes included designing efficient workflows, scaffolded 4Ms learning, and collaboration. These findings underscore the supports/innovations to amplify and challenges to address to support HCPs in learning and implementing the 4Ms to improve the quality of care for older adults.

SESSION 1540 (SYMPOSIUM)

SUPPORTING FAMILY CAREGIVING FOR PERSONS WITH DEMENTIA FROM CULTURAL AND LIFE-COURSE PERSPECTIVES

Chair: Jing Wang Co-Chair: Bei Wu

Providing person-centered and culturally sensitive support for persons with dementia and their family caregivers is critically important. This symposium focuses on understanding and supporting decision-making and family caregiving through a lens of a life course perspective. The first study explored Black and White family caregivers' experience of adjusting to their new role as caregivers of persons with dementia during the COVID-19 pandemic. The pandemic added to the complexity of their challenges and demonstrated the need for person-centered support. The second study provided insights into Chinese American family caregivers' attitudes toward and the preference of shared family decision-making on tube feeding for their family members with dementia. Almost all the participants considered pain and discomfort relief as a priority in decision making. The third study synthesized the literature on decision aid interventions for family caregivers of older adults with advanced dementia regarding tube feeding. The study found that culturally sensitive and family-centered decision aid interventions are needed to support the decision-making of tube feeding. The fourth study used data from two national databases and identified positive aspects of caregiving. It highlighted the significance of tailoring support for family caregivers based on their caregiving responsibilities and care recipients' cognitive status to enhance the positive aspects of caregiving. The last scoping review identified and synthesized existing technology-based interventions to address social isolation and loneliness among informal dementia caregivers. The results suggested that technology-based interventions could reduce feelings of loneliness and improve caregiver well-being.

THE ATTITUDES OF CHINESE AMERICAN FAMILY CAREGIVERS OF OLDER PEOPLE WITH DEMENTIA TOWARD TUBE FEEDING

Yaolin Pei[1], Xiang Qi[1], Zhen Cong[2], and Bei Wu[3], *1. New York University, New York City, New York, United States, 2. School of Social Work, Arlington, Texas, United States, 3. New York University, New York, New York, United States*

The aim of this study is to examine the attitudes toward feeding in Chinese American dementia family caregivers. 53 Chinese American dementia caregivers were interviewed in 2021-2022. The survey included their anticipated decisions for tube feeding if their care recipients are at the end of life, goals of care, and knowledge of tube feeding. 32.7% of them would choose tube feeding for individuals with dementia at the end of life; however, 53.9% are confident that the patient would not choose tube feeding if patients are able to make decisions. 92.3% prepared to relieve pain and discomfort as much as possible. 42.3 % of them thought tube feeding are recommended to use if oral feeding difficulties arise. More than 60% thought tube feeding can improve survival and nutrition status. More education is needed for the decision-making regarding tube feeding at the end of life for Chinese American dementia caregivers.

POSITIVE ASPECTS OF CAREGIVING IN DIFFERENT CAREGIVER GROUPS

Mengyao Hu[1], Dena Schulman-Green[2], Emma Zang[3], and Bei Wu[1], *1. New York University, New York, New York, United States, 2. Rory Meyers College of Nursing, New York University, New York City, New York, United States, 3. Yale Sociology Department, Yale University, New Haven, Connecticut, United States*

Previous studies have disproportionately focused on caregivers' negative experiences while overlooking the positive aspects of caregiving (e.g., quality of caregiver – care recipient relationship, meaningfulness of caregiving, and family cohesiveness) especially for caregivers of older adults with cognitive impairment. Therefore, we aim to identify how positive aspects of caregiving varied by care recipients' cognitive status (e.g., normal, mild cognitive impairment, dementia) and caregivers' relation to care recipients (e.g., spouse, adult child, other family member). We applied multilevel mixed-effects models on pooled three-wave data from the National Study of Caregiving and the National Health and Aging Trends Study (N = 2,717). The findings suggested that dementia and spouse caregivers had worse relationship with their counterparts. Overall, future research needs to study caregiver's experience integratively and focuses on caregiver's individual need. Policy makers need to fulfill caregiver's demands by establishing socially supportive programs.

DECISION-AID INTERVENTIONS TO SUPPORT DEMENTIA CAREGIVERS' DECISION-MAKING ABOUT FEEDING OPTIONS

Xiang Qi[1], Yaolin Pei[1], Dena Schulman-Green[2], Mengyao Hu[3], Kaipeng Wang[4], and Bei Wu[3], *1. New York University, New York City, New York, United States, 2. Rory Meyers College of Nursing, New York University, New York City, New York, United States, 3. New York University, New York, New York, United States, 4. University of Denver, Denver, Colorado, United States*

We sought to provide an overview of the literature on decision aid interventions for family caregivers of older adults with advanced dementia regarding decision-making around tube feeding. The process was guided by Arksey and O'Malley's methodological framework. Six publications reporting on four unique decision aid interventions were included. All the interventions targeted caregivers of older adults with advanced dementia. Three of decision aids were culturally adapted from existing ones. The Ottawa Decision Support Framework and the International Patient Decision Aid Standards Framework were used in these studies. Interventions aimed to improve decision-making regarding tube feeding for caregivers through static delivery methods. Caregivers rated these decisions as helpful and acceptable. Reduction in decisional conflict and increase in knowledge were consistently found among dementia caregivers, but no intervention effects were found on preferences for use of tube feeding. Culturally adapted decision aids effectively improve decision-making regarding tube feeding among the target population.

BECOMING A DEMENTIA CARE PARTNER DURING THE COVID-19 PANDEMIC

Hanzhang Xu[1], Laura Fish[2], Raman Nohria[2], Jacob Christy[2], Margaret Falkovic[2], Matthew Dupre[1], Ruth Anderson[3], and Truls Østbye[2], *1. Duke University, Durham, North Carolina, United States, 2. Duke University School of Medicine, Durham, North Carolina, United States, 3. UNC Chapel Hill, Chapel Hill, North Carolina, United States*

Persons with newly diagnosed Alzheimer's disease and related dementias (ADRD) and their care partners confront multiple challenges. These challenges have been even greater during the COVID-19 pandemic, where supportive resources often are limited or even discontinued. We conducted semi-structured interviews with 21 care partners of persons who were recently diagnosed with ADRD (2019-2020) to explore their lived experiences of adjusting to the new role. Directed and conventional content analyses were used and were informed by the life course theory. Care partners perceived difficulty in accessing medical and social services for their loved ones, particularly during the pandemic. Despite experiencing distress, some care partners chose not to seek help for fear of contracting COVID-19. This study provides insights on the unmet needs of care partners during a pandemic and highlights that effective, long-term strategies are needed to continue providing person-centered care to persons with ADRD and their families.

REVIEW OF TECHNOLOGY-BASED INTERVENTIONS ADDRESSING SOCIAL DISCONNECTION AMONG DEMENTIA CAREGIVERS

Weiyu Mao[1], Xiang Qi[2], Iris Chi[3], and Bei Wu[4], *1. University of Nevada, Reno, Reno, Nevada, United States, 2. New York University, New York City, New York, United States, 3. University of Southern California, Los Angeles, California, United States, 4. New York University, New York, New York, United States*

Social disconnection is a major public health concern. Informal dementia caregivers are particularly vulnerable to social isolation and loneliness, as the majority are older adults and at elevated risk of adversity. Technology-based interventions could offer accessible, affordable, and convenient solutions. Using a scoping review approach, we aimed to identify and synthesize existing technology-based interventions to address social isolation and loneliness among informal dementia caregivers. In a systematic search across six databases within the last ten years, ten eligible studies were included. The intervention type, format, and duration varied widely. The results suggested that technology-based interventions could reduce feelings of loneliness and improve caregiver well-being. The findings offer opportunities to use technology to reduce or prevent social isolation and loneliness. Investigating the role of technology in interventions addressing social isolation and loneliness among informal dementia caregivers could potentially overcome barriers to low uptake of services and improve sustainability of the interventions.

SESSION 1550 (SYMPOSIUM)

TECHNOLOGY-BASED INTERVENTIONS AND ASSESSMENT FOR OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Chair: JuYoung Park Co-Chair: Lillian Hung

During the COVID-19 pandemic, older adults with cognitive impairment experienced social isolation, stress, and challenges to stay healthy at home or in a long-term care facility. Technology-based interventions and assessment can be valuable in managing dementia at home before a crisis situation occurs, which can lessen caregiver burden and stress and improve quality of life for older adults with cognitive impairment. In the symposium, specific technology-based interventions (telepresence robot, online chair yoga, exergames, virtual cycling, video-conferencing platforms) and assessment (IOM2 biofeedback device) were used for older adults with cognitive impairment. We cultivated a novel interdisciplinary approach to emerging clinical entities of technology-based intervention and assessment for older adults with cognitive impairment. In the symposium, we will present a variety of technology-based clinical interventions. Our first study explored the experiences of virtual family visits in four Canadian long-term care homes, using a telepresence robot. Online survey, interviews, focus groups, and observations were conducted to explore the experience. The second study assessed feasibility of a remotely supervised online chair yoga (CY) intervention for older adults with dementia in Florida and explored the preliminary effects of CY on psychosocial outcomes in this population. The third study evaluated the ease of use and quality of cardiac data using IOM2 biofeedback device for older adults with dementia. Cardiac rhythms were analyzed from pulse data measured using the IOM2 biofeedback device (UNYTE). The fourth study was a scoping review to analyze evidence about online group-based exercise programs.

FEASIBILITY OF REMOTELY SUPERVISED ONLINE CHAIR YOGA INTERVENTION FOR OLDER ADULTS WITH DEMENTIA

JuYoung Park[1], Marlysa Sullivan[2], Keri Heilman[3], Jayshree Surage[2], Hannah Levine[4], Lillian Hung[5], and María Ortega[6], *1. Florida Atlantic University College of Social Work and Criminal Justice, Boca Raton, Florida, United States, 2. Maryland University of Integrative Health, Laurel, Maryland, United States, 3. University of North Carolina School of Medicine Psychiatry, Chapel Hill, North Carolina, United States, 4. Florida Atlantic University, Charles E. Schmidt College of Medicine, Boca Raton, Florida, United States, 5. University of British Columbia, Vancouver, British Columbia, Canada, 6. Florida Atlantic University Christine E. Lynn College of Nursing, Boca Raton, Florida, United States*

This study assessed the feasibility of a remotely supervised online chair yoga (CY) intervention for older adults with dementia, exploring preliminary effects of CY on chronic pain, mobility, risk of falling, sleep disturbance, autonomic reactivity, cardiac rhythms (using IOM2 biofeedback device), and loneliness in this population. Using a one-group pretest/posttest design, a home-based CY intervention was delivered remotely to a group of 10 older adults with dementia who were socially isolated due to COVID-19. The online intervention was conducted twice weekly in 60-minute sessions for 8 weeks; data were collected virtually at baseline, mid-intervention, and post-intervention. Results indicated that online CY is a feasible approach for managing physical and psychological symptoms in older adults with dementia, based on retention (70%) and adherence (87.5%) with no injuries or other adverse events during the intervention. Senior-friendly videoconferencing should be available so that more older adults can gain access to the online intervention

USING TELEPRESENCE ROBOTS TO SUPPORT FAMILY VIRTUAL VISITS DURING THE COVID-19 PANDEMIC

Lillian Hung, *University of British Columbia, Vancouver, British Columbia, Canada*

In this project, virtual family visits were made to residents of four Canadian long-term care homes using a telepresence robot. Guided by the Consolidated Framework of implementation Research (CFIR), we conducted an online survey, interviews, focus groups, and observations to explore the participants' experience. Analysis identified three themes: (a) relative advantage (easy to visit), (b) capacity for change (readiness and organizational support), and (c) cultural safety (champions leading the way during challenging times). Preliminary results indicate that staff, residents, and families accepted the robot for easy connection but had concerns about privacy issues. Future research should apply inclusive methods to bring relevant stakeholders together to explore user experiences fully: who is affected in what ways and the benefits, risks, and burdens of emerging technologies.

TECHNOLOGY AND GROUP EXERCISE INTERVENTIONS FOR PEOPLE WITH DEMENTIA OR MILD COGNITIVE IMPAIRMENT: A SCOPING REVIEW

Hannah Levine[1], Paavan Randhawa[2], JuYoung Park[3], and Lillian Hung[4], *1. Florida Atlantic University, Charles E. Schmidt College of Medicine, Boca Raton, Florida, United States, 2. Langara College, Vancouver, British Columbia, Canada, 3. Florida Atlantic University College of Social Work and Criminal Justice, Boca Raton, Florida, United States, 4. University of British Columbia, Vancouver, British Columbia, Canada*

We conducted a scoping review to analyze evidence about online group-based exercise programs. We searched six electronic databases and conducted team analysis with patient and family partners. Of 1,166 screened articles, the final review included 8 publications. Results identified three types of technology-based group exercise interventions for people with dementia or mild cognitive impairment (MCI): (a) exergames, (b) virtual cycling, and (c) video-conferencing platforms. These studies used psychosocial, physical function, biomarker, and cognitive outcome measures. The review identified three key impacts: (a) feasibility and accessibility; (b) physical, psychosocial, and cognitive benefits; and (c) adaptations necessary for persons with dementia or MCI. Over all, technology-based group exercise interventions were found to be accessible, feasible, and acceptable to persons with dementia or MCI. However, a "one-size-fits-all" game approach often did not work, suggesting that exercise interventions should be adaptable to meet the various needs of individual participants.

SESSION 1560 (SYMPOSIUM)

THE BOLD PUBLIC HEALTH CENTERS OF EXCELLENCE ON DEMENTIA: MOBILIZING PUBLIC HEALTH ACTION TO ADDRESS DEMENTIA

Chair: Matthew Baumgart Discussant: Nora Super

Under the BOLD Infrastructure for Alzheimer's Act, passed by Congress in 2018, the Centers for Disease Control and Prevention (CDC) established three Public Health Centers of Excellence (PHCOEs) to address Alzheimer's disease and related dementias. Awarded in the Fall of 2020, the three PHCOEs are: (1) Dementia Caregiving; (2) Dementia Risk Reduction; and (3) Early Detection of

Dementia. Each PHCOE is charged with identifying, translating, and disseminating research findings and evidence-based public health best practices in their particular area of focus – and then working with state, local, and tribal public health agencies across the country to undertake dementia-related activities in their communities. This Symposium will feature an overview by Dr. McGuire of the BOLD Act and CDC's efforts to address Alzheimer's and related dementia, followed by presentations on the work and the plans of each of the PHCOEs. Dr. Gaugler will discuss the Caregiving PHCOE's efforts to support unpaid caregivers of those living with dementia, including how best to meet the caregiving needs of diverse communities. Mr. Baumgart will present the Risk Reduction PHCOE's findings on the state of the evidence on risk reduction and how that evidence is being translated to public health action. Dr. Chodosh/Dr. Borson will review the plans of the Early Detection PHCOE to increase awareness of the value of earlier detection and the best ways of conducting detection strategies. Finally, Ms. Super will discuss how this public health work complements the work of the aging community in addressing Alzheimer's and related dementias.

THE POSSIBILITY OF PREVENTION: THE PUBLIC HEALTH CENTER OF EXCELLENCE ON DEMENTIA RISK REDUCTION

Matthew Baumgart, *Alzheimer's Association, New York, New York, United States*

While we may not be able to predict with certainty whether any particular individual can prevent dementia, we are now able to talk about dementia risk reduction at the population level. The Public Health Center of Excellence on Dementia Risk Reduction reviews and synthesizes the state of the science on modifiable risk factors for cognitive decline and dementia. The Center translates that science into public health action – identifying interventions and best practices to address those risk factors – and develops tools and resources for public health agencies. The Center disseminates this information and works with public health to undertake community-level actions to address risk factors. The Center also works with public health agencies to: (a) address the social determinants of health with respect to dementia risk; (b) build capacity to enable smaller agencies to engage in risk reduction activities; and (c) partner with health systems to advance risk reduction.

BUILDING OUR LARGEST DEMENTIA (BOLD) INFRASTRUCTURE FOR ALZHEIMER'S ACT: CENTERS OF EXCELLENCE

Lisa McGuire, *CDC, Atlanta, Georgia, United States*

While public health experts cannot yet say how to prevent Alzheimer's disease and related dementias (ADRD), emerging science indicates that ADRD may be slowed through the implementation of risk reduction strategies, early diagnosis, and better education and training of front-line health care professionals. The Building Our Largest Dementia (BOLD) Infrastructure for Alzheimer's Act was introduced into the Senate (S. 2076) on November 6, 2017 and signed into law on December 31, 2018 (P.L. 115-406) amending the Public Health Service Act (Section 398A; 42 U.S.C. 280c-3-4). CDC's Alzheimer's Disease and Healthy Aging Program (AD+HAP) was authorized to implement the activities outlined in BOLD which were designed to create a uniform national public health infrastructure. This presentation will provide an overview of BOLD and the demonstrate how BOLD Program and Public Health Centers of Excellence recipients are working together to build a uniform national public health infrastructure.

SUPPORTING DEMENTIA CAREGIVERS: THE PUBLIC HEALTH CENTER OF EXCELLENCE ON DEMENTIA CAREGIVING

Joseph Gaugler, *University of Minnesota, Minneapolis, Minnesota, United States*

The Public Health Center of Excellence on Dementia Caregiving has established a robust, national network of 17 organizations to jointly develop and disseminate information, tools, and resources to support families, friends, and other unpaid caregivers of people living with dementia. The Center is establishing partnerships with local, state, tribal, and other public health organizations throughout the United States to provide technical assistance on the sustainability of dementia caregiving support programs as well as the cultural adaptation of messaging and tools to best meet the needs of diverse communities The Center also has a robust stakeholder engagement process so that the voices of caregivers and public health providers are incorporated in all Center efforts. The Center also collaborates with the Public Health Centers of Excellence on Risk Reduction and Early Detection to develop and refine cross-cutting resources and tools to further meet the complex public health challenges of dementia.

PROMOTING EFFECTIVE DIAGNOSIS: THE PUBLIC HEALTH CENTER OF EXCELLENCE ON EARLY DETECTION OF DEMENTIA

Joshua Chodosh, *New York University Grossman School of Medicine, New York City, New York, United States*

The Public Health Center of Excellence on Early Detection of Dementia brings together a broad coalition of stakeholders to assure widespread awareness of why early detection of dementia matters. The Center assesses and disseminates the best evidence supporting early detection and how to accomplish it – the first step on the pathway to high quality, effective diagnosis and health care for people living with dementia. The Center's advisory group represents key state and county Departments of Health, healthcare systems and primary care providers, community organizations, and professional societies. The Center identifies effective materials and marketing strategies for increasing awareness about cognitive impairment, the value of earlier detection, and how best to conduct detection strategies. The Center works closely with state, county, and tribal public health agencies in dissemination, and seeks to establish collaborative linkages with healthcare systems and their primary care providers to build strategies for post-detection diagnosis and care.

PUTTING IT TOGETHER: THE COMPLEMENTARY EFFORTS OF PUBLIC HEALTH AND AGING TO ADDRESS DEMENTIA

Nora Super, *Milken Institute Center for the Future of Aging, Santa Monica, California, United States*

The Public Health Centers of Excellence are part of a larger effort by the Centers for Disease Control and Prevention (CDC), through the BOLD Infrastructure for Alzheimer's Act and the Healthy Brain Initiative, to advance cognitive health and dementia as public health issues – and to expand the public health response to the Alzheimer's crisis. These efforts are designed to complement, not supplant, the long-standing work of the aging community to help people with dementia and their families. This presentation will discuss how the new and expanded public health work corresponds with the efforts of the aging community and will illustrate the unique roles of the public health and aging communities in the fight against Alzheimer's. In addition, the presentation will review initiatives – such as the Milken Institute's Alliance to Improve Dementia Care – that seek to bring both communities together on a common dementia agenda.

SESSION 1570 (SYMPOSIUM)

ARTIFICIAL INTELLIGENCE AND ROBOTIC APPROACHES TO SUPPORTING OLDER ADULTS

Chair: Walter Boot

Emerging technologies in the domains of artificial intelligence (AI) and robotics hold tremendous potential for supporting the health, wellbeing, independence, and quality of life of older adults. This session presents a sampling of research examining the promise of these technologies and barriers necessary to overcome in order for these technology-based solutions to be implemented, accepted, and adopted. This session will start with K. Trainum presenting a broad overview of the potential of robots to benefit individuals living in senior-living facilities, and a summary of the literature to date. L. Vergara will describe findings related to older adults' attitudes toward a socially assistive robot and implications for the design and implementation of artificial intelligence through socially assistive robots in the home environment. M. Han will present a study examining older adults' preferences for digital conversational agents that can be used to help monitor health, and factors that influence older adults' intention to adopt digital conversational agents. Finally, S. Zhang will discuss the potential of artificial intelligence approaches to maximizing adherence to technology-based cognitive assessment and training through a just-in-time adherence support system tailored to the motivations of the individual. An overarching theme of the session is the need for a careful, thoughtful, user-centered design approach to ensure the success of emerging technology-based solutions to support the health and wellbeing of older adults.

ROBOTS IN SENIOR-LIVING FACILITIES: A SYSTEMATIC LITERATURE REVIEW

Katie Trainum[1], Elliott Hauser[2], and Bo Xie[1], *1. The University of Texas at Austin, Austin, Texas, United States, 2. University of Texas at Austin, Austin, Texas, United States*

Robots are promising technologies for improving both the care of older adults living in facilities and the job satisfaction of caregivers, but concerns about their efficacy, ethics, and best practices remain. To inform this ongoing debate, we examined the literature on robots utilized in senior-living facilities. Three rounds of searching and screening were conducted in February 2022, following PRISMA guidelines. Keyword searches produced 666 non-duplicate articles from 5 relevant databases. We screened titles and abstracts against inclusion/exclusion criteria, resulting in 127 articles. Full-text screening resulted in 78 articles for analysis, published between 2002-2022 and represent 17 countries. Most studies demonstrated promising effects of robots, however there was a lack of high-quality studies, overrepresentation of female participants, and focus on companion robots over service robots. Few studies addressed the effects of robots on caregivers or controlled for novelty effects. Research addressing these gaps should combine robotic and gerontological expertise.

UNDERSTANDING THE ROLE OF A SOCIALLY ASSISTIVE ROBOT TO SUPPORT AGING IN PLACE

George Mois[1], Lizandra Vergara[2], Afnaan Afsar Ali[3], Mimi Trinh[4], and Wendy Rogers[3], *1. University of Illinois Urbana-Champaign, Urbana Champaign, Illinois, United States, 2. Federal University of Santa Catarina, Florianópolis, Santa Catarina, Brazil, 3. University of Illinois Urbana Champaign, Champaign, Illinois, United States, 4. University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Communities may lack the infrastructure and required resources to support healthy aging and aging in place. Advancements in technology development such as socially assistive robots and artificial intelligence present new opportunities to support and meet the needs of older adults. For example, Misty is a socially assistive robot designed to allow customizability and adaptability to support and meet diverse user needs pertaining to tasks and activities. Our research aim is to understand if Misty can facilitate social interactions with older adults, control the home environment, and provide reminders. We are exploring older adults' attitudes towards Misty through demonstrations of these activities. Through this research we provide insights pertaining to the facilitators and barriers in the acceptance and use of a socially assistive robot like Misty, to support healthy aging. Furthermore, our findings will provide guidance for design and implementation of artificial intelligence through socially assistive robots in a home environment.

REFRAMING AGING: INTRA- AND INTERGENERATIONAL DIGITAL CONVERSATIONAL AGENTS TO SUPPORT OLDER ADULTS

Molly Han, and Cameron Piercy, *University of Kansas, Lawrence, Kansas, United States*

Digital conversational agents (DCAs) have become extraordinarily ubiquitous. Researchers envision the prospects of using DCAs to monitor health among older adults. However, older adults show hesitation to engage with DCAs. It is possible older adults prefer receiving human assistance rather than getting help from a machine. Another potential explanation is that communicative cues of DCAs such as voice need to be further optimized to invoke behavioral engagement. To understand how DCAs can better support older adults, we develop an experiment with three scenarios in which an agent (a human, an embodied DCA, a mixed presence of human and DCA) shares active aging information. We manipulate the agent's voice in terms of age (older voice, younger voice). We investigate how the interplay of agent categories and intragenerational/intergenerational voice cues affect older adult participants' evaluation of information and intention to adopt DCAs. Our study will contribute to DCAs design for older clients.

THE DEVELOPMENT OF ADHERENCE SUPPORT MESSAGES FOR AN AI-BASED REMINDER SYSTEM

Shenghao Zhang, Michael Dieciuc, Andrew Dilanchian, and Walter Boot, *Florida State University, Tallahassee, Florida, United States*

Artificial Intelligence (AI) holds tremendous potential for aiding in the customization and tailoring of interventions. This talk will focus on the initial development of an adherence support system to maintain older adults' engagement with at-home cognitive training and assessment delivered via mobile devices. As part of the NIA funded Adherence Promotion with Person-centered Technology (APPT) project, a reminder and adherence support system is being developed to automatically detect adherence lapses and provide just-in-time reminders with tailored messaging to facilitate reengagement. The results of an initial study (N=40) will be presented in which participants were delivered reminders via SMS text messaging that were either tailored or not tailored to their self-reported motivation to engage with the intervention. Tailored messages were perceived as more motivating, and qualitative data informed additional ways in which messages might further be tailored based on individual preferences to support adherence.

SESSION 2000 (SYMPOSIUM)

A POLICY- AND PRACTICE-ALIGNED RESEARCH AGENDA FOR ENGAGING AND SUPPORTING DEMENTIA CAREGIVERS IN CARE DELIVERY

Chair: Catherine Riffin Co-Chair: Francesca Falzarano Discussant: Sara Czaja

The Cornell Institute for Translational Research on Aging (CITRA) Research-to-Practice Consensus Workshop Model is an evidence-based method for generating practice- and policy-informed research agendas on aging-related topics. The model aims to bridge the gap between research-based knowledge and practice-based insight by involving multidisciplinary stakeholders in all aspects of the agenda-setting process. Using the CITRA model as a guiding framework, we convened an NIA-funded Conference on Engaging Family Caregivers of Persons with Dementia in Healthcare Delivery, with the goal of generating actionable research priorities that will lead to improvements in dementia caregiver identification, assessment, and support in health and long-term care settings. Conference attendees were multidisciplinary thought leaders representing five stakeholder groups: family caregivers of persons with dementia, healthcare providers, researchers, payers, and policy advocates. This symposium will describe the CITRA model, using our caregiver conference as an example, and provide practical guidance on how to use the model to promote cross-disciplinary dialogue and integrate research, policy, and practice perspectives. The first presentation will provide an overview of the CITRA model and its 5-step method (Pillemer). Subsequent presentations will describe the model's application to the topic of improving caregiver identification and support in care delivery (Griffin) and discuss how novel technology-based adaptations to the model helped to facilitate hybrid participation of virtual and in-person attendees (Falzarano). The final presentation will delineate the major priorities that resulted from the conference, discuss ongoing and future dissemination activities, and offer practical suggestions for leveraging the CITRA model in future consensus efforts (Riffin).

A FRAMEWORK FOR IDENTIFYING MAJOR RESEARCH PRIORITIES: THE CITRA RESEARCH-TO-PRACTICE CONSENSUS WORKSHOP MODEL

Karl Pillemer, *Cornell University, Ithaca, New York, United States*

The CITRA Research-to-Practice Consensus Workshop Model is an evidence-based method for identifying research priorities on aging-related topics. Its major goals are to promote knowledge translation and equal-status dialogue among stakeholders from multidisciplinary backgrounds. In this presentation, Dr. Pillemer, co-creator of the CITRA model, will provide an overview of the 5-step method: (1) Identifying a topic that is both an important challenge in aging-related policy or practice and one on which there is scientific evidence; (2) Selecting a panel of multidisciplinary experts from relevant stakeholder groups; (3) Preparing a non-technical background document that summarizes available research findings; (4) Convening multidisciplinary experts in a consensus conference involving panel presentations, discussion of the background document, and consensus activities; and (5) Preparing a final consensus report and disseminating the findings to relevant policy organizations, practice groups, and funding agencies. Common challenges and practical tips for executing each of the 5 steps will be addressed.

CONVENING A NATIONAL CONSENSUS CONFERENCE TO PROMOTE DEMENTIA CAREGIVERS' ENGAGEMENT AND SUPPORT IN CARE DELIVERY

Joan Griffin, *Mayo Clinic, Rochester, Minnesota, United States*

The goal of the 2021 Conference on Engaging Family and Other Unpaid Caregivers of Persons with Dementia in Healthcare Delivery, funded by the NIA, was to establish a policy- and practice-aligned research agenda for enhancing dementia caregivers' engagement and support in health and long-term care settings. Using the CITRA model as a guiding framework, Dr. Griffin will discuss important planning decisions leading up to the event, including the formation of a Steering Committee, selection of expert panelists and conference participants, and preparation of the non-technical background report. Her presentation will also describe the format of the consensus conference itself, focusing on the structure of the panel presentations and consensus activities, including small group breakout sessions in which conference attendees were charged with generating research recommendations; the process for voting on and prioritizing the identified recommendations; and method for refining and organizing the recommendations into major priority areas.

LEVERAGING TECHNOLOGY TO OPTIMIZE THE ENGAGEMENT OF VIRTUAL PARTICIPANTS IN A NATIONAL CONSENSUS CONFERENCE

Francesca Falzarano[1], and Lilla Brody[2], *1. Weill Cornell Medicine, Douglaston, New York, United States, 2. Weill Cornell Medicine, New York, New York, United States*

The COVID-19 pandemic has accelerated the uptake and use of technology in hosting virtual and hybrid (combining virtual and in-person) meetings and events. In this presentation, Dr. Falzarano will describe the ways in which the 2021 Conference on Engaging Family and Other Unpaid Caregivers of Persons with Dementia in Healthcare Delivery leveraged videoconferencing systems (e.g., Zoom) and other web-based platforms (e.g., Qualtrics) to enact a hybrid event. Specifically, she will discuss the various components involved in the event's planning and execution, including the appointment of a virtual liaison and audiovisual technicians to enable seamless integration and participation of both in-person and virtual attendees. She will also discuss how videoconferencing technology was used to facilitate the delivery of virtual panel presentations; strategies for immersing virtual attendees in both large group discussions and small group breakout sessions; and the process by which virtual attendees participated in the priority vote.

ENGAGING AND SUPPORTING FAMILY CAREGIVERS IN CARE DELIVERY: RECOMMENDATIONS FROM A NATIONAL CONSENSUS CONFERENCE

Catherine Riffin, *Weill Cornell Medical College, New York, New York, United States*

This presentation, by Consensus Conference Director, Dr. Riffin, will describe the major priorities identified by the 2021 Conference on Engaging Family Caregivers of Persons with Dementia in Healthcare Delivery. Recommendations centered on the need for multidisciplinary collaborations that attend to (1) Identification and assessment of dementia caregivers in care delivery settings, (2) Reimbursement and financing for caregiver assessment and support, (3) Caregiver training and support across the care continuum, (4) Healthcare provider education on family-centered care, and (5) Technology innovations that support dementia caregivers. Across all areas, there was consensus regarding the need to leverage implementation science to promote the uptake of evidence-based interventions in clinical practice and use community-driven approaches to engage stakeholders from traditionally marginalized groups in future and ongoing initiatives. Findings are being used to inform federal agencies and foundations about high-priority areas, provide guidance to national committees, and accelerate programmatic research on caregiver engagement and support.

SESSION 2010 (SYMPOSIUM)

ADVANCING COMMUNITY-BASED SOCIAL INNOVATIONS FOR AGING THROUGH ENGAGED RESEARCH

Chair: Emily Greenfield Discussant: Suzanne Kunkel

Community-based social innovations (CBSI) for aging are programs, initiatives, and other structures that support healthy aging and aging in community in ways that complement traditional health and human service systems. This symposium features research on several manifestations of CBSIs in the US. The first paper orients to innovation among aging services agencies, drawing on data from local Councils on Aging in Massachusetts to examine variation in their levels of engagement with age-friendly community (AFC) work. Findings elucidate the importance of community context and organizational capacity for deepening involvement in AFC work over time. Addressing innovation within communities as a whole, the second paper applies social network analytic methods to examine the constellations of connections among AFC core teams and their key partners across nine localities in New Jersey. Focusing on housing, the third paper presents findings from an evaluation of a national demonstration program to enhance the capacity of service coordinators within senior housing communities. This paper implicates the important role of services staff in systems innovation. Finally, with attention to creating age-friendly communities, the fourth paper presents findings from a project in Ohio that equipped older adults with a tablet-based transportation "diary" app. The findings demonstrate ways in which this technology facilitated deeper insight on users' experiences in terms of their mood, with implications for transit design and programs. Collectively, the studies make evident the importance of leveraging the tools of research alongside engaged partnerships to strengthen the knowledge base for continued innovation in community supports for aging.

EVALUATING AGE-FRIENDLY COMMUNITY INITIATIVES FROM A SOCIAL NETWORK PERSPECTIVE

Emily Greenfield, and Althea Pestine-Stevens, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

Age-friendly community initiatives (AFCIs) as community interventions systematically cultivate inter-organizational partnerships toward making policies, systems, and environments more supportive of healthy aging, aging in community, and aging equity. Building from a multi-year, university-community partnership to spur the development of AFCIs in New Jersey, we drew on social network theory and research methods to examine the networks of AFCI core teams and their key partners across diverse community settings. Data collection involved administering questionnaires to both AFC core teams and their key organizational partners. We report on the presence and strengths of dyadic relationships that comprise the networks, analyzed by sector, organizational function, and geographic service area of each network node. We discuss implications of the findings concerning policies and practices around sustainability planning for AFCIs as well as future directions for using network theory to understand AFC progress at various levels of geographic scope.

AGE-FRIENDLY TRANSFORMATION: AN EXAMINATION OF COMMUNITY MECHANISMS INFLUENCING INVOLVEMENT

Caitlin Coyle, and Ceara Somerville, *University of Massachusetts Boston, Boston, Massachusetts, United States*

Age-friendly community initiatives (AFCIs) have become key policy efforts aimed at improving quality of life for older residents, but there is limited evidence about the process. This mixed methods study draws on survey and demographic data from 350 municipalities in Massachusetts to characterize communities by these categories: 1) not interested in AFCIs (n=109); 2) interested in learning more about AFCIs (n=84); 3) planning for age-friendly action (n=71); and 4) maintaining an AFCI (n=86). Interview data from key-informants contextualize the process of developing an AFCI. Thematic analyses suggest that progression through AFCIs is self-defined by the accumulation of momentum. Communities committed to AFCIs have higher proportions of vulnerable residents (e.g., living with disability, living alone, non-English speaking). Municipal resources (e.g., budget, aging services) correlate with more advanced stages of AFCIs. Implications of the variability across AFCIs, including the effort required for moving from concept to execution of AFCIs, will be discussed.

LESSONS LEARNED FROM AN ENHANCED SERVICE COORDINATION MODEL IN SENIOR HOUSING

Alexandra Hennessa, and Robyn Stone, *LeadingAge, Washington, District of Columbia, United States*

Residents of affordable housing communities are growing older, and new residents are moving in at older ages. As these residents age, their need for services and supports increase. Approximately 5,200 housing communities subsidized by the U.S. Department of Housing and Urban Development (HUD) have a service coordinator on-site to help connect residents with needed services and resources. In 2021, the LeadingAge LTSS Center @UMass Boston (LTSS Center) conducted a process evaluation of the LSA Senior Connect Model, which was designed to build the capacity of service coordinators to better meet the needs of aging residents. The study activities included a review of program-related documents, analysis of resident assessments, interviews with staff, resident focus groups, and cost analysis. We will summarize the model's framework and tools, and discuss lessons learned from the process evaluation. Lessons for policy and practice will also be discussed.

TRANSPORTATION AND MOOD: THE ROLE OF TRIP CHARACTERISTICS

Holly Dabelko-Schoeny[1], Noelle Field[2], Anthony Traver[3], Ian Murphy[3], and Katie White[3], *1. Ohio State University, Columbus, Ohio, United States, 2. University of Texas -- Arlington, Arlington, Texas, United States, 3. The Ohio State University, Columbus, Ohio, United States*

Safe and affordable transportation has a positive impact on the health and well-being of older adults. What is less understood are which factors influence these outcomes. To examine the impact of trip characteristics on the mood of older adults, residents in three neighborhoods in Franklin County, Ohio (n = 32) were provided tablets and used an app (MyAmble) to document their travel. During a 14-day period, 1,190 trips were recorded; 71% of which were completed by car. Participants reported 72% of the trips improved their mood. Perceived importance of the trip, challenges associated with the trip, and trip destinations to social activities and to employment/education explained 33% of the variance in mood. Challenges associated with the trip was the strongest predictor of impact on mood. Identifying trip characteristics that impact mood provides new insights for the design and implementation of travel interventions for older persons.

SESSION 2020 (SYMPOSIUM)

BEFORE IT WAS COOL: THE AGING NETWORK'S ROLE IN ADDRESSING SOCIAL NEEDS AND REDUCING DISPARITIES

Chair: Traci Wilson Discussant: Suzanne Kunkel

Decades before social determinants of health (SDOH) became such a focus of attention across health and social care, Area Agencies on Aging (AAAs), Title VI Native American Aging Programs, and their Aging Network partners had developed local systems of coordinated services and supports to assess and address health-related social needs. Every service and program provided by an AAA or Title VI program addresses a need related to SDOH risks. The Older Americans Act mandates that funded services such as congregate and home-delivered meals, support for caregivers, transportation, and housing supports are targeted to older adults with the greatest economic or social need. Using the foundational study on "ACL's Impact on the Social Determinants of Health" as a framework, this symposium will demonstrate how OAA-funded programs map to SDOH pathways. Presenters will describe specific programs and new practices within the Aging Network that identify and address social needs of older adults from historically marginalized and underserved communities. These initiatives, many of which were born through COVID response, include analyses and partnerships to advance health equity and care integration. Presenters will describe how Aging Network practices and partnerships have altered community environments to make community living accessible to older adults who have been traditionally underserved, and current workforce challenges that threaten continued progress. The session will conclude with an interactive discussion about gaps, strategies, and next steps to reinforce, articulate and demonstrate the value of Aging Network services in addressing SDOH risks and needs.

"NO TIME TO OVERTHINK IT, JUST DO IT": AREA AGENCIES ON AGING AND INCLUSIVE COMMUNITY ENGAGEMENT

Traci Wilson, and Elizabeth Blair, *USAging, Washington, District of Columbia, United States*

AAAs have always been deeply engaged in addressing the health-related social needs of older adults from historically marginalized and underserved communities. As a confluence of COVID and social injustices moved issues of racial equity and inclusion to the forefront of national conversation, AAAs refocused their efforts to identify and address health inequities related to the social determinants of health (SDOH). One result of the COVID-19 pandemic and the urgency to reach and vaccinate older adults was that AAAs quickly formed new partnerships with culturally specific organizations. These relationships have developed and resulted in expanding culturally responsive service delivery. Presenters will describe this and other findings from a mixed methods study about AAA initiatives that seek to improve access and equity, such as inclusive community needs assessments, equity analyses that leverage census data to identify areas of greatest SDOH disparities, and dashboards to compare service recipients with community demographics.

OLDER AMERICANS ACT PROVISIONS AND SOCIAL DETERMINANTS OF HEALTH: INTERSECTIONS AND IMPACTS

Shannon Griffin[1], Robbie Skinner[1], Suzanne Kunkel[2], Elizabeth Blair[3], Lois Simon[1], Robert Graham[2], Traci Wilson[3], and Kristen Hudgins[4], *1. Insight Policy Research, Arlington, Virginia, United States, 2. Miami University, Oxford, Ohio, United States, 3. USAging, Washington, District of Columbia, United States, 4. Administration for Community Living, Washington, District of Columbia, United States*

Older Americans Act (OAA) programs and services are strongly linked to social determinants of health (SDOH) and integral to addressing social needs among older adults and individuals with disabilities and their families. Supported by the Administration for Community Living, researchers examined the intersection of OAA-funded programs and services under Titles III, VI, and VII and their impacts on SDOH. This study used an integration of extant literature; secondary data; and interviews with ACL office leadership, AAAs, Title VI program staff, and other local service providers to examine existing social needs among older adults, equity prioritization within OAA-funded program development, and impacts of OAA-funded programs and services. Study findings highlighted relationships between ACL and Aging Network entities, best practices for and process challenges of transforming grant funding into recipient services, and OAA-funded program areas for possible future development.

AAA WORKFORCE CHALLENGES AND THEIR IMPACT ON OLDER ADULTS: RESULTS FROM A NATIONAL POLL AND AGENCY INTERVIEWS

Elizabeth Blair, and Traci Wilson, *USAging, Washington, District of Columbia, United States*

Area Agencies on Aging (AAAs) play a critical role in addressing social needs that enable older adults to live independently. In 2022, over 90% of AAAs reported that the number of consumers seeking services and the complexity of consumer needs have increased. At the same time, the nation faces a shortage of direct care workers. Existing AAAs workforce challenges, such as worker shortages and staff burnout, have been exacerbated by the COVID-19 pandemic. We will share the results of a USAging poll of AAAs on the challenges facing their agency and provider workforce, reductions in volunteer staffing, and the impacts of workforce shortages on clients and services provided. Top impacts include clients not receiving the frequency of services needed, if at all. Services most impacted include personal care, respite, and transportation. Presenters will conclude by sharing innovative solutions that AAAs have developed to address these challenges.

COMMUNITY-BASED ORGANIZATIONS CONTRACTING WITH HEALTH CARE PARTNERS TO ADDRESS SOCIAL DETERMINANTS OF HEALTH

Robert Graham, and Isha Karmacharya, *Miami University, Oxford, Ohio, United States*

Community Based Organizations (CBOs), such as Area Agencies on Aging, play a vital role in their communities by offering a range of services that address the health-related social needs of older adults and people with disabilities. As health care entities (HCEs) become more aware of the effects of unmet social needs on health outcomes, there has been a significant increase in the number of HCEs contracting with CBOs to provide a wider range of services and care coordination for older adults and people with disabilities. Using findings from four waves of the national Aging and Disability Business Institute's CBO-Health Care Contracting Survey (2017–2021), presenters will describe trends in CBO/HCE contracting, including increased diversification of partnerships with health care payers and providers, services provided, and populations served. Results suggest that more CBOs are forming integrated networks to improve contracting with HCEs, and that assessment for SDOH is the most common service.

SESSION 2030 (SYMPOSIUM)

BUILDING BRIDGES: AN AGE-FRIENDLY CONFERENCE FOR THE GEROPSYCHOLOGY WORKFORCE

Chair: Brian Carpenter Co-Chair: Jennifer Moye
Discussant: Joseph Dzierzewski

As in other disciplines, there is a high demand for psychologists who have specialized training in aging, but the demand far outstrips the supply, with only 1% of clinical/counseling psychologists identifying aging as their area of focus. The field of geropsychology has held a series of training conferences, the last in 2006, to define a training model and aging-related competencies. Fifteen years later, the field gathered again for a conference focusing specifically on the pipeline, with the goals of 1) understanding the recent shortage of applicants for positions in academic settings, 2) addressing underrepresentation of individuals from diverse racial and ethnic backgrounds across clinical and academic geropsychology, and 3) implementing concrete solutions. In this symposium we describe our two-day, four-hour virtual national conference held in 2021, attended by more than 150 psychologists nationwide, including the structure and outcomes of the conference and the progress of several ongoing working groups. The first paper summarizes quantitative and qualitative findings of a pre-conference survey on perceptions of the geropsychology workforce. The second paper describes a career pathways webinar aimed at graduate students, interns, and fellows to attract students to diverse careers in aging. The third paper describes discussions about the impact of the pandemic on geropsychology training. The fourth paper presents a survey and efforts of a working group focused on post-licensure training. This presentation offers a possible model for others considering ways to galvanize interest and training in aging.

PERCEPTIONS OF THE GEROPSYCHOLOGY WORKFORCE

Jennifer Moye[1], Flora Ma[2], Nicholas Schmidt[3], Hannah Heintz[4], Rebecca Allen[5], and Brian Carpenter[6], *1. VA Boston Healthcare System, Boston, Massachusetts, United States, 2. Stanford HealthCare Psychology, Palo*

Alto, California, United States, 3. Boston VA Healthcare System, Boston, Massachusetts, United States, 4. VA Boston Healthcare System, Jamaica Plain, Massachusetts, United States, 5. The University of Alabama, Tuscaloosa, Alabama, United States, 6. Washington University in St. Louis, St. Louis, Missouri, United States

There is a longstanding shortage of teaching faculty and clinicians trained in psychology and aging (Moye et al. 2019). Further, there are few marginalized group members in the geriatric workforce. To better understand this issue, a survey was distributed to psychology and aging listservs in preparation for the "Building Bridges" conference. Problems noted by respondents (N=275) included fewer applicants for aging-related positions (42%), decreased interest in aging by students (32%), loss of aging-related positions (18%); 24% thought workforce problems are worse than 5 years ago. Similar themes emerged in qualitative comments including: (1) lack of applicants/ interest, (2) lack of or decline in the training/ education opportunities, (3) lack of finances/ funding/ resources, (4) lack of professional positions, and (5) positive experiences/ actions/ change. Themes specific to marginalized group members to support diversity, equity, and inclusion include mindful commitment, education (e.g., mentorship), and recognizing not doing enough.

BUILDING BRIDGES POST-LICENSURE: DEVELOPING GEROPSYCHOLOGY CONSULTATION SERVICES

Erin Emery-Tiburcio[1], Erin Kube[2], Cecilia Poon[3], and Ann Steffen[4], *1. Rush University Medical College, Chicago, Illinois, United States, 2. VA Salt Lake City Healthcare System/ VISN 19 Clinical Resource Hub, Salt Lake City, Utah, United States, 3. Nebraska Medicine, Omaha, Nebraska, United States, 4. University of Missouri-St. Louis, St. Louis, Missouri, United States*

More than one third of psychologists report frequently treating older adults, while only 1% consider themselves geropsychologists. Continuing education opportunities in geropsychology have historically been scant, with even fewer opportunities for expert case consultation in work with older adults. To identify interest in geropsychology consultation, the Building Bridges Post-Licensure (BBPL) group conducted an informal survey of licensed psychologists via listservs. Results among 80 respondents indicated strong interest in group consultation regarding foundational knowledge, assessment, and intervention. This presentation will describe the BBPL group's efforts to examine effective models of consultation, develop a consultation model for geropsychology, and partner with both professional and community-based organizations to develop the infrastructure for geropsychology consultation.

BUILDING BRIDGES TO FUTURE LEADERS: A CAREER PATHWAYS WEBINAR

Meghan McDarby, *Memorial Sloan Kettering Cancer Center, New York, New York, United States*

Educational webinars can improve attitudes toward careers in aging. We developed a 6-session webinar series about careers in geropsychology, detailing unique career pathways (e.g., academic, private practice, VA). Our evaluation of the series included trainees from graduate programs and postdoctoral fellowships. Participants rated their attitudes toward each career pathway at pre- and post-session. At post-session, participants reported significantly increased interest in careers in aging ($t(83) = 4.72$, $p < .00$). They also reported significantly increased understanding of the type of training required for careers in aging ($t(77) = 8.10$, $p < .00$). Importantly, at post-session, participants reported stronger beliefs that they could be successful in a career in aging ($t(84) = 3.86$, $p < .00$) and that they would have good work-life balance ($t(87) = 9.34$, $p < .00$). Results suggest that a webinar series may increase student interest in and understanding of unique career pathways in geropsychology.

THE UNIQUE IMPACT OF THE COVID PANDEMIC ON PREDOCTORAL GEROPSYCHOLOGY TRAINING: RECOMMENDATIONS FROM THE FIELD

Candice Reel[1], Hannah Bashian[2], Julia Boyle[3], Mary Jacobs[4], and Michelle Mlinac[2], *1. The University of Alabama, Tuscaloosa, Alabama, United States, 2. VA Boston HCS, Boston, Massachusetts, United States, 3. New England GRECC, Boston, Massachusetts, United States, 4. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, United States*

The COVID-19 pandemic impacted predoctoral psychology training at the graduate, practicum, and internship levels including a greater reliance on telehealth and evolving learning needs. However its unique impact on geropsychology training has not been explored. The Building Bridges workgroup for predoctoral training faculty levels, we describe opportunities and barriers to address evolving geropsychology training needs during the pandemic as determined through working group discussion. Negative impacts to training identified include: decreased opportunities for 1) face-to-face patient care and 2) telehealth care due to disparities in telehealth access and utilization in older adults. Other impacts on the geropsychology pipeline include declining opportunities to see older adults at practicum sites. Conversely, increased media attention to the impact of COVID on older adults' physical and mental health may lead to graduate students' having greater interest in geriatric mental health and reinforcing a geropsychology career. Recommendations for training programs to address the long-term ramifications of the pandemic will be offered.

SESSION 2040 (SYMPOSIUM)

EDITORS INSIGHTS ON PUBLISHING OPPORTUNITIES FOR THE GLOBAL GERONTOLOGICAL COMMUNITY

Chair: Edward Miller Co-Chair: Elizabeth Simpson

Global aging has proceeded at an unprecedented and accelerating rate. The aging of the population creates both opportunities and challenges for older adults, their families, and society in general. Importantly, there is substantial variation in the effects of and response to global aging both within and across nations depending, in part, on prevailing cultural expectations and values, political and economic imperatives, and social and demographic characteristics. Thus, while some regions and countries have responded with innovative policies and programs to better enable the growing cohort of older adults to remain active and engaged in the community, other regions and countries have struggled with their response or barely begun to plan for the rising population of older adults. This symposium assembles editors at five leading gerontology journals to demonstrate the role that peer-reviewed scholarship can play in disseminating knowledge that informs gerontological research, policy, and practice internationally. Editors include: Edward Alan Miller, PhD, FGSA, Journal of Aging & Social Policy; Jeffrey Burr, PhD, FGSA, Research on Aging; Julie Robison, PhD, FGSA,, Journal of Applied Gerontology; Sandra Torres, PhD, FGSA, Ageing & Society; and Julie Hicks Patrick, PhD, FGSA, International Journal of Aging & Human Development. Each presenter will review the scope, content, and focus of their journals and the role and opportunities for international scholarship.

THE ROLE OF GLOBAL SCHOLARSHIP IN THE JOURNAL OF AGING & SOCIAL POLICY

Edward Miller[1], Elizabeth Simpson[1], Michael Gusmano[2], and Pamela Nadash[1], *1. University of Massachusetts Boston, Boston, Massachusetts, United States, 2. Leigh University, Bethlehem, Pennsylvania, United States*

Policymakers, practitioners, and researchers need a balanced, thoughtful, and analytical resource to meet the challenge of global aging at a rate that's historically unprecedented. The Journal of Aging & Social Policy (JASP), which was founded in 1989, serves this role by drawing contributions from an international panel of policy analysts and scholars who assume an interdisciplinary perspective in examining and analyzing critical phenomena that affect aging and the development and implementation of programs for older adults from a global perspective. Study settings extend beyond the United States to include Europe, the Middle East, Australia, Latin America, Asia, and the Asia-Pacific rim. This presentation will document the scope, content, and focus of JASP, including the rise of international submissions, which now account for approximately half of articles published. Opportunities for publishing in JASP will be discussed; so too will strategies for navigating the peer-review process successfully.

RESEARCH ON AGING: THE INTERNATIONAL VIEW FROM THE EDITORS' DESKS

Jeffrey Burr[1], Chagmin Peng[1], and Kyungmin Kim[2], *1. University of Massachusetts Boston, Boston, Massachusetts, United States, 2. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

We review the scope, content, and focus of the peer-reviewed journal, Research on Aging (SAGE), publishing its 45th volume this year. We will discuss how scholarship produced from researchers around the globe has changed over the years. Data on submissions, acceptance rates, and the important role of an international editorial board will be presented. The review process will be described, along with suggestions on how to increase chances of success when submitting original research. Although Research on Aging is sometimes considered to focus primarily on social gerontology, the scope in recent years has widened considerably, with manuscripts in aging studies published from such fields as economics, psychology, demography, public health, and public policy, as well as from sociology, and social work, among others. One of several special issues forthcoming in the journal will be described to demonstrate the possibilities for international impact.

THE JOURNAL OF APPLIED GERONTOLOGY: AN INTERNATIONAL PERSPECTIVE

Julie Robison, *UConn Health, Center on Aging, Farmington, Connecticut, United States*

The mission of applied gerontology is to bridge science and practice to benefit the health and well-being of older people, their families, their communities, and other contexts. The Journal of Applied Gerontology features original investigations or meta-analyses/systematic reviews with significant clinical, policy, and/or practice implications. This presentation will provide insights from the Journal of Applied Gerontology and its commitment to publish and disseminate scholarship with international application. Following an overview of the growing internationalization of peer-reviewed submissions to the Journal of Applied Gerontology on a variety of topics and from a range of perspectives, the presentation will highlight opportunities to apply gerontological scholarship to aging contexts worldwide. Concluding comments will examine how outlets for dissemination and authors themselves can better position their work to enhance their influence on aging in an international context.

TIPS FOR TIMELY (AND POSITIVE) REVIEWS: THE INTERNATIONAL JOURNAL OF AGING & HUMAN DEVELOPMENT

Julie Hicks Patrick[1], Abigail Nehrkorn-Bailey[2], and Danielle Nadorff[3], *1. West Virginia University, Morgantown, West Virginia, United States, 2. University of Wisconsin-Green Bay, Green Bay, Wisconsin, United States, 3. Mississippi State University, Mississippi State, Mississippi, United States*

For more than 40 years, under the leadership of four editors and two publishers, The International Journal of Aging and Human Development (IJAHD) has featured multidisciplinary scholarship related to aging processes and older adults. With the publication of eight issues a year, with over 800 pages of scientific content, the IJAHD places emphasis upon psychological and social studies of aging and the aged. However, the Journal also publishes research that integrates observations from other disciplines that illuminate the "human" side of gerontology. A more recent focus includes midlife development, as well. About half (47%) of the publications in the IJAHD are from international colleagues. This presentation will discuss tips for both international and US-based scholars for ensuring timely reviews and positive decisions for manuscript submissions, including such areas as key words, suggesting unbiased reviewers, formatting, writing mechanics, clearly-articulated methods, and a sound theoretical basis.

PUBLISHING IN INTERNATIONAL JOURNALS AND THE EXPECTATION IT PLACES ON OUR WRITING: TIPS FROM AGEING & SOCIETY

Sandra Torres, *Uppsala University, Sweden, Uppsala, Uppsala Lan, Sweden*

Understanding the differences between academic writing genres is crucial to nailing down the craft that is writing for peer-review journal publication. Based on the experience of Ageing & Society, this presentation will bring attention to the different readers that peer-reviewed journals cater to and how these differences impact how we craft manuscripts about the research we conduct. Using this as a starting point, as well as allusions to how data collected in specific national settings can be reported so that it can be used to contribute to ongoing international debates in social gerontology, this presentation offers the Editor-in-Chief's top 10 tips for publishing in international peer-reviewed journals. By bringing specific attention to the routines that Ageing & Society utilize, and the expectations that its editors place on the different sections of a manuscript, this presentation aims to give attendees valuable insights into how to write for peer-reviewed outlets.

SESSION 2050 (SYMPOSIUM)

ENGAGING METHOD AND ANALYSIS TO DISCOVER AND REIMAGINE POSSIBILITIES FOR INDIVIDUALS AGING WITH AND INTO DISABILITY

Chair: Kelly Munly Co-Chair: Ted Ng Discussant:
Lieke van Heumen

This symposium engages diverse methods and analyses to discover and reimagine possibilities for individuals aging with and into disability. The presentations advance an understanding of the diversity of service/care needs as well as of social capital, with exploration into assistive technologies, educational attainment, and assessment of successful aging. In the first presentation, the authors delineate key informant interview data identifying capacity-building needs in professional skills, organizational operations, service/care models, and public policies to effectively serve older adults aging with and into disability. The second presentation offers a content analysis of how researchers conceptualize, measure, and apply social capital to developmental disability throughout the life course, reviewing peer-reviewed articles from 5 disciplines, across more than 20 years. In the third presentation, using National Health and Aging Trends Study data, the authors investigate the longitudinal associations between disabilities, assistive technologies, and subjective well-being among older adults. In the fourth presentation, the author uses multivariate regression analysis to analyze National Health Interview Survey (NHIS) data, building on prior research analyzing the association between educational attainment and the perceived need for future help with activities of daily living (ADLs), often measuring disability in the literature. In the fifth and final presentation, the authors use the National Health & Aging Trends Study data to understand successful aging from the perspectives of those who experience disability, integrating subjective components of self-rated health and well-being, and providing insights on subjective perceptions on successful aging among older adults with disabilities.

INCREASING SOCIAL CARE CAPACITY TO MEET THE NEEDS OF PERSONS AGING WITH DISABILITY

Michelle Putnam[1], Lieke van Heumen[2], Lydia Odgen[1], Caitlyn Coyle[3], and Kerri Morgan[4], *1. Simmons University, Boston, Massachusetts, United States, 2. University of Illinois at Chicago, Chicago, Illinois, United States, 3. University of Massachusetts, Boston, Boston, Massachusetts, United States, 4. Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States*

This national study presents key informant interview data (N=28) collected 2017-2018 identifying capacity building needs in professional skills, organizational operations, service/care models, and public policies to effectively serve older adults with long-term serious mental illness, intellectual/developmental disabilities, physical and sensory disabilities. A multi-university, interdisciplinary team collected data through phone interviews, coded, and analyzed transcripts thematically and using content analysis. Key informants worked in national affinity organizations, state-level organizations, academia, and social care organizations. Findings are broad in scope, highlighting variances in rural/urban areas, state government dispositions, workforce characteristics, social and health care infrastructure, beliefs about disability and chronic conditions, and other factors. Findings will informed the development of a larger survey study aiming to articulate an agenda for building capacity to meet the needs of aging with disability populations.

THAT'S WHAT FRIENDS ARE FOR: SOCIAL CAPITAL, DEVELOPMENTAL DISABILITY, AND THE LIFE COURSE

Jessica Hoyle, Jan Warren-Findlow, Lauren Wallace, James Laditka, and Sarah Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina, United States*

Social capital, resources from reciprocal relationships, helps us get by as we age. People with developmental disability have service needs that persist across the life course, which social capital can help address. However, social structures, communication problems and smaller social networks limit social capital for some people with developmental disability. We studied how researchers conceptualize, measure, and apply social capital to developmental disability research throughout the life course, reviewing peer-reviewed articles across 5 disciplines, from 2000 through February 2022. Of 673 studies, 71 met criteria. Studies used a common definition of social capital but no common measures. Fourteen studies focused on parents or other caregivers. Few included older adults with developmental disability as research participants. Results indicate a need to better understand social capital in the lives of people with developmental disability and how social capital resources can support and improve lives of people with developmental disability as they age.

USING ASSISTIVE TECHNOLOGIES AS A MEASURE TO SUPPORT WELL-BEING IN LATE-LIFE DISABILITIES

Tai-Te Su[1], and Shannon Mejía[2], *1. The University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 2. University of Illinois at Urbana-Champaign, Champaign, Illinois, United States*

In the United States, the trends of disabilities among older adults have been largely stable over the past decade. However, the impact of disabilities on health and quality of life remains substantial and requires continued research.

Along with a set of compensatory strategies, assistive technologies play a promising role in augmenting individuals' capacity and reducing environmental demands in daily activities. Using data from the five survey rounds of the National Health and Aging Trends Study (2015–2019), we aimed to investigate the longitudinal associations between disabilities, assistive technologies, and subjective well-being among older adults. A multi-class hierarchical spectrum was constructed to capture the state of disability and assistive technology use. Overall, results showed that subjective well-being decreased progressively along the spectrum. Additionally, assistive technologies were found to differentiate the associations between disabilities and well-being outcomes. Discussions focused on the insights and implications for successful accommodation to disabilities in later life.

EDUCATION AND PERCEIVED FUTURE NEED FOR ADL HELP

Julia Finan, *Syracuse University, Syracuse, New York, United States*

Extant literature suggests that adults with higher education are more likely to avoid poor health outcomes and to rate their health as better than individuals with less education. The current study builds on prior research by analyzing the association between educational attainment and the perceived need for future help with activities of daily living (ADLs), often measuring disability in the literature. 2011-2014 National Health Interview Survey (NHIS) data for adults in the United States age 40 to 65 (N=55,166) were analyzed using multivariate regression analysis. Among non-Hispanic Whites, increased years of education predicted stronger anticipation of the need for future ADL assistance. For non-Hispanic Blacks, this relationship was reversed at the some-college level. Education was not predictive of perceived future ADL assistance need for all other racial-ethnic groups. Results of this study suggest education has a unique impact on anticipation of future need for ADL assistance among non-Hispanic Whites.

CONCEPTUALIZING SUCCESSFUL AGING IN THE PRESENCE OF DISABILITY

Madina Khamzina, and Wendy Rogers, *University of Illinois Urbana Champaign, Champaign, Illinois, United States*

With the rapid demographic changes, it is predicted that every fifth person in the U.S. will be age 65 or older in the next decade. The quality of life and successful aging of older adults, who now live longer, is an important research area from societal and public health perspectives. Rowe and Kahn (1997) defined successful aging as having a low probability of disease and disability, high cognitive and physical functioning, and active engagement with life. A prominent limitation of this model is that it initially neglects essential components of aging and factors that are beyond an individual's choice and control, such as health declines and disabilities. We used the National Health & Aging Trends Study data to understand successful aging from the perspectives of those who experience disability integrating subjective components of self-rated health and well-being. These data provide insights on subjective perceptions on successful aging among older adults with disabilities.

SESSION 2060 (SYMPOSIUM)

ENSURING A KNOWLEDGEABLE GERIATRIC WORKFORCE: INTERDISCIPLINARY EDUCATION IN LONG-TERM SERVICES AND SUPPORTS

Chair: Gina Tucker-Roghi Co-Chair: Gail Towsley
Discussant: Linda Edelman

In this symposium, we describe five interdisciplinary educational programs to enhance the geriatric workforce in long-term services and supports (LTSS): Skilled nursing facilities (SNFs), assisted living, and home health and hospice. The interdisciplinary teams that came together to offer the programs leveraged technology to maximize access to experts in both the curriculum development process and the delivery of the educational programs for a wide range of target learners. The first program, an interdisciplinary telementoring series on dementia care for therapists in SNFs, was developed by a team of experts from occupational, physical and speech therapy. The program included asynchronous online didactic content and case-based learning relevant to therapists. The second program engaged faculty from seven graduate programs: Pharmacy, Physical Therapy, Occupational Therapy, Dentistry, Social Work, Nursing and Physician Assistant to co-create an interprofessional LTSS graduate certificate in Gerontology. The certificate encompasses asynchronous online courses to enable flexibility across programs and cover content specific to LTSS. In the third program, LTSS nurses completed an online educational course to better prepare them to care for complex older adults, improve leadership skills, become more resilient, and complete QAPI projects. The fourth program focused on utilizing interdisciplinary perspectives to educate LTSS direct care staff on the unique needs of LGBTQ older adults. The fifth program offered a virtual telehealth clinical experience to prepare physical therapy students for practice in a SNF setting. The curriculum included eight virtual modules and four telehealth patient encounters that exposed students to interdisciplinary teams in the SNF context.

INTERDISCIPLINARY TELEMENTORING FOR THERAPISTS IN SNFS TO IMPROVE DEMENTIA CARE KNOWLEDGE AND SKILLS

Gina Tucker-Roghi, *Dominican University of California, Santa Rosa, California, United States*

Occupational, physical, and speech therapists possess knowledge and skills that have the potential to reduce the burden of care and improve the quality of life of skilled nursing facility (SNF) residents living with dementia. Despite this opportunity to impact the well-being of residents with dementia, many therapy practitioners lack specialized training on the management of dementia. Therapy practitioners (n=31) from 22 SNFs participated in eight weekly interdisciplinary educational sessions using the Project ECHO (Extension for Community Health Outcomes) tele-mentoring model. An interdisciplinary team of therapy experts collaborated on the development of the curriculum, which included didactic content on dementia-care best practices as well as case-based learning. This presentation describes the process of developing an interprofessional tele-mentoring therapy education program, challenges encountered during implementation, and strategies to retain learners. Evaluation data from participants will be shared and implications for future tele-mentoring interprofessional educational offerings for therapists will be discussed.

DEVELOPING AN INTERPROFESSIONAL GRADUATE CERTIFICATE IN LONG-TERM SERVICES AND SUPPORTS

Gail Towsley[1], Leigh Elrod[2], Nicholas Cox[3], Alberto Varela[4], and Linda Edelman[5], *1. University of Utah, Salt Lake City, Utah, United States, 2. University of Utah Physician Assistant Studies, Salt Lake City, Utah, United States, 3. University of Utah College of Pharmacy, Salt Lake City, Utah, United States, 4. University of Utah School of Dentistry, Salt Lake City, Utah, United States, 5. University of Utah College of Nursing, Salt Lake City, Utah, United States*

The demand for long-term services and supports (LTSS) is increasing and the capacity and competencies of the interprofessional LTSS workforce need to be expanded to provide value-based, person-centered care. The purpose of this presentation is to describe the process of developing an interprofessional LTSS graduate certificate in Gerontology. We broadened an existing nursing graduate certificate to encompass content related to skilled nursing facilities, assisted living and home health and hospice agencies. We will discuss: 1) how we engaged faculty from seven graduate programs: Pharmacy, Physical Therapy, Occupational Therapy, Dentistry, Social Work, Nursing and Physician Assistant to co-create the certificate; 2) challenges and benefits to developing a certificate; and 3) the 15-credit hour certificate components. Our faculty partners were committed to offering a LTSS focused graduate certificate which includes didactic courses and clinical hours. Four students have enrolled in the LTSS graduate certificate in Gerontology since implementation in Spring 2021.

TRAINING TO SERVE: INTERDISCIPLINARY EDUCATION ON LESBIAN, GAY, BISEXUAL, TRANSGENDER, AND/OR QUEER AGING

Rajean Moone, *University of Minnesota, St Paul, Minnesota, United States*

Contemporary research details the significant health, economic, and social disparities experienced by lesbian, gay, bisexual, transgender, and/or queer (LGBTQ) older adults in comparison to their peers. Fundamental to overcoming these disparities is service provider understanding of the unique needs and challenges faced by LGBTQ older adults. This presentation will focus on the development and implementation of the research-based, interdisciplinary curriculum Training to Serve (TTS). TTS is designed to provide LGBTQ age-sensitivity training to service providers and since its inception over 15,000 providers have been trained. Evaluation data from participants will be presented. The framework for the development of the curriculum, based on interprofessional education, adult learning, and minority stress theories, will be shared. Implications for future training development and translation to electronic modules will be discussed.

IMPACT OF AN ONLINE COURSE ON GERIATRICS AND QUALITY IMPROVEMENT SKILLS FOR NURSES IN LONG-TERM SERVICES AND SUPPORTS

Jacqueline Telonidis[1], Kirstie Savage[2], Nanci McLeskey[2], and Linda Edelman[2], *1. University of Utah, Salt Lake City, Utah, United States, 2. University of Utah College of Nursing, Salt Lake City, Utah, United States*

Nurses working in long-term services and supports (LTSS) settings need training in geriatrics and quality improvement (QI). Our Geriatric Workforce Enhancement Program (GWEP) created an online Nurse Residency Program for nurses from other LTSS settings. Nurses (n=7) who completed the program showed statistically significant improvements in confidence in performing geriatrics skills (t = -3.12, df = 6, p = 0.01), attitudes about community-centeredness (t = -2.14, df = 6, p = 0.04), self-efficacy to engage in the treatment and assessment of depression (t = -3.06, df = 6, p = 0.01), and dementia (t = -2.04, df = 6, p = 0.04). Open-ended, satisfaction responses revealed improved self-efficacy with conducting a QI project. Empowering nurses in LTSS settings may improve quality of care, and decrease burnout and turnover. Future revisions will make the course both asynchronous and applicable to other professions in order to build stronger interprofessional LTSS teams.

VIRTUAL TELEHEALTH CLINICAL EXPERIENCE TO PREPARE STUDENT PHYSICAL THERAPISTS FOR PRACTICE IN A SNF

Kathleen Manella[1], Kai Williams[2], and Jon Anderson[3], *1. Nova Southeastern University- Tampa Bay Regional Campus, Indian Rocks Beach, Florida, United States, 2. Ensign Services, Inc, Cypress, Texas, United States, 3. Ensign Services, Inc, San Antonio, Texas, United States*

Student training was suspended in most post-acute settings in the United States due to the COVID-19 pandemic. Through a collaborative partnership between a university and a healthcare organization we offered a virtual telehealth clinical experience to prepare student physical therapists for practice in a skilled nursing facility (SNF) setting. 35 students engaged virtually for 80 hours with two clinical instructors. The curriculum included eight virtual learning modules along with four telehealth patient encounters that exposed students to interdisciplinary teams in the SNF context. Students completed a retrospective pre/post Self-Perception of Learning Survey. Results demonstrated students' self-perception of learning was significantly increased implying an improved ability to practice in the SNF setting. This approach advanced student learning in patient care management, interprofessional practice, and telehealth practice in the SNF setting. Future work is planned to expand the program to include 20 physical therapy, occupational therapy, and speech and language pathology students.

SESSION 2070 (SYMPOSIUM)

ESPO AND BEHAVIORAL AND SOCIAL SCIENCES SECTION SYMPOSIUM: TAILORING INTERVENTIONS TO REACH AND MEET THE DIVERSE NEEDS OF DIVERSE CAREGIVERS

Chair: Kylie Meyer Co-Chair: Sara Hackett

Family caregiving cuts across populations, making caregivers a highly diverse population in terms of culture, family organization, care situations, and more. A 2021 report from the National Academies of Sciences Engineering and Medicine reinforces the need to develop and test tailored interventions in order to successfully reach and support family caregivers. Yet, there is limited practical guidance to help researchers to develop intervention programs tailored to the diverse needs of family caregivers. This symposium endeavors to address this gap by sharing accounts from researchers who have effectively tailored existing interventions to meet the diverse needs of diverse caregivers, as well as those who collaboratively worked alongside family caregivers in order to build a tailored program from the ground up. To begin, Kristin Cloyes, PhD MN RN will describe a study where she examines alignment between LGTBQ+ hospice family caregivers and other members of the hospice care teams, as it relates to support and communication needs. Next, Jung-Ah Lee, PhD, RN, FGSA, FAAN, will describe the experiences of racially and ethnically diverse caregivers who received a community health worker intervention to access resources tailored to their language needs. Jaime Perales-Puchalt, PhD, MPH, will describe the results of CuidaTEXT intervention study, which used tailored Short Messaging Service-based text message to deliver support to Latin family caregivers. Lastly, Ishan Williams, PhD, FGSA, will present on findings from research on how community engagement as well as culturally informed intervention can improve the representation of family caregivers, especially African American caregivers, in caregiving research studies

ALIGNMENT OF COMMUNICATION AND SUPPORT NEEDS BETWEEN LGBTQ+ FAMILY CAREGIVERS OF HOSPICE PATIENTS AND PROVIDERS

Kristin Cloyes[1], Maija Reblin[2], Megan Thomas Hebdon[3], Miranda Jones[4], and Lee Ellington[5], *1. Oregon Health & Science University, Portland, Oregon, United States, 2. University of Vermont, Burlington, Vermont, United States, 3. University of Texas at Austin, Austin, Texas, United States, 4. University of Michigan Department of Psychology, Ann Arbor, Michigan, United States, 5. University of Utah and Huntsman Cancer Institute, Salt Lake City, Utah, United States*

Effective and equitable end-of-life care requires alignment between the support and communication needs of hospice family caregivers and the knowledge and competence of hospice care team members. We investigate alignment between LGBTQ+ caregivers and hospice providers in a secondary analysis of data collected in three studies: 1) Surveys identifying predictors of hospice providers' (N=122) attitudes toward LGBTQ+ caregivers and patients; 2) focus groups assessing hospice interdisciplinary care team members' (N=48) knowledge, training, and opinions regarding LGBTQ+ family caregiver and patient communication and care needs; and 3) in-depth interviews with LGBTQ+ hospice family caregivers (N=20). Synthesis of key findings show how alignment is impacted by lack of systematic, inclusive orientation and gender data, provider religiosity, expectations of disclosure, cisheteronormative assumptions about the universality of EOL experiences, and caregivers' experiences of minority stress. We discuss implications for developing interventions to improve provider communication, empowering caregivers, and addressing hospice-specific sources of minority stress.

A COMMUNITY HEALTH WORKER–LED HOME VISIT INTERVENTION TO SUPPORT DIVERSE DEMENTIA FAMILY CAREGIVERS

Jung-Ah Lee[1], Eunae Ju[2], Eilleen Sabino-Laughlin[3], Lisa Gibbs[4], and Adey Nyamathi[3], *1. University of California, Irvine, Irvine, California, United States, 2. University of California Irvine, Irvine, California, United States, 3. UC Irvine, Irvine, California, United States, 4. University of California, Irvine, Orange, California, United States*

Diverse family caregivers of persons with dementia (PWD) are often faced with challenges in obtaining necessary resources due to limited English-proficiency, accessing available resources, and stigma. Diverse community health workers (CHWs) provided dementia family caregivers culturally and linguistically appropriate education, compassionate listening during a 3-month home-visit intervention. 25 participants were recruited from communities in California: Race/Ethnicity 32% Korean, 32% Vietnamese, 16% Latino, 20% White; 76% Female; 44% Spouse; Age=62.6 (28-83 years); 44% work; English proficiency=2.9 of 5. Recruitment is ongoing. The key themes from the exit interview with participants included (a) accepting the role of a caregiver, (b) better understanding and patience with the PWD, and (c) ongoing support from CHW. The overall satisfaction on the intervention was 4.7/5. The CHW-led home-visit intervention was well-received by ethnically diverse dementia family caregivers. Participants reported the usefulness of education, community resources, and compassionate support delivered in their homes over 3 months.

DEVELOPING AND TESTING THE FEASIBILITY OF A TEXT MESSAGE DEMENTIA CAREGIVER SUPPORT INTERVENTION FOR LATINOS

Jaime Perales Puchalt, *University of Kansas Alzheimer's Disease Research Center, Kansas City, Kansas, United States*

Latinos experience several disparities in dementia including poor caregiver mental health and caregiving support access. Latinos' ubiquitous cell phone ownership and use of text messaging may offset those disparities. During this session, we will describe the development and feasibility testing findings of CuidaTEXT. CuidaTEXT is a tailored Short Messaging Service-based text message intervention to support Latino dementia family caregivers. This intervention was developed using mixed-methods research. This research resulted in a bilingual six-month intervention with automatic daily messages for all participants that address dementia education, self-care, social support, end-of-life, care of the person with dementia, behavioral symptoms, and problem-solving strategies. Participants who need more in-depth support, can use two functions: 1) every time they send a keyword-driven message (e.g., STRESS), they will receive an automatic message to support them with that topic, 2) for any other message they send (live chat), a coach will respond to their specific needs.

AMPLIFYING COMMUNITY ENGAGEMENT TO INCREASE REPRESENTATION AND APPLICABILITY OF CAREGIVING RESEARCH

Ishan Williams[1], Randy Jones[2], and Travonia Brown-Hughes[3], *1. University of Virginia, School of Nursing, Charlottesville, Virginia, United States, 2. University of Virginia School of Nursing, Charottesville, Virginia, United States, 3. Hampton University, Hampton, Virginia, United States*

Alzheimer's disease and related diseases (ADRD) disproportionately affect persons of African American ethnicity, yet persons who identify as Black/African American are consistently and markedly underrepresented in Alzheimer's research. Prior research suggests that a complex array of factors, from mistrust in medical research to non-inclusive recruitment approaches, have led to the disparity. With the growing rates of ADRD among racial/ethnic groups in the US, it is imperative that research scientists develop interventions and clinical research that are culturally informed and meaningful to the lives of diverse caregivers. The goal of our research is to demonstrate the importance of community engagement and culturally informed interventions, and to offer best practices to advance the science of caregiver recruitment, which may ultimately improve overall representation across racial/ethnic caregiver groups. Research findings will highlight the variety of recruitment strategies used to build trust and more sustainable relationships with diverse communities often underrepresented in research.

SESSION 2080 (PAPER)

GLOBAL PERSPECTIVES ON COGNITION AND OUTCOMES

AGE AT CARDIO-METABOLIC DISEASE ONSET IN A COHORT OF MIDLIFE WOMEN: SYSTEMATIC EXCLUSION MISESTIMATES THE MAGNITUDE OF RACIAL DISPARITIES

Alexis Reeves[1], Michael Elliott[2], Tene Lewis[3], Carrie Karvonen-Gutierriez[2], William Herman[2], and Sioban Harlow[2], *1. Stanford University, School of Medicine, Berkeley, California, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Emory University, Atlanta, Georgia, United States*

Cohort studies of aging recruit participants at an age before most of the population experiences the study outcome, to document its natural history. The age of study commencement is usually based on "normative" aging among Whites. However, "weathering" can cause accelerated health declines in minoritized populations compared to Whites due to cumulative experience of multiple forms of marginalization. Thus, considering if weathering among minoritized individuals could affect selection into cohort studies is necessary to effectively estimate and understand racial/ethnic disparities in aging and disease. Using the Study of Women's Health Across the Nation (SWAN), a multi-ethnic longitudinal cohort, and its cross-sectional screening survey, we examine the effects of selection on the racial/ethnic differences in the age of onset of 4 cardio-metabolic outcomes (hypertension, isolated systolic hypertension, insulin resistance and diabetes). Selection at study commencement (left truncation and left censoring) had greater effects on outcomes with earlier age at onset (hypertension) and right censoring had greater effects on outcomes with later onsets (metabolic). Full adjustment led to an average 20-year decrease in predicted median age of onset for all groups across the 4 outcomes and tended to decrease the predicted disparity in age at onset. However, significantly earlier onset of each outcome for Black and Hispanic women compared to Whites remained. Not considering the full extent of selection bias in cohort studies can misinform our understanding of aging and disease, especially for minoritized populations who have higher prevalence of these leading causes of morbidity and mortality earlier in life.

ASSOCIATION OF MID UPPER ARM CIRCUMFERENCE AND COGNITION: A POPULATION-BASED COHORT STUDY

David Lynch[1], annie Green Howard[2], Hsiao-Chuan Tien[3], Shufa Du[2], Bing Zhang[4], Huijun Wang[5], Penny Gordon-Larsen[2], and John Batsis[2], *1. UNC, Chapel Hill, North Carolina, United States, 2. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 3. UNC Chapel Hill, Chapel Hill, North Carolina, United States, 4. National Institute for Nutrition and Health Chinese Center for Disease Control and Prevention, China, Beijing, China (People's Republic), 5. National Institute for Nutrition and Health Chinese Center for Disease Control and Prevention, Beijing, Beijing, China (People's Republic)*

Introduction: Evidence suggests a positive association between muscle mass and cognitive impairment exists. Mid-upper arm muscle circumference (MUMC) is a simple measure that may provide prognostic information on cognitive status.

Methods: We included adults aged ≥55 years from the China Health and Nutrition Survey 1997-2018 with MUAC and triceps skinfold (TSF) measurements at each visit. Cognition was estimated based on a subset of the modified Telephone Interview for Cognitive Status (TICS, 0–27). Sex-stratified linear mixed-effects models accounting for within-individual and within-community correlation assessed the association between MUAC and the ratio of MUAC:TSF with TICS across age. We tested whether the rate of cognitive decline by age differed by quartiles of MUAC and MUAC:TSF in separate models. In cases of no statistical differences in cognitive declines by age, we tested whether overall cognitive function was associated with quartiles of MUAC and MUAC:TSF across all ages.

Results: Of 5,964 adults (53% female, age 62.4±6.4), mean MUAC was 26.6±3.74 and 26.2±3.9 cm, mean MUAC:TSF ratio was 2.9±1.6 and 1.94±1.1, and baseline TICS was 15.4±6.1 and 13.2±6.4 for men and women, respectively. MUAC was not associated with the rate of cognitive decline. Lower MUAC was associated with higher overall cognitive function scores for men ($p=0.01$) and women ($p=0.05$). For men and women there was no association between MUAC:TSF ratio and either cognitive decline or overall function.

Conclusion: MUMC can be a marker to predict overall cognitive function across this period in the lifecycle, suggesting that declining MUAC may help predict lower overall cognitive function

DRINKING WATER QUALITY, DYSLIPIDEMIA, AND COGNITIVE FUNCTION FOR OLDER ADULTS IN CHINA

Xi Pan[1], Ye Luo[2], Dandan Zhao[2], and Lingling Zhang[3], *1. Texas State University, San Marcos, Texas, United States, 2. Clemson University, Clemson, South Carolina, United States, 3. University of Massachusetts Boston, Boston, Massachusetts, United States*

The current study aimed to examine the associations between drinking water quality and cognitive function and to identify the direct and indirect effects of drinking water quality and dyslipidemia on cognitive function among older adults in China. Data for the study were selected from China Health and Retirement Longitudinal Study (CHARLS, 2015) and 4,951 respondents aged 60 and above were included. Dyslipidemia was measured by self-reported dyslipidemia diagnosis and lipid panel. Three composite measures of cognitive function included mental status, episodic memory, and global cognition. Mixed effects models were conducted to assess the associations between drinking water quality or dyslipidemia and cognitive function. The mediation effects of dyslipidemia were examined by path analyses. Results showed that exposure to high quality drinking water was significantly associated with higher scores in mental status, episodic memory, and global cognition ($B = 0.31$, $p < 0.001$ for mental status; $B = 0.22$, $p < 0.05$ for episodic memory; $B = 0.53$, $p < 0.01$ for global cognition). Elevated blood triglycerides was associated with higher scores in mental status and global cognition ($B = 0.21$, $p < 0.05$ for mental status; $B = 0.32$, $p < 0.05$ for global cognition). Self-reported dyslipidemia diagnosis was a suppressor, which increased the magnitude of the direct effect of drinking water quality on mental status and global cognition. Findings of the study suggest that improving drinking water quality could be a potential public health effort to delay the onset of cognitive impairment and prevent the dementia pandemic in older people.

IMPACT OF GENDER ON ASSOCIATION BETWEEN RACE AND DISABILITY: THE CALIFORNIA HEALTH INTERVIEW SURVEY (CHIS)

Lien Quach[1], Christine Vu[2], Isabelle Tran[3], Noah Peeri[2], and Uyen-Sa Nguyen[4], *1. Massachusetts General Hospital, Newton, Massachusetts, United States, 2. University of North Texas Health Science Center (UNTHSC), Fort Worth, Texas, United States, 3. Texas Christian University School of Medicine, Fort Worth, Texas, United States, 4. University of North Texas Health Science Center (UNTHSC), School of Public Health (SPH), Fort Worth, Texas, United States*

Women generally have higher prevalence of disability than men in later life. Moreover, Blacks and Hispanics usually have higher prevalence of disability than Whites. Little is known about the impact of gender on the association between race and disability. We used 2015-2016 CHIS data, restricted to adults ≥ 65 years old (n=15,044). Disability was classified as present or absent based on responses on questions related to "to physical, mental, and emotional conditions." Race was classified as: White, Black, Hispanic, Asian, and Other. We estimated sex- and race-specific proportions and 95% confidence intervals (CI) and used sex-specific multivariable logistic regression to examine the associations between race and disability adjusting for age, education, marital status, cigarette smoking, arthritis, hypertension, and diabetes, mental distress, and walking for work or pleasure. All analyses accounted for complex sampling weights. Approximately 52% of women and 47% of men had disability, while 48% of White, 48% of Black, 60% of Hispanic, 43% of Asian, and 50% of Other race responded as having disability. Adjusting for covariates, Hispanic women had 67% higher odds of having disability compared with White women (OR= 1.67, 95% CI= 1.07–2.60), but there were no differences in male counterparts (OR=1.03, 95% CI=0.68-1.56). Compared with White men, men of Asian or Other race had lower odds for disability, while associations were in the opposite direction in female counterparts; however, associations were not statistically significant. Further research is needed to understand higher prevalence of disability among older minority women compared with White women.

BIOLOGICAL RISK FACTORS FOR DEMENTIA AND COGNITIVE FUNCTION AMONG OLDER INDIANS: FINDINGS FROM LASIDAD

Qiao Wu[1], Eileen Crimmins[2], Mateo Farina[2], Jung Ki Kim[2], and Xinyao Zhang[2], *1. University of Southern California, LOS ANGELES, California, United States, 2. University of Southern California, Los Angeles, California, United States*

A number of clinical and exam-generated biomarkers have been associated with dementia. We assess the relative importance of 41 biomarkers using a novel dataset from an understudied population – a national sample of older Indians. The value of our data includes the biomarker extensiveness, the validated classification of dementia, and the relatively lower average education of the population. We use both traditional social science methods based on biological theories and agnostic machine learning algorithms to examine how biomarkers explain variance in dementia diagnosis and cognitive functioning. Comparing different approaches shows how to best characterize the influence of biology and how to trim and combine biomarkers. The six approaches used in our study include: (1) 41 individual biomarkers; (2) identification of subsets of biomarkers with elastic net; (3) support vector machine learning; (4) factor analysis; (5) principal component analysis; and (6) factor classification based on a theoretical approach. Preliminary results show that all the biomarkers or a reduced set of biomarkers identified by elastic net do the best job at explaining variability in dementia outcome, but the biomarkers chosen as most important by elastic net do not match well our understanding of biological mechanisms. Traditional social science approaches (e.g. factor analysis and principal components approach) provide better understanding and interpretation of the relative importance of biological systems as well as the association between biomarkers and cognition. These results are informative for others collecting and analyzing biomarker data in population samples.

SESSION 2090 (PAPER)

HEALTHCARE WORKFORCE DEVELOPMENT AND OUTCOMES

ADOPTION OF SNFISTS BY US NURSING HOMES DID NOT REDUCE REHOSPITALIZATION RATES AMONG POST–ACUTE CARE PATIENTS

Hye-Young Jung[1], Seiyoun Kim[2], and Kira Ryskina[3], *1. Weill Cornell Medical College, New York, New York, United States, 2. University of Pennsylvania, Philadelphia,, Pennsylvania, United States, 3. University of Pennsylvania, Philadelphia, Pennsylvania, United States*

SNFists, physicians and advanced practitioners who focus their practice in nursing homes, have grown in prevalence in recent years. In this retrospective cohort study, we measured the role of nursing home adoption of SNFists in rehospitalization rates. We used 100% Medicare facility and professional claims for hospitalized fee-for-service beneficiaries discharged to nursing homes in 2012-2019. We defined SNFists as generalist physicians and nurse practitioners with at least 80% of their Medicare Part B claims for nursing home care. All nursing homes that did not have a SNFist in 2012 were followed through 2019. We used an event study approach with staggered SNFist adoption to estimate the effect of a nursing home adopting at least one SNFist on the facility's unplanned 30-day rehospitalization rate, adjusted for patient case mix, facility and market characteristics. Models included facility and year fixed effects. Standard errors were clustered at the facility level. Of the 6,616 nursing homes in the sample, 77% adopted SNFists by 2019. Nursing homes that adopted SNFists did not experience a statistically significant change in rehospitalization rate compared to those that did not adopt: rehospitalization rates decreased by 0.02 percentage points (95% CI -0.35 to 0.32; p=0.93) one year after SNFist adoption and by 0.15 percentage points (95% CI -1.01 to 0.70; p=0.73) six years after adoption, compared to the baseline difference between the groups in the year before adoption. In sum, despite the wide adoption of SNFists by US nursing homes, we did not observe an associated decrease in rehospitalization rates.

EXPLORING THE IMPLEMENTATION OF FOUR TRANSITIONAL CARE INTERVENTIONS FOR OLDER ADULTS: A COLLECTIVE CASE STUDY

Amal Fakha[1], Merel Leithaus[1], Bram de Boer[1], Theo van Achterberg[2], Jan Hamers[1], and Hilde Verbeek[1], *1. Maastricht University, Maastricht, Limburg, Netherlands, 2. KU Leuven, Leuven, Vlaams-Brabant, Belgium*

Four transitional care interventions, aiming to improve transitions between hospital and home settings for older adults, were implemented in Belgium. These interventions are complex in nature and their implementation in practice is often challenging. This study explores the implementation of these interventions from the perspectives of healthcare professionals involved in the process, and by investigating three implementation aspects: influencing factors, strategies used, and outcomes. A retrospective qualitative collective case study was conducted using semi-structured interviews with thirteen healthcare professionals. Thematic analysis was used, and the Consolidated Framework for Implementation Research guided the final data interpretation. Key findings indicated that implementation barriers were mostly at the organizational level (i.e., resources, structure, networks & communication), while facilitators were at the individual level (i.e., personal attributes, champions). The prominent strategy used to implement these interventions was engagement and additional strategies were suggested for the future sustainability of the interventions (i.e., building strategic partnerships, developing policies to support transitional care). The overall implementation was perceived as favorable with high adoption as a key outcome. This study highlights the crucial role of healthcare professionals, being motivated and committed to fostering the implementation of interventions in transitional care. It is important to use implementation strategies targeting factors at both the individual level as well as the organizational level for implementing transitional care interventions in the future.

GERIATRICIAN CO-MANAGEMENT AND EDUCATION OF JUNIOR DOCTORS IMPROVE THE CARE OF HOSPITALIZED OLDER SURGICAL PATIENTS

Janani Thillainadesan[1], Sarah Aitken[2], Sue Monaro[2], John Cullen[2], Richard Kerdic[2], Sarah Hilmer[3], and Vasi Naganathan[2], *1. Department of Geriatric Medicine and Centre for Education and Research on Ageing (CERA), Concord Hospital, Concord, New South Wales, Australia, 2. Concord Hospital, Concord, New South Wales, Australia, 3. Royal North Shore Hospital, St Leonards, New South Wales, Australia*

We evaluated changes in processes of care after the introduction of a novel model of care for older vascular surgery inpatients. This model, called Geriatrics Co-management of older vascular surgery patients (GeriCO-V) embedded a geriatrician into the vascular surgery team who provided proactive geriatrics assessment of patients and education for junior surgical doctors. A pre-post study of the GeriCO-V model comparing prospectively recruited pre-intervention (n=150) and post-intervention (n=152) cohorts of consecutively admitted vascular surgery patients aged ≥65 years at an acute care academic hospital. Education of junior surgical doctors was embedded in the new model of care and included role modelling, provision of delirium and frailty screening lanyards and mobile Apps for 'just-in-time' learning, and a Wiki page of tips on assessing older patients. We measured processes of care by review of medical charts. After implementing the novel geriatrician and education embedded model of care, there was a significant increase in several processes of care by the junior surgical doctor: screening for cognition (8% vs 76%, p<.001) and delirium (2% vs 69%, p<.001), documentation of functional history (34% vs 76%, p<.001), medications (53% vs 74%, p<.001) and treatment preferences (5% vs 46%, p<.001) and prescribing of pharmacological venous thromboprophylaxis (93% vs 99%, p=.03) and co-prescription of laxative with opioid (60% vs 81%, p=.002). A collaborative model of care that embeds proactive geriatrician care and education of junior surgical doctors improves the quality of care for older vascular surgical patients.

SWISS NURSING HOMES' ENGAGEMENT IN QUALITY IMPROVEMENT: A MULTICENTER CROSS-SECTIONAL STUDY

Lauriane Favez[1], Michael Simon[2], Christine Serdaly[3], and Franziska Zúñiga[1], *1. University of Basel, Basel, Basel-Stadt, Switzerland, 2. The Institute of Nursing Science, Basel, Basel-Stadt, Switzerland, 3. serdaly&ankers, Conches, Geneve, Switzerland*

Many publications have focused on quality improvement interventions in nursing homes but the self-initiated daily involvement of nursing homes in quality improvement activities has rarely been investigated (e.g., conducting surveys, using data to set quality aims and track quality of care over time, conducting quality improvement projects). Such activities can be carried out by nurses in expanded roles with competences beyond those of regular registered nurses (e.g., advanced studies, Bachelor/Master's degree), but evidence is lacking. We aimed to described the involvement of nursing homes and of nurses working in expanded roles in quality improvement activities in Swiss nursing homes. A cross-sectional multi-center study (2018-2019) using survey data from a convenience sample of 115 Swiss nursing homes and 104 nurses in expanded roles was used and descriptive statistics applied. Most nursing homes reported carrying several quality improvement activities (median = 8 activities out of 10 surveyed). The group of nursing homes working with a nurse in an expanded role (n = 83) were more engaged in quality improvement than the other group (median = 8 versus 6.5) Higher-educated nurses participated more in a majority of quality improvement activities than lower-educated nurses (Bachelor/Master-educated nurses: median of 13 out of 17 activities surveyed, versus diploma-educated nurses: 10), except for clinical teaching. This study provides insights into nursing homes' involvement in daily quality improvement and suggests that, depending on the targeted quality improvement needs, nursing homes use different profiles and education levels of nurses in expanded roles.

SESSION 2100 (SYMPOSIUM)

CHANGING THE NARRATIVE ON NURSING HOME CARE

Chair: Patricia D'Antonio

Redesigning our nursing home care system will require substantial policy change, and we know that policy change needs an effective framing strategy. This panel will include speakers who have been studying public mindsets and opinions about nursing home care and its implications for advocacy communications. We will also talk about the implications of this research for the larger reframing aging initiative.

SESSION 2130 (SYMPOSIUM)

INTERDISCIPLINARY DEMENTIA CARE WORKFORCE TRAINING AND QI IMPLEMENTATION: LEARNINGS FROM 25 HOSPICES

Chair: Abraham Brody Discussant: Joseph Gaugler

To build and sustain a dementia-capable clinical workforce and care delivery organizations, it is essential to systematically disseminate evidence-based, interdisciplinary dementia care programs. The outbreak of COVID-19, clinical staff shortages, and competing priorities experienced by healthcare organizations including staff vaccination and other regulatory requirements, pose significant challenges to the continuation of agency-wide, interdisciplinary dementia care workforce training and quality improvement. In this symposium, we present our experience Implementing Aliviado Dementia Care, a comprehensive, interdisciplinary dementia care workforce training and quality improvement program amid COVID-19 across 25 U.S. hospice agencies, as part of an embedded pragmatic clinical trial. Aliviado Dementia Care consists of interdisciplinary dementia care workforce training, treatment algorithms, assessments, care plans, caregiver education, and clinical workflow changes. The symposium begins with a discussion of the training, knowledge improvement, turnover, and replenishing strategies of hospice champions during COVID-19. We then discuss how we tailored dementia care training for each of the skilled hospice disciplines (i.e., medicine, nursing, social work, spiritual care) and provide two case studies elucidating how additional tailoring was performed to fit local agency culture and needs during COVID-19. Furthermore, we discuss how we developed and iterated training for home health/hospice aides, the usability and training results, and specific considerations for training aides during COVID-19. Lastly, we conclude the symposium with a discussion of salient strategies and technologies that help sustain our nationwide implementation despite the ongoing COVID-19. Throughout each of these abstracts we also discuss how COVID-19 affected, and created differential implementation of components of the intervention.

NATIONWIDE ALIVIADO CHAMPION TRAINING: KNOWLEDGE IMPROVEMENT, CHAMPION TURNOVER, AND LESSONS LEARNED

Tina Sadarangani[1], Aditi Durga[1], Ariel Ford[2], Donna McCabe[3], Tessa Jones[1], Kimberly Convery[1], and Shih-Yin Lin[1], *1. New York University, New York, New York, United States, 2. New York University Rory Meyers College of Nursing, New York, New York, United States, 3. New York, New York, New York, United States*

Aliviado Champions are hospice employees selected by their agency to lead the local implementation of the Aliviado program. Accordingly, training and retention of champions are critical to hospices' success (or failure) of program implementation. As of February 2022, we have trained 308 champions across 19 agencies; 94% of the champions agreed all learning objectives were met. A total of 144 champions (97 nurses, 27 social workers, 16 chaplains, and 5 providers) completed pre- and post-training dementia knowledge surveys, demonstrating significant improvements in dementia knowledge, attitudes, and confidences in 7 out of 10 domains post training ($p<0.005$). The champion turnover rate during COVID-19 (March 2020-Feb 2022) was 11%. In addition, we share our experience adapting the originally 2 full-day, in-person Aliviado Champion Training into a Zoom-based format in response to COVID-19 including strategies to prevent Zoom fatigue. We also discuss strategies to address turnover and rapidly onboard new champions during COVID-19.

INTERDISCIPLINARY DEMENTIA CARE WORKFORCE TRAINING DURING COVID-19 AND TWO HOSPICE CASE STUDIES

Rebecca Lassell[1], Aditi Durga[1], Shih-Yin Lin[1], Tessa Jones[1], Ariel Ford[2], and Abraham Brody[3], *1. New York University, New York, New York, United States, 2. New York University Rory Meyers College of Nursing, New York, New York, United States, 3. HIGN at the NYU Rory Meyers College of Nursing, New York, New York, United States*

Hospice is a care model characterized by interdisciplinary team-based, person and family-centered care. To optimize agency-wide interdisciplinary team-based hospice dementia care, at least two levels of tailoring of the dementia care workforce training are imperative, first, by discipline, and second, by hospices' local culture and needs. As of February 2022, a thousand and one skilled hospice interdisciplinary team members (not counting champions) across 18 hospice agencies have completed their discipline-specific Aliviado dementia care training, including 56 providers, 763 nurses, 129 social workers, and 53 chaplains. In this presentation, we describe how we tailored dementia workforce training for skilled interdisciplinary team members (first level tailoring), as well as provide two case studies elucidating how we performed further tailoring of the program for two large hospice agencies (average daily census: 354 and 868, respectively) in two different states to meet their local needs (second level tailoring), and lessons learned.

ALIVIADO HOME HEALTH AND HOSPICE AIDE DEMENTIA CARE EXPERT PROGRAM IMPROVES AIDE DEMENTIA KNOWLEDGE

Shih-Yin Lin[1], Aditi Durga[1], Ariel Ford[2], S. Raquel Ramos[2], Michele Crespo-Fierro[3], Tina Sadarangani[1], and Abraham Brody[4], *1. New York University, New York, New York, United States, 2. New York University Rory Meyers College of Nursing, New York, New York, United States, 3. New York Univeresity Rory Meyers College of Nursing, New York, New York, United States, 4. HIGN at the NYU Rory Meyers College of Nursing, New York, New York, United States*

Most persons living with dementia receive home health or hospice aide services during their hospice stay. To equip aides with essential knowledge and skills to effectively communicate with and care for persons living with dementia, we developed a 17-video dementia care expert program for aides, available in both English and Spanish. The objective of this presentation is two-fold: first, describe the development and refinement of the Aliviado aide dementia care expert program, including topic selection, usability testing, and cultural tailoring; and second, discuss aide knowledge improvement, along with special considerations for training aides during COVID-19. The Aliviado dementia care expert program for aides has been completed by 414 aides across 15 hospices as of February 2022; of which, 384 aides (93%) completed a dementia knowledge assessment both before and after the training and demonstrated significant knowledge gains with moderate-to-large effect sizes ($p<0.0001$; Cohen's $d=0.63$).

STRATEGIES AND TECHNOLOGIES TO SUSTAIN NATIONWIDE IMPLEMENTATION OF ALIVIADO DEMENTIA CARE

Abraham Brody[1], Aditi Durga[2], Ariel Ford[3], Rebecca Lassell[2], and Shih-Yin Lin[2], *1. HIGN at the NYU Rory Meyers College of Nursing, New York, New York, United States, 2. New York University, New York, New York, United States, 3. New York University Rory Meyers College of Nursing, New York, New York, United States*

It is well documented that knowledge improvement alone is not sufficient to sustain systems level changes. Through supporting dementia care workforce training and the embedding of Aliviado program tools (treatment algorithms, assessments, care plans, and caregiver education materials) into hospices' clinical workflow across the U.S., we learned that both technologies and human support strategies are essential for lasting changes. In this presentation, we first discuss our experience leveraging a powerful customer relationship management software (Salesforce) to assign, manage, and encourage completion of the interprofessional Aliviado Dementia Care training for thousands of active users across the nation. We then share how we provide additional human support and implementation tools in the face of COVID-19, which can inform implementation of similar trials, including office hours, training reports, Plan-Do-Study-Act worksheets, symptom management cheat sheets, champion calls, and electronic health records integration meetings with each agency to locally tailor and embed Aliviado tools.

SESSION 2140 (SYMPOSIUM)

KEY PREDICTORS OF COGNITIVE AGING

Chair: Nicholas Turiano Co-Chair: Julie Blaskewicz Boron

Understanding who will experience cognitive dysfunction and dementia is as important as identifying methods to combat such deterioration. This symposium seeks to highlight new advances in understanding cognitive deterioration and promote resilience in adulthood. Odd and colleagues utilized a national sample (2,643 adults aged 34-85) to show that 9-year decreases in executive function and episodic memory predicted increased risk of dying. Use of a brief cognitive assessment administered via telephone was unique – a method that may assist clinicians administering cognitive screenings to older adults in isolated areas. Graham and colleagues utilized a daily diary approach in 116 older adults (aged 60-90) to show that greater daily fluctuations in mindfulness were associated with higher episodic memory and executive functioning. Further, mediational evidence suggested that on days when mindfulness was greater, individuals perceived a younger subjective age. Willroth and colleagues provide evidence that higher scores on eudaimonic well-being in older adults (n=349) predicted greater cognitive resilience. Specifically, even though some participants had neuropathological burden (e.g., increased beta-amyloid, neurofibrillary tangles), they did not exhibit pronounced cognitive declines. Using data from 14 longitudinal studies, Yoneda and colleagues examined the impact of physical activity on cognitive impairment and death. Multi-state survival analyses demonstrated engagement in more physical activity reduced risk of cognitive impairment and death. This symposium suggests that examining changes in cognition, incorporating subjective and objective indices of cognitive impairment, utilizing long-term longitudinal and daily diary designs, and testing key modifiable behaviors is crucial to understanding and promoting optimal cognitive functioning in adulthood.

CHANGE IN EPISODIC MEMORY AND EXECUTIVE FUNCTIONING PREDICTS MORTALITY RISK

Kaleena Odd[1], Julie Boron[2], Jacob Alderson[3], Margie Lachman[4], and Nicholas Turiano[3], *1. University of Nebraska Omaha, Omaha, Nebraska, United States, 2. University of Nebraska, Omaha, Nebraska, United States, 3. West Virginia University, Morgantown, West Virginia, United States, 4. Brandeis University, Waltham, Massachusetts, United States*

The current study explored whether the Brief Test of Adult Cognition via Telephone (BTACT) assessment could be used to predict longevity in a national sample of adults from the Midlife Development in the United States (MIDUS) study. Specifically, we examined whether 9-year changes in episodic memory (EM) and executive functioning (EF) predicted all-cause mortality risk (2004-2018). The sample included 2,643 participants (MAge=45.87; 92.23% white; 107 deceased) who completed the BTACT twice: between 2004-06 and between 2013-2017. Using change scores, decreases in EM (HR= 1.45 [1.09-1.93], p=.01) and EF (HR=1.585 [1.17-2.14], p<.001) increased the hazard of dying (controlling for age, gender, race, education, and self-rated health). Results suggest the BTACT is sensitive enough to detect health-consequential decreases in EM/EF. Future research should consider the BTACT as a viable assessment tool for older adults who may not have easy access to cognitive screenings.

WELL-BEING AND RESILIENCE TO DEMENTIA-RELATED NEUROPATHOLOGY

Emily Willroth[1], Bryan James[2], Eileen Graham[3], Alifiya Kapasi[4], David Bennett[2], and Daniel Mroczek[3], *1. Washington University in St. Louis, St. Louis, Missouri, United States, 2. Rush University, Chicago, Illinois, United States, 3. Northwestern University, Chicago, Illinois, United States, 4. Rush Alzheimer's Disease Center, Chicago, Illinois, United States*

Not all older adults with dementia-related neuropathology in their brains experience cognitive decline or impairment. Instead, some people maintain relatively normal cognitive functioning despite neuropathologic burden, a phenomenon called cognitive resilience. Using a longitudinal, epidemiological, clinical-pathologic cohort study (N=349), the present research investigated associations between well-being and cognitive resilience. Consistent with pre-registered hypotheses, higher eudaimonic well-being (i.e., Ryff Psychological Well-being Scale) and higher hedonic well-being (i.e., Satisfaction with Life Scale) were associated with better-than-expected cognitive functioning and less-than-expected cognitive decline relative to one's neuropathological burden (i.e., beta-amyloid, neurofibrillary tangles, Lewy bodies, vascular pathologies, hippocampal sclerosis, and TDP-43). The association of eudaimonic well-being in particular was present above and beyond known cognitive resilience factors (i.e., socioeconomic status, education, cognitive activity, low neuroticism, low depression) and dementia risk factors (i.e., ApoE genotype, medical comorbidities). This research highlights the importance of considering eudaimonic well-being in efforts to prevent dementia.

PHYSICAL ACTIVITY, COGNITIVE HEALTH, AND LONGEVITY IN OLDER ADULTHOOD

Tomiko Yoneda[1], Andrea Piccinin[2], Nathan Lewis[2], Jamie Knight[2], Jinshil Hyun[3], Luca Kleineidam[4], Scott Hofer[2], and Graciela Muniz Terrera[5], *1. Northwestern University, Evanston, Illinois, United States, 2. University of Victoria, Victoria, British Columbia, Canada, 3. Albert Einstein College of Medicine, Bronx, New York, United States, 4. University of Bonn, Bonn, Nordrhein-Westfalen, Germany, 5. Ohio University, Athens, Ohio, United States*

Research suggests that physical activity (PA) protects against cognitive impairment in older adulthood; however, the extent to which PA engagement throughout older adulthood influences the simultaneous risk of transitioning to cognitively impaired states and death is unclear. Applying coordinated data analysis across 14 studies, multi-state survival models (MSM) were independently fit to data from fourteen longitudinal studies (NTotal=52,039). PA was synthesized across studies using the metabolic equivalent of task approach. Adjusting for demographics and chronic conditions, meta-analytic results indicated that engaging in more PA was associated with a reduced risk of transitioning from no cognitive impairment to mildly impaired cognitive functioning (HR=0.94, 95%CI's=0.89,0.99) and death (HR=0.72, 95%CI's=0.65,0.80). Based on MSM estimates, multinomial regression models computed total life expectancy stratified by national PA recommendations. Meta-analytic results indicate a positive linear effect of PA, such that more PA is associated with longevity. This presentation will include discussion of knowledge translation efforts.

WITHIN-PERSON RELATIONSHIP BETWEEN MINDFULNESS AND COGNITION IS MEDIATED BY SUBJECTIVE AGE

Lyndsey Graham, and Shevaun Neupert, *North Carolina State University, Raleigh, North Carolina, United States*

Cognitive functioning fluctuates daily throughout adulthood. Lapses in mindfulness can have cognitive consequences, which may be impacted by how old a person feels each day. Subjective age was examined as a mediator in the within-person relationship between mindfulness and cognition. 107 younger adults (aged 18-36, M = 19.96) and 116 older adults (aged 60-90, M = 64.71) completed reports of mindfulness and subjective age and tests of inductive reasoning and episodic memory for 8 consecutive days. Within-person multilevel mediation models indicated that daily subjective age mediated the relationship between daily mindfulness lapses and both indicators of daily cognition across ages. However, the mediation effect was stronger for younger adults on inductive reasoning but was stronger for older adults on episodic memory. These results show that daily changes in subjective aging are an important mechanism for daily cognition, with differential impact based on age and cognitive component.

SESSION 2150 (PAPER)

LONGITUDINAL, INTERVENTION CLINICAL TRIALS, AND QUALITATIVE STUDIES TO EXAMINE CAREGIVER OUTCOMES AND EXPERIENCES

CAREGIVER SUBGROUP ANALYSES FROM AN EMBEDDED DEMENTIA CARE EFFECTIVENESS TRIAL

Richard Fortinsky[1], Dorothy Wakefield[2], Lily Zhong[2], James Grady[2], Catherine Piersol[3], Julie Robison[4], and Laura Gitlin[5], *1. University of Connecticut Center on Aging, Farmington, Connecticut, United States, 2. University of Connecticut, Farmington, Connecticut, United States, 3. Jefferson College of Rehabilitation Sciences, Philadelphia, Pennsylvania, United States, 4. UConn Health, Center on Aging, Farmington, Connecticut, United States, 5. Drexel University, Philadelphia, Pennsylvania, United States*

Efficacious dementia care interventions for family/informal caregivers are increasingly being tested for effectiveness in “real world” service delivery settings. We conducted an effectiveness trial in which we embedded the Care of Persons with Dementia in their Environments (COPE) program into Connecticut’s publicly-funded Home and Community-Based Services program. COPE is designed to build dementia management skills in caregivers of people with dementia in the home setting. In published results from this trial with the full study cohort, caregivers who received COPE, compared to controls, experienced improved well-being due to the dementia management skills they learned (perceived well-being), but they did not experience reduced levels of distress due to dementia-related behavioral and psychological symptoms (distress). For this presentation, we determined COPE effects for selected caregiver subgroups on perceived well-being and distress. Regarding caregiver sex, we found that COPE effects were statistically significantly positive on both outcomes for females (both $p<.05$) but on neither outcome for males. Controlling for sex, we also found positive COPE effects on both outcomes for daughters (both $p=.03$) but on neither outcome for spouses or sons. For perceived well-being, we found positive COPE effects for White ($p<.001$) but not for Black caregivers. For distress, we found positive COPE effects for caregivers living apart ($p=0.03$) but not for those living together with people with dementia. Findings suggest that male, Black, and co-residing caregivers may need more support from COPE, and more broadly demonstrate the value of subgroup analyses in offering greater precision when embedding nonpharmacological interventions in effectiveness trials.

GENDER DIFFERENCES IN CAREGIVING PRACTICES AND MARITAL RELATIONSHIPS OF SANDWICH GENERATION COUPLES IN MUMBAI

SRUTHI ANILKUMAR HEMALATHA, SEKHER T.V., and NAWAJ SARIF, *International Institute for Population Sciences, Mumbai, Maharashtra, India*

Over the next few decades, the most important demographic trend for the Asia Pacific region will be population aging. The increasing aging population in India and the fact that the economic dependence of the older adults is high and the cost of education and child care is on the rise pose serious challenges to generations of individuals and couples who are expected to take care of both their children and their parents. This study's primary objective is to comprehensively understand the effects of giving care to their children and their parents on various aspects of the life of sandwich generation couples. The study uses primary data of 300 multigenerational households and 100 two-generation/one-generation households in Mumbai. Specifically, the study attempts to understand the effect of giving care to two generations on the marital relationship of the caregiving couples. Additionally, the study also explores gender differences in caregiving practices. Results from bivariate and multivariate analyses show that providing simultaneous care to two generations significantly impacts the marital relationship of the sandwiched couples as opposed to couples staying in one/two-generation households. Results also show considerable gender differences in caregiving roles and time spent on caregiving. Women spend more time assisting in household activities, while men are more likely to provide monetary support. Thus, extensive research on the sandwich generation in India is necessary to ensure the socio-economic well-being of the couples, the welfare of their children and parents, and the physical and psychosocial health of these couples.

THIS TOO SHALL PASS: WEATHERING THE STORM AS OLDER FEMALE FAMILY CAREGIVERS FOR THOSE WITH AD/ADRD DURING COVID-19

Candace Harrington[1], and Dean Witt[2], *1. University of Louisville, Louisville, Kentucky, United States, 2. University of Louisville, Harrodsburg, Kentucky, United States*

Background:

Older female caregivers of persons with AD/ADRD are under-represented, under-reported, and understudied. Purpose: This qualitative study aimed to understand how COVID-19 affects older female caregivers' lived experience, ongoing capacity, and willingness to provide care for their loved one(s) with AD/ADRD. Specific Aims: Aim 1: Explicate older female caregivers' lived experience in the context of caring for family members with AD/ADRD during COVID-19. Aim 2: Elucidate how COVID-19 affected older female caregivers' relationships with their family members with AD/ADRD. Method: 172 units of meaning were extracted from 327 pages of transcripts and 972 minutes of interviews with urban ($n = 10$) and rural caregivers ($n = 10$). Thematic analysis was then conducted.

Results:

Respondents, recruited with purposive and snowball sampling, saw hastened AD/ADRD progression in their family member(s) attributed to social isolation. For many, long-term placement was not an option for financial reasons. Respondents providing full-time caregiving depended heavily on their care recipients' financial resources for basic living expenses, reporting placement in long-term care would leave them at risk of homelessness. Black caregivers expressed an "unspoken" cultural taboo about placement. For all, caregiver disability was the only impetus for placement. Respondents in rural communities more often reported faith-based gratefulness, moments of joy, relational harmony resulting from "being stuck together", and less availability of resources allowing virtual support. Urban caregivers reported more social isolation, less awareness of resources, more intentional family member distancing, and higher pandemic-related distress. Implications: These findings have broad economic, social, policy, research, and practice implications.

USE OF DIGITAL TECHNOLOGY SOLUTIONS TO SUPPORT CAREGIVING BY FAMILY CAREGIVERS OF OLDER ADULTS

Rahul Malhotra, Nur Diyana Azman,
Veronica Shimin Goh, and Abhijit Visaria, *Duke-NUS Medical School, Singapore, Singapore*

Caregiving-relevant information and services are increasingly available online. Greater understanding of the extent and purpose of their use by family caregivers of older adults and specific caregiver sub-groups that are more or less likely to use them can inform both policies related to and the content of such solutions. We investigated the extent to which family caregivers of older persons in Singapore use digital technology solutions such as the internet and apps, and the purposes for which they use them. Information on digital device use was collected from 278 caregivers. Of them, 139 caregivers gave detailed information on how they had used the internet or apps to support caregiving in the last six months. Most (89%) caregivers used digital devices regularly (mostly smartphones (87%)). Digital device use was associated with caregiver age, ethnicity and education. Common generic online activities included sending instant messages (77%) and surfing websites (64%). While 54% had used the internet to support caregiving (most common purpose: search for information on care-recipient's health conditions), 43% had used apps to do so (most common purpose: coordinate care with family members or other caregivers). Such use was associated with caregiver age, education and care-recipient health. While use of digital devices and generic online activities are common among caregivers, their use of the internet or apps to support caregiving is less common. Information-seeking and coordination are indicative of avenues in which digital technology solutions can complement 'physical' channels of communication and support with and for caregivers, and be further expanded.

SESSION 2160 (SYMPOSIUM)

LUCIDITY IN DEMENTIA: EMERGING CONCEPTS AND DATA

Chair: Andrea Gilmore-Bykovskyi Discussant:
Basil Eldadah

Episodes of lucidity among people with advanced Alzheimer's disease and Alzheimer's disease related dementias (AD/ADRD), reportedly evidenced by an unexpected return of meaningful communication or connection, are an area of growing interest. Event transient recovery of abilities in the setting of advanced AD/ADRD are potentially significant for caregivers and the person living with dementia; as well as for shaping our understanding of AD/ADRD more broadly. Despite the potential significance of these events, existing evidence is largely comprised of anecdotal reports and retrospective/case reports. Recently, the National Institute on Aging funded six studies to advance empiric studies on episodes of lucidity in advanced AD/ADRD. This symposium will provide an update on progress and findings across these funded studies. The first presentation focuses on acceptability and feasibility of a prospective observation study focused on characterizing potential observable indicators of episodes of lucidity in individuals with advanced AD/ADRD near end of life encompassing audiovisual observation, informant field interviews and case reviews. The second presentation will provide an overview of a 3-phase mixed methods study focused on development of preliminary types of lucid episodes. Collectively, presentations demonstrate a variety of approaches to investigating episodes of lucidity and shed light on emergent methods for operationalizing these events. Implications of various conceptualizations for EL and conceptual decisions across studies will be reviewed.

FEASIBILITY OF A LONGITUDINAL AUDIOVISUAL OBSERVATION PROTOCOL TO CHARACTERIZE LUCIDITY IN ADVANCED AD/ADRD

Andrea Gilmore-Bykovskyi, Laura Block, Clark Benson,
Jess Fehland, Meghan Botsch, Kimberly Mueller, and
Alison Coulson, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

Episodes of lucidity (EL) among individuals with advanced dementia, which are predominantly reported near end of life, are clinically and potentially epidemiologically significant events. Audiovisual observation offers a valuable approach to studying EL, providing opportunities to characterize verbal/non-verbal features of EL as well as their surrounding contexts. Approaches to capturing and characterizing audiovisual data and potential verbal/non-verbal indicators of EL near end of life are lacking. We determined the acceptability and feasibility of a multi-faceted observational study protocol among people with advanced dementia near end of life incorporating longitudinal audiovisual observation, informant field interviews/logs, and case review of high likelihood EL events. Five eligible individuals were enrolled, yielding a 100% enrollment/retention rate, 54 observations/140 hours of observation across participants. Task load and usability ratings indicate study procedures with iterative refinements were feasible; surveys and qualitative appraisal from participants and staff endorse high rates of acceptability and feasibility.

A METHODOLOGICAL APPROACH TO IDENTIFY EPISODES OF LUCIDITY AMONG PEOPLE WITH ALZHEIMER'S DISEASE

Kyungmin Kim[1], Theresa Frangiosa[2], Virginia Biggar[2],
Dawne Finnie[3], Lauren Bangerter[4], Joseph Gaugler[5],
Maria Lapid[3], and Joan Griffin[3], *1. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea, 2. UsAgainstAlzheimer's, Washington, District of Columbia, United States, 3. Mayo Clinic, Rochester, Minnesota, United States, 4. United Health Group, Edina, Minnesota, United States, 5. University of Minnesota, Minneapolis, Minnesota, United States*

People with late-stage Alzheimer's disease and related dementias (ADRD) who are assumed to have lost coherent cognitive capacity may exhibit unexpected episodes of lucidity (EL). Given the transient nature and lack of scientific explanation of the phenomenon, EL is under-investigated and poorly understood. To better understand this phenomenon, we set out to develop an operational definition of EL. Based on survey data from former and current family caregivers participating in UsAgainstAlzheimer's A-LIST® (N = 480), we defined four EL typologies. We then interviewed 25 caregiver respondents about their experiences and used analyzed qualitative data to refine the preliminary typologies. Finally, we conducted a Delphi consensus panel with clinicians, researchers, and health care providers with medical, pharmacological, and clinical expertise to describe potential explanations for EL to help further refine the typologies. Next we will test the validity of these typologies in a prospective, demographically diverse sample of current family caregivers.

APPLICATION OF QUALITATIVE METHODS IN THE DEVELOPMENT OF AN INFORMANT-REPORTED MEASURE OF LUCIDITY

Mildred Ramirez[1], Jeanne Teresi[2], Julie Ellis[3], Paloma Gonzalez-Lopez[4], Stephanie Silver[4], Usama Bhatti[5], Davangere Devanand[6], and Jose Luchsinger[7], *1. Hebrew Home at RiverSpring Health, Riverdale, New York, United States, 2. Research Division, HHAR, Riverdale, New York, United States, 3. La Trobe University, Nursing and Midwifery, Bundoora, Victoria, Australia, 4. Research Division, Hebrew Home at Riverdale by RiverSpring Health, Riverdale, New York, United States, 5. Research Division, Hebrew Home at Riverdale by RiverSpring Living, Bronx, New York, United States, 6. Columbia University Irving Medical Center, New York, New York, United States, 7. Department of Medicine, Columbia University, New York, New York, United States*

The aim was a qualitative evaluation of a lucidity measure for front-line staff or family informants. A sequential approach to item development and evaluation was followed: refinement of the operationalization of the construct; review of seminal items, modification, and purification; confirmation of the feasibility of reporting methodology. Modified focus groups were conducted with 20 staff and 10 family members who participated using a web-based survey. Sample themes included: reaction when hearing the term; words that come to mind; description of and first reaction to referenced or observed "lucidity" events. Data were extracted from Qualtrics for analysis using NVivo. Semi-structured cognitive interviews were conducted with10 health professionals working with older adults with cognitive impairment. An external advisory board reviewed the clarity, breadth, and scope of the conceptual definition and item content. Suggestions for item modification derived from the focus groups and cognitive interviews resulted in the final lucidity measure.

IS THERE A DIFFERENCE BETWEEN TERMINAL LUCIDITY AND PARADOXICAL LUCIDITY?

Andrew Peterson[1], Justin Clapp[2], Kristin Harkins[2], Melanie Kleid[2], Emily Largent[2], Shana Stites[2], and Jason Karlawish[2], *1. George Mason University, Fairfax, Virginia, United States, 2. University of Pennsylvania Perelman School of Medicine, Philadelphia, Pennsylvania, United States*

Recent arguments in aging and dementia research suggest that "terminal lucidity"—defined as unexpected communication or connectedness occurring shortly before death—is distinct from "paradoxical lucidity"—defined as an episode of communication or connectedness in a person who is assumed to have lost these capacities due to progressive neurodegeneration. We disagree with this distinction and argue that terminal lucidity is a special subtype of paradoxical lucidity. We suggest that specifying the relationship between terminal and paradoxical lucidity is important for investigating the underlying mechanism of lucidity in dementia.

APPROACHES TO INVESTIGATING LUCIDITY IN ADRD: A PRELIMINARY RESEARCH FRAMEWORK TO GUIDE OPERATIONAL HARMONIZATION

Andrea Gilmore-Bykovskyi[1], Joan Griffin[2], Kimberly Mueller[1], Sam Parnia[3], and Ann Kolanowski[4], *1. University of Wisconsin-Madison, Madison, Wisconsin, United States, 2. Mayo Clinic, Rochester, Minnesota, United States, 3. NYU Grossman School Of Medicine, New York, New York, United States, 4. Penn State University, State College, Pennsylvania, United States*

Episodes of lucidity (EL) in Alzheimer's disease and Alzheimer's disease related dementias (AD/ADRD), also termed "paradoxical lucidity," have garnered increasing attention as an important area of research. Efforts to study lucidity suffer from a lack of clear definitional criteria, inconsistent conceptualization and diverse approaches to operationalizing features of these events. To advance systematic investigation of EL in AD/ADRD, there is a need for clarity and precision in labeling event attributes, markers, and specific measurement strategies that enable operational harmonization across distinct approaches to investigating the relatively broad and nascent phenomenon. To that end, we propose a preliminary research framework to guide harmonization of approaches to investigating EL in AD/ADRD. Our goal is to provide a systematized approach to characterizing operational decisions that facilitates comparability across different methodological approaches and measurement strategies while allowing for exploration of multiple definitional criteria, measurement standards, and interpretive approaches.

SESSION 2170 (PAPER)

PAIN, PHYSICAL ACTIVITY, AND FUNCTION

EXPLAINING THE RACIAL AND ETHNIC DIFFERENCES IN ADL DISABILITY AMONG OLDER ADULTS: A POLYSOCIAL SCORE APPROACH

Chenkai Wu, and Junhan Tang, *Duke Kunshan University, Kunshan, Jiangsu, China (People's Republic)*

Disability in activities of daily life (ADL) is prevalent among older Americans. Racial and ethnic disparities in functional ability in old age continue to be a public health concern. We examined whether social environment, measured in a comprehensive way (polysocial score approach), could modify the racial and ethnic differences in ADL disability. Data are from the Health and Retirement Study; 5,925 older adults initially free of disability were included. Six ADLs were considered: bathing, eating, using the toilet, dressing, walking across the room, and getting in/out of bed. We included 24 social factors from five categories (economic stability, neighborhood environment, education, community/social context, and healthcare system) and used forward stepwise regression to screen for important ones. Polysocial score was created using 13 social factors and was classified as low (0-19), intermediate (20-30), and high (31+). We used the multivariable Poisson regression to estimate the risk of incident disability by three polysocial score categories and evaluate the interaction between race/ethnicity (non-Hispanic Whites and Others) and the polysocial score. A higher polysocial score is associated with a lower disability risk among non-Hispanic Whites and Others. We found an additive interaction between race/ethnicity and polysocial score categories. In the low polysocial score group, non-Hispanic Whites had a 4.7% lower risk of disability than the Others, while the difference significantly reduced to 2.4% and 2.6% in the intermediate and high polysocial score group, respectively. The polysocial score approach offers a new opportunity to explain the racial/ethnic disparities in functional capacity among older adults.

GROUP-BASED TRAJECTORY MODELING OF NURSING HOME RESIDENT PAIN SCORES

Connie Cole[1], Susan Hickman[2], Justin Blackburn[3], Janet Carpenter[4], and Chen Chen[4], *1. University of Colorado Anschutz Medical Campus, Kendallville, Indiana, United States, 2. Indiana University School of Nursing, Indianapolis, Indiana, United States, 3. IU Richard M. Fairbanks School of Public Health at IUPUI, Indianapolis, Indiana, United States, 4. Indiana University, Indianapolis, Indiana, United States*

Up to 80% of older adults living in a nursing home (NH) experience pain and up to 32% have substantial pain. Pain in NH residents is associated with poor quality of life, higher likelihood of depression, and decreased life satisfaction. Pain in NH residents has often been studied using a cross-sectional approach, which fails to consider the temporal nature of pain. Therefore, the purpose of this analysis was to identify and characterize clinically meaningful, dynamic pain trajectories in NH residents using data from the Minimum Data Set. A retrospective longitudinal analysis was conducted using group-based trajectory modeling with pain scores from admission to discharge or a maximum of 28 assessments. We identified four distinct trajectories: 1) consistent pain absence (48.9%), 2) decreasing-increasing pain presence (21.8%), 3) increasing-decreasing pain presence (15.3%), and 4) persistent pain presence (14.0%). Relative to residents' in the consistent pain absence trajectory, the likelihood of being in the persistent pain presence trajectory was more than twice as high for those living in a rural versus (AOR 2.7, CI 2.2-3.4, p<.001), over 4 times higher for those with hip fracture (AOR 4.3 CI 2.6-7.0, p<.001), nearly 3 times higher for those with a fracture other than hip (AOR 2.9, CI 2.0-4.1, p<.001), and almost twice as high for those with contracture (AOR 1.7, CI 1.4-2.1, p<.001). Using residents' characteristics associated with persistent pain such as hip fracture or contracture may improve care planning based on early identification or risk stratification and can improve mitigation of persistent pain.

RACE AND ETHNIC DIFFERENCES IN PHYSICAL ACTIVITY, OSTEOPENIA, AND OSTEOPOROSIS: RESULTS FROM NHANES

Elizabeth Vasquez[1], Md Towfiqul Alam[2], and Rosenda Murillo[3], *1. Albany University (SUNY), Rensselaer, New York, United States, 2. University of North Carolina at Greensboro, Greensboro, North Carolina, United States, 3. University of Houston, Houston, Texas, United States*

Introduction: Osteopenia and osteoporosis are common age-related disorders with enormous health and economic consequences to older adults and society. Physical activity (PA) is an important modifiable risk factor for bone mineral density (BMD). This study aims to determine whether current physical activity is related to osteopenia and osteoporosis (based on BMD) in a racial/ethnically diverse sample of older adults.

Methods: Femoral bone BMD data from the National Health and Nutrition Examination Survey (NHANES 2009-2010, 2013-2014, 2017-2018) was obtained for 3,331 adults 60-80 years old. Self-reported PA was categorized into high, moderate, and low. Linear regression models that accounted for the complex survey design of NHANES examined the association between PA and BMD for each race/ethnic group.

Results: Non-Latino blacks (blacks) and Latinos reported low levels of PA when compared to Non-Latino whites (whites) (40.7%, 38.2% and 32.4% respectively; p< 0.0001). Further, blacks and Latinos had a lower prevalence of osteoporosis (5.6%, 6.4% and 9.0% respectively; p< 0.0001), but have similar prevalence of normal BMD and osteopenia categories when compared to whites. There was a 0.03 g/cm2 difference in BMD between those in the high PA versus the low PA (p< 0.0001).

Conclusion: Our findings indicate that despite lower levels of activity, black and Latino older adults were less likely to have osteoporosis. High levels of activity were significantly associated with higher BMD after controlling for confounders. Considering the prevalence and burden of osteopenia and osteoporosis and projected increases of the older population we need more research evidence supporting the role of PA.

TESTING THE MODERATING EFFECTS OF DEPRESSIVE SYMPTOMS ON A PHYSICAL ACTIVITY INTERVENTION

Emily Smail, Christopher Kaufmann, and Todd Manini, *University of Florida, Gainesville, Florida, United States*

Depressive symptoms affect the physical and cognitive health of approximately 20% of older adults. These symptoms have strong, bidirectional ties with physical activity levels and mobility disability. Physical activity has a positive impact on mood and depression and is highly recommended for symptom management across all ages. However, it's unclear whether elevated depressive symptoms interfere with potential benefits that physical activity has on other health outcomes like mobility loss. The Lifestyle Interventions and Independence for Elders (LIFE) Study randomized over 1,500 older adults (aged 70+) to either a physical activity (intervention) or successful aging (control) program with an average of 2.2 years of follow-up. Our analysis used Cox proportional hazards models to evaluate whether elevated depressive symptoms (measured using the Center for Epidemiological Studies-Depression (CESD)-11 scale with a cutoff score of 16/22 points) moderated the relationship between intervention status and the primary outcome (incident major mobility disability, objectively measured as the ability to walk 400 meters). In a secondary analysis of 1,534 older adults (Mage = 78.8, 66.7% female), we confirmed significant main effects of both the physical activity intervention and elevated depressive symptoms on incident major mobility disability but found no evidence of moderation (interaction p-value=0.989). Results indicate that the benefits of the intervention were comparable between those with and without significant depressive symptoms at baseline, supporting the inclusion of individuals with depression in clinical trials. In addition to potential symptom relief, promoting physical activity in older adults with depression is important for protecting against mobility loss.

SESSION 2180 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: NUTRITION, METABOLISM, AND AGING

Chair: Rozalyn Anderson

Aging is associated with increased risk for a host of non-communicable diseases and disorders including diabetes, cardiovascular disease, cancer, and neurodegeneration. Although the underlying basis for this shared risk as a function of aging is not known, numerous diseases of aging have an established metabolic component. Data from preclinical and basic research indicate that the pace of aging is malleable, and studies in short-lived species have shown the ability of genetic and nutritional interventions to not only positively impact longevity but also to prolong health into older age. This symposium, “Nutrition, Metabolism, & Aging”, features internationally renowned aging research scientists whose work focuses on how nutrition and metabolism intersect with aging biology. We will hear from John Speakman from the University of Aberdeen who will present his research on “Metabolism and Extended Longevity”; Leanne Redman from the Pennington Biomedical Research Center whose work in humans will be described in her talk on “Dietary Interventions for Healthy Aging”; Holly Brown-Borg from University of North Dakota will discuss endocrine modulation of aging in her talk “Somatotropic Signaling in Health and Longevity”; and Valter Longo from the University of Southern California who will discuss the latest findings from his research in mice and humans in his talk “Periodic Fasting in Aging and Disease". Attendees will learn about nutrition and metabolism and how these cues are interwoven to regulate aging, impact health, and enhance longevity.

SOMATOTROPIC SIGNALING IN HEALTH AND LONGEVITY

Holly Brown-Borg, *University of North Dakota, Grand Forks, North Dakota, United States*

The endocrine system is highly integrated and regulates growth, reproduction, metabolism, and stress responses that influence aging. Reduced growth hormone (GH) signaling extends health and lifespan in part, by altering metabolism maintaining enhanced insulin sensitivity and defense mechanisms. Diet composition affects metabolism and GH status integrates these nutrient signals, modulating metabolic responses that result in age-related disease susceptibility. Two pathways affected by somatotropic signaling include methionine and lipid metabolism. GH appears to regulate oxidative defense and the methionine pathway via enzymes that affect S-adenosyl-methionine, glutathione, DNA methylation, and detoxification activities. We also have evidence that GH deficient mice escape fatty liver disease when fed high-fat diets. Together our work and others indicate that GH plays a significant role in an organism’s ability to respond to nutrients and cellular stressors by regulating factors that counter stress, modulating metabolic responsiveness to nutrients, and detoxification of endogenous and exogenous compounds.

PERIODIC FASTING MIMICKING DIET, LONGEVITY, AND DISEASE

Valter Longo, *Leonard Davis School of Gerontology, Los Angeles, California, United States*

Chronic dietary interventions have been known for decades to help prevent disease and extend longevity, yet most are difficult to adopt especially long-term. Brief periods of a diet that mimics fasting by regulating key starvation response genes including IGF-1, TOR-S6K and PKA lasting between 4 and 7 days and followed by long periods on a normal diet, are emerging as potentially effective pro-longevity interventions. These periodic fasting mimicking diets (FMD) provide low calories, sugars, and proteins and high levels of unsaturated fats. In mice, 4 day bi-monthly cycles of the FMD started at middle age extend longevity, reduce tumors by nearly 50%, reduce inflammatory diseases and increase cognitive performance at old ages. In humans, 3 monthly cycles of a 5 day FMD reduce markers or risk factors for aging, diabetes, cancer and cardiovascular disease including cholesterol, blood pressure, CRP, IGF-1, and fasting glucose, particularly in subjects with elevated levels of these markers at baseline. Here I will present our most recent mouse and clinical studies indicating that FMDs can help reverse insulin resistance, reduce risk factors/markers of aging and age-related diseases, and lower biological age.

DIETARY INTERVENTIONS FOR HEALTHY AGING

Sai Krupa Das[1], Leanne Redman[2], *1. Tufts University, Boston, Massachusetts, United States*
2. Pennington Biomedical Research Center, Baton Rouge, Louisiana, United States

Aging is associated with a host of cellular and molecular changes that cumulatively result in a progressive decline in metabolic and physical function, development of chronic disease, and increased risk of mortality. Dietary interventions targeting these age-related changes have been shown to attenuate the aging process and improve healthspan, i.e., the length of time individuals are disease- and disability-free. Calorie restriction (CR) is one such intervention that has been shown to be effective in reducing disease risk and improving multiple markers of biological aging. The biological mechanisms mediating the observed benefits of CR are not fully understood but possibly involve changes in energy metabolism, oxidative damage, insulin sensitivity, inflammation, and function of both the neuroendocrine and sympathetic nervous systems. Despite the benefits of CR, sustained adherence remains a challenge. An alternative dietary approach with potential for impact on markers of aging and disease risk is intermittent fasting (IF), which represents a broad class of meal-timing interventions that involve alternating periods of eating and extended fasting. One novel form of IF called time-restricted eating (TRE) involves eating within a 10-hour period and fasting for the rest of the day. TRE appears to improve adherence to IF and especially improve cardiometabolic health in humans. Studies in rodents and pilot studies in humans have found that TRE reduces body weight and hunger, improves insulin sensitivity, lowers blood pressure, reduces inflammation and oxidative stress, improves circadian rhythms, and, in rodents only, extends lifespan. With feasibility data demonstrating reasonably high adherence rates, TRE is a promising strategy to improve markers of healthspan.

SESSION 2200 (PAPER)

RESILIENCE

DISRUPTED ACTIVITIES AND CAREGIVERS RESILIENCE: LONGITUDINAL PATTERNS AND ASSOCIATIONS

Jeong Eun Lee, and Natasha Peterson, *Iowa State University, Ames, Iowa, United States*

PurposeRelatives are often caregiving for patients with advanced cancer and carry a heavy burden. Self-care and resilience-building activities offer building blocks to enhance their wellbeing and burden-bearing capacity. This study assessed the longitudinal patterns of disrupted activities of caregivers and their association with resilience reported by caregivers. MethodsData came from the National Study of Caregiving, a nationally representative study of caregivers. We analyze outcomes for caregivers for three waves of NHAT (2011-2017), estimating associations of disrupted activities and positive appraisals on 1) caregiving burden 2) resilience. Caregivers reported positive appraisals and the number of activities that have been interrupted due to their caregiving responsibilities. ResultsMultilevel models with heterogeneous within-person variance were fit to test the hypotheses on associations between disrupted activities, positive appraisals, and fluctuations in resilience and caregiving burden. Our analysis confirmed increasing disrupted activities among caregivers over time. When interrupted activities were higher than average, caregivers reported lower levels of resilience and higher levels of caregiving burden, suggesting that disrupted activities can contribute to caregivers. The reverse pattern was found for positive appraisals. ConclusionMore positive appraisals and lower levels of disrupted activities were associated with lower caregiver burden and higher levels of caregiver resilience. This study points to the critical value that caregiver self-care and positive appraisals are essential to bolster caregiver resilience and counteract caregiver burden. Future studies should illuminate the causal relation. This study will broaden our understanding of caregivers' self-care needs and provide practical implications for supporting caregivers.

MEASURING RESILIENCE ACROSS THE LIFE COURSE: FINDINGS FROM HRS AND ADD HEALTH

Miles Taylor, Tyler Bruefach, and Dawn Carr, *Florida State University, Tallahassee, Florida, United States*

The study and measurement of psychological resilience (PR) is increasingly of interest to interdisciplinary audiences focused on successful aging across the life course. Though existing nationally representative datasets have not directly measured PR previously, recent advances have produced two novel measures showing promise among older and younger adults, respectively. We examine whether these measures capture similar internalized resources and if they effectively measure PR across race/ethnicity, gender, SES, and age. Analyses use two PR measures: the Simplified Resilience Scale (SRS) created in the 2006/8 Health and Retirement Study (N=14,064), and the Add Health Resilience Scale (AHRS) created in Wave 4 (2008) of the National Longitudinal Study of Adolescent to Adult Health (N=4,936). Both scales reflect Wagnild and Young's (1993) conceptualization of PR as an internalized, multidimensional psychological resource that is protective for health and wellbeing. Confirmatory Factor Analyses suggest that both measures capture a single construct of PR well, on average (one-factor structure; CFI >.95, RMSEA <.06). These measures also perform similarly across social groups; we observed configural, metric, and at least partial scalar invariance across race/ethnicity, gender, education, and age. Assessing the validity of these measures across diverse US populations at various life stages is critical to understanding how PR shapes aging processes over the life course, and for promoting successful aging throughout mid and later life. Future research can advance understanding of PR and its measurement by leveraging intersectional combinations of social statuses including race/ethnicity, gender, education, and age.

RESILIENCE AND MULTIFACTORIAL STRESSORS AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC: A QUALITATIVE STUDY

Melissa Hladek[1], Deborah Wilson[2], Sabrina Shofner[1], Alden Gross[3], Karen Bandeen-Roche[3], and Nancy Schoenborn[1], *1. Johns Hopkins University, Baltimore, Maryland, United States, 2. Johns Hopkins University School of Nursing, Baltimore, Maryland, United States, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

The COVID-19 pandemic represents a complex stressor that is experienced differently across individuals and age strata. The present study explored perceptions and experiences of older adults within the domains of health, social interactions, finances and care of existing chronic medical conditions; and strategies used to cope with these stressors. We recruited 30 people (mean age 81.4 years) stratified by frailty status to complete semi-structured interviews about what changes to the above domains had occurred and what coping strategies were utilized. Using inductive and deductive coding techniques, thematic analysis revealed three overarching themes. The first was Pandemic Experience, which was perceived as stressful, especially in the domains of social isolation from friends and family and concern for others' well-being. The second domain was Resilience where participants reported highly adaptable and creative ways to connect with others and viewed the pandemic from a lens of lifetime experience, which acted as a stress buffer. The third theme was Silver Linings where participants reported unexpected renewal like reconnecting with family and friends in more meaningful ways and reconnecting with nature. We found no meaningful distinction in experience by frailty status and explore reasons for this. Policy implications including internet access and training and societal aging biases are discussed in the context of aging and coping theories.

RESILIENCY AMONG WHI WOMEN IN THE 80+ COHORT BY RACE AND NEIGHBORHOOD SOCIOECONOMIC STATUS

Jessica Krok-Schoen[1], Michelle Naughton[2], Crystal Cene[3], Aladdin Shadyab[4], Sparkle Springfield[5], Timiya Nolan[1], Ashley Felix[1], and Rebecca Jackson[1], *1. The Ohio State University, Columbus, Ohio, United States, 2. The Ohio State University Comprehensive Cancer Center, Columbus, Ohio, United States, 3. University of North Carolina, Chapel Hill, North Carolina, United States, 4. University of California at San Diego, La Jolla, California, United States, 5. Loyola University, Maywood, Illinois, United States*

Resilience, an individual's ability to successfully adapt to adversity, is a multifaceted outcome that may be affected by individual and community factors. A comprehensive examination of resilience by race and neighborhood socioeconomic status (NSES) among women aged 80+ is needed to better understand longevity in diverse populations. Women aged 80+ in 2011, in the Women's Health Initiative (WHI) study were included. Resilience was measured using the 3-item Brief Resilience Scale, with higher scores indicating better resiliency. Descriptive statistics and multivariable linear regression examined the association of demographic, psychosocial, and health variables with resilience by race (White, Black, Asian) and NSES. The majority of participants (n=29,367, median age=84.0) were non-Hispanic White (91.4%), and had multimorbidities (66%). There were no significant differences by race on mean resiliency scores (p=0.06). Mean resilience was higher among women with higher NSES (low NSES=3.94±0.83, moderate NSES=3.95±0.82, high NSES=4.00±0.81; p< 0.001). Optimism (p< 0.001), social support (p< 0.01), and physical/mental symptom burden (p< 0.05) were significant correlates of resilience among Asian, Black, and White women. Self-rated health (p< 0.001), depressive symptoms (p< 0.001), optimism (p< 0.001), social support (p< 0.001), physical/mental symptom burden (p< 0.001), and body mass index (p< 0.001) were significant correlates of resilience across women with low, moderate, and high NSES. Age was significantly associated with resilience among women with moderate (β=-0.004, p=0.019) and high NSES (β=-0.005, p=0.045). This study found several common correlates of resilience across race and NSES among women aged 80+ in the WHI. Future research to enhance resilience, such as through psychosocial and behavioral interventions, is warranted.

ROLE OVERLOAD AND SLEEP DISTURBANCE AMONG CAREGIVERS OF PERSONS WITH DEMENTIA: THE MODERATING EFFECT OF RESILIENCE

Elliane Irani, Fei Wang, Stephanie Griggs, and Ronald Hickman, *Case Western Reserve University, Cleveland, Ohio, United States*

Sleep disturbance is a significant sleep health problem among caregivers of persons with dementia and could exacerbate numerous adverse health outcomes. Resilience is one's ability to recover from challenges and is a protective factor that is posited to blunt the effect of caregiving stress on sleep disturbance. Therefore, the purpose of this study was to examine if resilience moderates the association between perceived role overload and sleep disturbance using data from the 2017 wave of the National Study of Caregiving. The sample consisted of 480 informal caregivers (mean age = 61.77 years, SD = 13.69 years) of persons with dementia in the U.S. Participants completed self-report questionnaires about their sociodemographic and health characteristics, perceived role overload, resilience (i.e., adjusting to change and recovering from hardship), and sleep disturbance (i.e., frequency of trouble maintaining sleep). Data were analyzed using multiple regression with interaction terms to evaluate the moderation effect of resilience. Higher perceived role overload was associated with higher sleep disturbance, while controlling for caregivers' age, race, gender, education, and self-rated health. The association of perceived role overload with sleep disturbance was attenuated among caregivers with higher levels of resilience (b = -.029, 95% CI: -.058, -.001). This study highlights the stress-buffering and sleep health benefits of resilience in the context of dementia caregiving. Among caregivers of persons with dementia, approaches to improve their ability to recover, resist, and rebound during caregiving challenges may mitigate stress and optimize their sleep health.

SESSION 2210 (SYMPOSIUM)

RURAL SYSTEM-BASED COPING STRATEGIES FOR ADVANCING RESEARCH AND HEALTHCARE WHILE TRANSITIONING TO THE NEW NORMAL

Chair: Joan Ilardo Co-Chair: Angela Zell

The pandemic brought about many changes at a system level that were necessary to facilitate continuity of research and the practice of healthcare. Rural and underserved populations were and continue to be the hardest to reach both before and during the COVID-19 pandemic. Therefore, the innovative coping strategies that were implemented during the pandemic are essential to continue as we transition into the endemic stage and realize our new normal as researchers and practitioners. This symposium will highlight adaptations made to research and practice during the COVID-19 pandemic that will apply to future system-level strategies. Drs. Wiese and Park will present results from an online exercise intervention for rural older adults that are at risk of cognitive decline. Drs. Ilardo and Zell will present a roadmap inspired by the pandemic to promote food equity. Drs. Zell and Haque will address rural solutions to polypharmacy issues using an interdisciplinary team approach. Dr. Monaghan-Geernaert will discuss important implications that international caregivers have in fulfilling caregiving gaps in the US, followed by Dr. Freeman et al.'s discussion of rural, long-term care facilities (LTCF) experiences during the pandemic. These system-based coping strategies have policy implications for rural healthcare as we transition to the new normal.

PANDEMIC-INSPIRED COLLABORATIVE ROADMAP TO PROMOTE RURAL FOOD EQUITY ACROSS THE LIFESPAN

Joan Ilardo, and Angela Zell, *Michigan State University, East Lansing, Michigan, United States*

Early during the pandemic, access to food by residents across the lifespan was problematic in many communities.

We observed well-intentioned responses by community organizations but a lack of centralized coordination across sectors. Most organizations were not aware of the efforts and capabilities of others causing duplication or gaps in services. Our team created a user-friendly, evidence-based roadmap to guide communities through developing and sustaining effective collaborative partnerships for food and nutrition-related problems to address together. We will describe elements of an effective, efficient roadmap development process using currently available evidence-based resources and creating evidence-informed resources when we identify gaps. Expected outcomes are: 1) format of the final roadmap; 2) types of groups willing to use it; 3) how well the roadmap was implemented; 4) feasibility of continued use of the roadmap by groups over the long term; and 5) potential to expand roadmap use to other communities.

TEAMS AND TOOLS: ADDRESSING POLYPHARMACY USING THE ARMOR TOOL IN A RURAL NURSING CARE FACILITY

Angela Zell, and Raza Haque, *Michigan State University, East Lansing, Michigan, United States*

Federal guidelines by the Centers for Medicare and Medicaid Services around the use of an interdisciplinary team (IDT) approach have been in place for years. However, use of evidence-based tools to address polypharmacy have not been specified. A study was conducted to evaluate the implementation of the ARMOR (Assess, Review, Minimize, Optimize, Reassess) tool to address polypharmacy in a rural nursing care facility. The tool provided a stepwise approach to a standardized process for the IDT to discuss individual resident care plans including psychotropic medications, psychosocial concerns, falls, quality of life, functional status and other factors in their weekly meetings. Surveys and a focus group were used to measure attitudes and skills of the IDT in relation to the use of the evidence-based tool in the IDT process. Data collected presents an overall positive attitude for and improvement in skills in the IDT with the use of the ARMOR tool.

DIGITAL LEARNING AND ONLINE CHAIR YOGA FOR RURAL UNDERSERVED OLDER ADULTS AT RISK OF COGNITIVE DECLINE

Lisa Wiese[1], and JuYoung Park[2], *1. Florida Atlantic University, Boca Raton, Florida, United States, 2. Florida Atlantic University College of Social Work and Criminal Justice, Boca Raton, Florida, United States*

We conducted a randomized control trial to test the feasibility of an online chair yoga intervention among rural older adults at risk for cognitive decline in an underserved, racially/ethnically diverse community. Participants were randomly assigned to either chair yoga (n=15) or computer brain games (n=15). Prior to the 12-week intervention, a computer training program was provided to all participants by local high school students, who followed a previously tested curriculum, and mentored the older adults in attending sessions. Digital literacy and cognitive, physical, and psychosocial measures were collected at baseline, 3 weeks, and post-intervention, with 3 and 6-month follow-up. We assessed students' attitudes toward older adults pre/post-intervention. Both student and resident samples were 98% minority (African American, Latino, and Afro-Caribbean), with residents' average age of 67.5 (SD = 8.3), years lived rural 38 (M = 11.5), and initial digital literacy of 48.5%. Additional outcomes will be detailed in this presentation.

THE EFFECTS OF COVID-19 ON THE MIGRATION OF HOME HEALTHCARE WORKER

Pamela Monaghan-Geernaert, *Northern State University, Aberdeen, South Dakota, United States*

Home health caregivers provide a vital role in allowing people to age in place. Women, and in particular immigrant women, have become the largest provider of home health care in Western Industrialized Countries. Global push-pull factors affecting caregivers were greatly disrupted with the emergence of the global pandemic – COVID-19. The pandemic highlighted how fragile the system is and how the easily the 'grey economy' can be compromised. This research looks at border access, immigration restrictions and other factors which impeded the migration of caregivers. Poor countries suffered greatly with restrictions on exporting women who use cross national moves as a means to generate income for families in their homeland, and rich countries faced extreme shortages. The results were devastating for all parties – caregivers and care recipients alike.

ASSESSING THE IMPACT OF COVID-19 ON THE HEALTH AND WELLNESS OF THE LONG-TERM CARE WORKFORCE IN RURAL AND NORTHERN AREAS

Shannon Freeman[1], Davina Banner[1], Hui Jun Chew[1], Tammy Klassen-Ross[1], and Piper Jackson[2], *1. University of Northern British Columbia, Prince George, British Columbia, Canada, 2. Thompson Rivers University, Kamloops, British Columbia, Canada*

There is growing recognition that the mental health and wellbeing of the LTCF workforce have been disproportionately impacted by COVID-19. Therefore, we sought to describe the experiences and challenges LTCF employees faced during COVID-19 in rural and northern communities and highlight factors affecting their ability to be resilient and provide high quality care. We conducted 53 qualitative interviews using zoom with LTCF care providers (care aides, nurses, social workers), staff (food service workers, recreation providers), and management between November 2021 and February 2021. Data was transcribed and thematic analysis undertaken. We will describe participants experiences stratified by LTCF employee type and highlight similarities and differences in participants experiences across geography and facility type (freestanding vs. co-located in hospital) and describe factors affecting well-being, job satisfaction, and retention. We will share an inventory of programs and strategies participants found useful to mitigate negative effects on their mental health and well-being.

SESSION 2220 (SYMPOSIUM)

SELF-PERCEPTIONS OF AGING IN THE CONTEXT OF CHALLENGING EXPERIENCES: PATTERNS OF RISK AND RESILIENCE

Chair: Hannah Giasson Co-Chair: Rachel Koffer
Discussant: Jacqui Smith

Self-perceptions of aging have important implications for health and well-being in later life. Early life experiences, cultural and societal notions about age, and one's present health and situational context may contribute to one's expectations and perceptions of their own aging (e.g., Levy, 2009; Diehl et al., 2014; 2021). However, self-perceptions of aging may also predict people's responses in the face of current or future challenges. This symposium takes a closer look at self-perceptions of aging in the context of different types of life challenges. Hu and Larkina discuss early life informal caregiving experiences as antecedents of negative self-perceptions of aging in later life. Koffer and Giasson discuss how ten-year longitudinal associations between subjective age and future loneliness differ among current caregivers and non-caregivers. Mejia and colleagues discuss the role of self-perceptions of aging in adaptation to life following a fall, highlighting potential protective effects of positive self-perceptions of aging and sense of control. Finally, Giasson and colleagues discuss positive self-perceptions of aging as predictors of preventive health behavior and resilience in the context of the COVID-19 pandemic. Dr. Jacqui Smith will conclude the session with an integration of common themes, practical implications, and future research directions that emerge from the four studies.

POSITIVE SELF-PERCEPTIONS OF AGING AS PREDICTORS OF COVID-RELATED PREVENTIVE BEHAVIOR AND RESILIENCE

Hannah Giasson[1], William Chopik[2], and
Alejandro Carrillo[2], *1. Arizona State University, Tempe, Arizona, United States, 2. Michigan State University, East Lansing, Michigan, United States*

Individuals have faced extraordinary challenges throughout the COVID-19 pandemic. Psychosocial strengths may promote individuals' resilience during this time. Positive self-perceptions of aging (SPA) have been found to predict a variety of health and well-being indicators. We examined SPA as a predictor of COVID-19-related behavior, adaptation, and resilience in a sample of 3,620 adults (Mage=65.88; 61.1% women; 65.4% white) from the 2016 and 2020 waves of the Health and Retirement Study. Linear regression results revealed that more positive SPA in 2016 was associated with more preventative health behavior (β=.03, p=.04), a higher likelihood of staying at home (β=.07, p<.001), less worry (β=-.27, p<.001), less stress (β=-.24, p<.001), less loneliness (β=-.27, p<.001), and greater resilience (β=.20, p<.001) during the first year of the pandemic (2020). Associations held after controlling for demographic covariates. Findings support SPA theories, suggesting linkages between SPA and adaptive behaviors and outcomes in the face of external challenges.

SUBJECTIVE AGE AND FUTURE LONELINESS: COMPARING CAREGIVERS AND NON-CAREGIVERS ACROSS TEN YEARS

Rachel Koffer[1], and Hannah Giasson[2], *1. Arizona State University, Phoenix, Arizona, United States, 2. Arizona State University, Tempe, Arizona, United States*

Experiences that make age salient can shape how old or young a person feels relative to their chronological age. Caregiving for a loved one may contribute to subjective age as well as the linkages between subjective age and well-being. We examined longitudinal associations between subjective age and future loneliness ten years later among 2,557 caregivers and non-caregivers (Baseline Mage=55) in the Midlife in the United States Study (2004-2014). Linear regression results indicated an interaction between caregiver status and subjective age (β = 0.60, 95% CI=[0.14, 1.06]), such that among non-caregivers, older subjective age predicted greater future loneliness, but among caregivers, younger subjective age predicted greater future loneliness. Associations hold after controlling for age, baseline loneliness, and caregiver status at follow-up. Future subjective aging research should examine the unique context of caregiving to further understand the meaning of subjective age and how it predicts important well-being outcomes among caregivers.

POSSIBLE SELVES THROUGH CAREGIVING: CAREGIVING HISTORY'S EFFECTS ON SELF-PERCEPTIONS OF AGING

Rita Hu, and Marina Larkina, *University of Michigan, Ann Arbor, Michigan, United States*

Most studies examine the consequences of self-perceptions of aging (SPA). Little is known about the antecedents. The possible selves framework suggests that earlier life experiences can shape people's scenarios about their own aging. We examine the association between early-life informal caregiving experiences and SPA later in life using data from the HRS Retrospective Life History Mail Survey and the Psychosocial and Lifestyle Questionnaire (N = 2,556, Mage = 72.9). Participants reported up to five periods of unpaid caregiving (≥ 6 months) with family members. SPA was measured by the HRS 8-item scale. Step-wise linear regression revealed that compared with people who had not been caregivers, early-life caregivers reported more negative SPA later in life (β = 0.20, 95%CI[0.12, 0.29]). The association holds after controlling for health-related and demographic covariates. Future research and interventions should focus on the consequences of early-life caregiving on the caregiver's scenarios about their own aging.

SUBJECTIVE EXPERIENCES OF AGING AND PHYSICAL ACTIVITY IN THE YEARS THAT PRECEDE AND FOLLOW A FALL

Shannon Mejía[1], Tai-Te Su[2], and
Faith-Christina Washington[1], *1. University of Illinois at Urbana-Champaign, Champaign, Illinois, United States, 2. The University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Falls are the leading preventable cause of death and disability in older adulthood. Subjective experiences of aging could facilitate fall prevention and adaptation to post-falls life. We use data from the 2008-2018 waves of the Health and Retirement Study to follow self-perceptions of aging (SPA), health-domain control (HDC), and physical activity (PA) in 12,000+ adults (Mage=69.09; 59% women; 83% white) to examine trajectories of subjective experiences and health behaviors preceding and following a fall. In total, 57% experienced falling. Both SPA and HDC were lower among fallers. Spline growth models showed that HDC, SPA, and PA significantly decreased over time. Additionally, the rate of decline in HDC and PA increased following the fall. After falling, the protective effect of HDC amplified, while positive SPA dampened change in PA. Our study illustrates the importance of subjective experiences of aging on adaptation and recovery in the context of falling.

SESSION 2230 (SYMPOSIUM)

THE FAMILY-CENTERED FUNCTION-FOCUSED CARE INTERVENTION: IMPLEMENTATION AND MEASUREMENT CONSIDERATIONS

Chair: Marie Boltz Discussant: Jane Flanagan

Family care partners can play an important role in promoting the functional recovery of hospitalized older adults living with dementia. Family-centered function-focused care (Fam-FFC) aims to create an "enabling" milieu for the person with dementia through, staff education, unit-based champions, environmental and policy assessment/modification, and individualized goal setting. In this patient/family-centered care approach, nurses purposefully engage family care partners in the assessment, decision-making, care delivery and evaluation of function-focused care during hospitalization and the 60-day post-acute period. Staff are provided with techniques to support positive interaction with patients and families and respect the role of care partners as advocates. The goal is to promote functional recovery and well-being in the patient, and prevent unnecessary long-term care admissions, while improving care partners' preparation for caregiving and well-being. Fam-FFC was developed with the input of patients, families, nurses, and rehab therapists. This symposium focuses on key factors associated with the implementation of Fam-FFC, and relevant measures. After an introductory overview of Fam-FFC, the nature of staff/patient interaction during hospitalization, including the influence of gender, will be discussed in the first presentation. Two presentations will address the planning for transition to the post- acute setting, including the intrinsic factors associated with preparation for caregiving, in contrast to the decision to seek long-term care. The final presentation will describe the approach to promoting fidelity to the Fam-FFC intervention, within the context imposed by COVID-19 restrictions. Our symposium will conclude with a discussion of future direction for policy, practice, and research.

FAMILY PREPAREDNESS AT HOSPITAL DISCHARGE OF THE PERSON LIVING WITH DEMENTIA

Marie Boltz[1], Irene Best[2], and Ashley Kuzmik[3], *1. Penn State, Pennsylvania State University, Pennsylvania, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States, 3. Penn State University, University Park, Pennsylvania, United States*

Family care partners face increased and more complex caregiving demands at the time of hospital discharge for persons living with dementia. This study examined family care partners' needs for preparation and factors associated with the degree of preparation for caregiving. Care partners who were younger (t=3.26, p=.001), demonstrated anxiety (t= 2.6, p=.010) and depression (t =4.6, p <.001), and were caring for a person in pain (t=2.3, p=.023) had lower scores on the Preparation for Caregiving Scale. Care partners described the least preparation to care for the patients' emotional needs (M= 2.8, SD=1.2) and deal with the stress of caregiving (M= 2.7, SD=1.2). Content analysis of nurses' transitional care notes converged with these findings, while also describing a lack of preparation to advocate for information from medical providers. Findings suggest the need to attend to the psychological and informational needs of care partners, while considering patient well-being and comfort.

GENDER DIFFERENCES IN INTERACTIONS AND WELL-BEING AMONG HOSPITALIZED PATIENTS LIVING WITH DEMENTIA

Anju Paudel[1], Marie Boltz[2], and Barbara Resnick[3], *1. Penn State Ross and Carol Nese College of Nursing, State College, Pennsylvania, United States, 2. Penn State, Pennsylvania State University, Pennsylvania, United States, 3. University of Maryland, Baltimore, Maryland, United States*

While the incidence of dementia is generally higher in women compared to men, gender differences in interactions and well-being in dementia is still unclear. This study examined gender differences in interactions and well-being among hospitalized patients living with dementia. A total of 140 hospitalized patients (53% female and 47% male) were included in the analysis. On average, the participants were 81.43 years old (SD= 8.29), had positive interactions with staff based on higher scores on Quality of Interaction Schedule, QUIS (5.81, SD= 1.36), and fair emotional well-being based on lower scores on Cornell Scale for Depression in Dementia, CSDD (7.79, SD= 5.59). Although men seemed to have more positive interactions (male=6.07, SD=1.13; female=5.59, SD=1.51) and greater wellbeing (male=7.52, SD=4.77; female=8.03, SD=6.25) than women, there were no statistically significant gender differences observed in linear models with appropriate covariates. Future work should continue to explore gender differences in interactions and well-being.

PREDICTORS OF THE DESIRE TO INSTITUTIONALIZE IN CARE PARTNERS OF HOSPITALIZED PERSONS WITH DEMENTIA AT DISCHARGE

Ashley Kuzmik, *Penn State University, University Park, Pennsylvania, United States*

Hospitalized persons with dementia are more likely to be discharged to long-term nursing home care as compared to persons without dementia. The desire to seek this care is due in large part to the inability of family care partners to continue to provide care at home. This study aimed to identify predictors of desire to institutionalize (DTI) in care partners of persons with dementia at hospital discharge. A stepwise multiple linear regression was done to examine the dyad factors among 434 patient and care partners associated with DTI . Lower preparedness for caregiving (p < .001), higher caregiver strain (p = .039), cohabitation (p < .001) and care partner race (White; p = .016) were associated with DTI. Findings underscore the need to assess family preparedness for caregiving, strain, and living situation upon admission, and suggest the need to examine racial differences in the desire to seek nursing home care.

INTERVENTION FIDELITY IN THE FAMILY-CENTERED FUNCTION-FOCUSED CARE INTERVENTION

Barbara Resnick, *University of Maryland, Baltimore, Maryland, United States*

This session will provide a description of the treatment fidelity (TF) plan from the Family-centered Function-focused Care (Fam-FFC) trial. Components of the TF plan, measures, procedures for implementation, and findings will be presented, and discussed within the context of the COVID-19 pandemic. The components of the Fam-FFC TF plan and results include: 1) Delivery based on completion of the steps in Fam-FFC ; 2) Receipt based on evidence of Staff knowledge of Fam-FFC (percentage of nursing staff that demonstrated test scores above 80%); 3) Enactment based on achievement of goals using the Goal Attainment Scale ; completion of the Fam-Path Audit of bedside goals and treatment plans, post-acute follow-up and plan update ; and evidence of Fam-FFC based on the Fam-FFC Behavior Checklist (80% staff performance of Fam-FFC). The TF plan demonstrated evidence of delivery, receipt and enactment of study activities. Findings will be used to develop an implementation trial.

SESSION 2240 (AWARD LECTURE)

MAXWELL A. POLLACK AWARD FOR CONTRIBUTIONS TO HEALTH AGING PRESENTATION AND LECTURE

Chair: Philip Rozario

The Maxwell A. Pollack Award for Contributions to Health Aging Lecture will feature an address by the 2021 Pollack Award recipient Namkee G. Choi, PhD, FGSA, of the University of Texas at Austin. This session will also include the presentation of the 2022 Maxwell A. Pollack Award to recipient Nancy Morrow-Howell, MSW, PhD, FGSA, of Washington University in St. Louis. The Maxwell A. Pollack Award for Contributions to Healthy Aging Award recognizes instances of practice informed by research and analysis, research that has directly improved policy or practice, and distinction in bridging the worlds of research and practice.

ADDRESSING THE MENTAL HEALTH NEEDS OF HOMEBOUND OLDER ADULTS IN AGING SERVICE SETTINGS

Namkee Choi, *University of Texas at Austin, Austin, Texas, United States*

Despite significant and urgent mental health needs among low-income homebound older adults, the existing mental health service systems' reach for these older adults is almost nonexistent. Given the current and projected geriatric mental health workforce shortages, innovative approaches are needed to better serve these underserved older adults. This presentation will focus on a series of randomized clinical trials that tested acceptable and feasible mental health service delivery models for homebound older adults who are served by aging service network agencies that provide hot meals and case management. Findings from the real-world effectiveness trials of tele-delivered behavioral activation treatment for depression and loneliness by bachelor's-level lay counselors who are embedded in aging service agencies will be shared. Ways to promote a wider adoption of scalable and sustainable mental health service delivery models for homebound older adults will be discussed.

SESSION 2241 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

HUMAN AGING INTERVENTIONS

Chair: Daniel Parker

Biological aging is the greatest risk factor for multiple non-communicable diseases affecting multiple organ systems. Evidence from animal studies suggest that the rate of biological aging is modifiable and that slowing the rate of biological aging may decrease the incidence of age-related morbidity and mortality. Based on these findings, several approaches are currently being studied to slow the rate of biological aging in humans. This symposium features internationally renowned aging research scientists whose work focuses on clinical interventions to modify biological aging in humans. We will hear from Rajagopal Sekhar from the Baylor College of Medicine who will present his research on "Improving oxidative stress, mitochondrial dysfunction, inflammaging, aging hallmarks and muscle strength in older adults: the novel role of GlyNAC and the 'Power of 3'"; Jamie Justice from the Wake Forest School of Medicine will present her work on "Response to dietary restriction interventions in older adults: biomarkers of cellular senescence and biological aging"; Reem Waziry from the Columbia University Mailman School of Public Health will present her work "Does Caloric Restriction Slow the Process of Biological Aging in Non-Obese Healthy Adults? Evidence from the CALERIE™ Trial"; and Daniel Parker from the Duke University School of Medicine will present his work "Does APOE genotype moderate the impact of diet modification and exercise training on age-related outcomes?". Attendees will learn about recent advances in interventions targeting human aging.

IMPACT OF CALORIE RESTRICTION ON PLASMA ALZHEIMER'S DISEASE BIOMARKERS IN HEALTHY YOUNG AND MIDDLE-AGED ADULTS

Daniel Parker, P. Murali Doraiswamy, William Kraus, and Kim Huffman, *Duke University School of Medicine, Durham, North Carolina, United States*

Midlife cardiometabolic risk factors are associated with an increased risk of Alzheimer's dementia (AD). Moderate calorie restriction (CR) in healthy, non-obese young and middle-aged adults improves cardiometabolic risk factors. Plasma concentrations of amyloid β oligomers (Aβ-42 and Aβ-40) and total tau are emerging biomarkers of AD pathology. Our objective was to determine the impact of two years of CR in healthy young and middle-aged adults on Aβ-42, Aβ-40, and total tau in the Comprehensive Assessment of Long term Effects of Reducing Intake of Energy (CALERIE) Study. Participants were randomized 2:1 to 24 months of CR (prescribed as 25% reduction in baseline calorie requirements) versus an ad libitum (AL) diet. We quantified plasma Aβ-42, Aβ-40, and total tau using the ultrasensitive single molecule array (SIMOA) technology at baseline and two years in a subset of CALERIE (N=133). We used linear regression to evaluate the impact of CR, including age, sex, and presence/absence of the APOE-ε4 risk allele as covariates. We hypothesized that there would be differential CR effects based on APOE-ε4 carrier status; to test this, we included an interaction term. As compared to AL, there was a trend towards decreased Aβ-40, controlling for age, baseline Aβ-40 concentrations, and APOE-ε4 carrier status (β=-12.59, 95% CI[-27.14, 1.96], p=0.093) with 12% (average achieved) CR. The CR*APOE-ε4 carrier status interaction term was significant at a pre-defined threshold of p<0.10 (p=0.062).

Stratified by APOE-ε4 carrier status, CR was associated with a decrease in plasma Aβ-40 (β=-33.72, 95% CI[-65.16,-2.09], p=0.041). In conclusion, moderate CR in healthy, non-obese young and middle-aged adults impacts plasma biomarkers of AD risk, primarily in APOE-ε4 carriers.

SUPPLEMENTING GLYNAC IN AGING IMPROVES GLUTATHIONE, MITOCHONDRIA, AND AGING HALLMARKS: A RANDOMIZED CLINICAL TRIAL

Rajagopal Sekhar, Premranjan Kumar, Chun Liu, James Suliburk, Jean Hsu, Farook Jahoor, Charles Minard, and George Taffet, *Baylor College of Medicine, Houston, Texas, United States*

Oxidative stress (OxS), mitochondrial dysfunction and aging hallmarks are important contributors to aging, but effective solutions to correct these defects in older adults (OA) are lacking. Via earlier translational studies we discovered that supplementation of GlyNAC (combination of glycine and N-acetylcysteine) improves/corrects these defects. We conducted a double-blind, placebo-controlled (RCT) in 24 OA (mean age 71y) to definitively determine the effects of supplementing GlyNAC vs. isonitrogenous placebo (alanine) for 16-weeks on intracellular glutathione (GSH), OxS mitochondrial function, inflammation, insulin-resistance, endothelial function, physical function, body composition and multiple aging hallmarks. 12 YA (mean age 25y) served as young controls and received GlyNAC for 2-weeks. Subjects were studied before receiving supplementation study, and after receiving supplementation for 2-weeks (OA, YA) and 16-weeks (OA). The RCT found that compared to YA, the OA had severe GSH deficiency (red-cells, muscle), mitochondrial dysfunction, OxS (TBARS, F2-isoprostanes), diminished physical function (gait-speed, muscle strength, exercise capacity), elevated waist-circumference and systolic blood pressure, and multiple hallmarks defects of aging (affecting mitochondrial function, mitophagy, nutrient sensing, inflammation, insulin-resistance, genotoxicity, stem-cells and cellular senescence). GlyNAC supplementation for 2-weeks rapidly improved several defects, and further improved/corrected multiple defects after 16-weeks. No improvements were seen in YA receiving GlyNAC, or in OA receiving the alanine placebo, suggesting that protein supplementation per se in OA does not improve defects. The results of this RCT provides proof-of-concept that GlyNAC supplementation improves/reverses GSH deficiency, mitochondrial dysfunction, OxS, inflammation, physical function/strength and multiple aging hallmarks. GlyNAC could be a novel, simple and safe nutritional supplement to improve/reverse age-associated defects and promote health in aging humans.

CIRCULATING BIOMARKERS OF CELL SENESCENCE IN A RANDOMIZED TRIAL OF CALORIC RESTRICTION WEIGHT LOSS

Jamie Justice[1], Iris leng[1], Nathan LeBrasseur[2], Natalia Mitin[3], Stephen Kritchevsky[1], barbara Nicklas[1], and Jingzhong Ding[4], *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 2. Mayo Clinic, Rochester, Minnesota, United States, 3. Sapere Bio, Durham, North Carolina, United States, 4. Wake Forest University, Winston Salem, North Carolina, United States*

There are no circulating markers exclusive to cell senescence for clinical trials in middle-aged/older adults. In this study we evaluated T-cell expression of tumor suppressor protein p16INK4a and plasma senescence associated secretory proteins (SASP)-factors in the context of an 18-week randomized trial of caloric restriction (CR) compared to a weight stable Control. The analysis includes 55 middle-aged/older adults (75%Women; 33%African American; 57.6±5.8 years) with obesity and prediabetes. We measured mRNA expression of select senescence and apoptosis gene transcripts (p16INK4a, p21, BCL2L, BAK1) in peripheral blood CD3+ T-cells (quantitative-RT-PCR) and a panel of 27 plasma SASP proteins (Luminex/multiplex; ELISA). Weight loss in those randomized to CR was -10.8±0.9 kg compared to +0.5±0.9 kg in Control. Using mixed models, T-cell expression of senescence-biomarkers p16INK4a, p21, BCL-2L, and apoptosis-marker BAK1 were not different between CR and control at 18 weeks (time × treatment adjusted for age, race, and sex, all p>0.05). We explored associations between biomarkers with weight loss; moderate spearman correlations (rs=0.28 to 0.64) were observed between weight loss and change in plasma SASP-factors (Activin A, I-CAM, MMP1, PAI-1, TNF-RI, TNF-RII, VEGF, uPAR, p< 0.05 all), but not T-cell biomarker expression. We evaluated associations between biomarkers and found change in T-cell p16INK4a was associated with change in plasma SASP-factors, Fas (rs=0.51), osteopontin (rs=0.34), myeloperoxidase (rs=0.39), and MMP2 (rs=0.40) (CR+Control combined). Among middle-aged/older persons with obesity undergoing 18-weeks CR, changes in T cell p16INK4a expression were correlated with reductions in key SASP factors, and weight loss was associated with lower pro-inflammatory SASP profile.

DOES CALORIC RESTRICTION SLOW THE PROCESS OF BIOLOGICAL AGING? EVIDENCE FROM THE CALERIE TRIAL

Reem Waziry, *Columbia University, New York, New York, United States*

Calorie restriction (CR) slows aging and increases healthy lifespan in model organisms. We tested if CR slowed biological aging in humans using DNA methylation analysis of blood samples from N=197 participants in the Comprehensive Assessment of Long-term Effects ofReducing Intake of Energy (CALERIE™) randomized controlled trial. We quantified CR effects on biological aging by comparing change scores for six epigenetic-clock and Pace-of-Aging measures between n=128 CR-group and n=69 ad-libitum-control-group participants at 12- and24-month follow-ups. CR effects were strongest for DunedinPACE Pace of Aging (12-month Cohen's d=0.3; 24-month Cohen's d=0.2, p<0.01 for both), followed by DunedinPoAm and the GrimAge epigenetic clock, although effects for these measures were not statistically differentfrom zero (p>0.08). CR effects for other epigenetic clocks were in the opposite direction (all p>0.15). CALERIE intervention slowed Pace of Aging but showed minimal effect on epigenetic clocks hypothesized to reflect longer term accumulation of aging burden.

SESSION 2245 (SYMPOSIUM)

THE CANNABIS AND OLDER PERSONS STUDY: EXPANDING OUR MINDS THROUGH INTERDISCIPLINARY RESEARCH

Chair: Brian Kaskie Discussant: Benjamin Han

The Cannabis and Older Persons Study has examined the increasing use of cannabis among Americans over 60 years old since 2016. This year's symposium presents varied methodological approaches researchers have used to better understand the harms and benefits associated with cannabis use among older Americans. Divya Bhagianadh examines the association between cannabis legalization policies across the Untied States and corresponding use of end of life programs and services. Julie Bobitt analyzes interviews provided by older adults in Illinois and defines how attitudes held by medical doctors and other clinical care providers are critical to shaping cannabis use among older adults. Brian Kaskie considers the role of cannabis policy clusters. Jacobo Mintzer reviews findings from a controlled trial providing two cannabinoids to treat agitation among persons with Alzheimers in hospice. Thorsten Rudroff examines cannabis use among a sample of older persons at risk for falls. These studies reflect how cannabis use among older persons continues to grow and diversify, and how researchers have use different approaches to advance scientific understanding of determinants and outcomes, both desirable and undesirable, associated with cannabis use among older adults. This symposium offers policy makers and health care leaders a balanced perspective. On one side, we discuss how prevention and treatment efforts for substance use disorder, including cannabis use disorder, must increase proportionally to the increasing number of older cannabis users. On the other side, we consider how more than 5 million older Americans, especially those with pain, find some benefit in using cannabis.

OLDER ADULTS' PERCEPTIONS OF CANNABIS AND OPIOIDS USE

Julie Bobitt, *University of Illinois at Chicago, Chicago, Illinois, United States*

Older adults in the U.S. are increasingly using cannabis as a method to manage pain. Some studies have linked increased cannabis use with an increase in prescription opioid use while others have suggested that older adults may be using cannabis as a way reduce/replace opioids. From April 2018 - January 2019 we conducted 12 focus groups throughout Illinois with 82 cannabis users aged 60+. To examine the relationship between cannabis and opioid use we used an inductive thematic analysis to code and theme the focus group transcripts. We found three themes 1) medical culture around opioids influences cannabis use; 2) past negative experiences with opioids influences cannabis use, and 3) aversion to ever trying opioids out of fear of an anticipated harm that may be brought about by opioid use such as overdose. In this session we present these findings and discuss cannabis use relative to opioids by older adults.

MEDICAL MARIJUANA LAWS AND OUT OF POCKET EXPENSES AT END OF LIFE

Divya Bhagianadh, and Kanika Arora, *University of Iowa, Iowa city, Iowa, United States*

Resource intensive and costly End-of-Life (EOL) care is a significant healthcare policy concern in the U.S. In addition to the high Medicare spending, out of pocket (OOP) expenses are also high during EOL adding considerable stress during terminal days. The Medical Marijuana Laws (MMLs) is a significant policy in this context. Previous studies have shown increased use of MM among older adults, better pain management, influence on site of death as well as evidence of reduction in Medicare expenditure on drugs in states with MMLs. In this study, we explore the association between MML and OOP expenses during EOL using data from the Health and Retirement Study exit and core interviews from 1995 to 2018. We use a difference in differences (DD) and event study models to examine this question. We find evidence of increased OOP expenses on drugs and doctor visits with the effects concentrated among the early implementing states, among decedents who are White and among cancer patients. Despite its growing acceptance in palliative medicine, affordability of MM could pose a significant hurdle to terminally ill patients especially since MM and related costs are not covered by insurance.

CANNABIS USE AND RISK OF FALLING IN OLDER ADULTS

Thorsten Rudroff, *University of Iowa, Iowa City, Iowa, United States*

The prevalence of cannabis use has significantly increased among US adults ≥ 50 years. However, the effect of chronic cannabis use on fall risk in older adults is unclear. A series of investigations were conducted to examine the intersection between cannabis use and fall risk in older adults. The findings indicated that: 1) Older (≥ 50 years) chronic cannabis users have a higher fall risk and walking impairments, 2) cannabis users might have a discrepancy between perceptual and physiological fall risk, and 3) chronic use of Δ-9-tetrahydrocannabinol (THC) might have negative influences on inhibitory control and brain activity. Future mechanistic (e.g., neuroimaging) investigations of the short- and long-term effects a variety of cannabis products (e.g., THC/CBD ratios, routes of administration) on cognitive/motor function, and fall incidence in older adults are suggested.

POTENTIAL BENEFITS OF THC AND CBD IN THE TREATMENT OF HOSPICE-ELIGIBLE DEMENTED AND AGITATED PATIENTS

Jacobo` Mintzer, *University of South Carolina, Columbia, South Carolina, United States*

Today, half of the patients suffering from Alzheimer's disease (AD) will use hospice care in the last days of their life. Most of them will present with moderate to severe agitation. In the absence of evidence-based guidelines, Hospice care eligible patients with Agitation and Alzheimer's disease (AD) or other types of Dementia (HAD) are treated with a combination of antipsychotics, benzodiazepines, and opiates, which generate a variety of side effects. Two cannabinoids, tetrahydrocannabinol (THC) and cannabidiol (CBD), appear to be promising therapies for agitation in HAD with minimal side effects. Specifically, we suggest that a combination of THC and CBD oils have enhanced synergistic effects while maintaining a low side effect profile that the combination may provide. The evidence for this hypothesis will be discussed during the symposium.

SESSION 2250 (PAPER)

CAREGIVING

A DUTY TO CARE: MALE PERSPECTIVES ON THE CAREGIVER ROLE FOR PERSONS WITH ALZHEIMER'S OR RELATED DEMENTIA

Michael Bueno[1], and Jo-Ana Chase[2], *1. University of California, Irvine, Placentia, California, United States, 2. University of Missouri, Columbia, Missouri, United States*

The population of family caregivers (FCGs) of persons with Alzheimer's Disease and related Dementias (ADRD) is growing, as is the proportion of males taking on this traditionally female role. Most caregiving research has mainly focused on females. Although female caregivers have reported more negative outcomes, men still report significant levels of burden. With the aging population and increased need for caregivers, there is a gap in knowledge exploring the male caregiving experience. Understanding male caregiving experiences can inform clinicians on developing future strategies to tailor support for this underrepresented group. The purpose of this qualitative descriptive study was to explore the experiences of male FCGs of people with ADRD. The Caregiver Identity Theory (CIT) was used to guide the study exploring participants' perception of self-identity within their caregiving relationship and self-identity as a male. Eleven male caregivers, recruited through social media and community resources, were interviewed by telephone or Zoom. Interviews were recorded, transcribed, and analyzed using thematic analysis. Four major themes emerged highlighting males' struggles with the unfamiliar caregiving role and changing identity; their acknowledgement of personal growth and discovery through caregiving, challenges in finding the "right" kind of support, and perceived reshaping of masculinity through the caregiving role. Male caregivers express unique experiences as FCGs suggesting future research is needed to explain gender differences in caregiving and identify additional factors that influence male caregivers' experiences. Furthermore, findings indicate clinicians should tailor support strategies for male FCGs' as they fulfill this potentially unfamiliar role.

CAREGIVER STRAIN AMONG AFRICAN AMERICAN AND HISPANIC MALE CAREGIVERS WITH CHRONIC CONDITIONS

Matthew Smith[1], Chung Lin Kew[1], Tiffany Washington[2], Caroline Bergeron[3], Ashley Merianos[4], Ledric Sherman[1], and Kirby Goidel[1], *1. Texas A&M University, College Station, Texas, United States, 2. University of Georgia, Athens, Georgia, United States, 3. University of Ottawa, Ottawa, Ontario, Canada, 4. University of Cincinnati, Cincinnati, Ohio, United States*

Caregiving strain often stems from caregivers' unmet needs and is a risk factor for physical and psychological ill-health. This study aims to identify factors associated with caregiver strain among middle-aged and older African American and Hispanic male caregivers living with one or more chronic conditions. Data were collected from 431 male caregivers using a web-based survey (55% African American, 45% Hispanic). Linear regression models were fitted to assess factors associated with caregiver strain, which was measured using caregiving difficulty items from Behavioral Risk Factor Surveillance System. On average, participants were age 54.9(±9.51) years, they self-reported chronic conditions were 3.74(±2.62), and their caregiver strain was 14.7(±7.30). Among African American caregivers, higher caregiver strain was positively associated with living with children below age 18 (β=0.14, P=0.045) and feelings of social disconnectedness (β=0.16, P=0.018) and depression (β=0.15, P=0.035). Conversely, caregiver strain was negatively associated with having insurance coverage (β=-1.34, P=0.028) and disease self-management efficacy (β=-2.26, P=< 0.001. Among Hispanic caregivers, higher caregiver strain was negatively associated with age (β=-0.28, P=< 0.001) and positively associated with feelings of social disconnectedness (β=0.16, P=0.041). Findings suggest African American and Hispanic males with chronic conditions have differing caregiving experiences. Compared to Hispanic men, contributors to caregiving strain among African American men were multifaceted and associated with financial resources, household dynamics, mental health, and the ability to self-manage their chronic conditions. While bolstering social connectedness may offset caregiver strain, tailored mental health and disease-management programming are needed to meet the specific needs of African American and Hispanic male caregivers.

CONTEXTUAL FACTORS ASSOCIATED WITH DECREASED DAILY DEPRESSION AND ANXIETY AMONG DEMENTIA CAREGIVERS

Frank Puga, Abigail Poe, Meghan Rafford, Danny Wang, and Carolyn Pickering, *The University of Alabama at Birmingham, Birmingham, Alabama, United States*

Family caregivers of individuals with dementia (IWDs) have an increased risk of developing depression and anxiety. Little is known about daily protective factors that mitigate this risk. The purpose of this study was to identify everyday coping strategies used by family caregivers that reduce the daily odds of experiencing depression and anxiety-related symptoms. Daily diaries were used to examine whether pleasant non-care activities with the IWD, social connection, and exercise were associated with a decrease in depression and anxiety-related symptoms. A national sample of ADRD caregivers (N=165) completed diaries over 21-days (n=2,841). Participants were asked about their daily experiences as caregivers, coping strategies, and mental health. Data were analyzed using mixed-level modeling. Depression and anxiety symptoms were endorsed by 141 (85.45%) and 155 (93.94%) participants, respectively. Social connection was associated with a decrease in the daily odds of depression (OR: 0.71, CI: 0.54 – 0.94, p=0.016) and anxiety symptoms (OR: 0.74, CI: 0.56 – 0.97, p=0.032). Caregivers were also less likely to endorse depression-related symptoms on days when engaging in a pleasant non-care activity with the IWD was reported (OR: 0.70, CI: 0.52 – 0.93, p=0.015). Finally, anxiety-related symptoms were less likely to be endorsed on days when caregivers reported engaging in exercise (OR: 0.65, CI: 0.49 – 0.86, p=0.003). The results from this study help elucidate coping strategies that may mitigate the risk of depression and anxiety associated with caregiving. These findings inform potential components for interventions to help support the health and well-being of family caregivers of IWDs.

EXPLORING THE ASSOCIATION BETWEEN FAMILY DYNAMICS AND PREPAREDNESS FOR FAMILY CAREGIVING AT THE END OF LIFE

Aimee Fox[1], Julia Sharp[2], and Christine Fruhauf[2], *1. Kansas State University, Manhattan, Kansas, United States, 2. Colorado State University, Fort Collins, Colorado, United States*

The transition to providing end-of-life (EOL) care to a family member can be challenging for family caregivers as they face difficult decisions regarding medical course of treatment, increasing caregiving responsibilities, and anticipatory grief. Low preparedness for EOL caregiving is associated with higher levels of caregiver strain, increased levels of depression and anxiety, and complicated and prolonged grief after the death of the family member. Despite the breadth of caregiving research, little is known about how family relationships and interactions relate to caregiver preparedness for EOL caregiving. Thus, the purpose of this study was to explore the association between family caregivers' family dynamics and their perceived preparedness for the transition to EOL caregiving. A sample of 173 family caregivers were recruited to complete an online, self-report survey. A structural equation model was used to analyze the association between family dynamics and caregiving preparedness. Most caregivers reported balanced family cohesion (75.1%) and family flexibility (75.7%), but low family communication and low family satisfaction. In addition, 20.2% of caregivers reported being not at all prepared for the transition to EOL caregiving. Although there was a lack of meaningful association between family dynamics and preparedness for EOL caregiving, it may be that family relationships and interactions grow more complex as families age and individuals take on new and different roles (such as family caregiving) within the family system. This study demonstrates the need for future research to develop new measures to explore how aging family dynamics relate to family caregiver experiences and outcomes.

FAMILY CAREGIVER SOCIAL CONNECTEDNESS: TECHNOLOGY USE ACROSS GENERATIONS DURING THE COVID-19 PANDEMIC

Janet Pohl[1], Jude Kolodisner[2], and David Coon[1], *1. Arizona State University, Phoenix, Arizona, United States, 2. Arizona State University, Tempe, Arizona, United States*

During the COVID–19 pandemic, maintaining connectedness was difficult for caregivers. Family caregivers represent multiple generations whose experience with and use of social technology to maintain connectedness can vary and differentially impact critical health outcomes. The aims of this study were to examine caregiver connectedness and technology preferences across three generations of caregivers who provide care to older adults with chronic illnesses. The semi-structured focus-groups/interviews conducted in August of 2020 with family caregiver participants including Millennials (n=6), Generation X (n=5), and Boomer (n=8). Two researchers analyzed the transcribed content via thematic analysis. Similarities and differences across generations were assessed via comparative analysis. The themes that emerged from the data were: (1) Millennials (a) Altered stage of life, (b) Altered connectedness, (c) Need others to understand, (d) Stay away from social network sites; (2) Generation X (a) Altered connectedness, (b) Need others to understand, (c) Burden, (d) Fear-of-failure; and (3) Baby Boomer (a) Altered connectedness, (b) Technology builds connectedness, (c) Information seeking. All generations expressed alterations in connectedness with caregiver role. Millennials and Generation X caregivers emphasized need for others to understand that caregiving altered their lives with unique responsibilities. Technology use differed across the generations, with Millennial texting for confidential communications. Millennial and Generation X caregivers do not use social media due to envy of others' fun. Baby Boomers expressed increased connectedness with the use of Zoom. Understanding the variation in the experience of caregiver connectedness and technology use by generation may identify targets for future caregiver connectedness intervention studies.

SESSION 2260 (PAPER)

INNOVATION IN GERONTOLOGY EDUCATION

In this session, gerontology educators describe a range of unique strategies for extending students' aging education and faculty development.

EXPERIENCES AND RECOMMENDATIONS FOR STARTING A UNIVERSITY GERONTOLOGY RESEARCH LABORATORY

Britteny Howell[1], and Jennifer Peterson[2], *1. University of Alaska Anchorage, Anchorage, Alaska, United States, 2. University of Alaska Fairbanks, Fairbanks, Alaska, United States*

Although founding and directing an independent research laboratory is often expected of faculty at American universities, there are several barriers to successful completion of this important task. There is little guidance in the literature regarding exactly how to go about starting a research laboratory. The guidance that does exist for faculty often focuses on running research labs in the "hard sciences," such as biomedical science and engineering, leaving social and behavioral scientists out of such considerations. Additionally, smaller or teaching-focused universities often have little infrastructure or support for starting a research lab, so faculty at these institutions may not know where to begin. These barriers are significant concerns for junior faculty, who are often unprepared for the realities and challenges of starting a successful research lab while obtaining other milestones required of promotion and tenure. We present two examples of recently-formed gerontology research laboratories begun by junior faculty, one in the psychology department of a research university and one in public health at a teaching-focused university. Our case studies present the audience with specific examples, lessons learned, and guidance for starting their own gerontology research laboratory in higher education, as well as recommendations on maintaining its functioning during a global pandemic (COVID-19).

PASSING THE TORCH: EXPLORING THE SUSTAINABILITY OF AN INTERPROFESSIONAL GERIATRICS FACULTY DEVELOPMENT PROGRAM

Kimberly Davis[1], Sarah Marrs[2], Ishan Williams[3], Kristin Zimmerman[4], Constance Coogle[2], Pamela Parsons[2], Patricia Slattum[2], and Leland Waters[2], *1. Virginia Commonwealth University/ School of Nursing, Richmond, Virginia, United States, 2. Virginia Commonwealth University, Richmond, Virginia, United States, 3. University of Virginia, School of Nursing, Charlottesville, Virginia, United States, 4. Virginia Commonwealth University, School of Pharmacy, Richmond, Virginia, United States*

Faculty development programs (FDPs) are an effective, evidence-based method of promoting the knowledge, skills and self-efficacy of faculty. However, the implementation and sustainability of curricula are rarely reported. Furthermore, the challenges to sustaining programmatic implementation of interprofessional FDP curricula in academic and clinical settings over time have yet to be extensively evaluated. Using dynamic sustainability as a framework, we aimed to assess the evolving barriers and facilitators that influence the implementation and sustainability of the geriatrics curriculum Capstone projects designed by faculty scholars in our FDP. We planned to report on projects that were and weren't successful. A survey, sent to 115 faculty scholars from eight different cohorts who completed our 10-month FDP, recruited faculty participants and set the stage for qualitative data collection to help us better understand the sustained impact of the program. Thematic analysis of virtual interviews with 17 Scholars revealed several key factors facilitating and hindering the implementation and dynamic sustainability of curricular projects. Three major themes and sub-themes were identified as follows: Project Implementation (Supportive Factors, Hindering Factors and Filling in Gaps in the Field); Pedagogical Development (Enhancement of Skills and Culture Change); and Sustainability Impact (Project Sustainability, Career Development and Passing the Torch). Supporting these factors through skills development may favorably impact project sustainability and thus the aspects of workforce development that catalyze practice change. Implementation of geriatrics-focused FDPs provides an evidence-based approach to sustainability. Further study of the ongoing barriers and facilitators to sustainability is encouraged.

SPIRITUAL DEVELOPMENT AND AGING HUMANITIES: READING HESSE'S STEPPENWOLF THROUGH MOODY'S FIVE STAGES OF THE SOUL

Stephen Fogle, *University of Nebraska at Omaha, Omaha, Nebraska, United States*

This paper explores Herman Hesse’s Steppenwolf through Harry Moody’s Five Stages of the Soul. Steppenwolf speaks to gerontological education objectives as it deals squarely with humanizing old age though, “deeply lived spiritual events which [the main character] has attempted to express by giving them the form of tangible experiences.” (Hesse, 1963, 21) Five Stages of the Soul is a seminal conceptual model for understanding spiritual development across the life course: particularly in old age. It documents lived experiences in five stages: call, search, struggle, breakthrough, and return. This paper follows Steppenwolf’s main character, Harry Haller, though each of these five stages. In doing so, this paper positions aging and spiritual development center stage in a tale featuring themes of enduring struggle such as personal identities, war & violence, sex, magic, and technological advancement. The plot line of Steppenwolf matches Five Stages of the Soul with enlightening consistency. Originally published a century ago, Steppenwolf enjoyed resurgent popularity among the baby boom cohort of older adults in the United States and globally during the 1960s. Today, Steppenwolf retains relevancy for understanding aging and spiritual development in lived contexts of social chaos and uncertainty. Steppenwolf is a classic and engaging piece of literature for contemporary readers of all ages. This paper helps students and teachers of gerontology apply a conceptual model of aging to a relevant case study. The paper contributes to incorporating literary masterpieces into gerontological curricula. Finally, this paper sheds light on the humanity of older adults engaged in spiritual development.

TEACHING THE INTERSECTION OF AGING AND DISABILITY FOR FIRST-YEAR STUDENTS

Kristine Mulhorn, *Drexel University, Wallingford, Pennsylvania, United States*

The honors college at Drexel included their Freshmen Seminar in a recent effort to offer various courses on the theme of aging across the campus. Usually, the themed courses are for juniors and seniors who can choose electives. This year, the theme of aging was interwoven into two freshmen seminars with a maximum of 20 students. The purpose of this course was to examine the complexity of these two concepts and recognize possible avenues for study, research, and careers based these perspectives. Disability is not only a way of describing how someone lives with biological or physical difference, but disability can be a social identity, and a group recognized in recent civil rights legislation. Aging is not only at the individual level, but an ongoing demographic change that is happening throughout the world. Students reflected on online quizzes on ableism and ageism to gain insights about their own biases and the biases within their chosen career fields. Through class discussions and reflections, students achieved course objectives: 1) describe how society can better prepare individuals to fully participate in society throughout life; 2) recognize key factors affecting those with disability and aging with disability as they navigate education, health services, housing and work; 3) synthesize literature on aging and disability to make recommendations for improving social participation for those either aging with disability or aging into disability; and 4) describe public policy challenges for those over 50 and those who identify as disabled.

THE JOY AND CHALLENGES OF STORY CREATION WITH TIMESLIPS: STUDENT FACILITATOR PERCEPTIONS

Emily Ihara, Emily Perez, Kendall Barrett, Megumi Inoue, and Catherine Tompkins, *George Mason University, Fairfax, Virginia, United States*

Creative arts interventions for people living with dementia have been shown to improve mood, emotions, communication, and relationships for older people living with dementia and their care partners. Previous research demonstrates that TimeSlips, a creative storytelling intervention, provides a “failure-free” environment and an opportunity for individuals to use their imagination. Because it does not involve memory, people living with dementia are encouraged to contribute and interact, thus creating an environment that focuses on dignity and strengths rather than deficits. This case study explores the student facilitators’ experiences of running TimeSlips sessions in different levels of care. The two facilitators ran continuous sessions over six months – with an individual at home, group sessions in memory care, and group sessions in assisted living. The facilitators journaled about their experiences after each session and the same picture prompts were used across the different types of sessions. Each journal entry was coded by two independent researchers using grounded theory principles. Through the coding, it was clear that the facilitators needed to use different skills to engage participants in storytelling based on their level of care. Themes that emerged include joy of connection, playfulness, and engagement. In addition, specific skills are needed to accommodate some behaviors of people living with dementia (such as aggressive behavior toward others in the group) and how to distract from those behaviors to continue with the storytelling. The benefits and challenges of each modality and gaps that may need to be addressed for student facilitators will be discussed.

SESSION 2270 (SYMPOSIUM)

COGNITIVE AGING ACROSS NATIONAL CONTEXTS: EVIDENCE FROM THE HARMONIZED COGNITIVE ASSESSMENT PROTOCOLS

Chair: Lindsay Kobayashi Co-Chair: Alden Gross
Discussant: Kenneth Langa

The global burden of dementia is rapidly rising and shifting to low- and middle-income countries. The triangulation of evidence across country contexts is essential for unlocking the causes of dementia and reducing its global burden. The Harmonized Cognitive Assessment Protocol (HCAP) is a recent innovation administered in the US Health and Retirement Study and several of its International Partner Studies. For the very first time, these HCAPs provide high-quality data for cross-national comparisons of later-life cognitive function that are sensitive to linguistic, cultural, and educational differences across diverse country contexts. However, despite the common HCAP protocols, human cognitive function does not lend itself to direct comparison across diverse populations without careful consideration of necessary test adaptations. This symposium presents results from analyses of the HCAP data in the US, England, Mexico, South Africa, China, and India, highlighting cross-national differences in later-life cognition identified using the HCAP data, and presenting key methodological concerns for cross-national comparisons of cognitive aging. First, Zhang will present findings comparing education gradients in later-life cognitive function across countries. Next, Cho will present longitudinal data comparing the relationships between short-term changes in household wealth in later-life and subsequent cognitive function across countries. Third, Avila-Rieger will present findings comparing sex/gender disparities in later-life cognitive function in the US and India and how they differ by education. Finally, Nichols will conclude the session by discussing differences in the measurement of cognition for the assessment of dementia across countries and implications for data interpretation and the design of future instruments.

EDUCATION GRADIENTS IN LATER-LIFE COGNITIVE FUNCTION ACROSS LOW-, MIDDLE-, AND HIGH-INCOME COUNTRIES

Yuan Zhang[1], Brendan O'Shea[2], Xuexin Yu[2], Tsai-Chin Cho[3], Kenneth Langa[2], Alden Gross[4], and Lindsay Kobayashi[2], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. University of Michigan School of Public Health, Ann Arbor, Michigan, United States, 4. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Education is positively related to cognitive function. However, educational gradients in cognitive function may vary across older populations with different educational compositions and physical and social environments. We conducted one of the first cross-national comparative studies on educational differences in later-life cognitive function using harmonized data. Multivariable linear regressions were employed to estimate the association between education according to International Standard Classification of Education (ISCED) categories and cognitive function for adults ages 60+ from the United States, England, Mexico, South Africa, India, and China. Cross-country differences were tested using fully interacted models. Controlling for demographics and parental education, we found significant educational gradients in cognitive function in low- and middle-income countries; however, in high-income countries, only those with upper secondary education and above had a consistent cognitive advantage over those with primary education. This study suggests substantial country-level differences in cognitive benefits of educational attainment.

SHORT-TERM WEALTH CHANGES AND SUBSEQUENT COGNITIVE HEALTH AMONG OLDER ADULTS IN CHINA, ENGLAND, MEXICO, AND THE US

Tsai-Chin Cho[1], Xuexin Yu[2], Alden Gross[3], Yuan Zhang[4], and Lindsay Kobayashi[2], *1. University of Michigan School of Public Health, Ann Arbor, Michigan, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 4. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

Household wealth is positively associated with later-life cognitive health, but little is known about the effects of changes in wealth over time and whether they differ across populations. In this study, we evaluated the within- and between-country relationships between short-term changes in household wealth and subsequent cognitive function among adults aged ≥65 years in China, England, Mexico, and the US. We used sampling-weighted, multivariable-adjusted linear models to estimate the relationships between household wealth change over 3- to 4-year periods and subsequent harmonized general cognitive performance factor scores using HCAP measures. We found that short-term decreases in household wealth were associated with poor subsequent cognitive health in the US and China, but not in England or Mexico. The observed associations were weaker in Mexico than in the US. In summary, macro-level social and economic structures may modify the association between wealth changes and cognitive health, although further investigation is needed.

DIFFERENCES IN THE MEASUREMENT OF COGNITION FOR THE ASSESSMENT OF DEMENTIA ACROSS GEOGRAPHIC CONTEXTS

Emma Nichols[1], Derek Ng[1], Shabina Hayat[2], Kenneth Langa[3], Jinkook Lee[4], Andrew Steptoe[2], Jennifer Deal[5], and Alden Gross[1], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. University College London, London, England, United Kingdom, 3. University of Michigan, Ann Arbor, Michigan, United States, 4. University of Southern California, Los Angeles, California, United States, 5. Johns Hopkins University, Baltimore, Maryland, United States*

Most cognitive assessments have been developed in high-income countries but are subsequently used in diverse contexts. Differences in culture and context may affect performance of cognitive items. We used the Harmonized Cognitive Assessment Protocol surveys in the US, Mexico, India, England, and South Africa (combined N=11,364) to quantify associations across countries between cognitive items and cognitive impairment status using age- and gender-adjusted logistic regression. Associations were stronger in the US (Median Odds Ratio [OR] across items=0.17) and England (Median OR=0.19), compared to South Africa (Median OR=0.23), India (Median OR=0.29), and Mexico (Median OR=0.28). Items assessing memory (e.g. delayed recall tasks) had the most consistent associations of the largest magnitudes across contexts. Transporting cognitive items among countries and cultures warrants caution. We identified items that performed well either in individual contexts or across the range of contexts considered; this information can be used to guide the design of future instruments.

CROSS-NATIONAL VARIABILITY IN SEX/GENDER DIFFERENCES AND LATER-LIFE MEMORY: INDIA AND THE UNITED STATES

Ashly Westrick[1], Justina Avila-Rieger[2], Alden Gross[3], and Lindsay Kobayashi[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Columbia University Medical Center, New York, New York, United States, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Little is known about the extent of sex/gender differences in later-life cognitive health in low-income countries such as India. We compared sex/gender differences in later-life memory, overall and by educational attainment, across men and women aged ≥65 years in India and the United States. Data were from Harmonized Cognitive Assessment Protocols (HCAP) in the population-representative Longitudinal Study of Aging in India (LASI; N=4,096;) and U.S. Health and Retirement Study (HRS; N=3,345). Multiple-group models estimated interactions between sex/gender and educational attainment on harmonized episodic memory scores across countries. In the U.S., women had a memory performance advantage compared to men across all education levels. In India, men had a memory performance advantage compared to women overall, interactions revealed that this advantage was only present among those with no formal education. Among those with at least lower secondary education, women demonstrated an advantage that increased with increasing education.

SESSION 2280 (SYMPOSIUM)

DYADIC AND LONGITUDINAL STUDIES OF CLOSE RELATIONSHIPS: NEW INSIGHTS INTO HEALTH AND WELL-BEING ACROSS ADULTHOOD

Chair: Gloria Luong Co-Chair: Christine Fruhauf

This symposium includes 5 papers using intensive, longitudinal, and/or dyadic data on social relationships, revealing novel insights into health and well-being across adulthood. Fruhauf and colleagues conducted a feasibility and acceptability to test their Merging Yoga and self-management to develop Skills (MY-Skills) intervention, which targets caregiving dyads (caregivers and care receivers) dealing with persistent pain. Participants completed group interventions meeting twice a week for eight weeks, with each two-hour session including self-management education followed by yoga. A priori benchmarks for feasibility were met for the dyads, suggesting that these interventions may lead to improved well-being for caregiving dyads. Turner and Hooker conducted a 30-day microlongitudinal study of middle-aged daughters who are caring for their parents with dementia. On days when caregivers had more positive appraisals of caregiving than their own average, they had greater physical activity goal pursuit, independent of that day's negative appraisals. Luong and colleagues also leverage an intensive longitudinal study spanning 3.5 month that prospectively tracked older adults and their close partners as they transitioned into senior housing facilities. Well-being varied by marital status, and changes over time varied by age. Weidmann & Chopik examined older romantic couples from 36 nations and found that between-partner correlations between depressive symptoms, self-rated health, and cognitive performance diffed across cultures. Finally, Purol et al. found that among middle-aged and older couples, similarity effects of personality facets on health and well-being were relatively small in magnitude, suggesting personality similarity among couples may be overstated in the literature.

INDIVIDUALS AND THEIR CAREGIVERS WITH PERSISTENT PAIN: A FEASIBILITY AND ACCEPTABILITY STUDY

Christine Fruhauf[1], Arlene Schmid[1], Aimee Fox[2], Jennifer Dickman Portz[3], Julia Sharp[1], Heather Leach[1], and Marieke Van Puymbroeck[4], *1. Colorado State University, Fort Collins, Colorado, United States, 2. Kansas State University, Manhattan, Kansas, United States, 3. University of Colorado Anschutz, Aurora, Colorado, United States, 4. Clemson University, Clemson, South Carolina, United States*

Persistent pain interventions targeting the caregiving dyad (i.e., caregivers and care receivers) are scarce. Thus, the purpose of this pilot study was to assess the feasibility and acceptability of the Merging Yoga and self-management to develop Skills (MY-Skills) intervention for caregiving dyads experiencing persistent pain. MY-Skills is a group intervention and was delivered in-person or online (due to COVID-19) twice a week for eight weeks, with each two-hour session including self-management education followed by yoga. Benchmarks for feasibility were set a prioi and included: recruitment, attrition, attendance, safety, acceptability/satisfaction, and study completion. Thirteen participants (caregivers n=7, care-receivers n=6) completed the in-person intervention and 18 individuals (9 dyads) completed the online version. Feasibility benchmarks were met, except for recruitment, where >1000 individuals were screened for eligibility. Interventions may lead to improved wellbeing, yet further research is needed to establish efficacy of health-related outcomes for the caregiving dyad experiencing persistent pain.

POSITIVE APPRAISALS OF CAREGIVING SUPPORT DEMENTIA CAREGIVERS' PHYSICAL ACTIVITY GOAL PURSUIT

Shelbie Turner[1], and Karen Hooker[2], *1. Weill Cornell Medical College, Pitman, New Jersey, United States, 2. Oregon State University, Corvallis, Oregon, United States*

Middle-age daughters caring for parents with dementia have multiple roles and often neglect their own health. In addition to reporting negative appraisals of caregiving dementia caregivers also report positive appraisals, which may support their health behavior. In this study we examine how positive and negative caregiving appraisals interacted to predict physical activity goal pursuit among 27 daughters of parents with dementia who participated in the ACHIEVE Study, an NIH-funded 30-day study on caregiving (Noccasions=622). On days when caregivers had more positive appraisals than their own average, they had higher physical activity goal pursuit, even after controlling for that day's negative appraisals (β=0.31, SE=0.09, p=0.001). Moreover, the association between positive appraisals and goal pursuit was not dependent on that day's negative appraisals (p=0.42). Supporting adult-daughter caregivers to feel positively about their role as a caregiver on a day-to-day basis may support them to stay on track with their physical activity goals.

DYADIC CHANGES IN WELL-BEING ACROSS THE TRANSITION TO SENIOR HOUSING FACILITIES: A PROSPECTIVE LONGITUDINAL STUDY

Gloria Luong, Andrea Russell, and James Miller, *Colorado State University, Fort Collins, Colorado, United States*

Previous research examining the transition into senior housing has focused primarily on individuals and has used cross-sectional, retrospective designs after older adults have already moved into the facilities. These designs cannot disentangle changes over time and how partners influence this process. The Relocation and Transitional Experiences (RELATE) study leverages a prospective longitudinal design that tracked 157 participants (97 who participated in the study as part of a dyad with a romantic partner or other close partner (family member)) prior to moving into senior housing and across 3.5 months after the move. Participants ranged between 40-95 years of age. Results showed that those who were unmarried reported fewer depressive symptoms, but also less social support and lower life satisfaction than married participants. Changes over the 3.5 month period in depressive symptoms, social support, and rumination also varied by age. This study suggests partners may influence one another's developmental health trajectories.

LINKS BETWEEN DEPRESSIVE SYMPTOMS AND SELF-RATED AND COGNITIVE HEALTH IN OLDER COUPLES AROUND THE WORLD

Rebekka Weidmann, and William Chopik, *Michigan State University, East Lansing, Michigan, United States*

Mental and physical health are important concerns in late adulthood. To gain a deeper understanding of the associations between depressive symptoms and self-rated and cognitive health as they occur contextualized within romantic relationships and across different cultures, we examined these links in older romantic couples of 36 nations. To that end, we used data from North and South America, Europe, and Asia with a total sample of 47,396 romantic couples. Between-partner correlations of depressive symptoms, self-rated health, and cognitive health demonstrated substantial variations across cultures. Further, we found that the depressive symptoms in one partner were linked to worse self-rated health and worse cognitive performance in both partners. Age, education, and functional difficulties partly accounted for these associations. These findings were also characterized by cross-cultural variation. Hence, depressive symptoms represent a potential risk factor for health in couples.

A MULTIPRONGED APPROACH TO MODELING DYADIC SIMILARITY AMONG MIDDLE-AGED AND OLDER ADULTS

Mariah Purol[1], Rebekka Weidmann[1], Louis Hickman[2], Jeewon Oh[3], and William Chopik[1], *1. Michigan State University, East Lansing, Michigan, United States, 2. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 3. Syracuse University, Syracuse, New York, United States*

One surprising finding in the field of dyadic influence is the minimal influence that couple personality similarity has for life and relational well-being. Most research has focused on pairing of symmetric psychological characteristics on a broad, trait level (i.e., one person's extraversion with their partner's extraversion) across romantic partners. However, many more cross-trait combinations are possible, and facet-level traits may provide additional information that is traditionally lost. Among 1,366 middle-age and older couples, we examined similarity effects of personality facets on health, life, and relational well-being using difference scores, response surface analyses, and machine learning approaches. Across analytic and operational approaches, partner and similarity effects were relatively small in magnitude, although additional variance was explained for some outcomes (e.g., relationship satisfaction) than others (e.g., memory, chronic illnesses). Our findings constitute one of the more comprehensive examinations to date and suggest even the modest effects of personality similarity may be overstated.

SESSION 2290 (SYMPOSIUM)

EPIDEMIOLOGY OF FALLS: RACIAL/ETHNIC CONSIDERATIONS

Chair: Wenjun Li Discussant: Su-I Hou

Prevention of falls is important to independent living and good health in older age. This symposium brings together four studies on epidemiology of falls among community-dwelling older adults. The first study examined location and activity-specific fall rates among 388 older adults in Massachusetts. Compared to Asians, annual rates of indoor and outdoor falls and falls while walking were substantially higher among non-Hispanic White and Hispanics. The second study evaluated racial/ethnic differences in fear of falling, depression, lack of physical activity and negative self-perceptions of aging in 121 low-income older adults. The highest levels of fall risk were found in Hispanics and Asian Americans, fear of falling in African Americans, and depression in Hispanics. The third study assessed the relationship between objectively measured sedentary bout frequency with recurrent falls (2+ falls/year) among 2,918 men aged 79.0±5.1 years attending the Osteoporotic Fractures in Men Study (MrOS) Year 7 (2007-2009) visit. The analysis found a likely U-shaped association between sedentary bout frequency and recurrent falls risk, with the least and most active men are at higher risk. The fourth study investigated the association between fear of falling and falls risk among Chinese and non-Chinese older adults in Singapore using data collected via an electronic survey between January and February 2022. The analysis did not find significant ethnic differences in fear of falling. Although limited by sizes, these studies found racial and ethic differences in fall rates, physical activity, fear of falling and other risk factors, which are of great interest for further investigations.

RACIAL DIFFERENCES IN LOCATION AND ACTIVITY-SPECIFIC FALLS IN MASSACHUSETTS, US

Wenjun Li[1], Linda Churchill[1], Annabella Aguirre[1], Anthony Clarke[1], Elizabeth Procter-Gray[1], Kevin Kane[1], Sarah Berry[2], and Marian Hannan[3], *1. University of Massachusetts Lowell, Lowell, Massachusetts, United States, 2. Hebrew SeniorLife / Harvard Medical School, Boston, Massachusetts, United States, 3. Hebrew SeniorLife, Roslindale, Massachusetts, United States*

Prevention of falls is important to independent living and good health in older age. Circumstances of falls may vary by older person's sociodemographic attributes, health conditions and living environment. Health Aging and Neighborhood Study (HANS) examined rates of location and activity-specific falls among 388 community-living older adults living in Central Massachusetts between 2018 and 2020. Data on falls were collected using monthly calendar, and information on falls was collected by trained staff via telephone interviews with the participants. The follow-up time ranging from 11.9 to 24.4 months. In total, 431 falls were reported, of which 97% had information on location of fall, and 95% had information on activity at time of fall. Annualized rate of any fall differed significantly by race/ethnicity. Asians had the lowest rate (0.26/year). Rate of Hispanics was approximately twice higher (0.55, p=0.04) and non-Hispanic Whites three times higher (0.84, p<0.001). For indoor falls, Asians reported significantly lower rates than Hispanics (0.10 vs. 0.44, p=0.005) or non-Hispanic Whites (0.10 vs. 0.36, p=0.009). Greater outdoor fall rate was associated with male gender (p=0.04); younger age (p=0.03); Asian (p=0.02) and, especially, non-Hispanic White race (p<0.001, with Hispanics as referent); higher income (p<0.001); and more years of education (p=0.001). Falls while walking were significantly associated with non-Hispanic White race (p<0.001) and Hispanic ethnicity (p=0.001). In summary, rates of any, indoor or outdoor falls vary significantly by race. The underlying mechanisms should be further investigated.

FALL RISK, FEAR OF FALLING, PHYSICAL ACTIVITY, AND SELF-PERCEPTIONS IN ETHNICALLY DIVERSE LOW-INCOME OLDER ADULTS

Ladda Thiamwong[1], Rui Xie[1], Nichole Lighthall[1], Joon-Hyuk Park[1], Victoria Loerzel[2], and Jeffrey Stout[1], *1. University of Central Florida, Orlando, Florida, United States, 2. College of Nursing, University of Central Florida, Orlando, Florida, United States*

Falls and fear of falling (FOF) are the leading cause of disability, and hospitalization in ethnically diverse low-income older adults. The present study included an ethnically diverse sample of low-income older adults (N=121) to examine ethnic and income-based group differences in risk factors for falls (high FOF, depression, avoidance of physical activity) and the role of negative self-perceptions of aging in driving these risk factors. Results revealed the highest levels of fall risk among Hispanics and Asian Americans, FOF among African Americans, and depression among Hispanics. Accelerometer-based physical activity measures confirmed that low-income older adults had lower levels of moderate to vigorous physical activity (MVPA) compared with their high-income counterparts (p=0.04). Further, financial difficulty was related to MVPA (p<0.001), depression, anxiety, and fall risk (p=0.01). Critically, we also found a strong relationship between negative self-perceptions of aging and FOF (p = 0.002) across groups.

THE ASSOCIATION BETWEEN OBJECTIVE MEASURES OF INTERMITTENT SEDENTARY BREAKS WITH RECURRENT FALL RISK IN OLDER MEN

Lauren Roe[1], Stephanie Harrison[2], Peggy Cawthon[3], Kristine Ensrud[4], Kelley Gabriel[5], Deborah Kado[6], and Jane Cauley[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. California Pacific Medical Center, Research Institute, San Francisco, California, United States, 3. California Pacific Medical Center Research Institute, San Francisco, California, United States, 4. University of Minnesota Medical School and Minneapolis VA Health Care System, Minneapolis, Minnesota, United States, 5. Department of Epidemiology, The University of Alabama at Birmingham, Birmingham, Alabama, USA., Birmingham, Alabama, United States, 6. Stanford University School of Medicine, Palo Alto, California, United States*

BACKGROUND: We assessed the relationship between objectively measured sedentary bout frequency with recurrent falls (2+ falls/year).

METHODS: The sample included 2,918 men aged 79.0±5.1 years attending the Osteoporotic Fractures in Men

Study (MrOS) Year 7 (2007-2009) visit. Sedentary bout frequencies were defined as the average daily number of transitions out of 5+ minutes sedentary (<1.5 METS). Falls were self-reported from mailed questionnaires. Generalized Estimating Equations estimated the odds of recurrent falls.

RESULTS: Over four follow-up years, 1,025 (35.1%) men had recurrent falls. Compared to men with <13.6 transitions from sedentary (Quartile (Q)1), the odds of recurrent falls among men with 13.6-<17.0 transitions (Q2), 17.0-<20.4 transitions (Q3), and 20.4-<34.6 transitions (Q4) were 0.82 (95%CI: 0.66-1.01), 0.79 (95%CI: 0.64, 0.99), and 1.01 (95%CI: 0.81, 1.27), respectively, after adjustment.

CONCLUSIONS: A U-shaped association may exist between sedentary bout frequency and recurrent falls risk. The least and most active men are at higher risk.

FEAR OF FALLING, FALL RISK, AND ETHNICITY AMONG OLDER ADULTS IN SINGAPORE: AN ELECTRONIC SURVEY

Wayne Chong[1], Tharshini Lokanathan[2], and W. Quin Yow[2], *1. Nanyang Technological University, Singapore, Singapore, Singapore, 2. Singapore University of Technology & Design, Singapore, Singapore*

This study investigated the association between fear of falling and falls risk among Chinese and non-Chinese community-dwelling older adults in Singapore. Preliminary data were collected from individuals who will turn 60 years old and above in 2022 via an electronic survey between January and February 2022. The majority (61%) of the 128 Chinese participants had no falls risk and low fear of falling as compared to other combinations of falls risk (absence, presence) and fear of falling (low, moderate, high), Pearson Chi Square (2) = 8.03, p = .02. Among the 16 non-Chinese participants, no dominant falls risk-fear of falling combination was found, Pearson Chi Square (2) = 3.47, p = .18. Multinomial logistic regression analyses found, however, that in the presence of falls risk, ethnicity did not predict moderate fear of falling, B = .24, p = .70, nor high fear of falling, B = -.37, p = .74.

SESSION 2300 (SYMPOSIUM)

FOSTERING MULTIDISCIPLINARY SOLUTIONS IN AGING: THE RESEARCH CENTERS COLLABORATIVE NETWORK

Chair: Stephen Kritchevsky Co-Chair: Odette van der Willik

The NIA supports the Research Centers Collaborative Network (RCCN) to build collaborations between scientists from the 6 NIA-sponsored center programs: Alzheimer's Disease Research Centers, Centers on the Demography and Economics of Aging, Claude D. Pepper Older Americans Independence Centers, Nathan Shock Centers of Excellence in the Basic Biology of Aging, Resource Centers for Minority Aging Research, and Roybal Centers for Translational Research on Aging. RCCN's premise is that researchers from different disciplines are most likely to collaborate when they are addressing common problems. To provide a forum for collaborative exchange, the RCCN has convened 6 workshops on topics that cross-cut the concerns of the various NIA center programs ranging from sustaining behavior change in older adults to measuring biologic age. After each Workshop the RCCN awards pilot funds related to the theme. This symposium will present key learnings from the workshops and present work of four RCCN pilot teams from the third and fourth workshops which focused on resilience and reserve, and life course perspectives on aging. Dr. Ramos will discuss how measurement of psychological resilience may predict physical resilience in older patients with lung cancer, while Dr. Reid will discuss positive affect as a source of resilience for older adults with chronic pain. Dr. White will discuss association between perceived discrimination trajectories and multimorbidity burden among middle-aged and older black adults, while Dr. Brooks will discuss development of a resilience index in chronic musculoskeletal pain. Dr. Kritchevsky will also summarize lessons learned across the first 6 workshops.

ENHANCING RESILIENCE IN OLDER ADULTS WITH ADVANCED LUNG CANCER

Katherine Ramos, *DUKE UNIVERSITY MEDICAL CENTER, Durham, North Carolina, United States*

For older adults with advanced cancer, the negative impacts on their emotional and physical health are prevalent, often jeopardizing their capacity to effectively cope and exhibit resilience. Research on multidisciplinary interventions that promote resilience in older adults facing advanced lung cancer has received limited attention. To enhance how healthcare systems/teams may improve oncogeriatric care, we present study findings from a theory-driven behavioral intervention pilot (Self-System Therapy; SST) designed to target patient self-regulation (e.g., behavioral activation, promotion-focused goal setting) to enhance psychological and physical resilience. A total of 15 older adults with late-stage lung cancer completed 6–8-weeks of SST all delivered via videoconference. Self-report, accelerometry, and exit interview data will be presented along with prior pilot data of 30 older adults (total N = 45). Preliminary findings suggest that participants found the use of videoconference feasible and acceptable; with a 95% adherence rate, 7% attrition rate, and 95% satisfaction with SST.

DISCRIMINATION TRAJECTORIES, RESILIENCE CHARACTERISTICS, AND MULTIMORBIDITY AMONG MIDDLE-AGED AND OLDER BLACKS

Kellee White[1], Kaitlynn Robinson-Ector[2], Melissa wei[3], Tianzhou Ma[2], Bethany Bell[4], and Ana Quinones[5], *1. University of Maryland College Park School of Public Health, College Park, Maryland, United States, 2. University of Maryland College Park, College Park, Maryland, United States, 3. David Geffen School of Medicine at UCLA, Los Angeles, California, United States, 4. University of Virginia, Charlottesville, Virginia, United States, 5. OHSU-PSU School of Public Health, Portland, Oregon, United States*

Discrimination is a chronic psychosocial stressor that can accelerate aging. While strong empirical evidence demonstrating linkages between discrimination and adverse health outcomes, the role of discrimination in multimorbidity burden has received less attention. Prior research on discrimination and health largely uses a single, static, cross-sectional measure to predict health at a second time point, that may mask significant heterogeneity in the dynamic nature of repeated exposures to discrimination. Characterizing longitudinal patterns of discrimination may be a better predictor of health risk and provide insight on resilience processes that influence aging-related outcomes such as multimorbidity. However, this relationship is not well understood. We investigate the association between discrimination trajectories, resilience characteristics, and multimorbidity burden among a sample of middle-aged and older black adults. Specifying discrimination trajectories and resilience characteristics that differentially predict multimorbidity burden may inform the design of culturally-relevant interventions to delay the development and progression of multimorbidity.

PROTECTIVE RESILIENCE INDEX FOR SUCCESSFUL AGING IN MUSCULOSKELETAL PAIN (PRISM): PRELIMINARY FINDINGS

Amber Brooks[1], Kimberly Sibille[2], Emily Bartley[3], Cynthia Garvan[4], and Angela Mickle[5], *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 2. University of Florida, Gainesville, Florida, United States, 3. Department of Community Dentistry &Behavioral Science, Gainsville, Florida, United States, 4. Department of Anesthesiology, Gainesville, Florida, United States, 5. Physical Medicine and Rehabilitation, Gainesville, Florida, United States*

Chronic musculoskeletal pain is a highly prevalent condition in older adults and is associated with a decrease in function, biological dysregulation and cellular aging, and increased risk of morbidity and mortality. Our previous work shows that a resilience index comprised of measures of recognized biobehavioral and psychosocial protective factors based on clinically validated norms (waist hip ratio, tobacco use, social support, perceived stress, optimism, positive affect, negative affect-low, active coping) was positively associated with telomere length, lower levels of clinical pain and pain-related functional decline which, also correlated with pain-related brain structure. We will report the initial findings from our multi-centered, NIA RCCN funded study, Protective Resilience Index for Successful Aging in Musculoskeletal Pain (PRISM), which seeks to refine and validate a resilience index that is predictive of biological and pain-related outcomes. This work will lay the foundation for a resilience index that can be used in everyday clinical practice.

A PILOT RANDOMIZED CLINICAL TRIAL TO PROMOTE POSITIVE AFFECT IN PATIENTS WITH FIBROMYALGIA

Cary Reid[1], Anthony Ong[2], Judy Moskowitz[3], Mubarak Sanni[1], Patricia Kim[1], Elaine Wethington[4], Elizabeth Addington[3], and Erica Sluys[1], *1. Weill Cornell Medicine, New York City, New York, United States, 2. Cornell University, Ithaca, New York, United States, 3. Northwestern University, Chicago, Illinois, United States, 4. Cornell, Ithaca, New York, United States*

Fibromyalgia syndrome (FMS) is a chronic musculoskeletal condition characterized by widespread pain, impaired physical functioning, and deficits in positive affect (PA). Standard behavioral therapies for FMS focus on reducing negative affect (NA) and yield only modest benefits. We examined the feasibility, acceptability and preliminary efficacy of a 6-week, online, PA-enhancing intervention, entitled: Lessons in Affect Regulation to Keep Stress and Pain UndeR control (LARKSPUR). We enrolled participants from one large health system in New York City and ResearchMatch. Ninety-five FMS patients were randomized to LARKSPUR or a neutral emotion reporting arm. Results to date indicate that LARKSPUR is feasible: recruitment (82%), retention (93%); and acceptable: mean satisfaction score on 1-10 scale (9.4, SD=1.2). Planned efficacy analyses will evaluate treatment effects on pain intensity and interference, depressive symptoms, and stress appraisals. If effective, LARKSPUR will lay the foundation for understanding how behavioral treatments for FMS can be optimized through PA enhancement.

SESSION 2310 (PAPER)

GENERATIVITY

ALASKA NATIVES AND GENERATIVITY: BENEFITS AND CHALLENGES OF GENERATIVITY IN A RAPIDLY CHANGING ARCTIC

Jordan Lewis, *University of Minnesota Medical School, Duluth, Minnesota, United States*

Generativity is not often associated with successful aging, but aligns with the cultural values and practices of Alaska Native Elders. This study explored the concept of generativity, why elders share their knowledge, how it makes them feel, and what they want everyone to know. This study interviewed 108 Alaska Native Elders across Alaska, ages ranging from 48 - 93 years old, and willing to share their knowledge of successful aging. Employing content analysis, we explored themes related to each research question on generativity. Elders felt motivated, happy, and good about sharing their knowledge, but only when others listened. Their motivations were to teach the real history of Alaska, leave a community or family legacy, and help youth engage in healthy behaviors. Knowing cultural values, your history, practical skills, and how to listen to your Elders were things they want to share with youth and fellow Elders. Participants also shared the challenges to being generative, including technology, lack of interest by others, and age differences in experiences and knowledge sought. We learned the importance of addressing the generative mismatch between generations and to improve quality of life for Elders and help youth age successfully, we need to create culturally meaningful activities to bring all generations together. Programs to teach youth to be healthy and develop a healthy identity through cultural practices and values, and provide Elders outlets to share and improve their quality of life will ensure cultural survival and foster and strengthen the cultural practice of Indigenous cultural generativity.

COVID CHALLENGES TO FULFILLING GENERATIVITY: PITFALLS AND BRIDGES FOR OLDER VOLUNTEERS TO RE-ENGAGE COMMUNITY

Kimberly Shay, *Wayne State University, Farmington, Michigan, United States*

The ongoing COVID pandemic undermines the social resources known to preserve health and well-being among older adults. This deeply affects developmental tasks, as traditional paths to fulfilling generativity are impaired. Generativity, a later life stage of seeking to nurture and contribute to the next generation, is accessible through volunteering. This pandemic has revealed gaps in our knowledge of the challenges and adaptations to generativity and meaningful social engagements for older adults. To address this, the author conducted an ethnographic study at four key sites of volunteer engagement by older adults from 2021 to 2022, utilizing a community-based study of older volunteers. Methods included participant-observation at public events and in-depth interviews with 14 key informants. This was a novel study period, post-vaccine, when hopes were raised, but not always achieved for return to generative activities. Analyses revealed three key themes: threats to the foci and spheres of generative expression (Rubinstein, et al, 2015) enacted through volunteering; difficulties and successes creatively crafting new modes to reestablish prior social ties; and threats to full-adult personhood. These themes were linked to altered capacities, experienced during quarantine, to participate with and contribute to the community. Fulfilling later life generativity is intrinsically linked to the ability to participate in community social life, but the pandemic limited opportunities and prompted new challenges and solutions. This paper highlights the need for research to prepare for threats from future disasters and pandemics that challenge meaningful participation and generativity for older adults.

DO INTERNALIZED AGE STEREOTYPES MEDIATE THE RELATIONSHIP BETWEEN VOLUNTEERING AND SELF-EFFICACY AMONG ADULTS 50+?

Andrew Steward[1], and Leslie Hasche[2], *1. University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, United States, 2. University of Denver, Denver, Colorado, United States*

Volunteering is associated with increased self-efficacy among older adults, and self-efficacy has been shown to mediate the relationship between ageism and health. A growing, compelling body of literature based in stereotype embodiment theory identifies significant, negative public health impacts of internalized age stereotypes. Yet, little research explores whether volunteering may both reduce internalized ageism and enhance self-efficacy as people age. This cross-sectional study examined whether internalized age stereotypes mediate the relationship between volunteering and self-efficacy for adults 50+. A convenience sample of volunteers (n = 165) 50+ years of age residing in the U.S. Mountain West was recruited. A 15-minute, online survey was utilized. The independent variable was number of volunteer hours per week (mean = 6.45, SD = 5.38). The dependent variable was self-efficacy measured by five items from the five-point, Likert-type general self-efficacy scale (α = .83; mean = 4.81, SD = 1.08). Drawing from the self-stereotypes of aging scale, the indirect effects of five internalized positive (e.g., “wise” and “capable”) and five negative (e.g., “grumpy” and “helpless”) age stereotypes were tested. Results indicate that increased internalized positive, but not negative, age stereotypes partially mediated the relationship between volunteer hours and self-efficacy while holding constant age, gender, race, self-rated health, functional limitation, education, employment, and previous volunteer experience. Although positive age stereotypes have long been considered a form of ageism, the results of this study suggest that internalized positive age stereotypes may function as a form of esteem to promote enhanced psychosocial health as people age.

EXAMINING THE PROCESS OF COMMUNITY-DWELLING OLDER ADULTS CREATING A LEGACY OF VALUES

Sarah Neller[1], Kristin Cloyes[2], Linda Edelman[3], Bob Wong[4], and Gail Towsley[4], *1. The University of Tennessee, Knoxville, Knoxville, Tennessee, United States, 2. Oregon Health & Science University, Portland, Oregon, United States, 3. University of Utah College of Nursing, Salt Lake City, Utah, United States, 4. University of Utah, Salt Lake City, Utah, United States*

Creating a legacy of values (e.g., legacy letter) is a way to promote generativity by communicating emotional and supportive instruction (e.g., values, life lessons) to others. This study aimed to a) understand the process of how older adults create a legacy of values, b) identify contextual factors surrounding creation, and c) describe older adults’ experiences of creation. We recruited community-dwelling older adults who had previously created a legacy of values to participate in semi-structured interviews. Interpretive description guided data collection and analysis. We initially coded the transcripts deductively, based on the literature, and inductively; data were organized into categories (i.e., by contextual factors and process steps) and analyzed using constant comparison to identify patterns. Participants (n=16) had a mean age of 72.3 years (SD=5.8, range=65-83), most were female (n=14), and all had children and identified as non-Hispanic White. Motivations for creation included aging, transitions, or events (e.g., travel). Participants tailored the contents (e.g., life lessons) and format to recipients, revised their legacy of values over time, and recommended the process to others. The creation process was non-linear, iterative, and influenced by participants’ personal and familial contextual factors. Synthesis of these findings resulted in developing the Process Model for Creating a Legacy of Values, which depicts the iterative and interconnected nature of the content, process, and experience of creating a legacy of values. Our findings indicate older adults are seeking resources to create their legacy of values in a self-directed way, and that it is an acceptable, accessible, and relevant process.

HOW TO PUBLISH: GUIDANCE FROM GSA’S JOURNAL EDITORS

Suzanne Meeks[1], Rozalyn Anderson[2], Steven Albert[3], Derek Isaacowitz[4], and Karen Jung[5], *1. University of Louisville, Louisville, Kentucky, United States, 2. University of Wisconsin, Madison, Madison, Wisconsin, United States, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 4. Northeastern University, Boston, Massachusetts, United States, 5. The Gerontological Society of America, Washington, District of Columbia, United States*

Each year the GSA publications team sponsors a symposium to assist authors who wish to publish in GSA's high impact and influential journals. The first part of the session will include five brief presentations from the editors of The Gerontologist, Innovation in Aging, and the Journals of Gerontology Series A and B plus journal managing editors. We will integrate practical tips with principles of publication ethics and scholarly integrity. The topics will be as follows: (1) Preparing your manuscript: strong and ethical scholarly writing for multidisciplinary audiences, (2) common problems that affect peer review, (3) addressing translational significance and fit to journal expectations, (4) transparency, documentation, and Open Science; and (5) working with Scholar One. Following these presentations, we will hold round table discussions with editors from the GSA journals portfolio. At these round tables, editors will answer questions related to the podium presentations and other questions specific to each journal. Intended audiences include emerging and international scholars, and authors interested in learning more about best practices and tips for getting their scholarly work published.

PREPARING YOUR MANUSCRIPT: STRONG AND ETHICAL SCHOLARLY WRITING FOR MULTIDISCIPLINARY AUDIENCES

Suzanne Meeks, *University of Louisville, Louisville, Kentucky, United States*

This presentation will emphasize the importance of plain, good writing. Editors read 10 or more manuscripts per week with pressure to reject 80-90% of them. If the point and contribution are not clear in a quick scan of the paper, it will not be reviewed favorably. I will provide tips for writing that are commonly violated in submissions, provide references for additional writing support, cover expectations for language consistent with GSA's Reframing Aging initiative, and discuss some common publication ethics issues that arise during the review process, including author contributions and embedding your scholarship in the context of prior work.

COMMON PROBLEMS THAT IMPACT PEER REVIEW

Rozalyn Anderson, *University of Wisconsin, Madison, Madison, Wisconsin, United States*

This presentation will review the most common issues that affect how reviewers see a manuscript submission. These include clarity, use of figures, and attention to existing research, especially establishing the significance and novelty of the work, and how to frame a narrative. I will also address responding to peer review. The focus will be on the biological science perspective (Journals of Gerontology Series A), but these issues are relevant to all submissions to GSA journals.

DEFINING TRANSLATIONAL SIGNIFICANCE IN GERONTOLOGY

Steven Albert, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Innovation in Aging requires a statement from authors on translational significance. This requirement forces authors to consider the implications of their research for changing some component of aging. How does the research address a challenge posed by aging bodies, minds, relationships, or societies? The editorial board has developed criteria for assessing translational significance. Translational research must meet at least one of three criteria. It (i) must predict or explain a health or behavioral outcome, (ii) be advanced enough in deployment or development to assess these effects, and (iii) have a clear pathway to large-scale program delivery or change in clinical practice. The criteria rule out some kinds of submissions, such as scale development, single-case studies, or reviews of literature. We use these criteria to structure each article's required translational significance statement. Rethinking translation may help focus research across the full set of GSA journals.

TRANSPARENCY, DOCUMENTATION, AND OPEN SCIENCE

Derek Isaacowitz, *Northeastern University, Boston, Massachusetts, United States*

Some GSA journals are especially interested in promoting transparency and open science practices, reflecting how some subdisciplines in aging are moving toward open science practices faster than others. In this talk, I will consider the transparency and open science practices that seem most relevant to aging researchers, such as preregistration, open data, open materials and code, sample size justification and analytic tools for considering null effects. I will also discuss potential challenges to implementing these practices as well as reasons why it is important to do so despite these challenges. The focus will be on pragmatic suggestions for researchers planning and conducting studies now that they hope to publish later.

GSA MANAGING EDITORS' PERSPECTIVE ON SUBMISSION DOS AND DON'TS

Karen Jung, and Kathleen Jackson, *The Gerontological Society of America, Washington, District of Columbia, United States*

In this presentation, the managing editors of GSA's peer-reviewed journals will discuss how the editorial offices operate and their roles in the publishing process. The topics will include how to navigate the ScholarOne submission system, why it is important to read the Instructions to Authors, and how authors can work with the editorial offices to increase the visibility and impact of their published articles.

SESSION 2340 (SYMPOSIUM)

IT'S A COOL LITTLE TOOL: PROVIDER PERSPECTIVES ON IMPLEMENTING PAL CARDS DURING COVID-19

Chair: Katherine Abbott Discussant: Natalie Douglas

This symposium describes the implementation of a person-centered care (PCC) communication tool in nursing homes. PCC is a philosophy that recognizes "knowing the person" and honoring individual preferences. The communication tool is based on an assessment of NH resident likes and dislikes via the Preferences for Everyday Living Inventory (PELI). The PELI is an evidenced-based, validated instrument that can be used to enhance the delivery of PCC. The Preferences for Activity and Leisure (PAL) Card was developed to communicate important resident preferences across care team members. From July 2020 to July 2021 we lead a Quality Improvement Project (QIP) approved by the Ohio Department of Aging providing virtual coaching to providers who created 15-20 PAL Cards for their residents. Our first presentation describes the QIP where n=16 started implementation and n=11 communities completed the project during the height of the pandemic. Providers were non-profit (50%) with an average star rating of 3.29 (SD 1.33). Feedback from n=68 direct care staff on PAL Card usage are reported. The next four presentations describe implementation of PAL Cards from the perspective of the provider champions who contributed to n=66 monthly interviews. Interviews were recorded, transcribed verbatim, and coded in Dedoose using the Consolidated Framework for Implementation Research as an a priori coding scheme. We present barriers and facilitators related to the domains of Inner Setting, Characteristics of the Individual, Characteristics of the Intervention, and Process. The Discussant, Dr. Natalie Douglas will discuss the implications of initiatives to address the quality of resident care.

DIRECT CARE STAFF PERSPECTIVES ON THE IMPACT OF PAL CARDS IN CARE DELIVERY

Katherine Abbott[1], Alexandra Heppner[1], Megan Kelley[1], Kamryn Kasler[1], Miranda Kunkel[1], and Kimberly Van Haitsma[2], *1. Miami University, Oxford, Ohio, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States*

This was the third time replicating the Preferences for Activity and Leisure (PAL) Card quality improvement project, but the first conducted entirely during the height of the pandemic. Nursing home providers attempted n=174 PAL Cards and completed n=166 (96%). Feedback from surveys with n=68 staff who came in daily contact with residents (e.g., 26% CNAs, 10% housekeepers, 6% maintenance, 9% dining) were collected by project champions. Staff had worked on average 6 years, indicated that they remember being been told about PAL Cards (81%), noticed them (94%), reported that the information on the PAL Card helped them start a conversation with a resident (79%), and helped them provide care (59%). PAL Cards are a feasible method to communicate important resident preferences to staff who come in daily contact with residents and may not have access to electronic health records. Recommendations for practice will be discussed including staff recommendations for improvements.

EXAMINING THE NURSING HOME INNER SETTING CHARACTERISTICS THAT LEAD TO THE SUCCESSFUL IMPLEMENTATION OF PAL CARDS

Kamryn Kasler[1], Megan Kelley[1], Miranda Kunkel[1], Reese Moore[1], Faith DeVengencie[1], Alexandra Heppner[1], Kimberly Van Haitsma[2], and Katherine Abbott[1], *1. Miami University, Oxford, Ohio, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States*

Implementation efforts of evidence-based practices focusing on the nursing home setting remain understudied. The purpose of this study was to explore the role of the Consolidated Framework for Implementation Research (CFIR) inner setting domain on the implementation of PAL Cards. Monthly qualitative interviews (n=50) with project champions (n=16) were audio-recorded, transcribed, checked for accuracy, and coded using the domain "Inner Setting" from the CFIR in Dedoose. Major themes emerging from the data included networks and communication (e.g., including PAL Card information in employee newsletter) among staff, compatibility of the PAL Cards (e.g., aligns with community values and fits into existing workflows), and available resources (e.g., adequate time and staff to implement the QIP). High-quality communication channels to educate and collaborate were shown to be an integral component of successful implementation. Implications for policy and practice will be discussed.

THAT'S JUST MY SUPERPOWER: THE ROLE OF NURSING HOME PROVIDER CHAMPIONS IN IMPLEMENTING A PERSON-CENTERED PROJECT

Miranda Kunkel[1], Megan Kelley[1], Reese Moore[1], Kamryn Kasler[1], Chloe Arrasmith[1], Alexandra Heppner[1], Kimberly Van Haitsma[2], and Katherine Abbott[1], *1. Miami University, Oxford, Ohio, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States*

Champions are crucial to successful intervention implementation; however, as an area of research champions have only recently begun to gain empirical focus. The purpose of this study was to identify the barriers and facilitators regarding champion qualities using the domain "Characteristics of the Individual" from CFIR. Qualitative interviews were conducted with nursing home provider champions (n=16) who led efforts to create PAL Cards for 15-20 residents and participated in a total of n=50 monthly interviews that were audio-recorded and transcribed verbatim. The following themes regarding characteristics of the individual emerged: champions' investment in their community, capacity and existing workload, and willingness to ask for help. While some champions saw the value of the PAL Cards, they lacked the bandwidth necessary to widely implement the intervention in their community. Champions who recruited a supportive team and valued person-centered care exhibited success in implementing PAL Cards.

IT'S A VERY MANIPULATABLE TOOL: CHARACTERISTICS OF PAL CARD USE THAT IMPACT SUCCESSFUL IMPLEMENTATION

Reese Moore[1], Megan Kelley[1], Miranda Kunkel[1], Kamryn Kasler[1], Julia Baker[1], Alexandra Heppner[1], Katherine Abbott[1], and Kimberly Van Haitsma[2], *1. Miami University, Oxford, Ohio, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States*

Understanding the barriers and facilitators of an intervention can inform implementation efforts. The purpose of this study was to understand the characteristics associated with the PAL Card intervention that led to successful implementation in nursing home (NH) settings. Qualitative telephone interviews were conducted with n=11 NH champions who completed the PAL Card QIP. Interviews were recorded, transcribed verbatim, and coded using the CFIR Intervention Characteristics domain in Dedoose. Three main themes regarding the intervention characteristics emerged including, relative advantage (i.e., advantage of using PAL Cards versus an alternate intervention), adaptability (i.e., how well the PAL Cards can be altered to meet community needs), and complexity (i.e., perceived difficulty of PAL Card usage). Participants voiced the simplicity and benefit of PAL Card implementation within their communities for both staff and residents alike. Implications for policy and practice will be discussed.

UNDERSTANDING PROCESSES NEEDED TO SUCCESSFULLY IMPLEMENT PAL CARDS IN NURSING HOMES.

Megan Kelley[1], Miranda Kunkel[1], Reese Moore[1], Kamryn Kasler[1], Lexi Talmage[1], Alexandra Heppner[1], Kimberly Van Haitsma[2], and Katherine Abbott[1], *1. Miami University, Oxford, Ohio, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States*

Background: The CFIR Process domain can be used to evaluate practices that are associated with successful or unsuccessful implementation. The purpose of this study was to understand the processes that led to successful implementation of the PAL Card QIP during the height of the pandemic from the provider champion's perspective.

Methods: Qualitative interviews with n=11 champions who completed the PAL Card QIP were audio recorded, transcribed verbatim, and coded using the CFIR Process Domain.

Results: Major themes regarding the process of implementation included engaging (e.g., staff and family), executing (adapting to different situations), planning (e.g., having a clear plan of implementation), and reflecting and evaluating (e.g., taking time to evaluate the project). Discussion: Providers articulated strategies that contributed to successful implementation during a global pandemic, which can help inform future quality improvement projects. Implications for practice and policy will be discussed.

SESSION 2350 (SYMPOSIUM)

MAKING CLASSROOMS MORE AGE-FRIENDLY: STRATEGIES FOR INTERGENERATIONAL EXCHANGE

Chair: Joann Montepare Co-Chair: Kimberly Farah
Discussant: Lisa Borrero

Aging populations are reshaping how we think about teaching and learning in higher education. As a result, educational opportunities for intergenerational exchange are on the rise with the growth of the Age-Friendly University (AFU) initiative. Endorsed by GSA's Academy for Gerontology in Higher Education, the AFU principles call for promoting intergenerational exchange to facilitate the reciprocal sharing of expertise between learners of all ages. Age diverse classrooms and learning spaces have distinctive needs and dynamics that instructors, and students, will need to learn how to navigate. This collaborative symposium, that brings together members of the Age-Friendly University (AFU) and Intergenerational Learning, Research, and Community Engagement (ILRCE) Interest Groups, will explore evidenced-based practices that contribute to successful experiences in and beyond the classroom. Montepare and Farah will provide an overview of the AFU initiative and intergenerational classroom issues. Jarrott and colleagues will address how technology and other strategies can prepare individuals for intergenerational learning experiences, including when circumstances limit in-person opportunities, such as during COVID. Dauenhauer and Heffernan will share insights from faculty about ways to develop and sustain a lifelong learning program that incorporates intergenerational interactions in the classroom experience. Leedahl will discuss strategies for developing age-friendly intergenerational internship experiences with community partners. Borrero, co-convener of the ILRCE Interest Group, will serve as the discussant.

THE AGE-FRIENDLY UNIVERSITY (AFU) INITIATIVE AND THE CALL FOR MORE AGE-FRIENDLY INTERGENERATIONAL CLASSROOMS

Joann Montepare, *Lasell University, Newton, Massachusetts, United States*

Changing age demographics are reshaping societies and challenging our living, learning, and work communities to consider how they can respond to more age-diverse, older populations. The pioneering Age-Friendly University (AFU) initiative, endorsed by GSA's Academy for Gerontology in Higher Education (AGHE), calls for institutions of higher education to respond to these shifting demographics through more age-friendly programs, practices, and partnerships. Moreover, the 10 AFU Principles recommend a set of specific educational options including the promotion of intergenerational learning to facilitate the reciprocal sharing of expertise between learners of all ages. This presentation provides an overview of the AFU initiative with a focus on strategies for intergenerational teaching and learning. It sets the stage for the other presentations by describing core questions and considerations educators should take into account when mounting intergenerational practices in and beyond the classroom.

EVIDENCE-BASED INTERGENERATIONAL PRACTICES SUPPORT AFU PRINCIPLES

Shannon Jarrott[1], Jill Juris[2], and Rachel Scrivano[1], *1. The Ohio State University, Columbus, Ohio, United States, 2. Appalachian State University, Boone, North Carolina, United States*

Theory and research informed a framework of best intergenerational practice that has proven effective in the field of community programs. Reflecting a number of AFU principles, this set of proven practices can promote positive intergenerational contact in college classrooms as well. Here, we present evidence-based and promising practices salient to the AFU, offering examples from the classroom and suggesting low- and high-tech solutions. For example, the intergenerational practices of offering meaningful roles and engaging youth and older adults in a novel activity can support AFU principle 4 reciprocal sharing of expertise between learners of all ages. Stakeholders, including instructors, university students, older adult learners, and community partners, benefit from preparation for the distinctive needs and opportunities of intergenerational learning experiences in higher education. Effective implementation of intergenerational strategies helps both younger and older learners to reimagine aging, offering the potential to address a critical need of individuals and communities.

PROMOTING AND SUSTAINING A COLLEGE-WIDE LIFELONG LEARNING PROGRAM: FACULTY INSIGHTS AND EXPERIENCES

Jason Dauenhauer, Kristin Heffernan, and Afeez Hazzan, *State University of New York at Brockport, Brockport, New York, United States*

Research has identified the benefits and challenges of creating multigenerational classrooms for the purpose of intergenerational learning in higher education. However, much less is known about the systems of support needed at the organizational level to promote intergenerational learning within lifelong learning initiatives. With a focus on formal and informal organizational structures, this session describes insights from faculty who opened their courses to older adults as part of a college-wide course auditing initiative. Many did not understand their own role in the program and offered suggestions to address these issues. Recommendations include ways to acknowledge the work of faculty who participate in the program, and to engage more professors and older adults in the community to ensure program success. To create an age-inclusive, and age-friendly university, formal structural change led from the top-down is as important, if not more important, as creating informal networks that start at the faculty level.

BEYOND THE CLASSROOM: A STUDENT INTERNSHIP MODEL THAT BUILDS AGE FRIENDLINESS AND CAREER READINESS

Skye Leedahl, Kristin Fratoni Souza, and Alexandra Morelli, *University of Rhode Island, Kingston, Rhode Island, United States*

For seven years, the University of Rhode Island (URI) Engaging Generations Cyber-Seniors Program has utilized university student mentors through an internship format and integration within service learning courses. In 2019, community interest in the program significantly increased as did student interest in gerontology internships. This led us to develop a robust internship program focused on building age and digital inclusivity across campus and the state of RI. The program integrates a three-pronged approach where students complete field hours within the URI Cyber-Seniors program, focus on enhancing the Career Readiness Competencies employers seek in graduates today as determined by the National Association of Colleges & Employers, and complete the components necessary to earn the Geriatric Education Center Interprofessional Teamwork in Geriatrics and Gerontology Certificate. This process has enabled 350 students from different majors, including Pharmacy and Human Development & Family Science, to complete internship experiences ranging from 30 to 210 hours.

SESSION 2360 (AWARD LECTURE)

MARGRET M. AND PAUL B. BALTES AWARD PRESENTATION AND LECTURE

Chair: Tamara Baker

The Margret M. and Paul B. Baltes Award Lecture will feature an address by the 2021 Baltes Award recipient, Laura B. Zahodne, PhD, of the University of Michigan. This session will also include the presentation of the 2022 Margret M. and Paul B. Baltes Award to recipient Eric S. Kim, PhD, of the University of British Columbia. The Margret M. and Paul B. Baltes Foundation Award in Behavioral and Social Gerontology recognizes outstanding early-career contributions in behavioral and social gerontology. The award is generously funded by the Margret M. and Paul B. Baltes Foundation.

BIOPSYCHOSOCIAL RISK AND RESILIENCE PATHWAYS IN DEMENTIA INEQUALITIES

Laura Zahodne, *University of Michigan, Ann Arbor, Michigan, United States*

In the United States, racial/ethnic inequalities in Alzheimer's disease and related dementias persist even after controlling for socioeconomic factors and physical health. Persistent and unexplained disparities suggest: (1) there are unrecognized dementia risk factors that are socially patterned and/or (2) known dementia risk factors exhibit differential impact across social groups. This talk will present data from multiple longitudinal studies of brain and cognitive aging to support each possibility. On average, marginalized racial/ethnic groups are more likely than non-Latinx Whites to experience structural and interpersonal discrimination, social and economic constraints, as well as barriers to accessing high quality education. However, these same groups also show evidence of greater psychosocial resilience that is linked to better late-life cognitive health. This talk will demonstrate how specific psychosocial factors can contribute to or offset dementia disparities, illustrate major challenges to this work, and introduce new data collection efforts to advance the field.

SESSION 2380 (SYMPOSIUM)

NEIGHBORHOOD QUALITY AS IT RELATES TO HEALTH AND WELL-BEING IN OLDER AFRICAN AMERICANS

Chair: Regina Wright Co-Chair: Alyssa Gamaldo
Discussant: Anna Lee

With the burgeoning older adult population, there will be an increased demand for neighborhood environments that are conducive to successful aging. For example, the need for affordable and usable housing developments for older adults that provide greater opportunities for social engagement, social services, and convenience to neighborhood resources (e.g., grocery stores, healthcare) will continue to rise. Several initiatives have sought to develop age-friendly neighborhoods, which focused on improving accessibility and affordability of community resources. However, limited effort has focused on the health and cognitive effects of neighborhood-level socioeconomic disadvantage, with respect to neighborhood income, education, employment, and housing quality. This symposium will include presentations from two studies that explored how neighborhood disadvantage (measured by the Area Deprivation Index) relates to health and cognition. The objectives of the proposed symposium are the following:

(1) discuss how neighborhood disadvantage relates to subjective and objective measures of physical health; and (2) discuss how neighborhood disadvantage relates to cognitive functioning. Allan and colleagues explored the association between neighborhood disadvantage as it relates to changes in self-reported health and objective measures (i.e., blood pressure) of health among older Black adults. Wright and colleagues explored the association between neighborhood disadvantage and measures of subclinical cardiovascular disease in older Black and White adults. Aiken-Morgan and colleagues examined associations between neighborhood disadvantage and cognitive functioning among Black older adults. Lastly, McCain and colleagues explored associations between neighborhood disadvantage and mobility among Black older adults.

EXAMINING LINKAGES BETWEEN NEIGHBORHOOD DISADVANTAGE AND SUBCLINICAL CARDIOVASCULAR DISEASE

Regina Wright[1], Alexa Allan[2], Alyssa Gamaldo[3], Adrienne Aiken Morgan[4], and Anna Lee[5], *1. University of Delaware, Newark, Delaware, United States, 2. The Pennsylvania State University, University Park, Pennsylvania, United States, 3. Pennsylvania State University, State College, Pennsylvania, United States, 4. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 5. North Carolina A&T State University, Greensboro, North Carolina, United States*

Limited research has examined the extent neighborhood disadvantage relates to subclinical CVD such as carotid atherosclerosis, arterial stiffness, and endothelial dysfunction which are key, understudied CVD risk markers. Our objective was to examine associations between neighborhood disadvantage and subclinical CVD and whether associations vary by age, sex, race, and education. The analysis included 165 Black and White older adults (mean age=64.5y). Neighborhood disadvantage was characterized using the Area Deprivation Index (ADI). Multivariable regression analysis, adjusted for age, sex, race, education, and depression, showed that national and state ADI were significant, inverse predictors of carotid atherosclerosis (near wall IMT; p=.02) and state ADI was a significant, inverse predictor of flow-mediated dilation (p=.04). A significant interaction between state and national ADI and education predicting carotid IMT emerged, but the simple slopes were non-significant (p=.02, .03). Future research should consider the role of neighborhood as a predictor of early cardiovascular risk.

NEIGHBORHOOD DISADVANTAGE AND COGNITION AMONG AFRICAN AMERICANS IN THE BALTIMORE STUDY OF BLACK AGING

Adrienne Aiken Morgan, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

Previous research has suggested an important and understudied association between neighborhood disadvantage and cognitive functioning among older African Americans. Data from the Baltimore Study of Black Aging (N=602) was utilized to examine the associations between Area Deprivation Index (ADI) and cognition. Multiple stepwise regression models, controlling for age, sex, education, and income, showed participants who scored better on measures of immediate memory, vocabulary, reasoning, and everyday cognition had lower ADI (less disadvantaged neighborhoods; p < .05). Interestingly, individuals living with higher ADI had better attention/working memory scores and better self-reported memory (p < .05). ADI was significantly associated with improvements or declines in performance, depending on the cognitive ability (e.g., learning and memory, working memory, global mental status, and visuospatial skill, p < .05). These findings suggest the importance of accounting for neighborhood context in African Americans' cognitive aging research.

AREA DEPRIVATION INDEX EFFECTS ON LONGITUDINAL REPORTS OF PHYSICAL HEALTH AMONG OLDER BLACK ADULTS

Alexa Allan[1], Alyssa Gamaldo[2], Regina Wright[3], Adrienne Aiken Morgan[4], Anna Lee[5], Jason Allaire[6], Roland J. Thorpe, Jr.[7], and Keith Whitfield[8], *1. The Pennsylvania State University, University Park, Pennsylvania, United States, 2. Pennsylvania State University, State College, Pennsylvania, United States, 3. University of Delaware, Newark, Delaware, United States, 4. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 5. North Carolina A&T State University, Greensboro, North Carolina, United States, 6. North Carolina State University, Raleigh, North Carolina, United States, 7. Johns Hopkins University, Baltimore, Maryland, United States, 8. University of Nevada, Las Vegas, Las Vegas, Nevada, United States*

Despite the association of neighborhood quality with poorer adult health, limited research has explored the association between neighborhood disadvantage, e.g., Area Deprivation Index (ADI), and older Black adults' health, prospectively. The Baltimore Study of Black Aging (n = 424) was utilized to examine the association between ADI and prospective physical health. Multiple regression analyses, covarying for age, sex, education, and income, showed that living in a neighborhood with greater disadvantage was significantly associated with decreasing average heart rate from wave 1 to wave 2 (approximately 33 months apart) (p < .05). This result was specifically significant for women living in neighborhoods with greater disadvantage. Additionally, findings indicated that living in a neighborhood with greater disadvantage was significantly associated with increased difficulty with activities of daily living (p < .01). More research is needed to examine the implications of neighborhood context on older Black adults' health prospectively.

ASSOCIATIONS BETWEEN NEIGHBORHOOD DISADVANTAGE AND MOBILITY LIMITATIONS AMONG AFRICAN AMERICANS

Dextiny McCain[1], Adrienne Aiken Morgan[2], Alexa Allan[3], Alyssa Gamaldo[4], Regina Wright[5], Roland J. Thorpe, Jr.[6], Jason Allaire[7], and Keith Whitfield[8], *1. North Carolina Central University, Durham, North Carolina, United States, 2. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. Pennsylvania State University, State College, Pennsylvania, United States, 5. University of Delaware, Newark,* *Delaware, United States, 6. Johns Hopkins University, Baltimore, Maryland, United States, 7. North Carolina State University, Raleigh, North Carolina, United States, 8. University of Nevada, Las Vegas, Las Vegas, Nevada, United States*

Research has shown that socioeconomic factors influence physical mobility; however, less is known about the influence of neighborhood disadvantage on mobility among African American older adults. Data from the Baltimore Study of Black Aging (N=602) were used to examine associations between neighborhood disadvantage, as measured by the Area Deprivation Index (ADI), and self-reported mobility limitations. Two-step logistic regression showed that participants residing in more disadvantaged neighborhoods, based on national ADI, had higher odds of mobility limitations, but those in less disadvantaged neighborhoods, based on state ADI, had higher odds of mobility limitations (national: OR = 1.02 (95% CI: 1.00–1.03); state: OR = 0.78 (95% CI: 0.65–0.92)). Stratified models showed the association was significant only within women (national: OR = 1.02 (95% CI: 1.00–1.04); state: OR = 0.77 (0.63-0.95)). These findings suggest that neighborhood disadvantage is an essential consideration when examining mobility limitations among African Americans.

SESSION 2390 (SYMPOSIUM)

RECRUITMENT AND ENGAGEMENT OF LGBTQIA+ OLDER ADULTS INTO AGING RESEARCH

Chair: Jason Flatt Co-Chair: Krystal Kittle Discussant: Jason Flatt

Lesbian, gay, bisexual, transgender, queer, intersex, and/or asexual (LGBTQIA+) older adults are a growing population that has been traditionally underrepresented in aging research. Due to stigma and discrimination, many LGBTQIA+ may be reluctant to disclose their sexual orientation and gender identity, which makes it difficult to recruit and engage LGBTQIA+ populations in aging research. In this symposium, we explore current efforts to recruit LGBTQIA+ older adults via social media, snowball sampling, or other novel methods, as well as ways engage LGBTQIA+ subgroups (e.g., caregivers, racial/ethnic minorities, transgender, intersex and other underrepresented groups). Two presentations focus on the recruitment of gender minorities including transgender and intersex older adults. Ethan Cicero will present a systematic review that highlights currents efforts to recruit older gender minority populations include those who identify as racial/ethnic minorities. Next, Nick Lampe will share methodological approaches for effectively recruiting and engaging transgender, non-binary, and intersex (TNBI) older respondents. Then Austin Oswald will highlight barriers and facilitators to engaging LGBTQ+ elders of color in participatory action research during the Covid-19 pandemic. Kasim Ortiz will examine correlates of survey response participation among older sexual minorities (LGB+) using internet-based sampling via the Census Household Pulse Survey. Finally, Krystal Kittle will highlight a three-stage, pilot intervention that aimed to recruit LGBTQ+ caregivers during COVID-19 pandemic restrictions. Jason Flatt, an expert in LGBTQIA+ aging research will facilitate a conversation about these results and place them in the context of current efforts to recruit and engage LGBTQIA+ populations in aging research.

EQUALITY IN CAREGIVING: RATIONALE AND DESIGN FOR AN INTERVENTION ON CAREGIVER MASTERY AMONG LGB CAREGIVERS

Krystal Kittle[1], Kelly Likos[2], Danielle Verble[2], Jason Flatt[3], Joel Anderson[4], and Whitney Wharton[5], *1. University of Nevada Las Vegas, Las Vegas, Nevada, United States, 2. Emory University, Atlanta, Georgia, United States, 3. University of Nevada, Las Vegas, School of Public Health, Las Vegas, Nevada, United States, 4. College of Nursing, University of Tennessee, Knoxville, Knoxville, Tennessee, United States, 5. Emory University, Nell Hodgson Woodruff School of Nursing, Atlanta, Georgia, United States*

Compared to heterosexual and cisgender caregivers, lesbian, gay, bisexual, transgender and queer (LGBTQ+) caregivers face unique challenges (e.g., physical, emotional, financial strain). The initial purpose of this pilot study was to assess an existing evidence-based intervention, the Savvy Caregiving Program, according to context-specific challenges faced by LGBTQ+ caregivers of people with Alzheimer's disease and related dementias (ADRD), improve caregiver mastery and mood, while reducing caregiver burden and physiological stress biomarkers. Given the inability to perform research in-person due to COVID-19, we redirected our research efforts. Trial modifications included: national vs local participation, shift to social media recruitment, virtual SCP classes and focus groups, addition of cross sectional health and caregiving data collection for all LGBTQ caregivers, and removal of biomarker collection. We will present survey results from a national sample of 49 LGBTQ caregivers. Descriptive statistics and non-parametric tests were used to assess differences between ADRD and non-ADRD caregivers.

RECRUITMENT OF TRANSGENDER, NONBINARY, AND GENDER DIVERSE OLDER ADULTS IN HEALTH RESEARCH: A SYSTEMATIC REVIEW

Ethan Cicero[1], and Jason Flatt[2], *1. Emory University, Atlanta, Georgia, United States, 2. University of Nevada, Las Vegas, School of Public Health, Las Vegas, Nevada, United States*

Despite the urgency reported by the National Institutes of Health and National Academy of Sciences to advance health knowledge about transgender, nonbinary, and gender diverse (TNGD) older adults, TNGD populations remain underrepresented in aging research. This review examines TNGD older adult recruitment approaches in health-related research. PubMed, CINHAL, and PsychINFO databases were searched using key terms/subject headings related to TNGD and aging/older adults to identify health-related, U.S.-based empirical studies published since 2011. Twenty-four studies met inclusion criteria (quantitative=15, qualitative=8, mixed-methods=1). Most (n=13) focused recruitment efforts on the broader LGBTQ community, whereas 9 studies (qualitative, n=5) specifically targeted TNGD older adults. One study that recruited from Amazon Mechanical Turk, but most TNGD-specific recruitment efforts used community-engaged approaches, including snowball and purposive sampling via listservs; groups, organizations, and events serving the transgender/nonbinary community; and outreach through researchers' personal and professional networks. Novel approaches are needed to increase TNGD representation in aging research.

RECRUITING AND ENGAGING TRANSGENDER, NON-BINARY, AND INTERSEX OLDER ADULTS IN AGING RESEARCH

Nik Lampe, *Vanderbilt University, Nashville, Tennessee, United States*

Aging research often erases sex and gender variation, thus ignoring the experiences of older transgender, non-binary, and intersex (TNBI) populations. At the same time, researchers have faced unique methodological challenges with recruiting and engaging with TNBI older patient populations in sexual and gender minority (SGM) aging research. Using data from 51 semi-structured individual interviews with TNBI older Americans, I explore methodological approaches for effectively recruiting and engaging TNBI older respondents. I describe the importance of disclosing researcher positionality and understanding community discourse (e.g., intersex status as a sex identity vs. a medical condition) when recruiting and engaging with TNBI older adults. Finally, I share why some traditional recruitment approaches in SGM aging research (e.g., purposive/snowball sampling techniques) may not be as effective towards TNBI older adults while offering some alternative techniques for meaningful recruitment and engagement opportunities.

BARRIERS AND FACILITATORS OF PARTICIPATORY ACTION RESEARCH WITH LGBTQ+ ELDERS OF COLOR DURING COVID-19

Austin Oswald, *Goldsen Institute of the University of Washington , Seattle, Washington, United States*

Participatory action research (PAR) is a promising approach to engage older adults in self-determined research that influences policies and practices; however, the voices of older adults are very often missing from most PAR projects. The purpose of this paper is to reflect upon the challenges and opportunities of engaging lesbian, gay, bisexual, transgender, and queer (LGBTQ+) elders of color in PAR during the Covid-19 pandemic. Data were generated through interviews with LGBTQ+ elders of color and their caregivers and analyzed thematically. Findings illustrate several barriers and facilitators of conducting PAR during the pandemic. Barriers included feelings of distrust toward research(ers), pandemic related issues and illnesses, and competing priorities and interests. Facilitators included leveraging community connections and participating in community-based activities. Study findings have the potential to advance a critical turn in gerontology that is committed to the liberation of marginalized older adults in aging research, policies, and practices.

ASSESSING NONSAMPLING BIAS ERROR AMONG SEXUAL MINORITY OLDER ADULTS IN THE CENSUS' HOUSEHOLD PULSE SURVEY

Kasim Ortiz, *University of New Mexico, Albuquerque, New Mexico, United States*

Previous research shows data quality and nonsampling bias error reduce accuracy of COVID-19 vaccination coverage in the Census' Household Pulse Survey. However, it is unclear how these issues relate to older sexual minority populations. Moreover, previous research has shown that sexual minority older adults survey nonparticipation rates are similar to their heterosexual older adult peers. Yet, it is less clear whether racial/ethnic variability in nonparticipation rates and patterns of missingness among sexual minority older adults exist. The current investigation utilizes repeated pooled data from the Census' Household Pulse Survey (N=329,078) to fill these gaps. Findings reveal nonsampling bias error contributing to inflated racial/ethnic inequities in vaccination coverage among older sexual minorities, with distinct racial/ethnic variability in missingness patterns among sexual minority older adults. The paper concludes with recommendations for improving survey-based research and details suggestions to improve recruitment strategies that minimize nonsampling bias.

SESSION 2400 (SYMPOSIUM)

SOCIOEMOTIONAL EXPERIENCE IN CLOSE PERSONAL RELATIONSHIPS AND TRAJECTORIES OF COGNITIVE AGING

Chair: Sara Moorman Discussant: Lucas Hamilton

Linked lives is a key tenet of the life course framework: Individuals age and develop in the company of a social convoy, or core set of relationships. The quality and quantity of relationships with friends and family are well-known predictors of physical and mental health outcomes, with research on how relationships affect cognitive health just beginning to blossom. This symposium presents four sociological studies of how positive and negative experiences in central, long-term personal relationships – marriages, parent-adult child relationships, and friendships – relate to cognition and the development of cognitive impairment over long periods of the life course, using data from the Health and Retirement Study (HRS) and the Wisconsin Longitudinal Study (WLS). Stokes, Prasad, and Barooah find that experiences of loneliness in marriage are negatively related both to one's own cognition and to the spouse's cognition. Herd and Sicinski also highlight potential negative and gendered aspects of marriage, showing no differences in cognitive performance between married and single men, while married women's cognition is not as strong as single women's cognition. In parent-adult child relationships, Zhang and Liu demonstrate that social support has stronger positive effects, and social strain, stronger negative effects, for mothers as compared to fathers. Moorman and Pai examine friendships with non-kin, and find benefits of emotional and instrumental support to cognition in the long term. Discussant Lucas Hamilton will provide perspective from psychology, addressing ambivalence in relationships and the potential for bidirectional associations between social experience and cognitive function.

SOCIAL SUPPORT FROM FRIENDS AND INCIDENCE OF COGNITIVE IMPAIRMENT A DECADE LATER

Sara Moorman[1], and Manacy Pai[2], *1. Boston College, Chestnut Hill, Massachusetts, United States, 2. Kent State University, Kent, Ohio, United States*

We inquire how diverse forms of social support from non-kin are associated with cognitive aging across ten years. We analyze data from 4,687 participants in the 2011 and 2021 waves of the Wisconsin Longitudinal Study (WLS), a cohort study of Wisconsin adolescents from the birth cohort of 1939 and their siblings. Net of sex, educational attainment, income, smoker status, depressive symptoms, self-reported health, diabetes, heart disease, high blood pressure, high cholesterol, and stroke incidence, each additional domain in which participants perceived that they had instrumental support available from friends in 2011 was associated with a 0.07 standard deviation increase in cognitive function (i.e., TICS-m score) a decade later (p = .001). Moreover, participants who had a non-kin confidante in 2011 had significantly lower odds of mild cognitive impairment (MCI) in 2021 (OR = 0.57; p = .006). Robust social engagement may help protect and maintain older adults' cognitive skills.

DYADIC LONELINESS AND COGNITIVE HEALTH AMONG OLDER MARRIED COUPLES: LONGITUDINAL EVIDENCE FROM THE HRS

Jeffrey Stokes, Anyah Prasad, and Adrita Barooah, *University of Massachusetts Boston, Boston, Massachusetts, United States*

Loneliness is associated with numerous poor health outcomes, including mortality. Additionally, loneliness is not merely an isolated individual's experience; rather, loneliness occurs regularly even among the married, and can affect both spouses' health. We analyze 3-wave dyadic data from the Health and Retirement Study (2008-2018; N = 7,907 dyads) to determine (a) whether loneliness is associated with participants' own and/or their partner's verbal fluency and episodic memory over a nearly decade-long period, and (b) whether these measures of cognitive health predict older spouses' own or their partner's loneliness over the same period. Results indicated that (1) loneliness, episodic memory, and verbal fluency were all "contagious" within couples, such that baseline levels of each predicted participants' own and their partner's values at follow-up; (2) participants' own loneliness was associated with poorer verbal fluency and episodic memory at follow-up; and (3) neither participants' own nor their partner's cognitive functioning predicted future loneliness.

RELATIONSHIP QUALITY AND OLDER PARENTS' COGNITIVE TRAJECTORIES: A NATIONAL LONGITUDINAL STUDY IN THE UNITED STATES

Yan Zhang[1], and Hui Liu[2], *1. University of Wisconsin-Madison, Madison, Wisconsin, United States, 2. Michigan State University, East Lansing, Michigan, United States*

This study aims to assess the impact of the relationship quality between parents and children on parents' cognitive function in later life, with an additional focus on variation by parents' gender. We analyze data from a nationally representative longitudinal panel survey of participants age 50 and older. We employ latent growth curve models (LGCM) to estimate how changes in parent-child relationship quality are related to cognitive trajectories over time. Maintaining frequent contact with children and receiving more support from children are associated with a slower rate of cognitive decline for older parents whereas experiencing relationship strain with children is associated with a faster rate of cognitive decline for older parents. These associations are stronger for mothers than fathers. This study highlights the importance of the "linked lives" of aging parents and their children. The findings have implications for the development of interventions and strategies to protect cognitive function in later life.

GENDER, MARITAL STATUS, AND COGNITIVE HEALTH IN LATE LIFE: IS MARRIAGE MORE PROTECTIVE FOR MEN?

Pamela Herd, *Georgetown University, Washington, District of Columbia, United States*

While marital status appears to be protective for one's health, there is also evidence of gender differences in its protective influence. In short, men appear to differentially benefit from marriage compared to women. A growing body of work on later life cognitive functioning and dementia also finds protective effects for those who are married. But there is less evidence as to whether those patterns differ by gender. Using the Wisconsin Longitudinal Study, a nearly full life course longitudinal study, we find evidence that while there are no differences for men, married women, as compared to their unmarried counterparts, have lower levels of cognitive functioning at ~age 80. Differences in underlying health, educational attainment, and adolescent cognitive functioning do not explain the pattern. Similar to broader health, women do not appear to benefit from marriage in late life. Indeed, we find evidence of cognitive benefits of being single for older women.

SESSION 2410 (SYMPOSIUM)

THE CHALLENGE OF ASSESSING AND MEASURING SOCIAL INCLUSION AND EXCLUSION IN LATER LIFE

Chair: Charles Waldegrave Discussant: Marja Aartsen

Social exclusion is a serious problem that can lead to diminished well-being, health problems, premature death and increased societal costs. Depending on the definition used, 10 to 30% of the older adults experience social exclusion, and many have been confronted with prolonged isolation during the pandemic. Constructing measures for social inclusion and exclusion is a challenging yet important endeavor, and various approaches exist. For example, EU-policy makers define social exclusion mainly in terms of poverty and lack of labor market participation However, a too narrow definition of social exclusion leaves large groups of people unattended leading to sub-optimal understandings of social exclusion and ineffective interventions. This symposium brings together scholars from different cultures. The first paper discusses newly developed social and well-being scales, that more adequately address cultural notions of exclusion and discrimination experienced by older Māori (indigenous New Zealanders). Based on unique data from time-diaries kept by older women from several European countries and the U.S, the second speaker discusses how increased time spend alone is key factor behind widows' reduced well-being. The last study finds a northwest to southeast gradient in objective exclusionary states, with the rates in southeast Europe to be pronounced among older women.

CO-CREATING WITH OLDER PEOPLE CULTURALLY SENSITIVE INCLUSION/EXCLUSION MEASURES

Charles Waldegrave[1], Chris Cunningham[2], Catherine Love[3], and Monica Mercury[1], *1. Family Centre Social Policy Research Unit, Lower Hutt, Wellington, New Zealand, 2. Research Centre for Maori Health and Development, Wellington, Wellington, New Zealand, 3. Family Centre Social Policy Research Unit, Wellington, Wellington, New Zealand*

This paper demonstrates a research approach to co-creating social and wellbeing indicator scales through a qualitative methodology, and then applying them in survey format to develop quantitative statistical correlation and regression analysis. We have been co-creating with older Māori (indigenous New Zealanders) a range of scales that more adequately address their notions of wellbeing, social connection, loneliness, discrimination, abuse, and neighbourhood wellbeing than the standard universal scales commonly used in most research. They are designed to be much more inclusive of participants' worldview and provide more authentic and accurate evidence for policy making and service provision. They draw on the knowledge and experience of the participant communities and reflect their understanding of the indicators. We compare the results with the more common universal indicators and highlight both the universal aspects of each indicator and the culturally specific features to provide more fine-tuned results for policy making and service provision.

HOME ALONE: WIDOWS' WELL-BEING AND TIME

Michal Myck[1], Maja Adena[2], Daniel Hamermesh[3], and Monika Oczkowska[1], *1. Centre for Economic Analysis, CenEA, Szczecin, Zachodniopomorskie, Poland, 2. Wissenschaftszentrum Berlin (WZB), Berlin, Berlin, Germany, 3. Barnard College, New York, New York, United States*

We provide a comprehensive picture of well-being in widowhood. Most importantly, our analysis accounts for time use in widowhood, an aspect which has not been studied previously. Based on data from several European countries we trace the evolution of well-being of women who become widowed by comparing them with their matched non-widowed 'statistical twins' and examine the role of an exceptionally broad set of potential moderators of widowhood's impact on well-being. We confirm a dramatic decrease in mental health and life satisfaction after the loss of partner, followed by a slow recovery. An extensive set of controls recorded prior to widowhood, including detailed family ties and social networks, provides little help in explaining the deterioration in well-being. Unique data from time-diaries kept by older women from several European countries and the U.S. tell us why: the key factor behind widows' reduced well-being is increased time spent alone.

GENDERED PATHWAYS AND OUTCOMES OF EXCLUSION FROM SOCIAL RELATIONS IN OLDER AGE

George Pavlidis[1], Thomas Hansen[2], Marja Aartsen[3], and Andreas Motel-Klingebiel[4], *1. Linkoping University, Linkoping, Ostergotlands Lan, Sweden, 2. Norwegian Institute of Public Health, Oslo, Oslo, Norway, 3. OsloMet Oslo Metropolitan University, Oslo, Akershus, Norway, 4. Linkoping University, Norrkoping, Ostergotlands Lan, Sweden*

Exclusion from social relations (ESR) in older age is associated with worse quality of life and adverse mental health outcomes. Recent evidence suggest that the perception of solitude and the evaluation of existing social networks modify the disadvantages of ESR among excluded older persons. This presentation takes a gender perspective on the topic, bringing together the quantitative evidence of the GenPath project. The results of the project suggest that over and above loneliness and objective ESR indicators, the perception of solitude and the evaluation of existing social relations modify the gendered risks of depression in older age. The findings also reveal a northwest to southeast gradient in objective ESR states, with the rates in southeast Europe to be pronounced among older women. It is concluded that objective and subjective factors at the micro and macro levels may shape gendered disadvantages among older persons who are challenged by ESR states.

SESSION 2420 (SYMPOSIUM)

THE COVID-19 EFFECT: ADAPTING FAMILY CARE TO A PANDEMIC CONTEXT

Chair: Amanda Leggett Discussant: Laura Gitlin

The COVID-19 pandemic carries risk for severe complications and mortality among older adults, placing their family caregivers in key support roles in helping their care recipients stay safe, maintain function, and abide by preventative recommendations. Yet such preventative safety precautions, changes to social support structures, and impacts on healthcare access may pose challenges with which caregivers must cope. This symposium considers how family caregivers adapted their care practices and adjusted to care-related challenges during the COVID-19 pandemic. First, Dr. Amanda Leggett presents data on pandemic-specific care-related challenges and supports experienced by dementia caregivers and their association with well-being and stress process outcomes. Ms. Sara Masoud shares mixed-methods data from persons living with dementia, caregivers, and healthcare professionals on their health and quality of life during the pandemic. Mr. Jiaming Liang presents dyadic findings from the National Study of Caregiving on persons living with dementia and their caregivers' perceptions of COVID-19 and personal and social COVID-specific preventative behaviors. Finally, Dr. Sheria Robinson-Lane offers a diverse caregiving perspective by presenting dyadic qualitative data on COVID-19 patients who were intubated in the hospital and their family caregiver, and offering themes on how caregivers adjusted to their new care role. To conclude, our discussant Dr. Laura Gitlin will offer insight on cross-cutting implications across studies and offer perspective on how lessons learned through pandemic caregiving may inform the field more broadly and enhance caregiver well-being beyond pandemic contexts.

PANDEMIC-SPECIFIC SUPPORTS AND CHALLENGES: ASSOCIATIONS WITH DEMENTIA CAREGIVER WELL-BEING

Amanda Leggett[1], Hyun Jung Koo[2], Cathleen Connell[2], Laura Gitlin[3], and Helen Kales[4], *1. Wayne State University, Ypsilanti, Michigan, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Drexel University, Philadelphia, Pennsylvania, United States, 4. University of California, Davis, Davis, California, United States*

This study examines the prevalence of pandemic-specific care supports and challenges (e.g., increased support from family and friends, difficulty accessing respite care, confusion on public health guidelines) and associations with stress and well-being among 100 family caregivers for persons living with dementia interviewed in 2021. Pandemic care challenges were common- 52% reported a decrease in support from family and friends, 43% had difficulty accessing medical care, and 31% had difficulty getting needed in-home and out-of-home services. Accounting for demographics and the care context, difficulties accessing various types of respite care (e.g., paid respite care, respite from family/friends) were associated with caregiver stress, burden, and less positive affect. Pandemic supports, including increased support from family and friends and receiving information on COVID-care were associated with greater positive affect, but not caregiver stress. While care-supports enhanced well-being, efforts to help caregivers take breaks from caregiving may have significant impact on reducing stress.

UNEXPECTED CAREGIVING: LIFE AFTER A COVID-19 INTENSIVE CARE UNIT HOSPITALIZATION

Sheria Robinson-Lane[1], Florence Johnson[2], Amanda Leggett[3], Alicia Carmichael[4], Natalie Leonard[4], and Richard Gonzalez[2], *1. University of Michigan School of Nursing, Ann Arbor, Michigan, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Wayne State University, Ypsilanti, Michigan, United States, 4. University of Michigan Institute for Social Research, Ann Arbor, Michigan, United States*

The coronavirus pandemic has led to an exceptional number of critical care hospitalizations followed by extended recovery periods that necessitate familial support. Using a qualitative descriptive approach, this study aimed to examine the strategies used by families to adjust to the caregiving role. Semi-structured interviews of patients who had been recently discharged from the Intensive Care Unit (ICU) (n=16) along with their family caregivers (n=16) were thematically analyzed. Three major themes were identified that highlight how family caregivers adapt to the caregiving role following an ICU COVID-19 related hospitalization including 1) engaging the support of family and friends, 2) shifting responsibilities to accommodate caregiving, and 3) managing one's emotions. Additional themes more specifically related to managing COVID-19 care included: 1) managing infection control, 2) care recipient's need for independence, and 3) managing support services. Flexibility and sufficient support allowed family caregivers to manage their new caregiving role and function optimally.

THE IMPACT OF THE COVID-19 PANDEMIC ON DEMENTIA CARE: A MULTISTAKEHOLDER PERSPECTIVE

Sara Masoud[1], Carole White[1], Ashlie Glassner[1], Shanae Rhodes[1], Mayra Mendoza[1], and Kylie Meyer[2], *1. UT Health San Antonio, San Antonio, Texas, United States, 2. Case Western Reserve University, Cleveland, Ohio, United States*

Persons living with dementia (PLWD) and family caregivers are particularly vulnerable to the effects of the COVID-19 pandemic. A multi-methods study was conducted to describe the impact of the pandemic on dementia care from the perspectives of stakeholders, including PLWD, family caregivers, and health and social care professionals (HCPs).The study was conducted using a community engaged approach. Cross-sectional surveys were conducted with PLWD (n=27), family caregivers (n=161), and HCPs (n=77), followed by focus groups and interviews with a subsample of survey participants (n=55). Participants reported declines in health and quality of life for PLWD and family caregivers. Participants experienced delayed or cancelled dementia care attributed to the pandemic. Most reported telehealth and tele-support were effective alternative models to care. The pandemic impacted the quality and accessibility of dementia care. Results highlight opportunities to improve quality of care through addressing inequities and identifying approaches to address isolation and virtual care.

ASSOCIATIONS BETWEEN COVID-19 PERCEPTIONS AND PREVENTIVE BEHAVIORS IN DEMENTIA CAREGIVING DYADS

Jiaming Liang, Maria Aranda, and Yuri Jang, *University of Southern California, Los Angeles, California, United States*

This study adopted a dyadic perspective to examine how the perceptions of COVID-19 (i.e., anxiousness & hopefulness) of dementia caregiving dyads are associated with their engagement in personal (e.g., washing hands, wearing mask) and social (e.g., avoiding physical contact and going restaurants/bars) preventive behaviors. Multiple cross-sectional Actor-Partner Interdependence Models (APIMs) were estimated using data from the 2020 NHATS/NSOC COVID-19 Supplements (N=1565). In the anxiousness models, participants' own feeling of anxiousness was associated with their own engagement in personal preventive behaviors (actor effects), and the perceived anxiousness of PLWD was associated with personal preventive behaviors of caregivers (partner effect). In the model on social preventive behaviors, both actor and partner effects were found on dementia caregiving dyads. No effect was found in the models on hopefulness. Our findings extend understandings of mutual influence within the caregiving dyads and demonstrate the possibility of developing interventions for caregivers to promote PLWD's health behaviors.

SESSION 2430 (SYMPOSIUM)

THE DAILY LIFE OF HEALTHY AGING: CONSIDERING PERCEPTIONS, APPRAISALS, AND CONSEQUENCES

Chair: Patrick Hill

For decades, researchers have shown how individuals deal with both stressful and positive events is central to our understanding of healthy aging. Multiple studies have demonstrated that reactivity to daily events shapes our health and wellbeing, with the potential for compounding effects to cause greater hindrance by older adulthood. This literature also notes that individuals differ significantly in their appraisals, resources, and experience with stressors, leading to the need for multimethod research into the role that daily events play in adult development. The current series of talks will investigate these topics using a variety of methodologies, while considering multiple perspectives on the study of stress and wellbeing. First, Megan Wilson will consider the deleterious outcomes associated with a specific form of daily stressors, everyday experiences of discrimination, focusing on how daily discrimination may negatively impact adults' sense of purpose in life. Second, Eric Cerino will discuss a collaborative effort that compares approaches to studying control beliefs at the dispositional and daily level, showing that researchers may benefit from considering daily stressor control as a construct unique from general beliefs. Third, Jessica Maras will also consider the role of perceptions, by examining how cognitive appraisals of stressful events impact future health outcomes. Fourth, Patrick Klaiber will present meta-analytic work that combines daily studies to consider whether the benefits of positive events on wellbeing differ by age. Taken together, these studies provide new insights into the daily life of healthy aging, and how it differs based on individual differences and stressor type.

CUMULATIVE DAILY DISCRIMINATION AS A RISK FACTOR FOR REDUCED PURPOSE

Megan Wilson[1], Lydia Ong[2], Gabrielle Pfund[3], Anthony Burrow[4], and Nancy Sin[2], *1. Washington University in St. Louis, St. Louis, Missouri, United States, 2. University of British Columbia, Vancouver, British Columbia, Canada, 3. Northwestern University, Chicago, Illinois, United States, 4. Cornell University, Ithaca, New York, United States*

Past research shows that discriminatory experiences may reduce sense of purpose among older adults, though these associations are inconsistent across groups. Work is needed both to understand the nuanced role discrimination plays on individuals' sense of purpose, whether it leads to feeling derailed from life goals, and if effects differ for younger versus older adults. The current study asked 354 American adults (age 19-74) to complete daily surveys over the course of two weeks, to examine whether experiencing discrimination during that two-week period led to a decline in purposefulness. Overall, findings suggest marked stability in sense of purpose during this short timeframe. However, greater daily discrimination predicted decreases in sense of purpose, and increases in derailment over the two weeks. While these associations were similar across age, older adults did report less discrimination at baseline. Findings will be discussed with a focus on successful aging among marginalized groups.

AGING-RELATED CHANGES IN DAILY STRESSOR CONTROL AND GENERAL PERCEIVED CONTROL ACROSS THE LIFESPAN

Eric Cerino[1], Susan Charles[2], Jacqueline Mogle[3], Jonathan Rush[4], Jennifer Piazza[5], Margie Lachman[6], and David Almeida[3], *1. Northern Arizona University, Flagstaff, Arizona, United States, 2. University of California, Irvine, Irvine, California, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. University of Victoria, Victoria, British Columbia, Canada, 5. California State University, Fullerton, Fullerton, California, United States, 6. Brandeis University, Waltham, Massachusetts, United States*

Perceived control is an important psychosocial resource for healthy aging. Using data from the National Study of Daily Experiences (N=2,021, M=55.82 years, SD=10.35, 57.27% Female), we examined aging-related changes in stressor control across 10 years and compared these trajectories with measures of general control (mastery, constraints). Over 8 consecutive days in waves conducted in ~2008 and ~2017, people reported their perceived control over four types of stressors (arguments, avoided arguments, work, home). Longitudinal analyses revealed declines in stressor control across 10 years ($p<.001$), driven by declines in home stressors specifically. The rate of decline did not depend on baseline age. General control trajectories showed unique patterns of age differences in aging-related change such that declines (less mastery, more constraints) were steeper among older adults ($p<.001$). Results suggest that stressor control is a distinct domain of control beliefs with aging-related declines that differ based on type of stress experienced.

THINK OF THE SITUATION IN A POSITIVE LIGHT: COGNITIVE REAPPRAISAL, AFFECTIVE REACTIVITY, AND HEALTH

Jessica Maras[1], and Kate Leger[2], *1. University of Kentucky, Lexington, Kentucky, United States, 2. The University of Kentucky, Lexington, Kentucky, United States*

Cognitive reappraisal is an emotion regulation strategy that benefits health and well-being, but it is currently unclear why this relationship exists. The current study examined how adults react affectively to daily stressful events as a mediating pathway between cognitive reappraisal and health and well-being outcomes across a 20-year period. Participants (N = 1,814) completed waves 1-3 of the Midlife in the United States survey series and the National Study of Daily Experiences, an 8-day daily diary. Results found that negative affective reactivity to daily stressors mediated the relationship between cognitive reappraisal and future health outcomes including the development of chronic conditions, functional limitations, and affective disorders. Exploratory analyses revealed that specific negative emotions, including being nervous and irritable explained this relationship. Findings from this study suggest that strengthening cognitive reappraisal skills may be a good way to reduce affective reactions to daily stressors and enhance long-term health and well-being outcomes.

AGE MODERATES THE LINK BETWEEN DAILY POSITIVE EVENTS AND WELL-BEING: A META-ANALYSIS

Patrick Klaiber[1], Lydia Ong[2], and Nancy Sin[2], *1. University of British Columbia, Department of Psychology, Vancouver, British Columbia, Canada, 2. University of British Columbia, Vancouver, British Columbia, Canada*

Daily positive events are linked to better health and well-being, and this association might be stronger for older adults due to age-related changes in motivations and emotion regulation. We therefore investigated whether age moderated the links between positive events and health-related outcomes, using data from a meta-analysis of 142 studies spanning 50 years of research. Multilevel meta-analytical moderation analyses revealed stronger correlations of positive events with better well-being (i.e. higher positive affect and life satisfaction), mental health, and lower disability in older compared to younger samples (p's < .05). No age moderation was found for links of positive events with social connection, health behaviors, physical symptoms, perceived stress, self-reported health, and inflammation. Findings suggest that although daily positive events were protective for health and well-being for all adult age groups, these experiences may be especially beneficial for positive well-being and mental health in late life.

SESSION 2440 (SYMPOSIUM)

THE MORE THINGS CHANGE, THE MORE THEY STAY THE SAME: CHANGE AND CONTINUITY IN ENDURING SOCIAL TIES

Chair: Athena Koumoutzis Co-Chair: Kelly Cichy

Enduring social ties with family and friends hold important implications for health and well-being across adulthood. Social relationships are simultaneously sources of support and strain, and both positive and negative aspects of relationships change daily and over time. This symposium explores continuity and change in relationship strains (i.e., conflicts, support needs) experienced in the context of enduring social relationships, particularly in response to anticipated and emerging needs for support in later life. First, Meinertz, Gilligan, and Suitor use qualitative data from spousal dyads to compare mothers' and fathers' explanations of which adult child they prefer as their future caregiver. Next, using longitudinal data across two waves, Bui, Kim, and Fingerman investigate how different types of past support exchanges between parents and adult children are associated with older parents' care receipt and expectations. Third, Koumoutzis, Cichy, and Kinney explore the association between change in parental disability and adult children's intergenerational ambivalence (i.e., both positive and negative sentiments), including the extent to which adult children's stress and reward appraisals mediate the link between parental disability and ambivalence. Kyungmin and colleagues explore how older adults (age 62-76) felt burden in their relationship with their very old parents (age 81-101) and what factors are associated with feelings of burden across two cultural contexts, the U.S. and Korea. Lastly, using ecological momentary assessment, Birditt and colleagues examine longitudinal trajectories of negative ties (i.e., irritating, demanding) and the links between daily positive and negative social interactions and emotional well-being.

CHANGE IN PARENTAL DISABILITY AND INTERGENERATIONAL AMBIVALENCE: THE MEDIATING ROLE OF APPRAISAL

Athena Koumoutzis[1], Kelly Cichy[2], and Jennifer Kinney[1], *1. Miami University, Oxford, Ohio, United States, 2. Kent State University, Kent, Ohio, United States*

Adult children often report intergenerational ambivalence (i.e., positive and negative sentiments toward their parents) that may be exacerbated when parents need increasing support. Evaluations or appraisal of providing support may mediate the links between stress and outcomes. Using structural equation modeling, we assessed the relationship between change in parental disability and intergenerational ambivalence through adults' perceptions of the stress and reward of providing help to parents. Participants included 369 adults (32% Black, 68% White) who provided information on 478 parents from Waves I and II of the Family Exchanges Study. The association between change in parental disability and intergenerational ambivalence was explained through stress appraisal; greater parental disability led to higher stress appraisal which led, in turn, to greater intergenerational ambivalence. The model did not significantly differ by race. Results show that stress, rather than reward, appraisal is an essential factor in determining relationship quality as parental care needs emerge.

FEELINGS OF BURDEN AMONG OLDER CHILDREN OF VERY OLD PARENTS IN THE US AND KOREA

Kyungmin Kim[1], Yijung Kim[2], Joohyun Kim[1], Kathrin Boerner[3], Daniela Jopp[4], and Gyounghae Han[1], *1. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea, 2. The University of Texas at Austin, Austin, Texas, United States, 3. University of Massachusetts Boston, Boston, Massachusetts, United States, 4. University of Lausanne, Lausanne, Vaud, Switzerland*

Very old adults (80+) are the fastest growing population worldwide. Children of the very old adults may see their prolonged relationship with parents as a benefit (e.g., longer time together) but also as burden (e.g., prolonged responsibility in their own late life). Using a sample of older children (N = 219) from the Boston Aging Together Study and Korean Aging Together Study, we investigated the factors associated with older children's (aged 62–76) reports of burden in their relationships with very old parents (aged 81–101), focusing on how family relations were imbedded in different cultural contexts. Overall, American older children showed lower levels of burden, compared to Korean older children. The factors associated with burden differed by country; support given to parents and relationship quality were associated with American older children's burden, whereas support received from parents, familism, and negative relationship quality were associated with Korean older children's burden.

INTERGENERATIONAL SUPPORT EXCHANGES AND OLDER PARENTS' CARE RECEIPT AND EXPECTATIONS

Cindy Bui[1], Kyungmin Kim[2], and Karen Fingerman[3], *1. University of Massachusetts Boston, Boston, Massachusetts, United States, 2. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea, 3. The University of Texas at Austin, Austin, Texas, United States*

Distinguishing between support and care, this study investigated how different types of past support exchanges with children were associated with older parents' care receipt and expectations. Older parents (N=190; Mage=79.98) reported on tangible, non-tangible, and childcare support exchanges with each of their adult children (N=709; Mage=52.69) in two waves of the Family Exchanges Study (2008 and 2013).

Multilevel, within-family, logistic regression models were estimated. Parents with functional limitations more likely received care from children whom they received more tangible support from at the prior wave. Parents without current limitations more likely named children whom they previously provided childcare support to and received more tangible support from as their expected future caregiver. These findings emphasize continuity in the transition from receiving tangible support to receiving and expecting care from adult children. The importance of older parents' childcare support given to adult children also highlights reciprocity in intergenerational care exchanges.

CHRONIC NEGATIVE SOCIAL TIES: IMPLICATIONS FOR EXPOSURE AND REACTIVITY TO DAILY SOCIAL INTERACTIONS

Kira Birditt, Angela Turkelson, Richard Gonzalez, and Toni Antonucci, *University of Michigan, Ann Arbor, Michigan, United States*

Negative relationships (i.e., irritating, demanding) predict poor well-being and daily processes may account for these links. This study examined longitudinal trajectories of negative ties and their links with daily social interactions and well-being. A total of 169 individuals ages 33 to 91 reported negative relationship quality (spouse/child/friend) in 1992, 2005, 2015, and 2018 and completed 4-5 days of surveys every three hours regarding positive and negative social interactions and negative affect. Latent class growth models revealed two trajectories of negative relationships (moderate-stable and low-decreasing). Individuals in the moderate-stable trajectory reported more frequent daily interpersonal tensions but no link with positive interactions. The link between negative relationship trajectories and daily negative affect was moderated by daily positive interactions such that the association was reduced when individuals had positive interactions. Thus, negative ties may increase exposure but not reactivity to daily tensions and daily positive interactions buffer the negative tie-well-being link.

THE ROLE OF GENDER IN FATHERS' AND MOTHERS' PREFERENCES FOR FUTURE ADULT CHILDREN CAREGIVERS

Naomi Meinertz[1], Megan Gilligan[2], and J Jill Suitor[3], *1. Iowa State University, Fairfax, Iowa, United States, 2. Iowa State University, Ames, Iowa, United States, 3. Purdue University, West Lafayette, Indiana, United States*

Previous caregiving research has focused on a single care recipient; however, no research has explored the potential simultaneous care needs of fathers and mothers in the same family. Drawing from gender role theory, we use qualitative data from 76 spousal dyads from the Within-Family Differences Study to compare fathers' and mothers' explanations of which adult child they prefer as their future caregiver. In 72% of families, fathers and mothers did not share the same care preferences suggesting that care preferences are dispersed among multiple adult children within the same family. In families in which fathers and mothers shared care preferences, 75% chose the same daughter. Additional findings showed that fathers' explanations for a preferred caregiver aligned with mothers' explanations; however, differences were identified based on children's gender. These findings shed light on the similarities and differences in parental care preferences and underscore the influence of gender in family care networks.

SESSION 2450 (SYMPOSIUM)

UNDERSTANDING MOBILITY, HEALTH, AND WELL-BEING OF OLDER ADULTS USING SENSING TECHNOLOGIES

Chair: Christina Röcke Co-Chair: Minxia Luo Discussant: Hans-Werner Wahl

Mobility has been identified as one important ingredient to older adults' health and well-being and is considered a high priority in the global agenda of healthy and active aging. However, mobility is still a relatively understudied concept in aging research. This symposium, including three empirical studies and one concept paper, presents how different sensing technologies can be utilized to examine mobility, health and well-being in older adults. Using infrared motion sensors and contact sensors, Wu and colleagues examine indoor mobility and show its associations with physical, cognitive, and mental health in community-dwelling older adults living alone. Luo and colleagues use a custom-built mobile GPS sensor and a smartphone-based ambulatory assessment to examine daily mobility and well-being in community-dwelling older adults. They find that a day with larger life space area, more time spent in passive transport modes, and higher number of different locations is associated with higher daily life satisfaction. Similarly, using a GPS sensor combined with a smartphone-based ecological momentary assessment, Kamalyan and colleagues examine life-space mobility, social interactions, and well-being in older adults with and without HIV. They show that prior day's at-home time is negatively associated with current day's happiness and that prior day's social interactions diminishes this association. Jansen presents a project combining sensor-based movement data, GPS-based geolocation data, and experience sampling to investigate relations between life-space mobility and social participation and the role of cultural and climatic differences across several European countries. Hans-Werner Wahl will discuss all papers from an ecological and contextualized aging perspective.

GPS-DERIVED DAILY MOBILITY AND DAILY WELL-BEING IN COMMUNITY-DWELLING OLDER ADULTS

Minxia Luo[1], Eun-Kyeong Kim[2], Robert Weibel[2], Mike Martin[1], and Christina Röcke[3], *1. University of Zurich, Zurich, Zurich, Switzerland, 2. University of zurich, Zurich, Zurich, Switzerland, 3. University of Zurich, Dynamics of Healthy Aging & Center for Gerontology, Zurich, Zurich, Switzerland*

Mobility as a multidimensional concept has rarely been examined as a day-to-day varying phenomenon in its within-person association with older adults' daily well-being. Using a custom-built mobile GPS sensor („uTrail") combined with a smartphone-based ambulatory assessment, this study examined associations between daily mobility and daily well-being in community-dwelling older adults. Analysis included 947 days' data from 109 Swiss older adults aged 65 to 89 years. Multilevel modelling showed that, within persons, a day with larger life space area, more time spent in passive transport modes, and higher number of different locations was associated with higher daily life satisfaction, but not daily positive or negative affect. Follow-up analysis showed that daily maximum distance from home was positively associated with daily life satisfaction, providing a first indication that exposure to non-habitual environments might be a candidate mechanism to explain effects of mobility. Results are discussed in the context of healthy aging research.

WEEKLY MOBILITY AT HOME AND ITS HEALTH AND ENVIRONMENTAL CORRELATES IN OLDER ADULTS LIVING ALONE

Chao-Yi Wu[1], Hiroko Dodge[1], Christina Reynolds[1], Lisa Barnes[2], Lisa Silbert[1], Miranda Lim[1], Jeffrey Kaye[1], and Zachary Beattie[1], *1. Oregon Health & Science University, Portland, Oregon, United States, 2. Rush Alzheimer's Disease Center, Rush University Medical Center, Chicago, Illinois, United States*

Mobility features are important for health. In this study, we quantified in-home mobility and explored potential health and environmental correlates. Participants included community-dwelling older adults living alone (n=139). Two indoor mobility features were developed (frequency; interdaily stability) using passive, room-level (bathroom; bedroom; kitchen; living room) infrared motion sensors, and contact sensors attached to homes' egress doors at entryways. Existing data on gait and cognition, weekly online surveys assessing mood (blueness; loneliness) and pain severity, and publicly available locality-based atmospheric (daylight hours) data were leveraged. On average, higher indoor mobility frequency was associated with faster gait speed (p=0.04), less time out-of-home (<.001), and less hours of daylight per week (p=0.003). Lower interdaily stability was associated with mild cognitive impairment (p=0.04), less time out-of-home (p=0.01), more severe pain (p=0.02), and loneliness (<.001). Pervasive sensing technology can be used to delineate multi-domain health in older adults who live alone.

CONNECTING MOBILITY AND SOCIAL PARTICIPATION IN OLDER ADULTS: A QUESTION OF CULTURE AND CLIMATE?

Carl-Philipp Jansen, *Robert-Bosch-Hospital Stuttgart, Stuttgart, Baden-Wurttemberg, Germany*

The main aim of the project is to investigate the relationship between life-space mobility and social participation in older adults (65+) taking into account cultural and climatic differences across several European countries. A mixed-methods approach will be applied, combining sensor-based movement data, GPS-based geolocation data, and in-situ participant-reported information by use of experience sampling. This will allow a deeper insight into the connection of mobility and social participation taking into account different environmental and socio-cultural realities. Linkage of seasonal climate across different climate zones can help to extrapolate multi-faceted transformation of future mobility behavior of older adults under pressure of more extreme weather and climate conditions. This is of clinical relevance as there may be no "one size fits all" answer on how to best adapt to this pressure and it can be used to steer uptake and maintenance of health-enhancing mobility, social participation, and sustainable quality of life.

SOCIAL INTERACTIONS REDUCE ASSOCIATION BETWEEN LIFE-SPACE AND DAILY HAPPINESS IN OLDER ADULTS WITH AND WITHOUT HIV

Lily Kamalyan[1], Jiue-An Yang[2], Caitlin Pope[3], Emily Paolillo[4], Laura campbell[5], Bin Tang[1], Colin Depp[6], and Raeanne Moore[7], *1. University of California San Diego, San Diego, California, United States, 2. Qualcomm Institute/Calit2, San Diego, California, United States, 3. University of Kentucky, Lexington, Kentucky, United States, 4. University of California San Fransisco, San Francisco, California, United States, 5. University of California San diego, San Diego, California, United States, 6. Department of Psychiatry, University of California San Diego, La Jolla, California, United States, 7. UC San Diego, San Diego, California, United States*

Objective: We used global positioning system (GPS) derived indicators and ecological momentary assessment (EMA) to assess real-time relationships between life-space, mood, and social interactions among older adults with and without HIV.

Methods: Participants (People with HIV [PWH] n=54, HIV- n=34) completed smartphone-based EMA surveys assessing mood and social interactions four times/day for 14-days. Participants' smartphones were GPS enabled. Mixed-effects models analyzed concurrent and lagged associations among life-space and mood.

Results: PWH spent more time at home (79% vs 70%, z=-2.08; p=.04) and reported lower mean happiness (3.2 vs 3.7; z=2.63; p=.007). More daily social interactions were associated with higher ratings of real-time happiness (b=0.12; t=5.61; p< 0.001). Prior day social interactions (b=0.15; t=7.3; p<.0001) and HIV status (b=-0.48; t=-2.56; df= 1026.8; p=0.01) diminished the effect of prior day time spent at home on happiness.

Conclusions: Interventions targeting social interaction may help increase positive mood in isolated older adults.

SESSION 2460 (SYMPOSIUM)

UNPACKING MILD COGNITIVE IMPAIRMENT/ YOUNG ONSET DEMENTIA IN THE WORKPLACE: EMPLOYER VERSUS EMPLOYEE

Chair: Philip Taylor Co-Chair: AnneMarie Levy Discussant: Allison Gibson

The symposium includes four studies exploring the impact of mild cognitive impairment and/or young onset dementia on the workplace, and area of increasing interest due to the aging workforce and government interest in prolonging work life. The papers adopt a rare, multi-level approach by examining both employee and employer perspectives, and how the interaction of both individual and organizational factors impact their self-reported outcomes. Following the paper presentations, Dr. Allison Gibson will lead a paper discussion. The goal of the symposium is to foster a research conversation amongst the presenters and symposium participants interested in exploring overlaps, potential for multidisciplinary collaboration and future research into resolution of workplace and workforce optimization with worker satisfaction that are identified with progressive cognitive impairment.

THE DIMENSIONS OF YOUNG ONSET DEMENTIA (YOD) AND WHAT THESE MEAN FOR EXTENDED WORKING LIVES

Philip Taylor, *Federation University Australia, Victoria, Victoria, Australia*

Drawing from a review of the literature and international statistical sources, this paper identifies the global prevalence of young onset dementia (YOD), its complex aetiology and its social and economic costs. YOD is often defined as dementia affecting those aged 65 or under, although definitions vary. Prevalence estimates also vary but recent evidence suggests a rate in the region of 119.0 per 100,000 population for those aged 30-64, and this is expected to increase markedly in the coming decades. Research identifies that the causes of YOD vary greatly among younger people. Individuals experiencing YOD face a complex range of psychological, familial, and socioeconomic challenges, while often being active in the labour market at the time of diagnosis. Costs of YOD cannot be easily disentangled from those for dementia generally but include: the direct costs of the 'resources' drawn on by the person with dementia; indirect costs, usually considered in terms of the value of lost productivity by the person with dementia or their carer, and less tangible costs, such as in terms of psychological wellbeing, social exclusion and time costs. The paper concludes by considering the potential significance of YOD for the future labour market in the context of ongoing efforts to prolong working lives.

REVIEW OF WORKPLACE-RELATED GUIDANCE PRESENTED BY ORGANIZATIONS DEALING WITH DEMENTIA OR MILD COGNITIVE IMPAIRMENT

James Carino[1], Philip Taylor[1], and Damian Morgan[2], *1. Federation University Australia, Victoria, Victoria, Australia, 2. James Cook University, Townsville, Queensland, Australia*

A range of organisations in English-speaking countries have prepared guidance materials for individuals who are facing concerns regarding dementia while employed. Some of these organisations have also prepared guidance materials for employers to assist them in engaging employees facing this condition. These are available on organisation websites and may be presented as a downloadable booklet, guide or one or more web pages, aiming to inform about the issues that need to be considered. Information of this type is becoming more important in assisting both parties as dementia is being detected and diagnosed earlier, and individuals need to consider their options regarding their future and their ability to continue to work. This presentation reports on a systematic analysis of around guidance items appearing on these websites. The topic areas, content, and approaches used to present this information to its intended audience were reviewed and compared. Analysis showed important gaps in content coverage from one guidance to another. No guidance presented by any of these organisations covers all areas identified that may potentially interest either employees or employers and in most cases it is not presented coherently for these groups. Employee topics that would benefit from further development include awareness of the condition, the importance of diagnosis and support, use of technology to assist in continuing to be functional and productive, and steps in transition from work to other activities. Employer topics that could be developed further include building awareness amongst employers and the workforce, identifying dementia in the workplace, engaging the wider work group, and positively managing employee separation from work.

DE-RISKING THE EMPLOYER-EMPLOYEE RELATIONSHIP WHEN WORKERS HAVE MILD COGNITIVE IMPAIRMENT OR YOUNG ONSET DEMENTIA

Josephine McMurray[1], Arlene Astell[2], AnneMarie Levy[1], Jennifer Boger[3], and Catherine Burns[3], *1. Wilfrid Laurier University, Waterloo, Ontario, Canada, 2. University of Toronto, Toronto, Ontario, Canada, 3. Waterloo University, Waterloo, Ontario, Canada*

The employee-employer relationship is one that is well established in law and involves a contract between a worker who performs the work, and an employer who determines when, how and where the work is done. Many countries have introduced legislation that helps guide employee-employer behavior when workers' performance of their duties is disrupted by illness or disability, such as mild cognitive impairment or young onset dementia (MCI|YOD). At any one time, about 8-12% of the workforce is off due to occupational or non-occupational work injury or illness with direct disability and absence costs projected about 7% of payroll in 2000. Drawing from data gathered in a systematic literature review and case study, this paper determined that uncertainty and risk influence employer-employee relationships when workers are identified with MCI|YOD. Employers' industry context, size and corporate values influence their "integrated risk management" approach to workers with MCI|YOD, and early intervention is considered key to managing financial and liability risk. In contrast, progressive onset, delayed diagnosis, stigma, privacy concerns, workplace uncertainty, and lack of information may delay employee disclosure, a common employee risk mitigation strategy. We conclude by considering strategies to de-risk relationships between workers with MCI|YOD and employers using dual process theory to understand intuitive and rational decisions in the context of the disability management process.

TRANSITIONS EXPERIENCED BY PEOPLE DIAGNOSED WITH DEMENTIA WHILE IN THE WORKFORCE

Jennifer Boger[1], Sheida Marashi[1], Anna Mäki-Petäjä-Leinonen[2], Mervi Issakainen[3], Ann-Charlotte Nedlund[4], Charlotta Ryd[5], Louise Nygard[5], and Arlene Astell[6], *1. Waterloo University, Waterloo, Ontario, Canada, 2. Insitute of Law & Welfare, Joensuu, Lappi, Finland, 3. Institute of Law & Welfare, Joensuu, Lappi, Finland, 4. Linkoping University, Linköping, Ostergotlands Lan, Sweden, 5. Karolinska Institutet, Solna, Sodermanlands Lan, Sweden, 6. University of Toronto, Toronto, Ontario, Canada*

Dementia is a progressive, irreversible neurological disorder that causes changes in cognitive function and behaviour. While at least 5% of people who develop dementia every year are under the age of 65, dementia in the workplace is currently not well recognised or supported. The changes associated with dementia present multiple challenges for individuals who wish to continue with their employment. Many lose their positions before receiving a diagnosis, whilst others take sick or disability leave or early retirement. The process of understanding what is happening and coping with this new situation is highly individualistic and involves several transitions. The MCI@work project is an international initiative taking place in Canada, Finland, and Sweden where we examine these transitions through the personal narratives of individuals who have either currently or recently gone through the experience of developing dementia whilst in the workforce. From these data, we have developed a framework for understanding the transitions experienced by people who develop dementia whilst in the workforce. The aim is to assist individuals and their employers to better understand the needs of people living and working dementia as well as engage in appropriate actions that support choices and dignified transitions either within the context of employment or out of the workforce.

SESSION 2470 (SYMPOSIUM)

USING INTENSIVE LIFESPAN DATA TO GAIN DEEPER INSIGHT INTO COPING AND EMOTION REGULATION PROCESSES

Chair: Claire Growney Co-Chair: Jennifer Bellingtier
Discussant: Carolyn Aldwin

Effective coping and emotion regulation are important for well-being across the lifespan. Successful maintenance or improvement in these processes are often invoked as explanations for age-related stability or enhancement of well-being. In this symposium, we leverage intensive data to gain a deeper understanding of how individuals manage daily emotions and stressors, critically examining evidence for age-related differences and similarities. Growney and English used experience sampling to examine interpersonal emotion regulation in adults aged 25-85, finding a negative association between age and interpersonal emotion regulation strategy use, but evidence suggesting more effective interpersonal emotion regulation in older age. Bellingtier and colleagues present evidence for age similarity in flexible emotion regulation strategy use across hassle domains in an experience sampling study of adolescents and adults aged 14-88, noting that hassle domain differentiation was associated with emotion regulation strategy use. O'Brien and Neupert used daily diaries to examine associations between daily stressor appraisals and affect in adults aged 60-90, identifying daily negative self-views of aging as a moderator which may be particularly consequential in older adulthood. Cerino and colleagues used data from the National Study of Daily Experiences to examine relationships between perceived stressor control and daily affect, highlighting differing findings across domains of interpersonal stressors. Finally, a discussion will center on the value of considering both age-related similarities and differences, age-relevant factors for successful emotion regulation and coping (e.g., negative and positive aspects of social relationships, views of aging), diverse contexts in which these processes occur, and statistical considerations with micro-longitudinal approaches.

MOMENTARY INTERPERSONAL EMOTION REGULATION IN AN ADULT LIFESPAN SAMPLE

Claire Growney, and Tammy English, *Washington University in St. Louis, St. Louis, Missouri, United States*

Older adults are theorized to maintain emotional well-being by drawing on their available resources, such as social partners who support their emotional goals. In the present study, adults (N = 290) age 25-85 completed an experience sampling procedure (6x/day for 10 days) in which they reported their current emotions and use of interpersonal emotion regulation (IER) strategies. Unexpectedly, older age was associated with lower overall use of IER strategies. Results from multilevel models indicate that within-person associations between IER strategy use and positive affect were strongest among older adults, with older adults experiencing highest positive affect on occasions where they report engaging in IER. Between-person associations between IER strategy use and negative affect were only present among younger and middle-aged adults, indicating that younger individuals who use IER more on average tend to have higher negative affect. Findings highlight the role of social partners in older adults' emotional wellbeing.

MOMENTARY EMOTION REGULATION ACROSS HASSLE DOMAINS

Jennifer Bellingtier[1], Gloria Luong[2], Cornelia Wrzus[3], Gert Wagner[4], and Michaela Riediger[1], *1. Friedrich Schiller University Jena, Jena, Thuringen, Germany, 2. Colorado State University, Fort Collins, Colorado, United States, 3. Ruprecht Karls University Heidelberg, Heidelberg, Baden-Wurttemberg, Germany, 4. Max Planck Institute for Human Development, Berlin, Berlin, Germany*

Adapting emotion-regulation strategy use to flexibly match contextual features of a hassle is thought to aid in effective coping. We investigated if hassle domains are a pertinent feature for understanding emotion-regulation strategy selection in the everyday lives of adolescents through older adults. Participants, ranging from 14 to 88 years old (N = 325), completed an experience sampling study of approximately 9 days over a 3-week period. At each momentary assessment, participants reported on their affect, hassles, and emotion-regulation strategies. Our findings indicated that strategy use varied by domain. For example, distraction was most common in the health domain, whereas emotion expression was least likely to be used at work or school. More strategies were used when hassles were associated with multiple domains. However, greater domain differentiation was not associated with reduced hassle reactivity. Findings were similar across ages suggesting domains may similarly relate to strategy selection across the lifespan.

DAILY STRESSOR APPRAISALS AND SELF-VIEWS OF AGING PREDICT SAME-DAY AFFECTIVE RATINGS

Erica O'Brien[1], and Shevaun Neupert[2], *1. Pennsylvania State University, University Park, Pennsylvania, United States, 2. North Carolina State University, Raleigh, North Carolina, United States*

Prior work suggests that more frequent or higher exposure to stressors relates to less positive affect and more negative affect in daily life. Limited knowledge exists about whether subjective appraisals of such stressors (i.e., perceived negative impacts on daily routine, personal health and safety, and finances) also have negative links to daily well-being. This study examines this link using data from an 8-day daily dairy study (n=675 days) in an online sample of older adults (n = 110 people, ages 60-90). We also explored potential psychological moderators particularly relevant to the experience of aging (i.e., self-views of aging, S-VOA). Results from multilevel models indicate that people reported more negative affect and less positive affect on days with more negative appraisals, especially on those days when they also had more negative self-views of aging. These findings highlight S-VOA as psychological resources that help people cope with stressful events in everyday life.

DAILY ASSOCIATIONS BETWEEN STRESSOR CONTROL AND AFFECT VARY AS A FUNCTION OF STRESSOR TYPE

Eric Cerino[1], Susan Charles[2], Jacqueline Mogle[3], Laura Klepacz[4], Jennifer Piazza[5], Jonathan Rush[6], and David Almeida[3], *1. Northern Arizona University, Flagstaff, Arizona, United States, 2. University of California, Irvine, Irvine, California, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. Department of Psychological Sciences, Northern Arizona University, Flagstaff, Arizona, United States, 5. California State University, Fullerton, Fullerton, California, United States, 6. University of Victoria, Victoria, British Columbia, Canada*

Perceived control is an important psychosocial correlate of emotional well-being. Using data from the National Study of Daily Experiences (N=1,797, M=55.82 years, SD=10.35, 57.27% Female), we examined how self-reported control over different types of stressors (arguments, avoided arguments, work, home, network) was associated with negative affect (NA) and positive affect (PA). Over 8 consecutive days in waves conducted in ~2008 and ~2017, people reported their daily NA, PA, and control over stressors they had experienced. Within-person associations revealed lower NA on days when stressor control was higher than usual (p<.001), driven by control over arguments, avoided arguments, and work stressors specifically. PA was higher on days when individuals perceived greater control over avoided and actual arguments (ps<.001), but lower on days when individuals perceived greater control over network stressors (p<.01). Results suggest the facilitative role of control over daily stress for emotional well-being depends on the type of stressor experienced.

SESSION 2480 (SYMPOSIUM)

WHY LOOKING AT THE FUTURE? FROM PSYCHOLOGICAL TO CONTEXTUAL MOTIVATORS

Chair: Yaeji Kim-Knauss Co-Chair: Frieder Lang
Discussant: Christiane Hoppmann

Human beings can represent future events, anticipate future consequences, and act in light of those representations to achieve the most favorable outcomes in the future. Although future-oriented thoughts or behaviors concern distant and delayed rewards than the present and instant ones, their roles in people's well-being and successful aging have been well-reported. Therefore, what motivates or differentiates such future-oriented thoughts and behaviors has been a central focus in developmental psychology. With a particular interest in future-oriented phenomena regarding age and aging, we look at the roles of psychological or contextual factors that drive views on aging and old-age preparation. Cohn-Schwartz et al. examine how having contacts with older adults benefits self-views on aging via changes in aging stereotypes. Park & Hess explore how importance attached to functioning and perceived control over functioning in different domains predict old-age preparation and compare patterns across different age groups. Fung et al. propose that perceived control, self-relevance, and responsibility for old-age preparation could mediate the well-reported cultural differences in old-age preparation. Rupprecht et al. investigate the adaptivity of approach and avoidance motivation in old-age preparation across different life domains, cultures, and age groups. Kim-Knauss & Lang looks at how the experience of social restrictions during the pandemic functions as a 'wake-up call' and thus induces people to engage in old-age preparation. Taken together, we suggest that various psychological appraisals and contexts shape future-oriented thoughts and behaviors, but these may vary across cultures, age groups, and target domains.

PANDEMIC-RELATED SOCIAL RESTRICTIONS INCREASED THE URGENCY AND ENGAGEMENT IN OLD-AGE PREPARATION

Yaeji Kim-Knauss, *Friedrich-Alexander University Erlangen-Nuremberg, Nuremberg, Bayern, Germany*

We investigated whether people who perceive more restrictions on social contacts during the pandemic set an earlier deadline to prepare for social connectedness in old age (i.e., the latest still good age to start preparation) than they had perceived in the pre-pandemic time. We also looked at whether this change in the deadline induces the engagement in the preparation concerning the same domain. We first fit the data obtained from 356 German adults in 2018 and 2020 (aged 22–95 years) to a change score model. The deadline for preparing for social connectedness in old age was set about 23 years earlier in 2020 compared to that reported in 2018. We found that perceiving more social restrictions during the pandemic predicted this shorter deadline, which in turn, induced greater engagement in the preparation. A possible consequence of the pandemic may be related to an increased motivation to prepare for old age.

BENEFICIAL EFFECTS OF CONTACT WITH OLDER ADULTS FOR AGE STEREOTYPES AND SELF-VIEWS OF AGING

Thomas Hess[1], Sylvie Graf[2], Shyhnan Liou[3], Clara de Paulo Couto[4], Helene Fung[5], Jana Nikitin[6], Klaus Rothermund[4], and Ella Cohn-Schwartz[7], *1. North Carolina State University, Raleigh, North Carolina, United States, 2. Czech Academy of Sciences, Brno, Moravskoslezsky kraj, Czech Republic, 3. National Cheng Kung University, Tainan, Tainan, Taiwan (Republic of China), 4. Friedrich Schiller University Jena, Jena, Thuringen, Germany, 5. The Chinese University of Hong Kong, Hong Kong, Hong Kong, 6. University of Vienna, Vienna, Wien, Austria, 7. Ben-Gurion University, Beer-Sheva, HaDarom, Israel*

Intergenerational contact is beneficial for improving attitudes toward older people, including age stereotypes (AS). To date, however, research on the topic has focused on younger adults (intergenerational contact), overlooking the possible perks for older adults themselves (contact with same-age peers). The current study investigated the association between contact with older adults and views of the self in old age (VSOA) among younger and older adults in a domain-specific way. The sample comprised younger (39-55 years, n = 1,012) and older (65-90 years, n = 1,344) adults from the Ageing as Future international study. Findings indicated that contact with older adults was related to more positive VSOA and this was partly mediated by AS. These relations were stronger for older adults, indicating that interactions with other older adults may help favorably shape how older adults view their ingroup and aging. Beneficial effects emerged mostly in the friends and leisure domains.

SELECTIVE ENGAGEMENT IN PREPARATIONS FOR OLD AGE: DETERMINANTS OF MOTIVATION

Jeongsoo Park, *Ajou University, Suwon-si, Kyonggi-do, Republic of Korea*

Preparations for old age in general are beneficial for one's adjustment in later life. Using Selective Engagement Theory (SET) as a conceptual framework, we examined how the importance attached to functioning, as well as perceived control over functioning in different domains (e.g., family, social relations, finances, health, etc.) predicted engagement in preparing for old age five years later. Two-wave data was obtained from Ageing as Future Study. The sample consisted of N = 1,255 aged from 30-85 in the US (n=315), Hong Kong (n=317), and Germany (n=623). Consistent with SET, ratings of importance were strongly predictive of subsequent preparations and more predictive than perceived control, with evidence in several domains of functioning that this was particularly true for older adults. These findings highlight the interaction between personal goals and resources in determining older adults' willingness to prepare for old age.

RELEVANT YET UNCONTROLLABLE: PERCEIVED CONTROL AS A MEDIATOR OF CROSS-CULTURAL DIFFERENCES IN OLD-AGE PREPARATION

Helene Fung[1], Nicole Long Ki Fung[1], and
Dwight Cheuk Kit Tse[2], *1. The Chinese University of Hong Kong, Hong Kong, Hong Kong, 2. University of Strathclyde, Glasgow, Scotland, United Kingdom*

Previous studies have shown that there are cross-cultural differences in old-age preparation rate (e.g. Kornadt et al., 2019). Drawing from the transactional stress-and-coping model (Lazarus & Folkman, 1984), we proposed that perceived control, self-relevance and responsibility for old-age preparation could mediate the cultural differences in old-age preparation. We recruited a sample aged 18 to 96 from Germany (N=366, Mage=52.63) and Hong Kong (N=252, Mage=57.47) to complete two online questionnaires across two years. Compared with German adults, Hong Kong adults prepared less (b=-2.159, p<.001), had lower perceived control (b=-0.899, p<.001) and responsibility (b=-0.713, p<.001), yet similar level of self-relevance over preparation. Preparation at time2 was related to self-relevance (b=1.004, p<.001) and control (b=0.785, p<.001) at time1. The cultural differences in preparation at time2 were only mediated by perceived control at time1 (indirect effect=0.706, p<.001). Findings highlight the importance to enhance individual perceived control over old age in promoting society-wide old-age preparation.

PREPARING FOR A GOLDEN AGE? APPROACH AND AVOIDANCE MOTIVATION IN THE CONTEXT OF OLD-AGE PREPARATION

Fiona Rupprecht, and Jana Nikitin, *University of Vienna, Vienna, Wien, Austria*

When it comes to old-age preparation, individuals may be motivated by positive outcomes they wish to approach (e.g., social connectedness) or by negative outcomes they wish to avoid (e.g., loneliness). We expected approach motivation to be adaptive in younger ages, when resources and possibilities for old-age preparation should be plentiful. For older adults, whose resources and time for (continued) old-age preparation are limited, the maintenance- and loss-oriented perspective of avoidance motivation may however be the more adaptive one. Using data from 2054 individuals aged 18 to 96 years and representing five cultures, we adopted a domain-specific, cross-cultural, and age-differential perspective on our research question. Results indicate that individuals tend to be both approach- and avoidance-motivated when it comes to old-age preparation and confirm the age-differential adaptivity of approach and avoidance motivation in terms of both, actual preparatory behavior and psychological well-being.

SESSION 2490 (SYMPOSIUM)

A PUBLIC HEALTH APPROACH TO ALZHEIMER'S DISEASE RISK REDUCTION: WHERE WE ARE AND WHERE WE'RE HEADED

Chair: John Omura Co-Chair: Eva Jackson Discussant: Kelly O'Brien

A growing body of evidence has identified potential modifiable risk factors for Alzheimer's disease and related dementias (ADRD). In 2021, the National Plan to Address Alzheimer's Disease (National Plan) included a new goal to promote healthy aging and address risk factors to help delay onset or slow progression of ADRD. Applying a robust public health approach to ADRD risk reduction can help achieve meaningful progress at the population level. The activities outlined in the Building Our Largest Dementia (BOLD) Infrastructure for Alzheimer's Act (P.L. 115-406) are designed to create a uniform national public health infrastructure with a focus on various issues including risk reduction. The purpose of this session is to illustrate a public health approach to ADRD risk reduction, including its current status along with future directions and priorities. An overview of the National Plan's new goal regarding ADRD risk reduction (McGuire) and data highlighting the current burden of key modifiable risk factors in the United States along with important disparities (Omura) will be presented. Holt will describe how ADRD risk reduction is integrated into the work of BOLD funding recipients, and Head will present experiences implementing public health activities that support ADRD risk reduction in the field along with successes and lessons learned. Finally, priorities and future directions for a public health approach to ADRD risk reduction will be presented from the perspective of the CDC's Building Our Largest Dementia Infrastructure Public Health Center of Excellence on Dementia Risk Reduction (Baumgart).

THE EVOLUTION OF A PUBLIC HEALTH APPROACH TO ADRD AND THE ROLE OF RISK REDUCTION

Lisa McGuire[1], and Eva Jackson[2], *1. CDC, Atlanta, Georgia, United States, 2. Alzheimer's Association, Chicago, Illinois, United States*

CDC, through the Healthy Brain Initiative (HBI) and Building Our Largest Dementia (BOLD) Infrastructure Act, is working to advance cognitive and brain health as integral components of public health practice, to keep older Americans healthy and independent as long as possible. HBI promotes brain health as part of public health practice and BOLD strives to build a uniform public health infrastructure. Both HBI and BOLD focus not only on people with cognitive decline or dementia but also their health care providers and caregivers. Recently, the 2021 Alzheimer's Disease National Plan added Goal 6, Accelerate Action to Promote Healthy Aging and Reduce Risk Factors for Alzheimer's Disease and Related Dementias. This presentation will describe the evolution of public health's role with respect to brain health and caregiving and how the national priority on risk reduction and healthy aging can be beneficial to the health and well-being of older adults.

MODIFIABLE RISK FACTORS FOR ALZHEIMER'S DISEASE: CURRENT STATUS AND OPPORTUNITIES FOR ACTION

John Omura, *CDC, Atlanta, Georgia, United States*

In 2021, the National Plan to Address Alzheimer's Disease included a new goal to address risk factors for ADRD. The Behavioral Risk Factor Surveillance System (BRFSS) assesses several modifiable risk factors in its core survey and subjective cognitive decline (SCD), which may be an early indicator of developing ADRD, in the optional Cognitive Decline module. To assess the current status of modifiable risk factors in the US and identify opportunities for public health action, data from the 2019 BRFSS were examined. Prevalence of eight modifiable risk factors for ADRD and proportion of respondents with total number of risk factors was estimated among respondents aged ≥45 years, overall, by SCD status, and by selected demographic characteristics. Findings can inform strategies and priorities to support the National Plan's new goal to reduce modifiable risk factors to help delay onset or slow progression of ADRD and its symptoms.

BUILDING OUR LARGEST DEMENTIA (BOLD) INFRASTRUCTURE FOR RISK REDUCTION

Heidi Holt[1], Laura Whalen[1], and Lisa Garbarino[2], *1. CDC, Atlanta, Georgia, United States, 2. Centers for Disease Control and Prevention, Atlanta, Georgia, United States*

The Building Our Largest Dementia (BOLD) Infrastructure for Alzheimer's Act (PL115-406) supports public health agencies to develop a uniform dementia infrastructure across the US. Applying a robust public health approach to ADRD that emphasizes data driven decision-making and action along with primary, secondary, and tertiary prevention strategies (e.g., risk reduction, early diagnosis, linkages to treatment and care, and the prevention and management of comorbidities leading to preventable hospitalizations and poor health outcomes) for persons living with dementia and their caregivers. Recipients of the BOLD Public Health Programs funds are expanding jurisdiction Dementia coalitions, updating, or creating Dementia Strategic Plans, and implementing strategies from those plans that address a wide variety of life-course strategies for brain health and dementia, including risk reduction. This presentation will explain how risk reduction is integrated and provide examples of several activities being planned and implemented by recipients.

GETTING TO BOLD USING SYSTEMIC EDUCATION, EVIDENCE, AND NETWORKS: HELPING GEORGIANS B-SEEN

Elizabeth Head, *Georgia Department of Public Health, Atlanta, Georgia, United States*

The complex nature of Alzheimer's disease and related dementias (ADRD) demands a comprehensive public health approach. Georgia is Building Our Largest Dementia infrastructure using Systemic Education, Evidence, and Networks (B-SEEN), with a vision for every Georgian – professional, patient, and care partner – to B-SEEN. The strength of Georgia's B-SEEN project is the existing infrastructure. Leveraging this established network, Georgia has engaged in population-based efforts to increase impact in the dementia risk reduction, early diagnosis of ADRD, prevention and management of comorbidities and avoidable hospitalizations, and caregiving. These outcomes are being achieved by stakeholders disseminating evidence-based programs personalized to their community needs and the B-SEEN team leading coordinated activities that address dementia and support the promotion of brain health. This presentation will describe how ADRD risk reduction is integrated into a 159 county, de-centralized state and provides examples of several activities being implemented via Georgia extension, faith-based organizations, and dedicated partners.

PUBLIC HEALTH PRIORITIES AND FUTURE DIRECTIONS FOR ALZHEIMER'S DISEASE RISK REDUCTION

Matthew Baumgart, *Alzheimer's Association, New York, New York, United States*

Reducing risk for diseases and chronic conditions is a fundamental priority of public health. Since 2007, the Alzheimer's Association has partnered with the CDC on the development of a series of Public Health Road Maps to guide the public health community in addressing cognitive health. In addition, the Alzheimer's Association's Public Health Center of Excellence on Dementia Risk Reduction, funded by the CDC, provides guidance on how public health can address the risk factors for cognitive decline and dementia. With recent advancements in the science on dementia risk factors, we can now identify targets for public health action. The addition of a national goal to address dementia risk factors underscores the urgency to act. This presentation will offer a perspective on how public health can move forward, through prioritization and action, in addressing risk factors for cognitive decline and dementia, including by addressing social determinants of health and health equity.

ACCELERATED AGING AMONG ADULTS LIVING WITH CEREBRAL PALSY

Mark Peterson[1], Sudarshan Dayanidhi[2], Patrick McPhee[3], and Heidi Haapala[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Shriley Ryan AbilityLab/Northwestern University, Chicago, Illinois, United States, 3. McMaster University, Hamilton, Ontario, Canada*

Cerebral Palsy (CP) is the most common pediatric-onset physical disability, with an estimated prevalence ranging from 2.6-3.1 cases per 1,000 live births in the United States. There is a lack of clinical follow-up for individuals with CP after they transition from pediatric to adult primary care, and insufficient surveillance to track patients with CP longitudinally. Despite the shortage of research to examine the natural history of CP and chronic disease trajectories in this population, a range of secondary conditions arise at an accelerated rate as compared to the adult population without CP, prompting the widespread notion and clinical hypothesis that patients with CP are prone to accelerated aging. These factors further worsen functional status and quality of life, as well as lead to decreased independence. Despite the well-established interrelationships between physical and mental health disorders in the non-CP older adult population, the extent to which, mechanisms underlying, and time course associated with the development of these chronic conditions among adults living with CP has received little empirical attention. The proposed course will build upon our ongoing work by highlighting new findings from three centers doing research pertaining to aging with CP, and will cover novel mechanisms of musculoskeletal pathophysiology in CP, risk factors of and unique CVD profiles among adults with CP, and new findings related to health trajectory differences of adults with CP from clinical and population-representative cohorts. We will also provide insights into the pathophysiologic mechanisms linking early frailty and long-term health outcomes among persons with CP.

SKELETAL MUSCLE MITOCHONDRIAL PHYSIOLOGY IN CHILDREN WITH CEREBRAL PALSY: CONSIDERATIONS FOR HEALTHY AGING

Sudarshan Dayanidhi, *Shriley Ryan AbilityLab/ Northwestern University, Chicago, Illinois, United States*

During healthy aging, there is an overall decline in mitochondrial activity and abundance, increase in mitochondrial DNA mutations, increase in oxidative stress, and reduction in overall muscular capacity. Individuals with cerebral palsy (CP) have significantly increased energetics of movement, reduced endurance capacity, and increased perceived effort. We will cover the results of recent work in muscles in ambulatory children with CP that show a marked reduction in mitochondrial function. Muscles show that mitochondrial protein content and DNA copy number are lower, suggesting a reduction in mitochondrial abundance, along with a reduction in markers for mitochondrial biogenesis. Gene expression networks are reduced for glycolytic and mitochondrial pathways and share similarities with gene networks with aging and chronic inactivity. Given the importance of mitochondria for energy production and changes with aging, ongoing efforts are needed to assess changes in mitochondria across the lifespan in people with CP.

THE FORMULA FOR CARDIOVASCULAR HEALTH AND WELL-BEING IN ADULTS WITH CEREBRAL PALSY

Patrick McPhee, *McMaster University, Hamilton, Ontario, Canada*

Persons with cerebral palsy (CP) have mobility limitations, heightened sedentary behavior, and are at increased risk for cardiovascular disease (CVD). Dr. McPhee will cover his innovative work to develop a core outcome set for cardiometabolic disease risk assessment in adults with CP, and will further discuss recent findings from ongoing work pertaining to novel CVD risk indicators showing accelerating cardiovascular aging in CP. Dr. McPhee will also present recent work on the role of exercise, sleep, and healthy nutrition in the context of healthy aging for individuals with CP across the lifespan.

NAVIGATING THE PATHWAY TO CARE IN ADULTS WITH CEREBRAL PALSY

Heidi Haapala, *University of Michigan, Ann Arbor, Michigan, United States*

As individuals with CP age, they face unique challenges which complicate their ability to access and receive appropriate health care. These problems exist at the level of the health care system, the clinician, and the individual. At the system level, there is an inadequate number of professionals who are informed of and interested in the care of adults with CP. Adult caregivers are often not knowledgeable about and may feel less competent about patients with CP. Differences in the physiologic development of individuals with CP render well-established clinical protocols for risk screening of chronic diseases less effective. Dr. Haapala runs an adult CP clinic and will present her clinical experience with treating complex patients with CP. She will present specific information pertaining to her work in studying and treating chronic overlapping pain in adults with CP, as well as her efforts to reduce polypharmacy and opioid dependence in her patients.

SESSION 2501 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

ESPO AND BIOLOGICAL SCIENCES SECTION SYMPOSIUM: HIGHLIGHTING THE FUTURE LEADERS OF GEROSCIENCE

Chair: Matt Yousefzaheh

EARLY-LIFE PROTEIN TRANSLATION SPIKE DRIVES AGING VIA JUVENILE HORMONE/GERMLINE STEM CELL SIGNALING

Harper Kim[1], Danitra Parker[1], Madison Hardiman[1], Erin Munkácsy[2], Steven Austad[3], Yi-dong Bai[2], James Mobley[1], and Andrew Pickering[4], *1. University of Alabama at Birmingham (UAB), Birmingham, Alabama, United States, 2. University of Texas Health San Antonio, San Antonio, Texas, United States, 3. University of Alabama at Birmingham, Birmingham, Alabama, United States, 4. University of Alabama at Birmingham, Hoover, Alabama, United States*

Protein translation (PT) is high in early-adulthood across invertebrates, rodents, and humans but sharply declines thereafter. It has been implicitly assumed that elevated PT at young ages is beneficial to health and PT ends up dropping as a passive byproduct of aging. However, whether this holds true and how dynamic fluctuations in PT over time impact aging remain unknown. In Drosophila, we show that a transient PT spike in early-adulthood exerts long-lasting negative impacts on aging trajectories and proteostasis in later-life. Conversely, blocking the early-life PT spike robustly improves life-/health-span and prevents age-related protein aggregation. Further, greater early-life PT rise strongly predicts shorter future lifespan across fly strains and is observed in neurodegenerative disorders long before symptoms/pathologies appear. Proteomics-guided investigations revealed that during the early-adulthood PT rise, juvenile hormone triggers proteostatic dysfunction and drives aging via aggregation-prone large lipid transfer proteins. The early-life PT spike also transcriptionally represses stress responses essential for proteostasis maintenance and drives aging via germline stem cell signaling. Our findings suggest that PT is thereby suppressed after early-adulthood as an adaptive response to alleviate proteostatic burden, slow down aging, and optimize life-/health-span. We thus propose that the rise and fall in PT over time impact aging in the opposite direction from what was previously assumed. Our work provides a novel theoretical framework for understanding how lifetime PT dynamics regulate the onset of aging. Further, our study provides a foundation for future research, including whether high early-life PT spike is an early biological event driving neurodegeneration/age-related diseases.

A FAT-PROMOTING BOTANICAL EXTRACT ARTEMISIA SCOPARIA EXERTS GEROPROTECTION IN C. ELEGANS

Bhaswati Ghosh[1], Hayden Guidry[2], Maxwell Johnston[1], and Adam Bohnert[1], *1. Louisiana State University, BATON ROUGE, Louisiana, United States, 2. Louisiana State University, Baton Rouge, Louisiana, United States*

Like other biological processes, aging is not random but subject to molecular control. Natural products that modify core metabolic parameters, including fat content, may provide entry points to extend animal lifespan and promote healthy aging. Here, we show that a botanical extract from Artemisia scoparia (SCO), which promotes fat storage and metabolic resiliency in mice, extends the lifespan of the nematode Caenorhabditis elegans by up to 40%. Notably, this lifespan extension depends significantly on SCO's effects on fat; SCO-treated worms exhibit heightened levels of unsaturated fat, and inhibiting Δ9 desaturases, which oversee biosynthesis of monounsaturated fatty acids, prevents SCO-dependent fat accumulation and lifespan extension. At an upstream signaling level, SCO prompts changes to C. elegans fat regulation by stimulating nuclear translocation of transcription factor DAF-16/FOXO, an event that requires AMP-activated protein kinase under this condition. Importantly, animals treated with SCO are not only long lived but also show improved stress resistance in late adulthood, suggesting that this fat-promoting intervention may enhance some aspects of physiological health in older age. These findings identify SCO as a natural product that can modify fat regulation for longevity benefit and add to growing evidence indicating that elevated fat can be pro-longevity in some circumstances.

FUCOIDANS ARE NOVEL SENOTHERAPEUTICS THAT ENHANCE SIRT6 AND DNA REPAIR ACTIVITY

Lei Zhang[1], Brian Hughes[2], Gregory Tombline[3], Luise Angelini[2], Matt Yousefzadeh[2], Vera Gorbunova[3], Laura Niedernhofer[2], and Paul Robbins[2], *1. University of Minnesota, Saint Paul, Minnesota, United States, 2. University of Minnesota, Minneapolis, Minnesota, United States, 3. University of Rochester, Rochester, New York, United States*

With age, senescent cells accumulate in various tissues where they contribute to loss of tissue homeostasis, aging, and age-related diseases through their inflammatory senescence-associated secretory phenotypes (SASPs). Senotherapeutics able to selectively eliminate senescent cells, termed senolytics, or suppress the detrimental SASPs, termed senomorphics, have been demonstrated to improve age-associated comorbidities and aging phenotypes. To discover novel senotherapeutics translatable to promote healthy longevity, we conducted a drug screening of diverse natural products based on the characteristic senescence-associated β-galactosidase activity. Several fucoidans from different brown seaweed were found to exhibit potent senotherapeutic activity. Fucoidans are long-chain sulfated polysaccharides found in various species of brown algae including seaweed. The best senomorphic fucoidan was able to suppress senescence in cultured senescent fibroblasts, in ex vivo human tissue explants, and in vivo in mouse models of natural and accelerated aging. Specifically, fucoidan reduced markers of cellular senescence and SASP in senescent mouse and human cells. Acute treatment of the fucoidan in naturally aged mice reduced tissue senescence, especially in the kidney and lung. Chronic treatment of the fucoidan in Ercc1-/Δ progeria mice attenuated composite aging symptoms and extended healthspan. Interestingly, preliminary mechanistic studies demonstrated that fucoidan can improve non-homologous end-joining-directed DNA damage repair and increase the mono-ADP-ribosylation activity of SIRT6, suggesting a relationship between cellular senescence, DNA repair, and SIRT6 signaling pathways. Collectively, fucoidans were identified as novel senotherapeutics with translational potential for reducing cellular senescence, ameliorating age-associated phenotypes, and extending healthspan as well as able improve DNA repair pathways through modulation of SIRT6 activity.

MOSAIC CHROMOSOMAL ALTERATIONS AND LONGEVITY

Anastasia Leshchyk[1], Qingyan Xiang[1], Stefano Monti[1], Thomas Perls[1], Stacy Andersen[2], Anastasia Gurinovich[3], Zeyuan Song[1], and Paola Sebastiani[3], *1. Boston University, Boston, Massachusetts, United States, 2. Boston University School of Medicine, Boston, Massachusetts, United States, 3. Tufts Medical Center, Boston, Massachusetts, United States*

Mosaic chromosomal alterations (mCAs) are structural alterations that are associated with mortality, age, cancer, cardiovascular disease, and diverse infections. The distribution of mCAs in long-lived subjects and individuals with familial longevity is not well described. We applied MOsaic CHromosomal Alteration (MoChA) caller on genome-wide genotype samples of 2025 centenarians, their siblings, and offspring and 273 unrelated controls from the New England Centenarian Study (NECS) and 3642 subjects with familial longevity and 920 controls from the Long-Life Family Study (LLFS). MoChA utilizes a Hidden Markov Model to detect mCA-induced deviations in allelic balance at heterozygous sites with Log R Ratio and B-allele frequency (BAF) with phased genotype information. We analyzed somatic mCAs in samples with genome-wide BAF phase concordance less than 0.51, LOD score greater than 10, and estimated cell fraction less than 50%. The results in the two studies showed that autosomal mCAs spanning over 100 kbase pairs increase with older age until approximately 102 years. However, the prevalence of the subjects with mCAs tends to plateau after that age, suggesting that the accumulation of mCAs is less prevalent in long-lived subjects. We also found that offspring and siblings of centenarians accumulate less autosomal mCAs (fixed-effect meta-analysis for NECS and LLFS: RR=0.78, p=0.033) compared to unrelated controls. In addition, consistent with results from other studies, mCAs are associated with increased risk for mortality (HR=1.08, p=0.02) and sex (Male RR=1.37, p=4.15e-05), and impact incident events of cancer, dementia, diabetes, and cardiovascular diseases even at extreme old ages.

SESSION 2510 (PAPER)

ADRD RISK

ALZHEIMER'S DISEASE RISK REDUCTION HEALTH COACHING: ALCOHOL EFFECTS

Faika Zanjani[1], Annie Rhodes[1], and Brian Battle[2], *1. Virginia Commonwealth University, Richmond, Virginia, United States, 2. VCU, Richmond, Virginia, United States*

Lifestyle risk reduction at the community-level, is currently considered an effective method to decrease Alzheimer's disease (AD). As part of the Virginia Commonwealth University iCubed Health and Wellness in Aging Core, diverse older adults (60+) in Richmond, VA, with incomes below $12,000/year and managing either diabetes/cardiovascular symptoms, were offered weekly lifestyle telephone-health coaching for 12-weeks, providing education, support, and monitoring for AD lifestyle risk in 2020-21. The study sample (n=40, mean age 68 years (range: 60-77 years) was 88% African American/Black (n=35), 100% Non-Hispanic, 45% males (n=18)), 60% reporting memory problems and 53% reporting any alcohol consumption. Thirty-nine (95%) of subjects successfully participated in coaching sessions; on average 91.9% (11) sessions were completed. Participants provided positive anecdotal feedback and the need for continued coaching during COVID. Average drinks per day decreased across the study period (F=7.44; p=.01) and alcohol risk, defined as more than 1 drink/day, decreased (F=3.46;p=.07). Drinking at baseline was associated with differential change in nicotine dependence (F=14.00 ;p=.02), depression risk (F=3.20;p=.09), light physical activity (F=4.52;p=.05), and cognition (COGTEL) (F=6.35;p=.02). Drinking between-subject effects indicated poorer level differences for smoking risk (F=5.68;p=.02), physical inactivity risk (F=4.66;p=.04), and total health behavior risk (F=14.54;p=.001), but higher cognition-scores (F=3.18;p=.11) for drinkers. In conclusion, there may be a paradoxical health effect for alcohol, with associations for negative health behaviors, but positive cognitive functioning. In conclusion, this preliminary work creates the impetus for future large-scale AD risk reduction investigations to improve the lives of AD-risk, low-income, diverse older adults reporting alcohol consumption.

ARE RECENTLY INCARCERATED OLDER ADULTS MORE LIKELY TO DEVELOP DEMENTIA THAN THE NEVER INCARCERATED?

Amy Byers[1], Richard Fortinsky[2], Brie Williams[1], W. John Boscardin[1], Yixia Li[3], and Lisa Barry[2], *1. University of California, San Francisco, San Francisco, California, United States, 2. University of Connecticut Center on Aging, Farmington, Connecticut, United States, 3. San Francisco VA Medical Center, San Francisco, California, United States*

Increasing numbers of older adults are reentering the community following incarceration (i.e., reentry). Yet, their risk of developing dementia and mild cognitive impairment (MCI) is unknown. We leveraged a national cohort of veterans who experienced reentry at age ≥ 65 years (N=5,920) and compared their risk of dementia or MCI to an age- and sex-matched never incarcerated sample (N=29,600). Those in the reentry sample were incarcerated for ≤10 consecutive years, experienced reentry between 10/01/2012 and 9/30/2018, and did not have a pre-incarceration MCI or dementia diagnosis per VA and CMS healthcare records (N=5,920). Fine-Gray models, controlling for race and pre-incarceration chronic conditions, serious mental illness, traumatic brain injury, and posttraumatic stress disorder, derived hazard ratios (HRs) and 95% Confidence Intervals (CIs). Samples were 99% male with average age 70 (±4.3) years. Reentry adults had a higher proportion of non-Whites (29% vs. 17%; p< 0.001) and more chronic conditions (2.1[±1.8] vs. 1.6[±1.6] p< 0.001). MCI incidence did not differ between reentry and never incarcerated groups (3.1% vs. 2.6%; HR=1.03; 95%CI 0.86-1.24). However, risk of any dementia was higher in reentry older adults (7.2% vs. 5.0%; HR=1.27; 95%CI 1.12, 1.44), as was risk of specific subtypes, e.g., vascular dementia (1.9% vs. 1.2%; HR=1.37; 95% CI 1.06-1.75) and frontotemporal dementia (0.2% vs. 0.1%; HR=2.3; 95% CI 1.2, 4.3). Those reentering the community in late life following incarceration may be a group that is especially at risk of developing dementia. These findings raise awareness of the need for appropriate transition planning for this vulnerable group.

DEMENTIA TRAJECTORIES, MEDICAID COVERAGE, AND HEALTHCARE SERVICES USE

Wassim Tarraf[1], and Marc Garcia[2], *1. Wayne State University, Detroit, Michigan, United States, 2. Syracuse University, Syracuse, New York, United States*

The evidence base linking dementia risk trajectories to transitions in Medicaid coverage and levels of health services is underdeveloped. We use Health and Retirement Study (2007/08-2015/16) data on adults 70-years and older (Unweighted N=8,227) at baseline to test how longitudinal dementia classifications (Langa-Weir), over 8-years, influence change in Medicaid coverage, nursing-home use (NHU) and inpatient hospitalizations (IH). We fit Joint Growth and Discrete-time Survival Mixture models to generate longitudinal risk classifications for dementia accounting for survival, and generalized linear models to test associations of these classifications with change in Medicaid coverage, NHU, and IH. Average baseline age was 78.4 years (SD=7.1), 3-in-5 were female, 1-in-4 had less than high school education, and 4-in-5 were non-Hispanic Whites. A three-class solution (C1=high dementia prevalence and mortality risk (8.6%), C2=low prevalence (68.3%), and C3=accelerated dementia prevalence and mortality risk (23.1%)) provided the best fit to the data. We observed substantial increase in rates of for Medicaid coverage for C1 (21%; 95%CI=[18-25] to 51%[36-65] among survivors) and C3 (12%; 95%CI=[10-14] to 32%[27-37]), but not C2 (6% to 8%). NHU also accelerated substantially from 10 to 37% in C1 and 7 to 38% in C2. Rates of inpatient hospitalizations remained stable over time for all groups, with C1 and C2 being more likely to be hospitalized and have multiple re-admissions. Estimates were differentially attenuated through adjustment to covariables. We report important longitudinal dementia risk classifications, profile their socioeconomic and health attributes, and identify differential associations with critical health policy outcomes (Medicaid coverage and healthcare utilization).

DO PERSONALITY TRAITS INFLUENCE THE ASSOCIATION BETWEEN DEPRESSION AND DEMENTIA IN OLD AGE?

Khuzeman Abbasi1, Ujunwa Ebili[2], Henry Egbuchiem[3], AFOLABI OREKOYA[4], Olawale Olanisa[5], Abimbola Arisoyin[6], and Adeleye Adaralegbe[7], *1 Vanderbilt University Medical Center , Glen Burnie , Maryland, United States, 2. Emel Specialists and Pediatric Center, Festac Town, Lagos, Nigeria, 3. The Everest Foundation, Los Angeles, California, United States, 4. Wellspring Medical Center, Riverdale, Georgia, United States, 5. IQVIA Biotech, Morrisville, North Carolina, United States, 6. TCA health, Lagos, Lagos, Nigeria, 7. University of Connecticut, Storrs, Connecticut, United States*

Depression and personality traits are independent predictors of dementia or cognitive impairment. Despite the well-established relationship between these two psychosocial factors and dementia, no research has been documented on how personality traits can influence dementia in older adults exhibiting depressive symptoms. This study explored the influence of personality traits on the association between change in depression and dementia in old age. We used a population-based longitudinal cohort study involving two waves of data collected 5 years apart, containing 2210 American older adults, from the National Social Life, Health, and Aging Project to explore if personality traits influence how change in depression predicts the development of dementia. We used multivariate logistic regression to examine the relationship between depression and dementia at T2 while adjusting for sociodemographic characteristics, comorbidity index at T1, and baseline dementia. Change in depression increased the likelihood of dementia at T2 by 4.2% (AOR = 1.04, p = 0.019) in the co-variate adjusted model. Personality traits, overall, did not influence how depression predicts the development of dementia. However, agreeableness individually nullified the effect of depression on the development of dementia, whereas extraversion was the only personality trait that significantly predicted dementia. We recommend the promotion of prosocial behaviors in old age as these appear to be protective. In addition, early life education and a strong social support can keep the depression-dementia spectrum at bay in old age.

FOOD INSECURITY AND COGNITIVE TRAJECTORIES IN COMMUNITY-DWELLING OLDER ADULTS

Boeun Kim[1], Sarah Szanton[2], Roland J. Thorpe, Jr.[1], Deidra Crews[1], and Laura Samuel[1], *1. Johns Hopkins University, Baltimore, Maryland, United States, 2. Johns Hopkins University School of Nursing, Baltimore, Maryland, United States*

Food insecurity, defined as limited access to nutritionally adequate and safe foods due to social and economic conditions, has adverse effects on physical health and well-being. However, it remains unclear whether food insecurity accelerates cognitive decline in older adults. This study examined the association of food insecurity with cognitive decline. We analyzed data from 4,508 community-dwelling participants in the National Health and Aging Trends Study (NHATS) collected from 2011 to 2020, a prospective cohort study of a nationally representative sample of Medicare beneficiaries ages 65 years and older. Food insecurity was measured using 5 items within functional, social support, and financial limitations domains. Immediate and delayed recall were assessed by a 10-item word-list memory task (range: 0—10). Executive function was evaluated by the Clock Drawing Test (range: 0—5). Each year's cognitive functions were linked to the prior year's food insecurity values. Weighted linear mixed effect models were fitted. Prevalence of food insecurity at baseline was 3.5% (95% CI: 2.9 — 4.3). Persons with food insecurity were more likely to have Black race or Hispanic ethnicity, low income, and less than high school education. Food insecurity was associated with faster decline in executive function accounting for demographic and socioeconomic characteristics: the average difference, over 1-year, in executive function score between people exposed to and not exposed to food insecurity was 0.038 points (95% CI: -0.072 — -0.003). Food assistance programs or increasing healthy food access may reduce food insecurity and delay cognitive aging in community-dwelling older adults.

SESSION 2520 (SYMPOSIUM)

ADVANCING RESEARCH ON PERSON-CENTERED COMMUNICATION IN DEMENTIA CARE

Chair: Clarissa Shaw Co-Chair: Carissa Coleman
Discussant: Marie Savundranayagam

Communication is an essential component to achieving person-centered care. However, few measures exist for measuring person-centered communication and methods vary widely on measuring communication. The purpose of this symposium is to provide an overview of methods and recent findings related to research on person-centered communication. Four presentations will highlight a variety of methods and a variety of populations. Presentation one compares the congruence of communication by hospital nurses in a simulated care setting to communication during actual care encounters with hospitalized patients with dementia. Presentation two evaluates the impact of validation by family caregivers to persons living with dementia (PLWD) using a time sequential analysis of second-by-second coding of the caregiver's communication and the PLWD behavioral response. Presentation three introduces the Changing Talk Scale (CHATS) as a tool to measure gains in knowledge of person-centered communication in the nursing home setting. Presentation four determines the impact of person-centered care versus task-centered care on mealtime behaviors in nursing home residents with dementia using a psychometrically established behavioral coding scheme and time-sequential approaches. Communication strategies to use with PLWD frequently lack sufficient evidence to be deemed effective or person-centered. Advanced methods are needed to understand what constitutes person-centered communication based on behavioral responses and other health outcomes off PLWD. This symposium provides an overview of these methods with formal and informal caregivers and PLWD in varied care settings including the community, hospitals, and nursing homes.

ESTABLISHING THE VALIDITY OF SIMULATION TO CAPTURE ELDERSPEAK COMMUNICATION IN DEMENTIA CARE

Clarissa Shaw[1], Katie Knox[2], Heather Bair[2], Erica Watkinson[2], Delaney Weeks[2], and Paige Hanson[2], *1. University of Iowa, Iowa City, Iowa, United States, 2. University of Iowa College of Nursing, Iowa City, Iowa, United States*

Using simulation may be an innovative approach for evaluating dementia care in research and education. The purpose of this study was to determine if communication in the simulated environment is congruent to communication in the naturalistic environment. Nursing staff (n=10) were each audio-recorded caring for an actual hospitalized person living with dementia (PLWD), and in three simulations evaluating the use of a manikin, young nursing assistant, and trained older adult standardized patient acting as the PLWD. The audio-recordings were coded for elderspeak (i.e., infantilizing) communication. Reactions to each simulation were gathered and qualitatively analyzed. The amount of elderspeak and neutral communication in the actual care encounters did not significantly differ (p>.05) from the communication in any of the three simulations indicating that simulation may be a valid method to capture elderspeak by nursing staff. The nursing staff indicated that the standardized patient provided the most realistic simulation.

RESPONSES OF PERSONS LIVING WITH DEMENTIA TO VALIDATING COMMUNICATION BY FAMILY CAREGIVERS: A SECONDARY ANALYSIS

Kaitlyn Campbell[1], Carissa Coleman[2], and Kristine Williams[3], *1. University of Pennsylvania Hospital, Kansas City, Kansas, United States, 2. University of Kansas, Kansas City, Kansas, United States, 3. University of Kansas Medical Center, Lawrence, Kansas, United States*

Validation is a person-centered approach for communicating with people living with dementia (PLWD). This study evaluated how PLWD respond to caregiver communication that includes or fails to include validation. This secondary analysis of homecare videos (N=41) of family caregivers interacting with a PLWD during daily care used behavioral coding of validating communication (affirmation, acknowledging emotions, encouraging emotional expression, verbalizing understanding) in relation to responses of PLWD (resistiveness to care, apathy, or cooperation). A 10 second time-lag sequential analysis identified an 11% probability of a cooperative response when caregivers communicated using affirmations. Caregiver verbalizations of understanding resulted in a 6% probability and silence had an 8% probability of cooperative responses. Use of validating communication did not result in a significant probability of negative PLWD responses (apathy or resistiveness to care). Use of validating communication strategies may assist caregivers to achieve goals of care without negative responses from PLWD.

THE CHANGING TALK SCALE (CHATS): A TOOL TO MEASURE GAINS IN KNOWLEDGE OF PERSON-CENTERED COMMUNICATION

Yelena Perkhounkova[1], Clarissa Shaw[1], Maria Hein[2], Carissa Coleman[3], and Kristine Williams[4], *1. University of Iowa, Iowa City, Iowa, United States, 2. University of Iowa College of Nursing, Iowa City, Iowa, United States, 3. University of Kansas, Kansas City, Kansas, United States, 4. University of Kansas Medical Center, Lawrence, Kansas, United States*

Assessment of knowledge gain from educational interventions is common in health care research. However, validity of tools developed to measure knowledge gains is often overlooked. For our current pragmatic clinical trial, we developed two 13-item parallel forms of the Changing Talk Scale (CHATS) to measure gains in knowledge of effective and person-centered communication due to the Changing Talk Online (CHATO) communication education for nursing home staff. This has been a multi-year, multi-study process of writing and editing test items in accordance with CHATO learning objectives and results of psychometric analyses of pilot data. Items were revised based on difficulty and discrimination. The tool has improved from an initial Cronbach's alpha of .27 (pre-education) and .14 (post-education) to .63 (pre-education) and .64 (post-education).

CHATS provides an exemplar of how measuring change in knowledge is a complex process that needs to be rigorously completed to accurately capture outcomes.

TEMPORAL RELATIONSHIPS OF PERSON- AND TASK-CENTERED DEMENTIA CARE AND MEALTIME BEHAVIORS: SEQUENTIAL ANALYSIS

Wen Liu[1], Yelena Perkhounkova[1], Maria Hein[2], and Roger Bakeman[3], *1. University of Iowa, Iowa City, Iowa, United States, 2. University of Iowa College of Nursing, Iowa City, Iowa, United States, 3. Georgia State University Department of Psychology, Atlanta, Georgia, United States*

Person-centered mealtime care is highly recommended in dementia care. While current research examined associative relationships between person- and task-centered care and resident mealtime behaviors, few studies evaluated their temporal associations. Videotaped mealtime observations (N=160) involving 36 staff and 27 residents (53 staff-resident dyads) in 9 nursing homes were coded. Staff person-centered and task-centered approaches were conceptualized as antecedents of resident positive behaviors, functional impairments, and resistive behaviors using 5-, 10-, and 15-second time windows. Immediately after staff person-centered approaches, resident positive and resistive behaviors were more likely (p range=<.001–.29) and functional impairments less likely (p range=<.001–.62) with diminished effects in time. Immediately after staff task-centered approaches, resident positive behaviors were less likely (p range=<.001–.09). Person-centered mealtime care should be individualized, context-based, and resident-oriented. Resident resistiveness to care may be behavioral responses to person-centered care indicating mismatch to individual preferences and needs, warranting adequate awareness and appropriate assessment.

SESSION 2530 (PAPER)

COMMUNICATION STRATEGIES AND SENSORY FUNCTION

IMPLEMENTATION OF MULTIMODAL INTERVENTIONS FOR CAREGIVERS OF OLDER ADULTS WITH VISUAL IMPAIRMENTS

Afeez Hazzan, Pamela Haibach-Beach, and Lauren Lieberman, *State University of New York at Brockport, Brockport, New York, United States*

There is a paucity of research on the impact of caregiving on the quality of life of unpaid caregivers for older adults aged 60 years or older with visual impairments (VI). The purpose of this study is to test multimodal interventions to improve quality of life and well-being in unpaid caregivers of older adults with VI. The objectives were: (1) to implement multimodal interventions targeted towards improving the quality of life of family caregivers of older adults with a VI; (2) to evaluate the efficacy/effectiveness of the interventions in improving the quality of life of older adults with a VI. The outcomes of interest include: quality of life, health, stress, burden, problem-solving, and barriers. For this study, a 10-week virtual intervention was implemented with 12 caregivers and eight older adults with visual impairments, for a total of 20 participants. The intervention was held for one hour for 10 consecutive weeks and included activities such as tai chi, yoga, meditation, music, nutrition, and other de-stressing techniques. Participants completed a series of questionnaires before and after the intervention period. These questionnaires include: Satisfaction with Life Scale, Living Arrangement and Indicators of Social Interaction survey, Caregiver quality of life (EQ-5D), the Perceived Change Index, and the Geriatric Depression Scale. Findings from the data analysis show excellent caregiver engagement throughout, including participation in the pre and post surveys. Results show the benefits of multimodal interventions for caregivers as well as older adults with VI. Future studies should focus on interventions that are most promising.

STRATEGIES FOR EFFECTIVE COMMUNICATION USING PERSONAL PROTECTIVE EQUIPMENT IN NURSING HOMES: A QUALITATIVE STUDY

Clarissa Shaw[1], Kristine Williams[2], Carissa Coleman[3], and Paige Wilson[4], *1. University of Iowa, Iowa City, Iowa, United States, 2. University of Kansas Medical Center, Lawrence, Kansas, United States, 3. University of Kansas, Kansas City, Kansas, United States, 4. The University of Kansas Medical Center, Kansas City, Kansas, United States*

Care of persons with living with dementia is complicated by using personal protective equipment (PPE). Masks and other facial coverings although protective, prohibit visualization of lip-reading and nonverbal cues and obscure identity. The purpose of this qualitative study was to determine best practices for effective communication while using PPE from the provider (n=10), resident (n=5), and family perspective (n=4). The 19 participants were recruited from four states. Qualitative content analysis identified two major themes: (1) challenges experienced during nursing home pandemic care, and (2) the communication strategies to overcome PPE challenges. Although our interviews were not focused on experiences outside of using PPE, all participants voiced trauma surrounding the lockdown for residents and separation from their families. All participants expressed pessimism surrounding the PPE, but this was also met with feelings of normalization surrounding its use. The communication strategies discussed focused on emphasizing (1) verbal and nonverbal communication skills, and (2) person-centered communication. The general communication strategies recommended were consistent with expert opinions such as using written messages and gestures, using loud speech, using clear speech, identifying self, and varying approaches based on person and context. Person-centered approaches centered on the staff and resident "knowing each other." Specifically, knowing the resident is essential to understanding their personal barriers and facilitators to successful communication and knowing each other in a personal and trusting manner helps overcome barriers caused by PPE. This study provides practical suggestions for best practices in communication and reinforces the need for person-centered communication focused on psycho-emotional care.

VERBAL COMMUNICATION BETWEEN NURSING HOME STAFF AND RESIDENTS WITH DEMENTIA AND APATHY: LANGUAGE ANALYSIS

Ying-Ling Jao[1], Yo-Jen Liao[2], Diane Berish[1], Marie Boltz[3], Wen Liu[4], Jacqueline Mogle[5], and Helen Kales[6], *1. Pennsylvania State University, University Park, Pennsylvania, United States, 2. Pennsylvania State University, Pennsylvania State University, Pennsylvania, United States, 3. Penn State, Pennsylvania State University, Pennsylvania, United States,* *4. University of Iowa, Iowa City, Iowa, United States, 5. The Pennsylvania State University, University Park, Pennsylvania, United States, 6. University of California, Davis, Davis, California, United States*

Communication is fundamental in daily caregiving activities in nursing homes and impacts the quality of care. This study examined the verbal communication of nursing home staff and residents with dementia and apathy during daily caregiving activities. This study used a repeated measures design. Participants included 13 residents with dementia and apathy and 13 staff from two nursing homes. A total of 39 videos were recorded to capture staff-resident interactions during caregiving activities (3 videos for each resident). All video-recorded communication was transcribed and segmented into phrases. Bivariate correlations were used for preliminary analysis. The average length of each interaction was 7.5 minutes (range=1.5-12.5). On average, staff verbalized 46.6 words (range=9.3-121.9) with 11.3 phrases (range=3.7-23.4) per minute. Residents verbalized an average of 18.9 words (range=0-83.8) with 4.8 phrases (range=0-17.1) per minute. Unadjusted correlations demonstrated that residents' phrases per minute were significantly negatively associated with apathy (r=-0.36, p =0.0239), while being significantly positively associated with age (r=0.42, p=0.0071), cognitive function (r=0.42, p=0.0114), caregivers' words per minute (r=0.44, p=0.0055), and phrases per minute (r=0.42, p=0.0077). After adjusting for clustering by residents, caregivers' words and phrases remained significantly positively associated with residents' phrases. Findings suggest that higher resident apathy and cognitive impairment are associated with fewer verbalizations. When caregivers verbalize more phrases and words, residents are also likely to use more phrases. Findings identify the high-risk population for lack of verbal expression and emphasize the importance of staff verbal communication to promote verbal communication in nursing home residents with dementia and apathy.

VISUAL IMPAIRMENT PREDICTS PHYSICAL FUNCTION DECLINE: THE HEALTH, AGING, AND BODY COMPOSITION (HEALTH ABC) STUDY

Atalie Thompson[1], Michael Miller[2], Christopher Webb[3], Jeff Williamson[2], and Stephen Kritchevsky[2], *1. Atrium - Wake Forest Baptist Health, Winston-Salem, North Carolina, United States, 2. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 3. Atrium Health Wake Forest Baptist, Winston Salem, North Carolina, United States*

The relationship between visual impairment (VI) and decline in physical function with age is poorly understood. We constructed separate linear mixed models to evaluate the relationship of self-reported (visual function question (VFQ) score) or performance-based (visual acuity (VA); log contrast sensitivity (LCS); stereoacuity (SA)) VI with change in performance on the Short Physical Performance Battery (SPPB) over 8 years in 2219 Health ABC participants. Mean age was 75.5 years (range 71-82); 52.4% were female, and 37.4% were black. For all measures of visual function, better vision was associated with loss of approximately -0.3 SPPB units/year which was similar to the unadjusted change in SPPB over time (-0.328 units/year 95%CI (-0.35, -0.31)). Participants with LCS ≤1.3 log units experienced 58% faster rate of decline versus those with better LCS (test of difference in slopes p< 0.0001). Those with poor VA ≥20/50 showed a 50% greater decline in SPPB (p=0.0029), and those with low SA ≤85 arcsec demonstrated a 33% faster decline (p< 0.001) relative to those with better visual function. Compared to the slope at the mean VFQ score, a 1 standard deviation lower score was associated with 23% greater decline in SPPB (p< 0.0001). The difference in SPPB slopes remained significant across VI measures after adjusting for longitudinal decline associated with age, sex, and black race (all p< 0.05). Both self-reported and performance-based VI predicted faster declines in SPPB over time. Whether older adults with VI might benefit from targeted intervention to prevent declining mobility function remains to be evaluated.

FUNCTIONAL HEARING AND VISION IMPAIRMENT AND SOCIAL ISOLATION OVER 8 YEARS IN COMMUNITY-DWELLING OLDER ADULTS

Alison Huang[1], George Rebok[1], Nicholas Reed[1], Jonathan Suen[2], Bonnielin Swenor[2], Thomas Cudjoe[3], and Jennifer Deal[2], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins University, Baltimore, Maryland, United States, 3. Johns Hopkins School of Medicine, Baltimore, Maryland, United States*

One in four older adults experience social isolation. Sensory impairment is a potentially modifiable risk factor for social isolation. Little is known about the long-term impact of sensory impairment on social well-being. This study quantifies the longitudinal associations between hearing, vision, and concurrent hearing and vision impairment (dual sensory impairment) and social isolation over 8 years among older adults. Data were from the National Health and Aging Trends Study (NHATS), a nationally representative longitudinal study (2011- 2019) of U.S. Medicare beneficiaries. Social isolation was measured by a composite that incorporated four domains: living arrangement, core discussion network size, religious services attendance, and social participation. Baseline hearing and vision were measured by self-report. Associations between sensory impairments and odds of overall social isolation over 8 years were assessed using multivariate generalized logistic mixed models adjusted for demographic and health characteristics. Among 5,552 participants, 18.9% reported hearing impairment, 4.8% reported vision impairment, and 2.3% reported dual sensory impairment. Over 8 years, hearing impairment was associated with 28% greater odds of social isolation. Specifically, participants with hearing impairment were more likely to live alone and limit engagement in social activities. A similar pattern of association was observed for dual sensory impairment; however, estimates did not reach statistical significance. No association was observed between vision impairment and social isolation. Older adults with hearing impairment may be a clinically important subgroup to monitor for social isolation. Interventions for increasing social support and social participation may be especially valuable for older adults with hearing impairment.

SESSION 2540 (SYMPOSIUM)

CREATIVE QUALITATIVE RESEARCH METHODS WITH LESBIAN, GAY, BISEXUAL, TRANSGENDER, AND QUEER (LGBTQ+) OLDER ADULTS

Chair: Austin Oswald Co-Chair: Sara Bybee Discussant: Austin Oswald

The voices of lesbian, gay, bisexual, transgender, and queer (LGBTQ+) older adults are very often overlooked in research contexts. Creative qualitative methods have been utilized to study populations who have been neglected, empowering marginalized communities, and fostering equitable research processes and outcomes (Archibald & Blines, 2021; Jen & Paceley, 2021; McGarry & Bowden, 2017). This innovative symposium explores creative qualitative methods of data collection and analysis, such as creative writing and poetry, which have been employed in research about LGBTQ+ aging and also describes how each method may provide a unique contribution to the research process and literature. The first presentation describes the process of facilitating a weekly creative writing group with LGBTQ+ older adults and how creative writing can facilitate the retelling of life events and reimaging of new futures. The second presentation describes the process of analyzing pieces of creative writing in order to elucidate the potential and possibility of queer futurities and their implications for research on aging trajectories and imaginings. The third presentation details how found poetry created from dyadic semi-structured interviews sheds new light on the relationships of LGBTQ+ couples facing cancer. Through these three presentations, we will illustrate how creative methods contribute strengths of generating evocative and poignant narratives, illuminating not-yet-possible futures, and inspiring equally creative interventions. The overall objective of this symposium is to explore creative qualitative research methods for their utility in research with LGBTQ+ older adults, ultimately fostering more inclusive and nuanced research processes and products.

IMAGINING QUEER FUTURES BEYOND BOUNDARIES: A NARRATIVE ANALYSIS OF CREATIVE WRITING

Sarah Jen[1], and Rebecca Jones[2], *1. University of Kansas, Lawrence, Kansas, United States, 2. Open University, Milton Keynes, England, United Kingdom*

Scholars have called for "queering aging futures" beyond normative assumptions or scripts (Sandberg & Marshall, 2019), which is well-aligned with queer theory's Cruising Utopia which suggests "cruising ahead" toward a queer utopian future that is not yet possible (Muñoz, 2009). Due to emphasis on form rather than content, narrative analyses enable the reimagining of queer futures not bound by material realities. This study presents a narrative analysis of 40 pieces of creative writing in Bi Women Quarterly (BWQ) that examine aging. Authors used writing to queer stories of relationships, activism, and aging. Many used incoherent, non-linear, and dreamlike or omnipotent storytelling to queer narratives, allowing them to "cruise" across time and versions of themselves, imagining futures that were new and unscripted. Narrative analysis allowed researchers to examine choices authors made in taking agency through storytelling. Findings indicate that queer people are well positioned to queer expectations of successful old age.

USING FOUND POETRY TO EXPLORE SEXUAL AND GENDER MINORITY COUPLES' EXPERIENCES FACING CANCER

Sara Bybee[1], Kristin Cloyes[2], Kathi Mooney[3], Katherine Supiano[1], Brian Baucom[4], and Lee Ellington[5], *1. University of Utah, Salt Lake City, Utah, United States, 2. Oregon Health & Science University, Portland, Oregon, United States, 3. University of Utah College of Nursing, Salt Lake City, Utah, United States, 4. University of Utah Department of Psychology, Salt Lake City, Utah, United States, 5. University of Utah and Huntsman Cancer Institute, Salt Lake City, Utah, United States*

This study explored how relationships of sexual and gender minority (SGM) couples change through the cancer experience. Twelve couples (N = 24) completed surveys assessing demographics and dyadic semi-structured interviews. Thematic analysis was used to analyze interview transcripts. Participants had been together for 19.1 years on average (SD = 9.9, R = 9-44) and commonly described dyadic strength and durability as a result of cancer. Using in-vivo language extracted from the theme dyadic strength and durability, a found poem was constructed depicting how couples saw themselves as two-person teams united against any external stressors. When SGM couples experienced cancer together, it resulted in feeling closer to one another, like they could handle anything that came their way, and assured them that they would stay together regardless of any future hardships experienced. Creative qualitative methods revealed SGM couples facing cancer felt like unyielding, impenetrable, eternal duos with which to be contended.

CREATIVE WRITING AS A TOOL FOR LESBIAN, GAY, BISEXUAL, TRANSGENDER, AND QUEER (LGBTQ+) HISTORY AND FUTURE MAKING

Lujira Cooper[1], and Austin Oswald[2], *1. Services and Advocacy for GLBT Elders, New York, New York, United States, 2. Goldsen Institute of the University of Washington , Seattle, Washington, United States*

The shift toward embracing creative methods in qualitative research opens new possibilities for gerontologists and older adults to explore the nuances of aging and its affective undertones. This paper describes the process of facilitating a weekly creative writing group for lesbian, gay, bisexual, transgender, and queer (LGBTQ+) older adults and their subjective experiences. Various creative writing practices (e.g., poetry, fiction, short story, biography) facilitates the retelling of life events and reimaging of new futurities. Done in community, it creates opportunities for social connectedness, collective meaning making, and psychosocial and instrumental support. Creative writing is a useful method for describing the LGBTQ+ aging experience not fully realized in gerontology. Our findings demonstrate the utility of creative methods in describing and re-imagining LGBTQ+ aging histories and futures. We argue for more creative methods that re-present the complexities of LGBTQ+ aging.

SESSION 2550 (SYMPOSIUM)

DIVERSITY OF EXPERIENCES OF AGING AMONG BIRTH COHORTS AND RACIAL/ETHNIC GROUPS IN NSHAP

Chair: Linda Waite Discussant: Amelia Karraker

Aging, the process of getting older, takes many forms. This symposium uses data from the National Social Life, Health, and Aging Project to study changes and differences between groups in the experience of older adults. Dale and coauthors look at the implications for future mortality of failing to respond to a follow-up interview in an ongoing survey. Those who drop out of NSHAP are more similar to those who died than to those who are reinterviewed, suggesting that survey dropout carries important information about health that has been ignored to this point. Choi and Waite compare social networks and social support for the Silent Generation cohort, born 1920-1947, to the Baby Boom cohort, born 1947-1965, and finds that the BB cohort has fewer kin in their networks and receive less support from family and friends than the older cohort, suggesting that they are more disconnected. Piedra and Iveniuk compare social networks of White, Black and Hispanic older adults. They find that Hispanics are initially more likely to have restricted networks, showing low social connectivity but increase in network diversity over time, suggesting resilience, whereas White and Black move toward lower connectivity as they get old. Iveniuk and Gupta compare marital histories of older adults in different racial and ethnic subgroups, with Blacks least and Whites most likely to be married at older ages, and Hispanics more likely to be recently widowed. These presentations point to the diversity of pathways through aging, and their consequences.

IMPLICATIONS FOR MORTALITY RISK: CONSEQUENCES OF SURVEY NONRESPONSE IN HOME-DWELLING OLDER ADULTS

Marianne Razavi[1], William Dale[2],
Colm O'Muircheartaigh[3], L.Philip Schumm[3],
Ashwin Kotwal4, and Linda Waite[5], *1. City of Hope, Duarte, California, United States, 2. City of Hope Comprehensive Cancer Center, Duarte, California, United States, 3. University of Chicago, Chicago, Illinois, United States, 4 University of California, San Francisco, San Francisco, California, United States, 5. National Opinion Research Center (NORC at Chicago), Chicago, Illinois, United States*

Nonrespondents generally suffer from worse health outcomes than respondents. Are they unwilling or unable to respond? Our aim was to address this issue. Data (N=3,130) from 2010-2015 waves of National Social Life Health and Aging Project (NSHAP, W2, W3) was used. Four groups of participants were considered based on their response status at W3: alive, incapacitated, deceased, and nonrespondents. Nonrespondents represented cases with no information at W3, beyond their disability and death information. General linear models were used to compare group means at baseline (W2) in terms of mortality risk (Lee index) or cognitive impairment (MOCA), adjusted for demographic variables. Like the deceased or incapacitated groups, the nonrespondent group displayed significantly worse outcomes (Least Squares Means) than the alive group: Lee index alive=5.82, deceased=9.66, incapacitated=8.29 and nonrespondents=7.80; MOCA alive=21.57, deceased=19.79, incapacitated=19.19 and nonrespondents=19.84. Being a nonrespondent likely indicates incapacity, not reluctance to responding. Earlier follow-up surveys could optimize response rates.

COHORT DIFFERENCES IN SOCIAL TIES TO FAMILY AND FRIENDS

Won Choi[1], and Linda Waite[2], *1. University of Chicago, Chicago, Illinois, United States, 2. National Opinion Research Center (NORC at Chicago), Chicago, Illinois, United States*

Dramatic changes in family life may have altered the structure and quality of social ties to family and friends. However, little is known about whether and how social relationships vary between older adults from different cohorts. Using data from the National Social Life, Health, and Aging Project, we compared social network composition and social support between older adults at ages 57 to 67 from the Silent Generation cohort (N=2,316) and the Baby Boom cohort (N=1,500). Compared with the Silent Generation cohort, the Baby Boom cohort had significantly higher odds of not listing any kin in their core discussion network. There were no cohort differences in proportion of friends in the network. The Baby Boom cohort also reported lower levels of family and friend support than their counterparts. Results suggest that the Baby Boom cohort is more socially disconnected from friends and particularly family compared with the Silent Generation cohort.

THE SHIFTING SOCIAL NETWORKS OF OLDER ADULTS: AN ANALYSIS OF VARYING TYPOLOGY BY RACE/ETHNICITY

Lissette Piedra[1], and James Iveniuk[2], *1. University of Illinois at Urbana-Champaign, Urbana, Illinois, United States, 2. NORC at the University of Chicago, Chicago, Illinois, United States*

We explored whether network groupings change over time, and how they vary by race and ethnicity. We draw upon data from 6,489 respondents, collected across three rounds of National Social Life Health and Aging Project (NSHAP). Using Latent Class Analysis to identify groupings of social-relational characteristics, we arrive at: A 'restricted' class with overall low social connectivity, an 'enriched' class with strong connections across all domains and a 'diverse' class showing the greatest network range. In the first round, 49% of Hispanic respondents were in the 'restricted' class, compared to 24% of non-Hispanic Whites, and 37% of non-Hispanic Blacks. By the third round, the percentage of Hispanic respondents in the 'restricted' class dropped but rose for all other groups. We speculate that, over time, context-specific factors may be contributing to network resilience among Hispanics and network vulnerability among non-Hispanic Blacks.

MARITAL SEQUENCING ACROSS THE LIFE COURSE: RACE AND COHORT INTERSECTIONS

James Iveniuk, and Riddhi Gupta, *NORC at the University of Chicago, Chicago, Illinois, United States*

In this paper, we undertake an analysis of marital/cohabitation sequences over a person's entire life course, examining intersections between race and cohort. We draw upon data from a nationally representative survey of older Americans (collected in 2005/2006; N=3005). Using optimal matching and cluster analysis, we find three clusters: those who have been without a partner for many years (10%), those who recently lost a spouse (27%), and those who are still married (62%). All three clusters tended to marry young; only 2% never married or cohabited. Non-Hispanic Black respondents were far less likely than Non-Hispanic White respondents to be in the still-married cluster. The oldest Hispanic respondents were also more likely to be in the recently-unpartnered cluster, compared to younger Hispanic respondents. Cluster membership was also associated with being married ten years later (2015/2016; 1535 retained), with the longstanding-unpartnered cluster less likely to be married, compared to the recently-unpartnered cluster.

SESSION 2560 (SYMPOSIUM)

EMBRACING DIVERSITY BY FOSTERING STRONG COMMUNITY CONNECTIONS

Chair: Robyn Golden Co-Chair: Erin Emery-Tiburcio Discussant: Rani Snyder

Age-Friendly Health Systems are essential; however, most health and healing take place outside of the walls of a hospital or physician's office. Thus, it is imperative that health systems foster strong community connections, in particular with older adults from underserved communities who experience multiple barriers to quality, age-friendly health care. At Rush, there are several interdisciplinary initiatives designed to ensure that the 4Ms reach beyond the medical center and impact historically marginalized communities. In this symposium, we present three of these innovative approaches to bringing the 4Ms to into the community. Each presentation will describe the program and community served, explore how the 4Ms concepts are integrated, and present outcomes data on the program impact to date. Facilitating Caregiver Health and Wellness: Age-Friendly Health System Caring for Caregivers (AFHS-C4C) is an initiative to expand the age friendly health system to include caregivers. CATCH-ON Connect enables older adults to do What Matters to them by expanding virtual access to older adults, often from underserved communities. Finally, Rush@Home addresses the 4Ms by removing barriers to care and enabling older adults with medically complex needs to receive care in their home. The interactions of these programs will be discussed briefly by the session chair, along with service and policy implications of multiple programs addressing the 4Ms of an Age-Friendly Health System within one community.

FACILITATING CAREGIVER HEALTH AND WELLNESS: AGE-FRIENDLY HEALTH SYSTEM CARING FOR CAREGIVERS (AFHS-C4C)

Robyn Golden[1], Diane Mariani[1], Leslie Pelton[2], Teresa Moro[1], and Ellen Carbonell[1], *1. Rush University Medical Center, Chicago, Illinois, United States, 2. Institute for Healthcare Improvement, Boston, Massachusetts, United States*

Family caregivers of older adults are vital partners in health care. The health care system is uniquely positioned to connect with caregivers and help address their own needs. The Age-Friendly Health System Caring for Caregivers (AFHS-C4C) model focuses on achieving health system change by identifying and incorporating caregivers into standard health care practices while assisting caregivers with their own health and well-being. Created at Rush University Medical Center, this model was tested in six AFHS. At Rush, caregivers (n=322) were mostly female (74%) and African American (38%) or white (37%). Between baseline and follow-up, statistically significant (p<.05) decreases were observed in caregiver burden (BSFC: 18.51 to 13.82), depression (PHQ-9: 8.40 to 4.09), and anxiety (GAD-7: 7.73 to 5.15). Application of this program at additional sites has yielded important lessons learned about engagement, training needs, and sustainability. These lessons will be discussed in the context of scaling and spreading interventions nationally.

INCREASING TECHNOLOGY ACCESS TO FOR UNDERSERVED COMMUNITIES: CATCH-ON CONNECT

Erin Emery-Tiburcio[1], Siqi Wang[2], Steven Reaves[2], and Salvador Castaneda[2], *1. Rush University Medical College, Chicago, Illinois, United States, 2. Rush University Medical Center, Chicago, Illinois, United States*

Many older adults from underserved communities do not have access to technology or a reliable internet connection. Even when access is not an issue, older adults often find technology challenging. CATCH-ON Connect provides community-dwelling adults age 65+ with cellular-enabled tablets with pre-installed apps to enable them to reduce social isolation and engage in telehealth visits. This program also provides personalized technical assistance and education about accessing electronic health records and the 4Ms. For example, participants are encouraged to address the 4Ms during telehealth visits. Among 139 participants enrolled, 51% were non-Hispanic Black, 30% non-Hispanic white, 13% Hispanic, and 7% other. Willingness to engage in telehealth appointments increased 9% (p<.05), discussions with primary care providers about mobility increased by 13% (p<.001), and loneliness scores decreased by 0.6 (p<.05) in the first three months of participation. Implementation and policy implications for ongoing technology device and training services will be discussed.

EXPANDING HOME-BASED PRIMARY CARE FOR MEDICALLY COMPLEX PATIENTS: RUSH@HOME

Walter Rosenberg, Nathaniel Powell, Elizabeth Davis, Leticia Santana, and Robyn Golden, *Rush University Medical Center, Chicago, Illinois, United States*

Medically complex older adults from underserved communities experience multiple barriers to obtaining necessary health care and services. Often these individuals are largely unable to leave their homes due to a lack of community resources facilitating travel to and from provider appointments. Rush@Home is a home-based primary care program that focuses on the 4Ms by incorporating patient navigation and social work services for medically complex older adults. The majority of the patients enrolled in the Rush@Home program identify as Black and/or Latino (>50%) and reside on the West Side of Chicago which is historically underserved in terms of health care access. To date, Rush@Home has enrolled n=234 participants with n=176 patients who are currently active in the program. Among participants there less than a 10% readmission rate and an ED visit rate of approximately 5%. This presentation will discuss the Rush@ Home data and the importance of community engagement.

SESSION 2570 (SYMPOSIUM)

ESPO AND SOCIAL RESEARCH, POLICY, AND PRACTICE SECTION SYMPOSIUM: WHAT AROUND THE PERSON MATTERS: REIMAGINING ENVIRONMENTAL JUSTICE AND AGING

Chair: Kexin Yu Co-Chair: Sarah Dys

From Lawton's seminal Ecological Theory of Aging (ETA) to the recent development of Wahl's COntext Dynamics of Aging (CODA), conceptual and empirical work has repeatedly shown that the living environments fundamentally influence health and wellbeing in later life. The CODA framework posits five correlated contexts that can predict developmental outcomes in aging: physical, social, service, socioeconomic, and technological contexts. The ongoing COVID-19 pandemic further manifested the lack of environmental justice for marginalized and minoritized older adults, calling for reflection on the paradigm for ecological aging research, practice, and actionable policymaking. This SRPP/ESPO symposium featured emerging and established scholars' work that shed light on reimagining environmental justice for older adults with diverse abilities, backgrounds, and resources. Panelists will share stories of their professional development journeys, highlighting empirical evidence with under-researched, systematically excluded populations and examining new directions in aging and environment research. Topics include accessible and affordable housing, built environment, neighborhood contexts, conceptualizing the community, and the experiences of those most likely to bear the burden of precarious housing in later life. This symposium will hold the space for emerging scholars to learn and discuss short- and long-term practice and policy priorities for promoting environmental justice for older adults and provide tools to conceptualize their research informed through ecological and equity-centered perspectives.

CONTEXTS OF COGNITIVE DECLINE: MAPPING NEIGHBORHOOD OPPORTUNITIES AND BARRIERS FOR HEALTHY AGING IN PLACE

Jessica Finlay[1], Robert Melendez[2], and Philippa Clarke[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Social Environment and Health Program, Institute for Social Research, University of Michigan, Ann Arbor, Michigan, United States*

Stark geographic variation in later-life health outcomes suggests that local built and social environments are critical in shaping disease and disability, physical and cognitive function, and engagement in everyday life among older adults. This paper presents a community-engaged mapping project aiming to depict the uneven distribution of hazards and amenities relevant to cognitive aging across the United States. Living in neighborhoods with opportunities for social interaction (e.g., coffee shops, senior centers), intellectual stimulation (e.g., museums, libraries) and physical activity (e.g., parks, walkable streets) may slow rates of cognitive decline and reduce risk for Alzheimer's disease. We assembled a community advisory board to translate research findings into a pilot website and interactive map that assesses neighborhoods for cognitive aging resources and amenities. The objective is to increase public awareness and inform public health and policy efforts to ameliorate community barriers and create more equitable opportunities to promote healthy aging in place.

TOWARD STRUCTURAL CHANGE: ADVANCING PRAXIS ON AGE-FRIENDLY CITIES AND COMMUNITIES

Emily Greenfield, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

The global age-friendly cities and communities (AFCC) movement has inspired leaders across the public, private, and academic sectors to re-imagine how environments can better support long and healthy lives. There is growing recognition, however, of structural and other constraints that impede the translation of AFCC aspirations into systematic, comprehensive, impactful, and sustainable action. This paper will describe the importance of researchers' engagement in AFCC praxis to better support the movement toward structural change for aging equity and healthy aging. The paper will present a case example of academic researchers' long-standing involvement in collaborative efforts toward the development and sustainability of age-friendly community initiatives in New Jersey. The case will emphasize the importance of creating synergies across research, teaching, and service activities; cultivating coordinated AFCC efforts across the mico, meso, and macro levels; and developing sustainable structures for deliberate inter-organizational and multi-sectoral partnerships toward short- and long-term goals.

A JOURNEY INTO HOW PLACE MATTERS

Terri Lewinson, *The Dartmouth Institute for Health Policy and Clinical Practice, Lebanon, New Hampshire, United States*

It is now well known that housing is a significant determinant of health and that systematic inequities shape the influence of home for many people. In this paper, I will present my research program designed to incrementally understand housing-health experiences of low-income residents in hotels, assisted living facilities, and senior housing apartments using qualitative, community-based, and biomedical approaches in Metropolitan Atlanta. Focused through an ecological lens, I will share insights from pedagogical and policy experiences that contributed to (and detracted from) the promotion of environmental justice for marginalized communities using inclusive strategies that were respectful of population identity. In this talk, I will discuss how institutional influences shaped opportunities for me to advance work on healthy housing as a social justice issue and detail my current project exploring air quality in a nontraditional home setting.

SESSION 2580 (PAPER)

HEALTHCARE UTILIZATION AND OUTCOMES

COST OF US EMERGENCY DEPARTMENT AND INPATIENT VISITS FOR FALL INJURIES IN OLDER ADULTS: 2016–2018

Lisa Reider[1], Jason Falvey[2], Safiyyah Okoye[3], and Joseph Levy[1], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. University of Maryland Baltimore, Baltimore, Maryland, United States, 3. Johns Hopkins School of Nursing, Baltimore, Maryland, United States*

Falls are a leading cause of injury among older adults. While numerous studies have estimated the economic burden of falls, how health care spending varies by sociodemographic and injury factors is not well understood. The purpose of this study was to describe the average annual frequency of emergency department and inpatient visits and associated costs for fall injuries among older adults in the United States and identify factors associated with higher cost using data from the 2016-2018 National Inpatient Sample and National Emergency Department Sample. The study cohort included encounters with an ICD-10 external cause of injury code for fall (W00-W19). Number of visits was computed using survey weights. Direct visit cost was estimated from charges, applying cost-to-charge and professional fee ratios. On average, an estimated 2.7 million (95%CI: 2.5-2.9) fall-related ED visits and 1.1 million (95%CI: 1.1-1.2) inpatient visits occurred annually. The annual average cost was $1,105 (95%CI: $1,083-$1,127) per ED visit and $18,047 (95%CI: $17,905-$18,189) per inpatient visit totaling $22.9 billion annually. Higher inpatient cost was associated with age (65-74: $20,258 vs 85+: $16,183), gender (men: $19,541 vs. women: $17,181), and race (White: $17,570 vs. Black/Hispanic: $19,602); higher ED cost was associated with age (65-74: $1,009 vs. 85+: $1,198) and dementia diagnosis ($1,369 vs. $1,073). Fifty five percent of inpatient and 25% of ED visits were for fracture which had higher cost compared to sprains, dislocations, and superficial injuries. Results indicate growing number of fall-related admissions and costs underscoring need for targeted prevention and intervention strategies.

FORECASTING THE REGIONAL DISTRIBUTION OF HOME CARE PATIENTS USING BIG DATA OF INSURANCE CLAIMS IN JAPAN: 2015 TO 2045

Yasuhiro Nakanishi[1], Yuichi Nishioka[2], Yukio Tsugihashi[2], Tomohiro Kakinuma[1], Tatsuya Noda[2], Tomoaki Imamura[2], and Manabu Akahane[1], *1. National Institute of Public Health, Wako, Saitama, Japan, 2. Nara Medical University, Kashihara, Nara, Japan*

Regional distribution of home care patients and future demand in Japan are unknown. This study aimed to reveal the actual situation of home care patients by region and forecast demand up to 2045. Linked complete health and long-term care insurance claims data on Nara Prefecture (around 1% of the total population and area of Japan) patients aged 75 years or older who received planned and/or urgent medical treatment by physician home visit between April 2015 and March 2016 were extracted and analyzed by sex, age group, and municipality. We calculated the proportion of home medical care utilization and projected the number of home care patients for every five-year period up to 2045 across five administrative areas of the medical service in Nara Prefecture. Data on 12,656 patients, including 1,455 aged 75–79 years, 2,753 aged 80–84, 3,854 aged 85–89, and 4,594 aged 90 years or older, were extracted. The current proportion of patients receiving home medical care (unadjusted for age) by medical service administrative area showed a difference of up to 1.6 times for those aged 90 years or older. Results of forecasting showed a marked increase in the number of patients aged 90 years or older, with overall numbers continuing to increase up to 2040, reaching a maximum of around 25,759 then decreasing thereafter. The future increase in home care patient numbers could vary by age and area, and our findings suggest that public health policy based on the future demand in each area will be required.

HOW ARE MULTIPLE CHRONIC CONDITION COMBINATIONS DIFFERENTIALLY ASSOCIATED WITH HEALTH SERVICE USE?

Aaron Ogletree[1], and Benjamin Katz[2], *1. National Institutes of Health, Washington, District of Columbia, United States, 2. Virginia Tech, Blacksburg, Virginia, United States*

A growing body of literature describes important advances in the study of chronic conditions, most notably a paradigm shift from the study of individual chronic conditions to the study of multiple chronic conditions (MCCs). Despite these advances, little research has explored MCC combinations, and almost no published research has explored how MCC combinations are related to health service utilization. Using data from the 2018 wave of the Health and Retirement Study, we categorized 16,447 older adults into one of 32 groups using self-reports of five prevalent chronic conditions: arthritis, diabetes, heart problems, hypertension, and respiratory problems. ANOVAs assessed associations between MCC combinations and two self-report measures of health service use: (1)number of medical visits, including emergency room visits, clinic visits, and house calls; and (2)total out-of-pocket costs for major medical expenses. Results show that older adults with more conditions had a greater number of medical visits ($p< 0.0001$). The pattern between total number of conditions and out-of-pocket costs is less clear, though still varied significantly ($p< 0.01$). Findings demonstrate variability in outcomes among MCC combinations with the same total number of conditions. Those in the Heart-Hypertension-Respiratory group averaged 9 medical visits while those in the Arthritis-Diabetes-Heart group averaged 16. Adults in the Diabetes-Heart group averaged $2,546 in out-of-pocket costs, which is nearly double the costs reported by the Diabetes-Hypertension group ($1,254). Findings highlight complex associations of MCC combinations with health service use, and can inform resource allocation, policy priorities, and care planning among providers serving older adults with MCCs.

POPULATION TRENDS IN HEALTHCARE USE BY MEXICAN ADULTS AGED 60 AND OLDER WITH AND WITHOUT COGNITIVE IMPAIRMENT

Brian Downer, Jose Eduardo Cabrero Castro, and Rebeca Wong, *University of Texas Medical Branch, Galveston, Texas, United States*

Government policies that have greatly expanded health insurance coverage in Mexico have taken place in the context of rapid population aging and an increasing number of older adults living with cognitive impairment. We used data from the Mexican Health and Aging Study to investigate population-level trends in self-reported healthcare use by cognitive status in 2001, 2012, 2015, and 2018. Healthcare measures included having an outpatient procedure, any doctor visits, staying >1 nights in the hospital, and screenings for high cholesterol, diabetes, and hypertension. All outcomes were dichotomized as yes/no. The sample sizes included 6179 (2001), 8924 (2012), 9429 (2015), and 8916 (2018) participants aged 60 and older who completed a direct interview (total N=33,448). Participants with cognitive impairment were identified using five cognitive assessments (2001 n=1000; 2012 n=1273; 2015 n=1467; 2018 n=1372). Generalized estimating equations that adjusted for demographic characteristics and self-reported health conditions were used. The adjusted odds of having spent >1 night in the hospital, outpatient procedures, any doctor visits, and preventive screenings were significantly higher in 2012, 2015, and 2018 than in 2001 regardless of cognitive status. Overall, participants with cognitive impairment had significantly higher adjusted odds for >1 nights in the hospital (OR=1.31, 95% CI=1.20-1.42), but significantly lower odds for any doctor visits (OR=0.81, 95% CI=0.75-0.88), outpatient procedures (OR=0.70, 95% CI=0.57-0.85), and preventive screenings for high cholesterol (OR=0.75, 95% CI=-.70-0.81), diabetes (OR=0.78, 95% CI=0.72-0.85), and hypertension (OR=0.76, 95% CI=0.70-0.82). These results are important to understanding the healthcare needs of Mexico's growing older adult population.

THE LONGITUDINAL RELATIONSHIPS BETWEEN SOCIAL ISOLATION AND HEALTH OUTCOMES: THE ROLE OF PHYSICAL FRAILTY

Fereshteh Mehrabi, and François Béland, *University of Montreal, Montreal, Quebec, Canada*

Social isolation is a public health issue that is linked to poor health outcomes. However, the mechanisms underlying this association remain unclear. The main objective of this study was to explore whether changes in frailty moderated the relationship between changes in social isolation and changes in health outcomes over two years. We examined the mediating role of changes in frailty when the moderation hypothesis was not supported. A series of latent growth models (LGMs) were used to test our objectives using data from three waves of the FRéLE study among 1643 Canadian community-dwelling older adults aged 65 years and over. Missing data were handled by pattern mixture models with the assumption of missing not at random. We measured social isolation through social participation, social networks, and social support from different sources of social ties. We assessed frailty using the Fried frailty phenotype. Our moderation results revealed that high levels of changes in social participation, support from friends, nuclear, and extended family members, and social contacts with friends were associated with greater changes in cognitive and mental health among frail older adults with diminished physiological reserves compared to robust older adults. Additionally, changes in frailty mediated the effects of changes in social participation and social contacts and support from friends on changes in chronic conditions. This longitudinal study suggests that frailty moderated the relationships between social isolation and mental and cognitive health but not physical health. Overall, social support and strong friendship ties are key determinants of frail older adults' health.

SESSION 2590 (SYMPOSIUM)

IMPLEMENTATION AND IMPACT OF MANAGED LONG-TERM SERVICES AND SUPPORTS IN PENNSYLVANIA

Chair: Howard Degenholtz

In 2018, Pennsylvania began implementing a mandatory Medicaid managed care program called Community HealthChoices (CHC). CHC replaces the 1915(c) aging waiver and 4 other waiver programs that covered adults with disabilities and people with acquired brain injury. The new program covers people receiving long-term services and supports (LTSS) in both nursing homes and home and community-based settings as well as people dually eligible for both Medicaid and Medicare. The program is administered by 3 managed care organizations (MCOs) that are obligated to coordinate with Medicaid Behavioral Health, Medicare Advantage and D-SNP plans. The MCOs are incentivized to serve people with LTSS needs in community-based settings by increasing access to HCBS and supporting transitions from nursing homes back into the community. This symposium will present findings from a comprehensive, mixed-methods evaluation of the program. Drawing from our qualitative interviews with key stakeholders and examination of program materials, we will describe some of the challenges of the implementation process. Next, we will share findings from interviews with cohorts of participants conducted before and after implementation of the new program. Next, we will present findings from analysis of Medicaid claims data to examine changes in use of home and community-based services as well as overall rebalancing. Finally, we will present both qualitative and quantitative data on person-centered service planning- a critical requirement for HCBS programs.

EFFECT OF COMMUNITY HEALTHCHOICES ON PARTICIPANT QUALITY OF LIFE AND PSYCHOLOGICAL WELL-BEING

Howard Degenholtz, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

A stratified random sample of participants was interviewed in each region of Pennsylvania during each phase of the implementation. In addition, comparison groups were interviewed from the third implementation region. This allowed us to draw causal inferences regarding the effect of the program on participant quality of life and psychological well-being. The sample was stratified to represent: people age 21-59 and those over age 60 who receive home and community based services (HCBS), plus people age 21 and older who are dually eligible for Medicaid and Medicare but do not use long-term services and supports. We found that engagement in preferred activities both inside and outside the home increased among people who used HCBS and those who did not. In addition, psychological well-being improved slightly while the prevalence of depressive symptoms declined. In general, the implementation of Community HealthChoices appears to have led to improvements in several measures of well-being.

THE EFFECT OF COMMUNITY HEALTHCHOICES ON USE OF HOME AND COMMUNITY-BASED SERVICES

Keri Kastner, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Medicaid claims data for the years 2013 to 2020 were analyzed to examine use of common categories of home and community-based services (HCBS) as well as the proportion of people living in nursing homes as opposed to receiving long-term services and supports in the community. There was a long-term trend prior to Community HealthChoices of a shift the locus of LTSS away from nursing homes. The implementation of managed care to deliver LTSS continued, but did not appear to accelerate this trend. However, MLTSS did appear to control to growth in hours of personal care per person both in the aggregate and longitudinally within the same individuals over time. There were decreases in the use of adult day services and home delivered meals. However, the decline in home delivered meals was more than offset by an increase in uptake of the supplementary nutritional assistance program (SNAP).

IMPLEMENTATION OF THE COMMUNITY HEALTHCHOICES PROGRAM

Teresa Beigay, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

The Community HealthChoices program was implemented in three phases, starting in 2018 in the SouthWest region of Pennsylvania, followed by the SouthEast in 2019 and the remainder of the state in 2020. Interviews were conducted with participants in each region during the first several months of each implementation. Focus groups were conducted in the months immediately following each phase. We reviewed all participant materials and public education events in each region. The percentage of participants who reported having received information about the new program increased in each phase. This is consistent with our observation that more public education events were held in 2018 and 2019 than in 2017. However, satisfaction with information did not improve over time. Focus groups revealed a mixed picture of successes (new benefit cards were received and claims were paid) and challenges (providers were not aware of the program; selecting primary care providers was confusing).

THE EFFECT OF COMMUNITY HEALTHCHOICES ON PARTICIPANT SATISFACTION WITH HOME AND COMMUNITY-BASED SERVICES

Todd Bear, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

A stratified random sample of participants was interviewed in each region of Pennsylvania during each phase of the implementation using the Consumer Assessment of Health Providers Survey – Home and Community Based Services (CAHPS-HCBS) version. In addition, comparison groups were interviewed from the third implementation region. These data were combined with surveys conducted by the three Community HealthChoices managed care organizations (MCOs). Data were weighted to create geographically representative estimates of participant experience across a range of composite measures. We found that participant ratings of their personal care attendants declined on three out of four measures, however measures of medical and non-medical transportation improved as a result of the implementation of Community HealthChoices. There were notable differences between people of different racial and ethnic groups, with non-Hispanic whites consistently reporting lower levels of satisfaction with person care.

THE IMPACT OF COMMUNITY HEALTHCHOICES ON PERSON-CENTERED SERVICE PLANNING

John Yauch, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Person-centered service planning (PCSP) is a required component of home and community-based services programs that operate under Medicaid waivers. CMS requires that states have processes in place to assure that participants and their family members (as desired and appropriate) are involved in decisions about their care. This mixed-method study combines interviews with participants and qualitative service coordinators regarding the PCSP process. Participant interviews using the Consumer Assessment of Health Providers Survey – Home and Community Based Services version found that the measure of "choice over services" improved slightly however, the "planning your care" measure was unchanged. Interviews with service coordinators found that the introduction of managed care had led to a system that was overly bureaucratic and focused on medical rather than social needs. This led to a perception that the service plans neglect aspects of daily living that are important for a good quality of life.

SESSION 2600 (SYMPOSIUM)

IMPLEMENTATION SCIENCE FOR THE SCALE-UP, SPREAD, AND SUSTAINABILITY OF ASSISTIVE TECHNOLOGIES FOR HEALTHY AGING

Chair: Shannon Freeman Discussant: Simon Carroll

In this symposium we present papers from four key stakeholders on a Michael Smith Foundation for Health Research (MSFHR) Implementation Science Team (IST) that is investigating the application of an emerging approach, the non-adoption, abandonment, scale-up, spread, and sustainability (NASSS) framework (Greenhalgh et al., 2017, 2018), to help predict and evaluate the success of technology-supported health and social care programs in British Columbia (BC). Specifically, our team's intention is to apply the NASSS framework to answer the following research questions: 1) Can the NASSS framework be used to enhance the effectiveness and impact of innovative ATs through improving the equitable scale-up, spread, and sustainability of these technologies for older adults? 2) What are the most important factors in the technology development and implementation process that contribute to equitable scale-up, spread, and sustainability of ATs for older adults? And 3) How can we improve transdisciplinary and intersectoral collaborations to enhance and improve the equitable implementation of ATs for older adults? Based on discussions from team, advisory, and expert panel meetings, a Rapid Realist Review (RRR) of the literature, and an analysis of data collected to date, the speakers will respond to these questions.

ASSESSING INNOVATIVE ASSISTIVE TECHNOLOGIES FOR OLDER ADULTS; A KNOWLEDGE AND TECH DEVELOPER'S PERSPECTIVES

Robin Syme, *University of Victoria, Victoria, British Columbia, Canada*

Objective: CanAssist is a University of Victoria organization that has been developing assistive technologies (ATs) for almost two decades aimed at developing client-centred broad-impact solutions that address unmet need and help people improve their independence and quality of life. CanAssist's interest and involvement in this study is predicated on our belief that their approach to technology development align with the criteria needed for determining better tools for evaluating assistive technologies need to be developed and implemented. This is critical to our goal of providing successful customized technology solutions to sustain our clients' independence and autonomy.

Methods: From the beginning of the project, as a Research User Co-Lead, CanAssist has actively participated in regular advisory committee and expert panel meetings along with several other research activities to co-create all dimensions of the study.

Results: The results from the Rapid Realist Review and preliminary analyses of the interview data with older adults and caregivers have validated the need for more appropriate assessment/evaluation tools to address the varied AT needs of older adults and their caregivers. In particular, the study has provided opportunities for our staff and clients to examine and discuss important factors/processes for successful AT development and implementation.

Conclusions: As a key partner on this implementation science team, CanAssist will use the study's findings to provide information to our development and management teams on how to appropriately scale-up, spread, and sustain the use of ATs in the health and social care system.

A RAPID REALISTIC REVIEW TO INFORM AN IMPLEMENTATION PROJECT; ASSISTIVE TECHNOLOGIES WITH CO-DESIGN AND OLDER ADULTS

Matilde Cervantes Navarrete, *University of Victoria, Victoria, British Columbia, Canada*

Objective: This presentation reports on a rapid realist review of participatory co-design approaches to developing assistive technologies with older adults. It provides an evidence synthesis of the key mechanisms, contexts and outcomes that drive success and failure in the use of participatory co-design in this field. This KISSS-AT sub-project, was undertaken to help inform stakeholder partners and the wider gerontechnological community of the key challenges and opportunities, that participatory co-design offers the field.

Methods: We conducted a rapid realist review (Saul et al., 2013). We identified 1060 citations from databases (AgeLine, BSC, CINAHL, MEDLINE, PycINFO, Sociological Abstracts and Web of Science), and 936 from hand journal searches (Ageing and Society, CSCW, Gerontechnology). We screened 311 full-text articles, with 19 articles for extraction. We extracted an additional 9 articles in order to capture post-search publications and a few articles identified through additional snowball citation searches. We analyzed the data for context-mechanism-outcome configurations (Pawson, 2015; Wong et al., 2013) that we found were relevant to our initial program theory, and used analytical induction to test emerging themes with our data set.

Results: We identified two key theoretical dimensions (1. Epistemological 2. Ethico-political) of participatory co-design with older adults, as part of our program theory, along with several C-M-O-Cs related to each dimension.

Conclusions: We found that paying attention to the underlying dimensions of participatory co-design, and the key mechanisms and contexts that support its successful implementation is fundamental to realizing the promise of this approach to gerontechnology development and implementation.

ASSESSING INNOVATIVE ASSISTIVE TECHNOLOGIES (ATS) FOR OLDER ADULTS: AN EXECUTIVE SPONSOR'S PERSPECTIVE

Manik Saini, *British Columbia Ministry of Health, Victoria, British Columbia, Canada*

The BC Ministry of Health (BC MoH)'s Health Technology Assessment unit is part of the Partnerships and Innovation Division. Our interest in this project concerns the status of ATs and the health technology assessment (HTA) process. The role of AT implementation as a key feature of the potential for new ATs to maximize health impact for older adults is something the Ministry sees as critical to meet the goal of enhancing healthy ageing and sustaining independence and autonomy.

Methods: From the beginning of the project, as Executive Sponsor, the Partnerships and Innovation Division helped to co-create the research program and played a key role in developing partnerships with health authorities and other stakeholders. With monthly meetings and several other research activities, the project has provided multiple opportunities for genuine policy engagement.

Results: The results so far have seen the project extend the scope of its partnerships with key stakeholders in BC. The Ministry was on a local reference group of knowledge users for a rapid realist review of participatory co-design, and Mr. Saini is a co-author on a publication based on that work. The project received additional funding from the BC MoH, and recently the Ministry collaborated on a successful University of Victoria Research Acceleration Fund grant application.

Conclusions: The BC MoH sees this as a key implementation science project, which will provide guidance to the HTA process, as it inevitably confronts increased demand for the public provision of ATs for older adults, particularly vulnerable and disadvantaged groups.

A KNOWLEDGE USERS' PERSPECTIVE; CONSTRUCTING MEANINGFUL PARTNERSHIPS AT THE IMPLEMENTATION SCIENCE PROJECT

Kahir Lalji, *United Way British Columbia – working with communities in BC's Interior, Lower Mainland and Central & Northern Vancouver Island, Burnaby, British Columbia, Canada*

Objective: United Way of British Columbia (UWBC) mission is to strengthen community capacity to address social issues for British Columbians. We use the Community-based Seniors' Services (CBSS) sector framework to promote healthy aging within the community. Our mission in Population Health is to keep older adults active, connected, and engaged. Assistive technology is very relevant to connect and support older adults. Over the past few years, the development of innovative assistive technologies (ATs) has gained significant momentum and is viewed as an important potential contributor to enhancing healthy ageing and living in place.

Methods: This project uses a Community-Based Participatory Action Research approach focusing on broader stakeholder engagement to enlist with a large array of knowledge users in participatory, collaborative action research processes. As a knowledge-user for this project, we have participated in monthly advisory committee and expert panel meetings and have participated on key team discussions.

Results: We have actively facilitated the development of effective and meaningful partnerships between the academic research community and UWBC and its partner organizations. This partnership has strengthened the capacity for implementation research and the potential for improved outcomes vis-à-vis our healthy ageing mandate in BC.

Conclusions: The UWBC will benefit from the outcomes from this study. We aim to disseminate the research results across our vast network of community organizations through the Collaborative Online Resources Education (CORE) initiative. Additionally, through our work with policymakers, we will support the equitable deployment of ATs to older adults and their caregivers in BC.

SESSION 2610 (SYMPOSIUM)

INNOVATIONS IN AGE-FRIENDLY UNIVERSITY (AFU) CAMPUS PRACTICES: ENGAGING COMMUNITY

Chair: Ramraj Gautam

The Age-Friendly University (AFU) global network adopted 10 AFU principles, and AGHE endorsed the AFU principles in 2016. Institutions of higher education are initiating several innovative age-inclusive approaches to teaching, research, and community engagement. This symposium features AFU partner institutions that will discuss their approaches, guided by the AFU principles, for engaging the older adult community to foster age-inclusivity at universities. Guided by the AFU Principle 8 (access for older adults to the University's range of programs) Elfenbein (University of North Georgia) will discuss the design and implementation of the University of North Georgia (UNG) Personal Enrichment, Action and Knowledge Series (PEAKS) program, a novel university and community coalition activity for older adults from the region. The program aims to develop a future life-long learning program. Gautam, et al. (University of Massachusetts Lowell) will discuss their initiative to engage the university's own retired community (AFU principle 9) in promoting intergenerational activities benefiting both students and the University. Melillo, et al. (University of Massachusetts Lowell) will share the qualitative study findings exploring the perceptions of emeritus professors regarding AFU principles 4 and 9. Clark, DiMaria-Ghalili and Gitlin (Drexel University) will discuss the design, implementation, and challenges of launching a pilot grant program at the University that focused on faculty, staff, and students, and integrated the 10 AFU principles. Townsend, et al. (University of Massachusetts Lowell) will highlight the Age Friendly Communities (AFC) and AFU initiatives involving graduate students working with 25 Action Group community-residing adults 50+ (AFU Principle 7 and 10).

AN AGE-FRIENDLY UNIVERSITY INITIATIVE: EMERITI PROFESSORS' INTEREST IN INTERGENERATIONAL ACTIVITIES

Ramraj Gautam, Karen Devereaux Melillo, Sarawut Sritan, and Montri Khumrungsee, *University of Massachusetts Lowell, Lowell, Massachusetts, United States*

The Age-Friendly University (AFU) Climate Survey (in collaboration with UMass Boston) in 2019 identified the need to engage the University's own emeriti professors; this need reflects the AFU Principle 9. The objective of this study was to explore emeriti professor's perspectives and areas of interest in intergenerational activities. After IRB approval, an online Qualtrics survey was sent to 315 emeriti professors. Eighty-six (27.3%) participants responded to the survey. About 60% reported interest in guest lecturing either online or face-to-face, and 48% reported interest in sharing retirement experiences with students. In addition to descriptive statistics this paper will present the analysis of open-ended questions relating to intergenerational education, research, service activities and their interest in establishing an emeriti association as a venue to connect with the University. The AFU principles will be discussed in the context of engaging emeriti professors in intergenerational relationships benefiting both students and the University.

EMERITUS PROFESSORS' PERCEPTIONS: QUALITATIVE RESEARCH EXPLORING AGE-FRIENDLY UNIVERSITY PRINCIPLES

Karen Devereaux Melillo, Ramraj Gautam, Sarawut Sritan, and Montri Khumrungsee, *University of Massachusetts Lowell, Lowell, Massachusetts, United States*

In 2020, the UML AFU campus launched the AFU Inventory and Climate Surveys (in partnership with UMass Boston). The results identified a need for campus improvement related to "involving retired faculty in University activities' (Principle 9) and "promoting intergenerational learning to facilitate the reciprocal sharing of expertise between learners of all ages" (Principle 4). An IRB-approved follow-up survey invited respondents to participate in one-hour virtual qualitative interviews to explore the research question: What are the perceptions of Emeritus Professors regarding AFU Principles 4 and 9? Emeritus Professor interviews (n=19) were held in 2021. Four researchers completed the content analyses, which revealed six major themes: promoting intergenerational learning activities; considering emeritus group; being proactive; supporting continued UML relationships; meaning of emeritus and preferred engagement; actual and perceived benefits. The findings will be discussed as to how AFU principles can benefit both Emeritus Professors and students through understanding of this untapped resource.

THE AGE-FRIENDLY DREXEL PILOT GRANT PROGRAM: A GRASSROOTS APPROACH TO THE AGE-FRIENDLY UNIVERSITY MOVEMENT

Katherine Clark[1], Laura Gitlin[2], and Rose Ann DiMaria-Ghalili[3], *1. Drexel University - College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States, 2. Drexel University, Philadelphia, Pennsylvania, United States, 3. Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*

In January 2022, Drexel University's AgeWell Collaboratory launched the Age-friendly Drexel Pilot Grant Program to catalyze university-wide knowledge about and projects that will establish our campus as a lifelong community. This suite of funded initiatives includes faculty, staff and students from seven different colleges, each focusing on different components of the 10 AFU principles. We sought out projects that: create learning environments that disrupt ageism; highlight the intersectionality of aging, race, ethnicity and health disparities; foster intergenerational connectivity; and innovate through research. Awarded projects are now increasing access to campus buildings through a design charrette; inventorying university wellness and recreational services to be offered to older community members, alumni, and retirees; developing novel intergenerational courses and experiences abroad through virtual reality, memoir writing and product design; adding older adults to existing community engagement programming; and addressing the technology divide. This presentation will cover the design, implementation, and challenges of this program.

AFU INNOVATIONS: PEAKS (PERSONAL ENRICHMENT, ACTION, KNOWLEDGE SERIES)

Pamela Elfenbein, *University of North Georgia Institute for Healthy Aging, Oakwood, Georgia, United States*

With careful consideration, including SWOT analysis, demographic projections data, and community input, we envisioned and designed PEAKS – Personal Enrichment, Action, and Knowledge Series. In creating PEAKS our mission was to provide engaging programming designed for the older adults. Our vision was to establish the University of North Georgia, an AFU, as the region's premiere educational and activity resource for older adults in our region. In January of 2021 PEAKS began as monthly series of virtual programs that attracted our intended constituents. During the summer programming paused. During this pause, community members approached the university and asked for PEAKS to expand to include in-person experiences during the summer months. This presentation follows our journey as we research, create, and facilitate the PEAKS programs, both virtual and in-person. We also share our research focusing on the development of PEAKS and goals and the degree to which we achieve them.

AGE-FRIENDLY LOWELL: INTERGENERATIONAL CONNECTION THROUGH EXPERIENTIAL LEARNING OPPORTUNITIES

Michelly Townsend[1], David Cornell[2], Andrew Hostetler[2], Robin Toof[2], Karen Devereaux Melillo[2], and Sabrina Noel[2], *1. University of Massachusetts Lowell, Wakefield, Massachusetts, United States, 2. University of Massachusetts Lowell, Lowell, Massachusetts, United States*

The rapid growth of the aging demographic requires students entering the workforce to be adept at engaging with older adults in a professional capacity. The Age Friendly Community (AFC) and Age Friendly University (AFU) initiatives present an opportunity for researchers and students to work alongside older residents to improve Age Friendly practices, policies, and infrastructure in their local communities. Age Friendly Lowell developed an Action Group (AG) of 25 Lowell residents aged 50y+, who provide feedback and guidance for 12 graduate students, as they develop measurement tools for a comprehensive community assessment. Students work with AG members to identify, pilot test, and adapt evaluation tools and learn innovative strategies for recruitment. This experiential learning structure is mutually beneficial, as residents lend their expertise, while students learn to echo those concerns throughout their work. This structure serves as a unique and effective model for other communities pursuing AFC and AFU designations.

SESSION 2620 (SYMPOSIUM)

INNOVATIVE APPROACHES TO EVALUATING THE LIFESPAN ASSOCIATIONS OF STRESS, HEALTH, AND WELL-BEING

Chair: Lewina Lee

Despite widespread agreement on the importance of stress in health and aging, the mechanisms by which psychosocial stressors influence emotional and physical health are not fully understood. Thorough operationalization of stressor exposure and stress response can contribute to a "common language of stress" (Epel et al., 2018) across disciplines, and a lifespan approach can inform the developmental timing of stress-health mechanisms. Guided by these considerations, this symposium presents five studies led by early-career researchers to delineate stress-health associations across the lifespan. Dr. Olivia Atherton will leverage father-offspring data over 25+ years to examine domains of early life stressors that are susceptible to intergenerational transmission and modifiers of such transmission. Drawing from daily diary bursts embedded within a longitudinal study, Dr. Emily Willroth will report on the role of affective reactivity to daily stressors as potential mediators of the association between childhood psychosocial stressors and all-cause mortality risk. Dr. Meaghan Barlow will present on a novel emotion construct – emotion globalizing – by considering the extent to which emotional response to daily stressors influences global assessment of well-being and age differences in these processes. Dr. Soomi Lee will consider job characteristics linked to 10-year stability and change in sleep health profiles in a national adult sample. Dr. Victoria Marino will illustrate a novel approach to assess the flexibility with which individuals select strategies for coping with stressors and describe its association with mortality. Altogether, this symposium contributes evidence on how psychosocial stressors may shape health and well-being across the lifespan.

TO WHAT EXTENT IS THERE INTERGENERATIONAL CONTINUITY IN EARLY-LIFE STRESSORS?

Olivia Atherton[1], Eileen Graham[2], Avron Spiro[3], Marc Schulz[4], Robert Waldinger[5], Daniel Mroczek[2], and Lewina Lee[6], *1. University of Houston, Houston, Texas, United States, 2. Northwestern University, Chicago, Illinois, United States, 3. Boston University, Jamaica Plain, Massachusetts, United States, 4. Bryn Mawr College, Bryn Mawr, Pennsylvania, United States, 5. Harvard University, Boston, Massachusetts, United States, 6. Boston University School of Medicine, Boston, Massachusetts, United States*

Prior work has investigated the correlates and consequences of early life stress within a person's lifetime, but less is known about whether early life stressors are sustained across generations. Using multi-generational data from 1,312 offspring and their fathers (N = 518 families), we examined the extent to which there is intergenerational continuity in childhood social class, childhood home atmosphere, parent-child relationship quality, and childhood health, as well as whether person-level and family-level factors strengthen (or weaken) intergenerational continuity. Results suggest notable intergenerational continuity in childhood social class, but no continuity in childhood home atmosphere, parent-child relationship quality, or childhood health. Moreover, the intergenerational continuity of early life stressors was modified by father education level and education mobility, such that low education level conferred risks, and upward education mobility conferred benefits, for offspring adverse experiences. We discuss broader implications of the findings for future research, clinical interventions, and social policy.

EARLY-LIFE STRESSORS, ADULT AFFECTIVE REACTIVITY TO DAILY STRESSORS, AND MORTALITY RISK

Emily Willroth[1], Jing Luo[2], Eileen Graham[2], Mina Antic[3], Maria Lopes[4], Avron Spiro[5], Daniel Mroczek[2], and Lewina Lee[6], *1. Washington University in St. Louis, St. Louis, Missouri, United States, 2. Northwestern University, Chicago, Illinois, United States, 3. Massachusetts General Hospital and Harvard Medical School, Boston, Massachusetts, United States, 4. Massachusetts General Hospital, Boston, Massachusetts, United States, 5. Boston University, Jamaica Plain, Massachusetts, United States, 6. Boston University School of Medicine, Boston, Massachusetts, United States*

Exposure to stressors in childhood is theorized to sensitize individuals to stressors experienced later in life. One way that stress sensitization might manifest is through greater affective reactivity to daily stressors. In turn, greater affective reactivity to daily stressors has been associated with poorer health and increased mortality risk. The present preregistered investigation tested greater affective reactivity to daily stressors in later life as a potential mediator of the association between early life stressors and mortality risk in a sample of 144 men from the VA Normative Aging Study. Partially consistent with our hypotheses, greater early life psychosocial stressors were associated with greater positive (but not negative) affective reactivity to daily stressors in later life. However, neither early life psychosocial stressors nor affective reactivity to daily stressors were significant predictors of mortality risk. We will discuss implications of these findings for theories of stress experience across the lifespan.

AGE DIFFERENCES EMOTION GLOBALIZING: AN EXAMINATION OF BOUNDARY CONDITIONS

Meaghan Barlow[1], Emily Willroth[2], Carsten Wrosch[3], Oliver John[4], and Iris Mauss[4], *1. Wilfrid Laurier University, Waterloo, Ontario, Canada, 2. Washington University in St. Louis, St. Louis, Missouri, United States, 3. Concordia University, Montreal, Quebec, Canada, 4. UC Berkeley, Berkeley, California, United States*

Emotion globalizing is an individual difference variable referring to the extent to which daily variations in an individual's current emotions spillover into their evaluations of life satisfaction. The present research sought to: 1) extend the conception of emotion globalizing to stressor-related emotions, 2) examine age differences in these processes, and 3) differentiate associations with evaluations of life satisfaction and day satisfaction. To do so, we used daily diary data from two adult lifespan community samples [Study 1: N = 133 females, age range = 23-78; Study 2: N = 137, age range = 18-95]. Multilevel models revealed older (compared to younger) adults exhibited less negative (but not positive) emotion globalizing and stressor-related emotion globalizing. No age differences were revealed in the association between stressor-related emotions and day satisfaction. These findings support and extend assumptions underlying the mechanisms of emotion globalizing and inform theories of emotional aging.

MID-LIFE JOB STRESS AND SUPPORT PREDICT SLEEP HEALTH TRAJECTORIES THROUGHOUT ADULTHOOD

Soomi Lee[1], Claire Smith[1], Tammy Allen[1], Meredith Wallace[2], David Almeida[3], Orfeu Buxton[3], Sanjay Patel[4], and Ross Andel[1], *1. University of South Florida, Tampa, Florida, United States, 2. University of Pittsburgh, Pittsburg, Pennsylvania, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Good sleep is necessary for healthy aging, but it may be threatened by work stress. This study connected midlife job characteristics to trajectories of sleep health profiles (within-person configurations of key self-reported facets: duration, regularity, sleep onset latency or SOL, insomnia symptoms, feeling unrested, and napping) over one decade. A working adult sample (N=847, Mage=45) of the Midlife in the United States study provided data on sleep and job characteristics in 2004-2006 (T1) and 2013-2016 (T2). Four sleep profiles were consistently identified at both time points: (1) good sleepers, (2) irregular but sufficient, (3) short sleepers, and (4) long SOL/insomnia. Higher job demands at T1 predicted a transition from good or irregular/sufficient sleep at T1 to long SOL/insomnia at T2. Higher workplace social support at T1 predicted maintenance of good or irregular/sufficient sleep over time. Attention to job demands and workplace social support may help promote sleep health.

COPING VARIABILITY AND ITS ASSOCIATION WITH ALL-CAUSE MORTALITY

Victoria Marino[1], Avron Spiro[2], and Lewina Lee[1],
1. Boston University School of Medicine, Boston, Massachusetts, United States, 2. Boston University, Jamaica Plain, Massachusetts, United States

Coping strategies – cognitive, behavioral, and emotional tactics used to manage stressors – are associated with morbidity and mortality. Between-strategy coping variability, defined as (un)evenness in usage across coping strategies, may reflect context-specific coping and account for additional variance in health outcomes beyond mean strategy use. This study examined prospective associations of mean coping strategy use and between-strategy coping variability with time to death in 823 men from the Normative Aging Study. In Cox proportional hazard models, 1-SD higher in mean usage of positive action, negative action, prayer, withdrawal, and substance use strategies was associated with 17-32% greater risk of all-cause mortality over 27 years, after adjusting for baseline demographics, health status, and depression. Contrary to prior research, mortality risk did not differ by coping variability. We will consider findings within the stress and coping framework and discuss implications for biobehavioral pathways linking coping to all-cause mortality.

SESSION 2630 (AWARD LECTURE)

M. POWELL LAWTON AWARD PRESENTATION AND LECTURE

Chair: Tiffany Washington

The M. Powell Lawton Award Lecture will feature an address by the 2021 recipient David L. Roth, PhD, FGSA, of Johns Hopkins University. This session will also include the presentation of the 2022 M. Powell Lawton Award to recipient Jon Pynoos, PhD, FGSA, FAGHE, of the University of Southern California. The M. Powell Lawton Award is presented annually to an individual who has made outstanding contributions from applied research that has benefited older people and their care. The Lawton Award is generously funded by the Polisher Research Institute of Abramson Senior Care.

FROM STRESSED CAREGIVERS TO HEALTHY CAREGIVING: THE IMPLICATIONS OF BALANCED PERSPECTIVES AND UPDATED FINDINGS

David Roth, *Johns Hopkins University, Baltimore, Maryland, United States*

Research on family caregiving continues to evolve and stress process models are now frequently balanced by perspectives of benefits emanating from prosocial behaviors including caregiving and volunteering. Initial findings that caregivers have elevated inflammation levels and shorter life expectancies than non-caregivers have been contradicted by numerous more recent findings from larger, population-based, epidemiological studies. In many ways, the caregiving literature shows a bias pattern that is sometimes found in other areas, where initial studies with relatively small samples and alarming results are widely cited, whereas subsequent studies with larger samples and contradicting results are given much less attention. A minority of caregivers are highly stressed, but most caregivers are resilient and face other challenges besides stress-related health problems. Caregivers are the backbone of long-term care, and interventions and policy initiatives to support caregivers are vital, but should be based on replicable findings of verifiable challenges to vulnerable caregiving subgroups.

SESSION 2640 (SYMPOSIUM)

METHODOLOGICAL APPROACHES TO GERONTOLOGICAL CANCER RESEARCH

Chair: Sean Halpin

The wide range of gerontological cancer research necessitates a variety of methodological approaches. In our symposium, we bring together researchers who represent varied approaches to studying multiple cancer types—with a focus on demonstrating how to apply different methods. First, Ye, will discuss the use of a unique cross-sequential design to facilitate comparison between health change in long-term older cancer survivors and demographically-matched older adults with no history of cancer. Zanwar, will present disparities in cancer screening using secondary nationally representative complex survey data, provide examples of survey data that can be utilized in aging and cancer prevention and control research, and present challenges and opportunities for using survey data. Von Ah, will discuss research methods pertaining to a series of non-pharmacological clinical trials and offer insight to reducing barriers and improving acceptability to technology-based intervention programs in older breast cancer survivors. Next, Castaneda will present quantitative (i.e., group trajectory modeling, conditional Poisson regression) and qualitative approaches to understand the role of monoclonal gammopathy of undetermined significance in healthcare utilization and progression to multiple myeloma. Last, Halpin will discuss the use of naturally occurring data such as participant observation and audio recordings to evaluate education for patients with multiple myeloma preparing for autologous stem cell transplant. Understanding how a variety of methodological approaches are applied to gerontological cancer research will help facilitate a broader understanding of the tools available for these studies.

DIFFERENCES IN HEALTH TRAJECTORIES BETWEEN CANCER SURVIVORS AND NONCANCER OLDER ADULTS

Minzhi Ye[1], Eva Kahana[2], Gary Deimling[2], Adam Perzynski[3], and Kurt Stange[4], *1. Kent State University, Cleveland, Ohio, United States, 2. Case Western Reserve University, Cleveland, Ohio, United States, 3. MetroHealth and Case Western Reserve University, Cleveland, Ohio, United States, 4. Case Western Reserve University Center for Community Health Integration, Cleveland, Ohio, United States*

The current study addresses how cancer and aging influence older adults' health trajectories differently. The unique cross-sequential design allowed the study to compare the health changes between long-term (5 years +) older cancer survivors (breast, prostate, and colorectal cancer) and demographic-matched older adults without a history of cancer in the same geographic area within the same period by merging two longitudinal studies. The study also captured comprehensive information on health disparities over time. General linear models were employed. The findings showed that neither previous cancer experience nor aging affects health trajectories in later life. Conversely, comorbidities, being African American, female, having less than a college degree, and living alone significantly decreased the health trajectory in later life for all older adults. Moreover, when compared to other groups, older African American cancer survivors reported low scores in self-reported health after controlling for other conditions.

ASSESSING CANCER SCREENING DISPARITIES USING SECONDARY SURVEYS: CHALLENGES AND OPPORTUNITIES

Preeti Zanwar, *Jefferson College of Population Health, Philadelphia, Pennsylvania, United States*

According to the WHO, cervical cancer is the fourth common cancer in women, with 90% each of the 604,000 new cases and 342,000 deaths in 2020 occurring in low-and middle-income countries. Cervical cancer can be cured if diagnosed early and treated promptly. Cervical cancer screenings by Pap-tests are evidence-based secondary prevention which are important in diagnosis and for receiving timely treatment for pre-cancerous lesions. I will present intersectional disparities in compliance with the U.S. Preventive Services Task Force guidelines for Pap testing in age-eligible women with disabilities by race/ethnicity using nationally representative Medical Expenditure Panel Survey. I find overall the proportion of women current with Pap testing is significantly lower among women with versus without disability. Additionally, I will provide example of other survey data such as the Behavioral Risk Factor Surveillance System that can be used for cancer screening and prevention and opportunities and challenges for using survey data.

RANDOMIZED CONTROLLED TRIALS FOR CANCER-RELATED COGNITIVE IMPAIRMENT IN OLDER CANCER SURVIVORS: LESSONS LEARNED

Diane Von Ah, *OSU, Columbus, Ohio, United States*

Breast cancer survivors (BCS) face a myriad of late and long-term symptoms including cancer-related cognitive impairment (CRCI). In fact, up to 75% of the 3.8 million BCS report concerns with memory, processing information speed, and decision-making. It is hypothesized that a subset of vulnerable BCS incur 'accelerated aging' resulting in CRCI with older BCS at greatest risk. CRCI has many downstream negative effects on everyday functioning and health-related quality of life. Despite considerable need, there are currently no effective treatments which have been sufficiently validated for CRCI. Cognitive training, which is based on the principles of neuroplasticity (brain's ability to reorganize and form new neural connections to accomplish tasks), may be a therapeutic option. Clinical trials from our lab and others offer insights into the needs of BCS with CRCI and considerations (facilitators, barriers, acceptability and satisfaction) for older BCS will be highlighted to address this potentially debilitating symptom.

THE ROLE OF A MONOCLONAL GAMMOPATHY OF UNDETERMINED SIGNIFICANCE DIAGNOSIS IN HEALTHCARE UTILIZATION

Maira Castaneda-Avila[1], Kate Lapane[2], and Mara Epstein[3], *1. University of Massachusetss Chan Medical School, Shrewsbury, Massachusetts, United States, 2. University of Massachusetts Chan Medical School, Worcester, Massachusetts, United States, 3. Meyers Health Care Institute, Department of Medicine, UMass Chan Medical School, Worcester, Massachusetts, United States*

Monoclonal Gammopathy of Undetermined Significance (MGUS) is an understudied precursor of multiple myeloma (MM), the second most prevalent hematologic malignancy in the US. MGUS is incidentally diagnosed, and its significance is unclear as only 1% per year transition to MM. MGUS is highly prevalent among adults aged ≥ 50 years. In this presentation, we will review mixed-method approaches. Using healthcare claims and electronic health records from patients in central Massachusetts, we applied group-based trajectory modeling and conditional Poisson regression. These analyses were complemented by a qualitative analysis of in-depth interviews with providers and MGUS patients. Together, these methodologies provided a comprehensive evaluation of the impact of MGUS on healthcare utilization in older adults. The qualitative analysis provided a better understanding of the patient and provider factors influencing healthcare utilization after an MGUS diagnosis. The presentation will highlight how the use of these methodologies provide different perspectives among understudied premalignant conditions.

USING NATURALLY OCCURRING QUALITATIVE DATA IN GERONTOLOGICAL CANCER RESEARCH

Sean Halpin[1], and Michael Konomos[2], *1. Evidera, Decatur, Georgia, United States, 2. Emory University, Atlanta, Georgia, United States*

Cancer therapies for older adults have accelerated at breakneck speed in the last few decades, necessitating evaluation of their delivery and uptake to ensure patients receive their maximum benefit. Among the vast array of evaluation tools available, those utilizing naturally occurring data—data produced without intervention from a researcher—are a powerful but underused tool. In this presentation, we will review two methods for examining naturally occurring data, participant observation and conversation analysis (CA), in an educational intervention study of multiple myeloma patients receiving autologous stem cell transplant. First, we will review how participant observation of nurse-led education visits (n=70) was incorporated to iteratively improve video-based education. Next, we will review use of CA in reviewing audio recordings containing reference to the education videos of 12 nurse-led education visits (1011 minutes of audio). Ultimately, understanding the purposes of and ways of using naturally occurring data have potential for improving the evaluation of patient education.

SESSION 2650 (SYMPOSIUM)

NARROWING THE DISPARITIES GAP IN LTSS: POLICY AND PRACTICE

Chair: Rita Choula

Access to and the quality of long-term supports and services (LTSS) are not equitable for all older Americans.

Disparities have been documented qualitatively and quantitatively for marginalized racial and ethnic communities and LGBTQI+ communities but the specific causes of gaps in equity differ by community, locality, and state. To be effective, policy solutions must be grounded in the lived experiences of Black, Latino, Asian American and Pacific Islander, and LGBTQI+ older adults in those communities. This symposium showcases how community-based research can be employed to understand the root causes of inequities in LTSS access and care affecting older adults of color and LTGBTQI+-identifying older adults and presents community-grounded policy solutions to remedy those inequities. Papers 1 and 2 use participatory research methods to understand barriers to equitable LTSS care access and quality and develop locally grounded solutions to those barriers. Caldera (Paper 1) shares results from a study of Cook County, IL nursing home residents and their caregivers focused on racial and ethnic disparities in access to and experiences with nursing home care. Hado (Paper 2) presents findings from research in Georgia and New York examining disparities in access to and experiences with HCBS for older racial and ethnic and LGBTQI+ communities. Fashaw-Walters (Paper 3) discusses the how systemic racism is at the root of inequities in LTSS access for communities of color and shares actionable recommendations aimed at ending racial and ethnic inequities in LTSS policies.

UNDERSTANDING RACIAL AND ETHNIC DISPARITIES IN NURSING HOME CARE IN COOK COUNTY, IL

Selena Caldera, *AARP, Washington, District of Columbia, United States*

Nursing facility data from the Illinois Department of Public Health reveals significant racial disparities in access to high quality nursing homes (NH) for older Black and Latino Illinoisans. While half of all Illinois NH residents live in a 1- or 2- star rated nursing home, 68% of Black NH residents live in such facilities. This study seeks to understand racial and ethnic disparities in access to, quality of, and experiences with care in Cook County, Illinois NHs and develop community-identified solutions to close quality, access, and equity gaps. We employ key informant interviews in a two-stage process that begins by developing a current state analysis of the experience with care through interviews with community stakeholders, including advocacy groups, policy and community leaders and public agencies. Those findings then guide interviews with older Black, Latino, and Chinese NH residents and their caregivers where we identify community-grounded solutions to closing equity gaps.

NARROWING RACIAL AND ETHNIC DISPARITIES IN HOME AND COMMUNITY-BASED SERVICES

Edem Hado, *AARP, Washington, District of Columbia, United States*

Older adults overwhelmingly prefer to age at home and in their community, yet research shows uneven access to quality home and community-based services (HCBS), especially among diverse racial and ethnic groups. Our research in Georgia and New York employs participatory research methods, including key informant interviews and focus groups conducted in 2021 and 2022, to identify root causes of disparities in access to, quality of, and experience with HCBS for older racial and ethnic and LGBTQI+ communities. Some root causes identified include: complexity in and lack of funding, tension between equal versus equitable service provision, and meaningful community outreach, particularly in Latino communities. We then identify scalable opportunities policy and programmatic interventions to improve care and service equity for older adults in those communities.

ADDRESSING SYSTEMIC RACISM ACROSS LONG-TERM SERVICES AND SUPPORTS

Shekinah Fashaw-Walters[1], Tetyana Shippee[2], and Jasmine Travers[3], *1. University of Minnesota School of Public Health, Minneapolis, Minnesota, United States, 2. University of Minnesota, Minneapolis, Minnesota, United States, 3. NYU, New York City, New York, United States*

Long-term services and supports (LTSS) are some of the most racially segregated healthcare services in the U.S. today. Marginalized users (e.g., Black and Latino older adults) have disproportionate access to high-quality care and subsequently report poorer health outcomes when compared to White users. It is important to acknowledge racism as a fundamental cause of these inequities to LTSS access. As the U.S. works to expand LTSS, it is critical to diversify and strengthen the LTSS workforce, increase Medicaid reimbursements along with efforts to improve accountability and transparency, reconsider payment models and the use of public reporting, improve quality metrics, implement effective support systems for patients of color, expand access to care, and increase promotion of integrated care. Health equity researchers, Drs. Tetyana Shippee, Shekina Fashaw-Walters, and Jasmine Travers will share 7 actionable evidence-based recommendations for LTSS policy change aimed to dismantle racism and advance health equity.

SESSION 2660 (SYMPOSIUM)

PHYSICAL AND MENTAL HEALTH OUTCOMES AMONG OLDER MILITARY VETERANS

Chair: Scott Landes Co-Chair: Janet Wilmoth

Older veterans are a unique health population, with physical and mental health outcomes impacted by the positive health aspects of military social capital as well as the negative aspects of military-related hazards. This symposium focuses on physical and mental health outcomes among older military veterans both before COVID-19, and during the COVID-19 pandemic. Three studies address veteran health outcomes pre-pandemic. Two of the pre-pandemic studies focus on veteran-only samples in order to determine whether aspects of marital quality predicted levels of loneliness, and risk factors for trauma re-engagement among those with medical illness. The third pre-pandemic study examines whether the increased mortality risk observed among older veterans compared to nonveterans varies by combat status. Two studies address veteran health outcomes during the COVID-19 pandemic. The first uses a sample of older veterans with PTSD who were surveyed pre-pandemic and during the pandemic in order to ascertain the mental and physical health impact of the pandemic. The second COVID-19 study uses data from a study of Veterans Affairs' Home

Based Primary Care (HBPC) providers to learn about the best practices discovered to ensure COVID-19 vaccination uptake by some of the most vulnerable older veterans. Results from each of these studies will shed light on policies and practices needed to ensure the best physical and mental health outcomes for older military veterans.

MORTALITY RISK AMONG OLDER VETERANS AND NONVETERANS: THE IMPORTANCE OF COMBAT STATUS

Scott Landes[1], and Jennifer Piazza[2], *1. Syracuse University, Syracuse, New York, United States, 2. California State University, Fullerton, Fullerton, California, United States*

Over 17.4 million Americans have served in the U.S. armed forces. Although long-term mortality risk is reported to be higher among older veterans than nonveterans, research does differentiate whether there is variation by combat status. This study examined later-life mortality rates among nonveterans, noncombat veterans, and combat veterans. Data were from Wave 2 of the Midlife Development in the United States Survey (N = 4,633). Participants included 3832 nonveterans, 584 noncombat veterans, and 217 combat veterans. Mortality rates did not differ when comparing nonveterans and noncombat veterans. Combat veterans, however, had a higher risk of mortality than did than nonveterans. Combat experience is a determinant of long-term mortality risk among veterans. Future studies should account for combat status when comparing health and mortality between veterans and nonveterans. Because of their heightened mortality risk, combat veterans should be provided with additional services during and after their time in the armed forces.

EXPLORING MULTIDIMENSIONAL RESILIENCE IN OLDER VETERANS WITH PTSD DURING THE PANDEMIC

Katherine Hall, *Durham VA Health Care System, Durham, North Carolina, United States*

The COVID-19 pandemic and restrictions for physical and social distancing has affected all older adults, but one segment that has unique needs and experiences is older veterans with PTSD. This presentation will explore how PTSD symptomology, and psychosocial functioning in this population have changed compared to pre-pandemic findings. The impact of the pandemic on daily life activities and functional impairment will also be explored. Participants recruited to a wellness clinical trial for older veterans with PTSD at two different timepoints (pre-pandemic, n=54; post-pandemic, n=28) completed PTSD and mental health assessments, and a physical performance battery testing strength, mobility, balance, and aerobic endurance. PTSD symptoms, specifically avoidance and hypervigilance were markedly lower in the post-pandemic sample. Higher levels of physical impairment were observed in the post-pandemic sample, suggesting a need for targeted outreach and health promotion programs among older adults with PTSD symptoms during the pandemic.

MARITAL QUALITY AND LONELINESS AMONG AGING COMBAT VETERANS: THE MODERATING ROLE OF PTSD SYMPTOMS

Christina Marini[1], Jeremy Yorgason[2], and Anica Pless Kaiser[3], *1. Adelphi University, Garden City, New York, United States, 2. Brigham Young University, Provo, Utah, United States, 3. VA Boston Medical Center, Jamaica Plain, Massachusetts, United States*

Loneliness is a robust predictor of aging veterans' health. Even married older adults may experience loneliness if their relationships are of poor quality. We therefore examined facets of marital quality as predictors of loneliness within a sample of aging veterans: (1) companionship (relationship promotes connection to spouse) and (2) sociability (relationship promotes connection to others). We further evaluated whether veterans' PTSD symptoms moderated these associations. We utilized two waves of data from 269 Vietnam-era combat veterans (M age = 60.5, SD = .73) collected in 2010 and 2016. Upon controlling for baseline loneliness, demographics, and chronic conditions, higher companionship and sociability each predicted lower subsequent loneliness. We detected interactions between companionship and PTSD subclusters. For example, companionship protected against loneliness only for veterans with low and moderate (but not high) avoidance. Findings highlight nuances in how marital quality predicts aging veterans' loneliness, some of which are dependent on PTSD symptoms.

DISCUSSING AND DELIVERING THE COVID-19 VACCINE: EXPERIENCES IN VA'S HOME BASED PRIMARY CARE PROGRAM

Tamar Wyte-Lake[1], Suzanne Gillespie[2], Chelsea Manheim[3], Aram Dobalian[4], and Leah Haverhals[5], *1. Veterans Emergency Management Evaluation Center (VEMEC), US Department of Veterans Affairs, North Hills, California, United States, 2. VA Finger Lakes Health Care System, Canandaigua, New York, United States, 3. Rocky Mountain Regional VAMC, Aurora, Colorado, United States, 4. Veterans Emergency management Evaluation Center, North Hills, California, United States, 5. VA Eastern Colorado Health Care System, Rocky Mountain Regional VA Medical Center, Denver, Colorado, United States*

COVID-19 vaccines represented a new type of vaccination with specific logistical challenges for distribution and administration. As the Department of Veterans Affairs (VA) embarked on a campaign to vaccinate its Veterans, homebound Veterans presented unique challenges. Therefore, we studied how VA's Home Based Primary Care (HBPC) teams vaccinated Veterans to inform best practices for future vaccination efforts for similar vulnerable populations. From March-May 2021, we fielded a survey to HBPC staff at 145 VA programs nationally, gathering insights from 73 teams. Findings highlighted the importance of vaccine communication and education; the need to prioritize HBPC Veterans receiving vaccines; ironing out vaccine distribution and administration logistics; and that internal and external structures were required to safely vaccinate Veterans in-home.

ADDRESSING TRAUMA IN OLDER VETERANS IN HOME-BASED PRIMARY CARE

Jennifer Moye[1], Hannah Bashian[2], Hannah Heintz[3], Jennifer Daks[3], Lola Baird[4], Anica Pless Kaiser[5], Kelly O'Malley[1], and Anna Etchin[5], *1. VA Boston Healthcare System, Boston, Massachusetts, United States, 2. VA Boston HCS, Boston, Massachusetts, United States, 3. VA Boston Healthcare System, Jamaica Plain, Massachusetts, United States, 4. Boston VA Medical Center, Jamaica Plain, Massachusetts, United States, 5. VA Boston Medical Center, Jamaica Plain, Massachusetts, United States*

As Veterans age, confronting illness and role changes, they may experience later adulthood trauma reengagement (LATR). To better understand this process in medically ill Veterans, we completed six focus groups with 21 VA Home Based Primary Care (HBPC) mental health clinicians in rural and urban settings; 14 completed a follow-up survey. Thematic analysis of focus groups confirmed the LATR model with unique presentation and treatment challenges related to medical, physical, and cognitive changes. In surveys, the most challenging symptoms were: intrusive symptoms, dissociative reactions, and psychological/physiological reactivity (79%). In addition to focus group themes, surveys described challenges related limited social engagement, Veteran ambivalence, and lack of empirically supported treatments appropriate to HBPC. Results of these focus group and survey data provide key insights into the unique presentation of trauma in aging medically ill Veterans. Ongoing efforts to adapt materials and resources for this population will be described.

SESSION 2670 (SYMPOSIUM)

SENSORY LOSS AND BRAIN HEALTH: SPOTLIGHTING JUNIOR INVESTIGATORS IN THE SENSORY HEALTH INTEREST GROUP

Chair: Jennifer Deal Discussant: Heather Whitson

Sensory loss (hearing, vision, touch, smell, taste) is common in older adults, with over 2/3 of adults over age 55 experiencing loss in multiple senses. Sensory loss has been consistently linked to dementia and cognitive decline in epidemiologic studies. However, research gaps exist, with some senses having been studied more widely than others. Given differing underlying anatomy and physiology of the senses, the nature of the pathways linking sensory loss to dementia may vary and some have yet to be elucidated. For some, it may be that they are both caused by a common underlying biology (e.g., neurodegeneration). Alternatively, potential causal mechanisms include increased cognitive load, changes brain structure/function, social isolation and/or reduced activity. Additionally, gaps exist in how sensory loss may impact the lived experience of people with dementia. This session will address these research gaps by highlighting the work of outstanding junior investigators in the GSA Sensory Health Interest Group. The association between touch and dementia will be reported, a relationship which hitherto has not been well described. We will present on the relationship between olfaction and white matter integrity in the brain and describe how sensory function predicts levels of Alzheimer's disease biomarkers over 10 years. We will present evidence for associations between audiometric hearing, structural brain volumes, white matter integrity, and cognitive test performance on speech-in-noise processing and will conclude by describing how hearing loss may impact patient-provider communication among older adults with dementia.

TOUCH SENSATION IS AN UNDERSTUDIED PREDICTOR OF DEMENTIA RISK IN OLDER ADULTS

Willa Brenowitz[1], Nathaniel Robbins[2], Elsa Strotmeyer[3], and Kristine Yaffe[1], *1. University of California, San Francisco, San Francisco, California, United States, 2. Geisel School of Medicine, Dartmouth, Lebanon, New Hampshire, United States, 3. School of Public Health, University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Few studies have focused on touch sensation as risk factor or marker of dementia, although other sensory impairments are associated with cognitive decline. We studied touch sensation as measured by peripheral sensory nerve function; impairment was defined as insensitivity to 10-g monofilament or vibration detection threshold >130µm of the toe, in 2,174 Black and White participants (52% women; 35% black, aged 70-79 years) from Health, Aging, and Body Composition Study who were ambulatory and without dementia at enrollment. Incident dementia over the following 11 years was determined based on medical records, cognitive scores, and medications. Impaired touch sensation was associated with a 1.63-fold higher risk of dementia (95% CI 1.21, 2.19) after adjustment for demographics, health behaviors, and health conditions. Associations persisted even after additional adjustment for hearing, vision, and smell (HR: 1.45; 95%CI 1.09, 2.03). These findings highlight the underappreciated association between poor touch sensation and risk of dementia.

OLFACTORY IMPAIRMENT AND MICROSTRUCTURAL INTEGRITY OF THE BRAIN IN THE ARIC STUDY

Srishti Shrestha[1], Xiaoqian Zhu[1], Kevin Sullivan[2], Beverly Gwen Windham[2], Jennifer Deal[3], Honglei Chen[4], Michael Griswold[5], and Thomas Mosley[2], *1. University of Mississippi Medical Center, Jackson, Mississippi, United States, 2. UMMC-The MIND Center, Jackson, Mississippi, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States, 4. College of Human Medicine, Michigan State University, East Lansing, Michigan, United States, 5. The MIND Center at UMMC, Jackson, Mississippi, United States*

We examined cross-sectional associations between microstructural integrity of the brain and olfaction in 1417 participants from the ARIC Study who completed MRI scans in 2011-2013 (mean age=76±2 years, 41% male). Microstructural integrity was measured by two diffusion tensor imaging measures, fractional anisotropy (FA, higher=better) and mean diffusivity (MD, higher=worse), and olfaction by a 12-item odor-identification test. In multivariable linear regression models, higher FA in several regions was associated with better olfaction, with the strongest association in the stria terminalis [β:0.333 (95%CI:0.188, 0.478) per standard deviation (SD) higher FA]. Higher MD was associated with lower olfaction in almost all regions, but associations were strongest for some temporal sub-regions [for example, hippocampus, β:-0.796 (95%CI: -0.942, -0.651) per SD higher MD]. Our findings suggest that neuronal microstructural integrity is an important predictor of olfaction; this may also have important implications in understanding early dementia neuropathology as olfaction is affected very early in dementia.

TEMPORAL ASSOCIATIONS OF SENSORY FUNCTION AND BLOOD-BASED NEURODEGENERATIVE AND ALZHEIMER'S DISEASE BIOMARKERS

Natascha Merten[1], Adam Paulsen[2], Richard Chappell[3], Yanjun Chen[2], Karen Cruickshanks[4], Corinne Engelman[5], Laura Hancock[6], and Carla Schubert[2], *1. School of Medicine and Public Health, University of Wisconsin-Madison, Madison, Wisconsin, United States, 2. Department of Ophthalmology and Visual Sciences, School of Medicine and Public Health, University of Wisconsin-Madison, Madison, Wisconsin, United States, 3. Department of Biostatistics and Medical Informatics, School of Medicine and Public Health, University of Wisconsin-Madison, Madison, Wisconsin, United States, 4. McPherson Eye Research Institute, University of Wisconsin-Madison, Madison, Wisconsin, United States, 5. Department of Population Health Sciences, School of Medicine and Public Health, University of Wisconsin-Madison, Madison, Wisconsin, United States, 6. Department of Neurology, School of Medicine and Public Health, University of Wisconsin-Madison, Madison, Wisconsin, United States*

Sensory changes are risk factors of neurodegeneration and Alzheimer's Disease (AD) but their relations with emerging blood-based biomarkers of neurodegeneration and AD are rather unknown. We assessed long-term temporal relationships of sensory functions and blood-based neurodegenerative and AD biomarkers.This study is based on 10-year follow-up data of n=1529 (primarily middle-aged) Beaver Dam Offspring Study participants. We conducted pure-tone audiometry, visual acuity testing, and quantified serum neurofilament light chain (NfL), total tau, and amyloid beta. Linear mixed-effects and linear regression models were used to determine longitudinal associations and the effect sizes of temporal effects.Preliminary analyses revealed that NfL increased slightly more slowly per year with every 1SD better hearing (-0.3%/year[-0.5%,-0.1%]) and vision (-0.2%/year[-0.4%,0.01%]). Effect sizes of baseline sensory function effects on NfL levels 10-years later were 3-4 times larger than effects of the opposite direction. Longer follow-up is needed to confirm whether hearing changes occur before blood-based NfL changes.

ASSOCIATIONS OF AUDIOMETRIC HEARING, BRAIN MRI, AND COGNITIVE PERFORMANCE WITH SPEECH-IN-NOISE PERFORMANCE

Kening Jiang[1], Josef Coresh[2], Kathleen Hayden[3], Clifford Jack, Jr.[4], Thomas Mosley[5], James Pankow[6], Frank Lin[1], and Jennifer Deal[2], *1. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins University, Baltimore, Maryland, United States, 3. Department of Social Sciences and Health Policy, Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 4. Mayo Clinic, Rochester, Minnesota, United States, 5. UMMC-The MIND Center, Jackson, Mississippi, United States, 6. University of Minnesota, Minneapolis, Minnesota, United States*

Speech-in-noise performance is fundamental to daily communications and comprehensive characterization is needed. We studied 590 dementia-free participants aged 70-84 years, including 428 hearing-impaired participants from the Aging and Cognitive Health Evaluation in Elders (ACHIEVE) study baseline (2018-19), which is a randomized controlled trial partially nested within the Atherosclerosis Risk in Communities (ARIC) Study, and 162 normal-hearing ARIC Visit 6/7 (2016-17/2018-19) participants. The Quick Speech-in-Noise (QuickSIN) test was used to measure speech-in-noise performance. Predictors included (1) Four-frequency better-ear pure-tone average (PTA); (2) Magnetic resonance imaging (MRI) measures (total and lobar volumes, diffusion tensor imaging, white matter hyperintensities); (3) Global and domain-specific (language, memory, executive function) cognitive performance. All predictors were standardized to Z-scores. We used multivariable-adjusted linear regression, adjusting for demographic and disease covariates. PTA and cognitive performance, but not MRI measures, were independently associated with speech-in-noise performance, with PTA explaining the largest variance, indicating the promising role of hearing aids.

DEMENTIA AND HEARING LOSS: A DOUBLE HIT ON PATIENT-PROVIDER COMMUNICATION?

Danielle Powell[1], and Nicholas Reed[2], *1. Johns Hopkins University, Baltimore, Maryland, United States, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Hearing difficulty may adversely impact patient-provider communication and be exacerbated by the presence of other conditions like dementia. We examined the association between reported Alzheimer's disease/dementia and reported difficulty communicating with providers. Using the 2019 Medicare Current Beneficiary Survey, we included participants were aged ≥65 years who reported functional difficulty hearing. Exposure was the presence of reported Alzheimer's disease/dementia. Our outcome is reported difficulty communicating with medical providers. Multivariate logistic regression was used for association between the added presence of dementia and reported difficulty communicating with healthcare providers. Among 5,535 beneficiaries reporting hearing difficulty, diagnosis of Alzheimer's disease or another dementia showed 2.76(95%CI:1.97-3.87) times greater odds of reporting difficulty communicating with providers compared to not reporting dementia. In summary, older adults with reported hearing difficulty and dementia may have increased difficulty communicating with medical providers. Findings suggest hearing management may aid in improving health outcomes for adults with dementia.

SESSION 2680 (PAPER)

SUPPORTING PERSON-CENTERED CARE

ASSESSING PREFERENCES FOR COMMUNICATING WITH TECHNOLOGY: A PERSON-CENTERED APPROACH TO CARE MANAGEMENT

Andrea Sillner[1], Marie Boltz[2], Logan Sweeder[3], and Kimberly Van Haitsma[4], *1. Pennsylvania State University Ross and Carol Nese College of Nursing, University Park, Pennsylvania, United States, 2. Penn State, Pennsylvania State University, Pennsylvania, United States, 3. The Pennsylvania State University, State College, Pennsylvania, United States, 4. Pennsylvania State University, University Park, Pennsylvania, United States*

Technological advances, such as telehealth, have been used to manage the multiple chronic conditions that impact over 25% of the US adult population. Technology-assisted communication (TAC) can help to bridge the gap in effective management of health conditions in the community by patients, informal caregivers, and healthcare providers, while emphasizing person-centered care. The purpose of this project was to develop a new theoretically-derived and evidence based subscale for the Preferences for Everyday Living Inventory (PELI) that addresses preferred TAC approaches for community-dwelling adults over the age of 50 years in the context of multiple chronic conditions (N=297). Results indicated that over 60% of older adults are satisfied with technology-based healthcare communications. In general, older adults in the sample are satisfied with all domains of technology-assisted communication that are asked within P-TAC, including timing, sending and receiving of information, and content of communications. Almost 80% (N=234) indicate that they are satisfied with the content of TAC. This research has lead to the development of assessment items that will allow providers to better assess and then integrate patient preferences for technology communication strategies into plans of care. Potential benefits of understanding preferences for TAC include alignment of chronic care management with preferred strategies which may lead to improvement care congruence and improved healthcare outcomes for the older adult.

HEALTH LITERACY AMONG OLDER ADULTS IN SWITZERLAND: CROSS-SECTIONAL EVIDENCE

Clément Meier[1], Sarah Vilpert[1], Carmen Borrat-Besson[1], Gian Domenico Borasio2, Ralf J. Jox[3], and Jürgen Maurer[1], *1. University of Lausanne, Lausanne, Vaud, Switzerland, 2, Lausanne University Hospital and University of Lausanne, Lausanne, Vaud, Switzerland, 3. Lausanne University Hospital and University of Lausanne, Lausanne, Vaud, Switzerland*

Despite being widely regarded as a major cause of health inequalities, little is known regarding levels of health literacy among older adults in Switzerland. To fill this gap, this study assesses health literacy and its associations with individuals' social, regional, and health characteristics in a nationally representative sample of adults aged 58 years and older in Switzerland. We use data of 1'625 respondents from a paper-and-pencil self-completion questionnaire that was administered as part of wave 8 (2019/2020) of SHARE in Switzerland. Health literacy is measured using the short version of the European Health Literacy Survey questionnaire (HLS-EU-Q16). We use multivariable regressions to explore how respondents' sociodemographic characteristics are independently associated with health literacy. Overall, 6,8% of the respondents had inadequate health literacy, 24,6% problematic health literacy, and 68,6% sufficient health literacy. There were significant associations between health literacy and individuals' gender, education, economic situation, and self-rated health. Women had higher levels of health literacy than men ($p < 0,001$). Moreover, a higher education level ($p < 0,001$), fewer financial difficulties ($p< 0.01$), and higher self-rated health ($p < 0,001$) were positively correlated with adequate/higher levels of health literacy. One-third of older citizens have difficulties managing health-related issues in Switzerland. These findings call for targeted interventions, such as using simplified health or eHealth information tools, improved patient-provider communication, and shared decision-making, promoting lifelong learnings activities and health literacy screening for older patients to increase low health literacy and mitigate its consequences, thereby alleviating remaining social health inequalities in the Swiss population.

MULTILINGUAL THEMATIC ANALYSIS USING VARIED TRANSLATIONS AND LINGUISTIC VALIDATION OF CODES: ADVANCING INCLUSION

Orly Tonkikh[1], Elena O. Siegel[1], Anna Zisberg[2], Nurit Gur-Yaish[3], Ksenya Shulyaev[4], Amos Rogozinski[4], and Heather Young[1], *1. University of California Davis, Sacramento, California, United States, 2. University of Haifa, Israel, Haifa, Hefa, Israel, 3. Oranim Academic College of Education, Tivon, Hefa, Israel, 4. University of Haifa, Haifa, Hefa, Israel*

Despite the widely acknowledged cultural diversity among older adults and family caregivers, the representation of people from different linguistic backgrounds in a single study is rare. Single language is a common inclusion criterion, limiting the diversity of samples. Performing cross-cultural qualitative research using several languages within a study requires a systematic data harmonization approach to assure the trustworthiness of the analysis. This paper describes strategies used to establish trustworthiness in the multi-lingual thematic analysis of a dyadic qualitative descriptive study of older adults hospitalized in general hospitals and family members who accompanied them during the hospitalization. Participant interviews (n=22) were conducted in English, Hebrew, and Russian according to individual preferences. Four of the dyads (8 participants) were interviewed in different languages. Based on the template analysis approach, we performed multiple multi-lingual translations and linguistic validation of an inductively identified high-level coding scheme. Each linguistic validation process included a reconciliation of two forward translations and harmonization using back translation, performed for each pair of languages. We describe the rationale for decisions regarding the translation process (the timing of translation after establishing a high-level coding scheme, using a hermeneutic translation approach to achieve conceptual equivalence, variability in the socio-demographic context of the translators, recruitment of both translators and linguists). This study provides principles of a feasible systematic approach to overcome linguistic barriers in caregiving research, providing an avenue for inclusive research among multi-cultural and multi-lingual study samples.

OLDER ADULTS' PERSPECTIVES OF INDEPENDENCE THROUGH TIME: RESULTS OF A LONGITUDINAL INTERVIEW STUDY

Emily Taylor[1], Julia Frost[2], Victoria Goodwin[2], Susan Ball[2], and Andrew Clegg[3], *1. University of Exeter, Truro, England, United Kingdom, 2. University of Exeter, Exeter, England, United Kingdom, 3. University of Leeds, Leeds, England, United Kingdom*

Understanding how older people experience, and adapt to maintain, independence through time has implications for person-centred care. Quantifiable measures can provide a gauge of change in practice. However, little is known about how older people themselves perceive independence through time, or whether measures used are commensurate with what matters to older people. This study aimed to identify whether and how older adults assimilate their perceptions of independence in response to change through time. Two semi-structured interviews were conducted longitudinally, one year apart, to explore the views of 12 community-dwelling older adults, aged 76-85 years. A constructionist approach using dramaturgical and descriptive codes, facilitated the data interpretation. Sixteen analytical questions guided exploration of participants' perceptions of independence through time. Interview participants felt that common interpretations of independence underestimated, and omitted, important aspects of their experience through time. Some participants questioned the value of instruments that were insensitive to individual values and context. Changes in life trajectories required participants to adapt the form, or means of obtaining independence. The impact of change on participants' sense of independence was value-dependent, informed by the function a participant ascribed to maintaining independence. This study builds on the understanding of independence as a complex and multifaceted construct. The findings challenge the congruence of common interpretations of independence with older people's views, showing areas of commonality and discrepancy. Exploration of independence in terms of form and function provides important understanding about how continuity of function takes precedence to form in determining the maintenance of independence through time.

RE-EXAMINING PATIENT-CENTERED CARE THROUGH DESIGN PROCESS

Kristine Mulhorn[1], and Shushi Yoshinaga[2], *1. Drexel University, Wallingford, Pennsylvania, United States, 2. Drexel University, Philadelphia, Pennsylvania, United States*

Service design is the adoption of design process to healthcare and other service sectors. This was a transdisciplinary research project in which investigators were faculty members from Graphic Design and Health Administration. In addition, two student research assistants were recruited from undergraduate Graphic Design and Health Science majors. The objective of service design is to involve consumers, designers, and businesspeople in an integrative process, which can be applied to post-acute rehabilitation hospital settings focusing specifically on the experience of those who are 65 and older. The aim of this pilot study was to explore "designing with people rather than just for them", an approach to improve the patient experience. Our first step involved on-site interviews. The patient narratives raised challenges and positive aspects of their interactions with the facility. On our initial site visit, we interviewed five members of clinicians and administrative staff. During the two follow-up visits, our student research assistants interviewed seven patients. Based on our staff member interview findings, we developed a revised set of questions for patients. The questionnaire was divided into three sections related to appointments: pre-arrival, during the visit, and after their appointments. Interview results were summarized in a visual data format and collaborative recommendations were made during the final presentation such as interior layout, wayfinding, online portal and their functionalities. Our findings also confirmed that the interior signage created confusion, promoting frequent questions to staff. These results will engage stakeholders and contribute to a co-designing process that will ultimately improve the patient journey.

SESSION 2690 (SYMPOSIUM)

TALKING ABOUT LONELINESS: QUALITATIVE INSIGHTS FROM OLDER ADULTS: IMPLICATIONS FOR RESEARCH, POLICY, AND SERVICES

Chair: Roger O'Sullivan Discussant: Gerry Leavey

The very personal and complex nature of loneliness is too rarely articulated in research papers. Each presenter in this interdisciplinary and international symposium presents insights into loneliness and /or social isolation that can help bridge this gap. Victor (Social Gerontology) using open ended responses from the 2018 BBC Loneliness Experiment, presents how 1480 older people describe loneliness and highlights the need to give more attention to existential loneliness. O'Sullivan (Public Health) presents the results of 18 life story interviews with older adults attending a mental health service. The analysis identified three different typologies of loneliness with specific recommendations for training and services. Phone-based support programs are increasingly being used as a solution for those experiencing loneliness. However, less is known about what aspects are most helpful. Perissinotto (Geriatrics and Palliative care) presents results from 38 qualitative interviews with a focus on barriers and facilitators to implementing a phone-based support intervention, particularly for older adults experiencing loneliness. Cudjoe (Medicine) presents qualitative data from older adults (English, Spanish and Mandarin speaking), living in non-profit affordable housing in 22 different states. Drawing on experiences of their social connections during the COVID-19 pandemic, the paper gives voice to the implications of the loss of common facilities, and opportunities to socialize with other residents, and the increased role technology plays in staying connected. Our discussant, Prof Leavey, a leader in the field of mental health, will reflect on the major themes emerging from these multidisciplinary perspectives, especially what they mean for public health and services.

LONELINESS ACROSS THE LIFE COURSE; LIFE STORY INTERVIEWS WITH MENTAL HEALTH SERVICES USERS

Roger O'Sullivan[1], Annette Burns[2], Gerry Leavey[3], Jeannette Golden[4], Dermot Reilly[4], and Brian Lawlor[5], *1. Institute of Public Health in Ireland, Belfast/Dublin, Ireland, 2. Institute of Public Health, Dublin, Dublin, Ireland, 3. Ulster University, Belfast, Northern Ireland, United Kingdom, 4. Saint James' Hospital, Dublin, Dublin, Ireland, 5. Trinity College Dublin, Dublin, Dublin, Ireland*

Introduction: The complexity of loneliness and its negative impact on our health and wellbeing is well established. However, the qualitative experience of loneliness over the life course is poorly understood. Method: This presentation, based on 18 life story interviews, with a sample of older adults, who were attending a mental health service and objectively defined as lonely, provides an insight into the personal experiences of loneliness as well as the situations and factors associated with loneliness across the life course.

Results: The analysis identified three distinct typologies of loneliness; those who experienced (1) chronic loneliness across their life (2) those whose loneliness became chronic after a transition e.g. bereavement (3) those whose loneliness remained situational/transitional.

Conclusions: The insights are important to inform both general loneliness services and policy as well as specialist mental health services and training. The presentation demonstrates the importance of a life course approach to addressing and understanding loneliness.

HOW DO LONELY OLDER PEOPLE TALK ABOUT LONELINESS? PRELIMINARY ANALYSIS OF THE BBC LONELINESS EXPERIMENT

Christina Victor[1], Manuela Barreto[2], and Pamela Qualter[3], *1. Brunel University London, London, England, United Kingdom, 2. University of Exeter, Exeter, England, United Kingdom, 3. University of Manchester, Manchester, England, United Kingdom*

Three types of loneliness, social, emotional and existential, are identified in research, policy and practice. Do these categories reflect the language used by older adults to describe their experiences of loneliness? We use data from the 2018 BBC Loneliness Experiment and focus upon lonely adults aged 60 and older, living in the UK and with a maximum score of 9 on the UCLA loneliness scale. 1619 participants meet these criteria, 1480 provided a response to the question ''What does loneliness mean to you?" Participants ages ranged from 60-94; 90% aged 60-74 and 38% male. Free text answers ranged from 1-189 words, included both subjective (feeling alone) or objective (being alone) words and described social (no one to talk to), emotional (lack of closeness) and existential (lack of purpose) loneliness. Lonely older adults 'talk' about the three different types of loneliness singly or in combinations when explaining what loneliness means to them. We conclude that:- (a) existential loneliness merits more attention as it is less prominent in research compared with other types of loneliness and (b) lonely older adults describe different types of loneliness in the same answer.

EVALUATING A PHONE-BASED SUPPORT PROGRAM TO ADDRESS LONELINESS: LESSONS LEARNED FROM PARTICIPANTS AND STAFF

Carla Perissinotto, Ashwin Kotwal, Soe Han Tha, Katrina Hough, and Bri Matusovsky, *University of California, San Francisco, San Francisco, California, United States*

Introduction: Phone-based support programs are increasingly being used as a solution for those experiencing loneliness. However, less is known about what aspects of these support programs are most helpful to participants and even less known about the staff and volunteer who work in these programs.

Methods: Mixed methods structured surveys of participants (N=247 baseline, N=147 follow-up), and in-depth qualitative interviews of both participants (N=15, and staff=23).

Results: We present the results from the qualitative interviews with a focus on what barriers and facilitators are to implementing a phone-based support intervention, particularly for older adults experiencing loneliness. Preliminarily, 77% of staff and volunteers felt more connected themselves through their role in the phone-support program. 100% of staff also believe the callers feel less lonely as a result of using the line, and 80% feel they create a meaningful relationship with callers. Themes included and overall sense of need for expansion of these services, while better understanding the optimal length and frequency of calls. Consistent with staff responses, amongst callers, 90% fell more socially connected because they use the telephone support line. Similarly, to staff and volunteers, participants felt their needs were met during calls, but wished the length of calls could be flexible. This demonstrates that the line is beneficial to both participants and staff. There is high satisfaction on the quality of the calls and the connections made, but emerging themes suggest a need to scale services to meet demand at all hours and allow for flexibility in length of calls.

GAINS AND LOSSES OF OLDER ADULTS LIVING IN SUBSIDIZED HOUSING DURING THE COVID-19 PANDEMIC

Marcela Blinka[1], Suzanne Grieb[2], Katherine Runge[3], Laura Andes[3], Carl Latkin[4], Cynthia Boyd[4], and Thomas Cudjoe[5], *1. JHSOM, Baltimore, Maryland, United States, 2. BEAD CORE, Baltimore, Maryland, United States, 3. Mercy Housing, Denver, Colorado, United States, 4. Johns Hopkins University, Baltimore, Maryland, United States, 5. Johns Hopkins School of Medicine, Baltimore, Maryland, United States*

Social isolation is prevalent among community dwelling older adults. Low income older adults living in subsidized housing may have increased risk for social isolation. To examine resident experiences and perspectives relating to their social connections during the COVID-19 pandemic, we conducted semi-structured interviews with 13 older adults (62+) who are English, Spanish, and Mandarin speaking recruited from a large non-profit affordable housing organization with communities in 22 states. Twelve housing communities were identified based on distributions of socio-demographic factors and prevalence of self-reported social isolation l in the housing community's annual survey of residents in order to maximize site diversity. We used qualitative thematic analysis methods to examined participants' views about their social connections before and during the COVID-19 pandemic, as well as their personal and the housing community's strategies to mitigate experiences of social isolation. Emerging themes include loss of common facilities and opportunities to socialize with other residents due to COVID-19 restrictions, and increased use of technology to stay connected.

SESSION 2700 (SYMPOSIUM)

THE EXPERIENCE OF THE COVID-19 PANDEMIC AMONG OLDER ADULTS IN PUERTO RICO

Chair: Denise Burnette Discussant: Yamile Martí Haidar

Older age groups and racial and ethnic populations are more likely to have medical conditions that increase their risks for illness, hospitalization and death from COVID-19. Puerto Rico has a high prevalence of acute and chronic health conditions and the lowest percent of people reporting good / excellent health of all U.S. states and territories. The effects of poor health on the island have been compounded in recent years by economic and political instability and by major natural disasters; yet, as of February 2022, 95% of persons aged 65 and older had received at least one vaccination and 88% were fully vaccinated. This symposium comprises five papers based on a study of personal, social, physical health, and mental health factors associated with COVID-19 in a community sample of 213 adults aged 60 and over in Puerto Rico. The first paper will introduce the study, including its purpose, theoretical framework, and methodology. Next, we will address methodological and ethical challenges of conducting research with older adults during the pandemic and strategies we used to overcome these. The third paper will report on the core focus of the project: to assess the knowledge, attitudes, and practices of older Puerto Ricans toward COVID-19. The fourth paper will focus on mental health effects of loneliness and loss, two of the most challenging exigencies of the pandemic for older adults. Finally, we will consider participants' responses to open-ended questions about how they have coped with the pandemic and made meaning of their experiences.

OVERVIEW OF COVID-19 STUDY WITH OLDER ADULTS IN PUERTO RICO

Thomas Buckley[1], and Denise Burnette[2], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. Virginia Commonwealth University, Richmond, Virginia, United States*

This presentation will provide an overview of our study with older adults in Puerto Rico during COVID-19. From January through December, 2021, we conducted telephone and face-to-face interviews with a nonprobability sample of 213 adults aged 60+ in 21 of the island's 78 municipalities. Average age of participants was 71.9 (SD=8.8), 55.9% were female and 55.4% had annual household incomes under $12,500. About two in five older adults reported feeling lonely (39.4%) and poor/fair health (39.9%). Fully 65.3% were overweight or obese, 59% reported at least one chronic disease (59.4%) and 25.8% had delayed medical care during COVID-19. KAP index scores were reasonably high and 97.2% of participants were either vaccinated or planned to be. We will also discuss the development, translation and adaptation of the data collection instrument and the important social, economic and political backdrops of successful public health measures during the pandemic in Puerto Rico.

METHODOLOGICAL AND ETHICAL ISSUES OF RESEARCH WITH OLDER ADULTS IN PUERTO RICO DURING COVID-19

Sunghwan Cho[1], David Camacho[2], Thomas Buckley[3], Julia Vazquez[4], and Kiara Carrasquillo-Sánchez[5], *1. Virginia Commonwealth University, Richmond, Virginia, United States, 2. University of Maryland, Baltimore, Norwalk, California, United States, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 4. University of Maryland, Baltimore, Baltimore, Maryland, United States, 5. Seneca Family of Agencies, Oakland, California, United States*

Engaging diverse groups of older adults is essential to addressing health disparities. In this presentation, we will describe how we used our research team's networks and knowledge of the target population to engage key stakeholders in our KAP project. We will address our partnerships with clergy, NGO staff and administrators, housing authorities, colleagues at Puerto Rican universities, and older adults who serve as informal community and institutional gatekeepers. We will discuss how these partnerships facilitated our ability to identify and access study sites and participants; conduct telephone and in-person interviews; ensure data quality through training and monitoring; and, assure safety through adherence to COVID-19 protocols. Finally, we will describe key cultural and ethical issues of conducting research with older adults through community partnerships during a pandemic. The presentation has implications for developing beneficial partnerships with local community leaders and enhancing the representation of diverse groups of older adults in research.

KNOWLEDGE, ATTITUDES, AND PRACTICES TOWARD COVID-19 AMONG OLDER ADULTS IN PUERTO RICO

Todd Becker[1], Thomas Buckley[2], and Denise Burnette[3], *1. University of Maryland, Baltimore, Baltimore, Maryland, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 3. Virginia Commonwealth University, Richmond, Virginia, United States*

To better understand the dynamics of their health behaviors during the pandemic, we examined older adults' COVID-related knowledge, attitudes, and practices (KAP). KAP theory postulates that individuals acquire knowledge about a health condition which influences their attitudes and beliefs and that these, in turn, lead to health practices. We used hierarchical regression to examine the influence of knowledge and attitudes (Step 1) on practices, controlling for health and relevant covariates (Step 2). The Step 1 association between increased knowledge and better practices ($B = 0.14$, $p = .046$) became nonsignificant in Step 2. Greater worry about contracting COVID-19 remained significant throughout (Step 2: $B = 0.15$, $p = .043$). We further explored subgroup differences within KAP measures via bivariate analyses. For instance, women had significantly higher overall knowledge ($p = .013$), while men had significantly better overall attitudes ($p = .044$). We will discuss implications of such subgroup differences for practice and policy interventions.

DOES LOSS OF A LOVED ONE TO COVID-19 MODERATE THE ASSOCIATION OF LONELINESS AND MENTAL HEALTH AMONG OLDER PUERTO RICANS?

Matthew Morgan[1], Seon Kim[2], Todd Becker[3], and Thomas Buckley[4], *1. Virginia Commonwealth University, Richmond, Virginia, United States, 2. Virginia commonwealth university, Richmond, Virginia, United States, 3. University of Maryland, Baltimore, Baltimore, Maryland, United States, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Loneliness is a well-established risk factor for poor mental health. During COVID-19, loneliness and mental health have been exacerbated by widespread disease-related mortality, suggesting that loss of a loved one may influence this relationship. Using data from 187 older adults in Puerto Rico, we assessed the association between loneliness and mental health and the potential moderating role of loss. Moderated multivariable linear regression results indicated that loneliness was significantly, positively associated with mental health ($B = 1.58$, $p < .001$). Although loss due to COVID-19 was not significantly associated with mental health ($p = .473$), it did moderate the relationship between mental health and loneliness ($B = -1.00$, $p = .048$). The lack of significant association of loss and mental health contrasts with previous research on COVID-19 and warrants further investigation. Nevertheless, the statistically significant interaction suggests that grief should be considered when assessing individual and community support during the pandemic.

LIFE LESSONS: THE EXPERIENCES OF OLDER ADULTS LIVING IN PUERTO RICO DURING COVID-19

Humberto Fabelo[1], Matthew Morgan[1], Julia Vazquez[2], and Todd Becker[2], *1. Virginia Commonwealth University, Richmond, Virginia, United States, 2. University of Maryland, Baltimore, Baltimore, Maryland, United States*

What life lessons emerge from a group of older Puerto Ricans concerning their experiences with COVID-19. We will review study participants' reports of how they spent their time during the pandemic, what they found most difficult to cope with, and life lessons they learned as a result. We will use Erickson's life course theory of psychosocial development to frame their responses to these questions, including the crises (and strengths) of generativity versus stagnation (care) and ego integrity versus despair (wisdom). We will report evidence of care and wisdom as core ego strengths resulting from their lived experience. We will also review how isolation, sense of community, and key mental and physical health factors seemed to influence how their responses suggest coping strengths. We will discuss our findings in the context of social and cultural norms of current cohorts of older Puerto Ricans, highlighting the salience of community and family relations. (150 words)

SESSION 2710 (SYMPOSIUM)

THE HEALTH OF THE DIRECT CARE WORKFORCE: EVIDENCE AND IMPLICATIONS ACROSS LONG-TERM CARE

Chair: Kezia Scales Discussant: Kezia Scales

Direct care workers play a key role in supporting the health and wellbeing of older adults and people with disabilities across care settings—yet their own health risks are largely overlooked. The four papers in this symposium address this critical knowledge gap. First, McCall and colleagues will present a comparative analysis of the health status, health insurance coverage, and healthcare experiences of direct care workers across long-term care using National Health Interview Survey data. Next, Lee et al. will present the trends and characteristics of occupational injuries and illnesses among California's long-term care workers from 2019 to 2020 using California Workers' Compensation data, assessing the impact of COVID-19 on their occupational health. Sterling will characterize the physical and mental health of the direct care workforce before and during COVID-19 using data from the CDC's Behavioral Risk Factor Surveillance Survey, as well as drawing on qualitative and survey-based studies of unionized, agency-employed home care workers in New York. Sterling will also present findings from a pilot feasibility study of an intervention aimed at improving home care workers' well-being. Finally, Quinn et al. will synthesize findings on home care workers' occupational hazards—including needlesticks, musculoskeletal strain, violence and infections—and examine how preventing these risks can improve safety for both workers and clients. The discussant will draw out themes and implications from across these complementary studies, highlighting the importance of safeguarding direct care workers' health as a key step toward improving care quality and outcomes for older adults and people with disabilities.

CARING FOR CAREGIVERS: HEALTH AND HEALTHCARE EXPERIENCES OF DIRECT CARE WORKERS

Stephen McCall, *Altarum, Saint Petersburg, Florida, United States*

Direct care workers play a significant role in supporting the health of older adults and people with disabilities across long-term care settings—but as a primarily low-income, women of color workforce, they likely face significant health risks themselves. To build understanding on the health of this essential workforce, this paper examines direct care workers' health status, health insurance coverage, and experiences utilizing, accessing, and paying for healthcare services using pooled 2014 to 2018 data from the National Health Interview Survey. We find direct care workers have worse health, lower rates of insurance coverage, poorer access and utilization, and greater cost barriers compared to other healthcare workers. We also observe disparities within the direct care workforce according to industry, gender, and race/ethnicity. This study helps inform efforts to support the health of direct care workers and stabilize the critical services they provide.

THE PHYSICAL AND MENTAL HEALTH OF HOME HEALTHCARE WORKERS: WHAT DO WE KNOW AND WHAT CAN WE DO ABOUT IT?

Madeline Sterling, *Weill Cornell Medicine, New York City, New York, United States*

This presentation will use data from the 2014-2018 CDC's Behavioral Risk Factor Surveillance Survey to characterize the physical and mental health of home health care workers compared to other similar frontline, low-wage worker groups, before the COVID-19 pandemic. Next, using primary survey data collected in partnership with the 1199SEIU Training and Employment Fund, the health of the workforce during the COVID-19 pandemic will be presented, as well as the workforces' needs. The survey includes data from over 250 home health care workers employed in New York, NY who provided care during the pandemic. Finally, data from a pilot feasibility study of an intervention aimed at improving home care workers' well-being will be presented.

IMPACT OF COVID-19 ON OCCUPATIONAL INJURY AMONG LONG-TERM CARE WORKERS IN CALIFORNIA

Soo-Jeong Lee, *University of California, San Francisco, San Francisco, California, United States*

Long-term care is the industry with the highest occupational injury and illness rate in the United States. During the Coronavirus Disease 2019 (COVID-19) Pandemic, healthcare workers have been affected physically and psychologically by increased workload and stress. Such increased physical and psychological demands may increase the risk of injury among long-term care workers. The aim of this study is to assess the impact of COVID-19 on occupational injury or illness incidence among long-term care workers. Analyzing California Workers' Compensation (WC) data reported in 2019 and 2020, the study will report the number and rate of WC claims among California long-term care workers by month and examine changes over time during 2019-2020. The study will also characterize WC claims during 2019-2020 by demographic (age, gender), occupational (occupation, job tenure), and injury or illness characteristics (cause of injury, nature of injury, affected body part) and identify characteristics with greater changes during COVID-19.

HEALTHY AGING IN PLACE REQUIRES A HEALTHY HOME CARE WORKFORCE: THE SAFETY AND HEALTH OF PAID CAREGIVERS

Margaret Quinn[1], Pia Markkanen[2], Susan Sama[2], Catherine Galligan[2], John Lindberg[3], and Rebecca Gore[2], *1. University of Massachusetts Lowell/College of Health Sciences, Lowell, Massachusetts, United States, 2. University of Massachusetts Lowell, Lowell, Massachusetts, United States, 3. University of Massachusetts Lowell,, Lowell, Massachusetts, United States*

Home care (HC) aides provide health and personal care services that enable older adults to live at home as they age. Aides are increasingly in demand as our population ages rapidly. Yet there is an aide shortage due in part to instabilities in HC work organization and to occupational safety and health (OSH) hazards, resulting in aides losing work time or leaving their jobs. Aide injuries and illness interrupt the continuity of care delivery and HC hazards can put clients and family caregivers at risk. This research synthesizes recent findings of aide OSH studies in order to identify risks and preventive interventions to improve both HC aide and client safety. Mixed methods were used to characterize aide OSH hazards including needlesticks, musculoskeletal strain, experiences of violence, COVID-19 and other infections and harmful disinfection practices. Improving aide OSH can contribute to improved care services enabling older adults to live at home.

SESSION 2720 (SYMPOSIUM)

THE ROLE OF CAREGIVERS DURING DISASTERS

Chair: Tamar Wyte-Lake Co-Chair: Leah Haverhals

The COVID-19 pandemic laid bare the critical role caregivers play in supporting the older adult population, and how easily care structures can fall apart under the stress of a disaster event. As our population rapidly ages, it is imperative to better understand how to support caregivers to ensure relationships between caregivers and older adults remain robust and guarantee everyone's safety. Therefore, this symposium focuses on the roles of formal and informal caregivers during disasters, primarily the COVID-19 pandemic. Dr. Richard Chunga will present findings from a survey of homecare aides, exploring drivers of high turnover rates and describing how employers can improve job satisfaction. Dr. Lindsay Peterson will describe barriers and facilitators to disaster preparedness among caregivers, using interviews with caregivers from diverse backgrounds in Florida. Ms. Jessica McLaughlin (PhDc) will share experiences of informal female caregivers, derived from interviews across the United States (US). Chelsea Manheim (LCSW) will describe adaptations to care provision for rural Medical Foster Home (MFH) Veterans from interviews conducted with MFH care providers from across the US. Dr. Carrie Wendel-Hummell will share data around the strengths and challenges of the self-directed care model for home-based long-term care, drawing on interviews with consumers, caregivers, workers, and providers in Kansas. As a whole, these presenters will provide insights into experiences of caregivers as they navigated challenges associated with the COVID-19 pandemic and generate forward thinking on how to inform future disaster response. Sponsoring SIGs: Paid Caregiving, Family Caregiving, Assisted Living, Disaster and Older Adults

FACTORS ASSOCIATED WITH HOME CARE AIDES' JOB SATISFACTION DURING COVID-19

Richard Chunga[1], Verena Cimarolli[2], Natasha Bryant[2], Kathrin Boerner[1], and Robyn Stone[2], *1. University of Massachusetts Boston, Boston, Massachusetts, United States, 2. LeadingAge, Washington, District of Columbia, United States*

The COVID-19 pandemic has pronounced already high turnover rates among home care aides (HCAs). High turnover negatively affects home care quality. Job satisfaction among HCAs is a major driver of turnover, but little is known about factors associated with HCAs' job satisfaction during COVID-19. Using survey data, the purpose of this study was to identify variables associated with job satisfaction among HCAs during the pandemic (N=114). Correlational analyses show that lower job satisfaction is associated with experiencing financial hardship, lack of PPE and employer protocols/guidance, understaffing, lower quality of employer communication related to COVID-19, and HCAs' lower perceived preparedness to care for clients with COVID-19. In a regression analysis, experiencing financial hardship and lower quality of employer communication remained significant predictors. Findings underscore the importance of employer supports in HCAs' job satisfaction and provide important lessons for how employers can support HCAs during the pandemic and beyond.

BARRIERS AND FACILITATORS OF DISASTER PREPAREDNESS FOR CAREGIVERS OF PERSONS WITH DEMENTIA

Lindsay Peterson, Debra Dobbs, Sara Hackett, and William Haley, *University of South Florida, Tampa, Florida, United States*

Emergency preparedness for disasters such as hurricanes is critical. A common feature of disasters is their disruption of daily life, which is magnified for persons living with Alzheimer's disease and related dementias (ADRD). It is critically important to understand more about disaster preparedness for those with ADRD and the informal caregivers responsible for their safety. We conducted individual interviews between April and September, 2021. The sample included 50 family caregivers of persons with dementia (11 Hispanic, 12 Black, 27 White), who were asked about their disaster experiences, concerns about future disasters and level of preparedness. Interviews were transcribed and coded using a team coding approach. Initial analysis identified three main themes, 1) caregivers attitudes about the importance of disaster preparedness, 2) what makes it difficult to prepare, and 3) facilitators of preparedness. Results have the potential to guide program development to improve preparedness among diverse caregivers of persons with ADRD.

THE ROLE OF WORKPLACE POLICY ON EMPLOYED FEMALE CAREGIVERS DURING THE CORONAVIRUS PANDEMIC

Jessica McLaughlin, *Knoebel Institute for Healthy Aging , Denver, Colorado, United States*

The coronavirus pandemic has indelibly impacted society over the past two years. This qualitative study explores how working female caregivers, in particular, experienced the pandemic and how the workplace supported them during this time. Findings from interviews with 29 working female caregivers revealed that many caregivers were unable to set boundaries around caregiving during the pandemic. Caregivers frequently found themselves on their own in providing care. This meant that caregivers had little time to themselves to rest and recharge. Whereas prior to the pandemic, caregivers may have had help with caregiving through services like respite and adult daycare, these services were no longer options. This reduced level of external support and care influenced caregivers' socioemotional wellbeing. Workplace policies, such as the ability to work remotely and working flexible hours, helped to ease caregiver burden. These findings have implications for both caregivers and workplaces during future crises and disasters.

CARING FOR HOMEBOUND VETERANS DURING COVID-19 IN THE US DEPARTMENT OF VETERANS AFFAIRS MEDICAL FOSTER HOME PROGRAM

Chelsea Manheim[1], Maya Katz[1], and Leah Haverhals[2], *1. Rocky Mountain Regional VAMC, Aurora, Colorado, United States, 2. VA Eastern Colorado Health Care System, Rocky Mountain Regional VA Medical Center, Denver, Colorado, United States*

The COVID-19 pandemic made older, homebound adults with multiple chronic conditions increasingly vulnerable to contracting the virus. The United States (US) Department of Veterans Affairs (VA) Medical Foster Home (MFH) program cares for such Veterans residing in private homes of non-VA caregivers. In this qualitative study, we assessed adaptations to delivering safe and effective healthcare during the early stages of the pandemic for Veterans living in rural MFHs, interviewing (n=37) VA MFH care providers at 19 MFH programs across the US. We identified themes reflecting adaptations to care provision, including care providers increasing communication and education to caregivers who prioritized Veteran safety. Caregivers coordinated increasing telehealth visits, applied creative strategies to mitigate social isolation of Veterans and themselves, and Veterans were prioritized for in-home COVID-19 vaccinations. Study findings illustrate the importance of clear, regular communication and intentional care coordination to ensure high quality care for vulnerable, homebound populations during crises.

SELF-DIRECTED CARE IN HOME-BASED LONG-TERM CARE DURING THE PANDEMIC: POLICY AND PRACTICE IMPLICATIONS

Carrie Wendel-Hummell[1], Tracey LaPierre[1], Darcy Sullivan[1], Jennifer Babitzke[1], Lora Swartzendruber[1], and Danielle Olds[2], *1. University of Kansas, Lawrence, Kansas, United States, 2. St. Lukes Hospital, Kansas City, Missouri, United States*

The COVID-19 pandemic highlighted strengths and challenges of the self-directed care model for home-based long-term care. We discuss policy and practice implications drawing on interviews with over 50 home-and-community-based-services consumers, caregivers, workers, and providers in Kansas. Low-pay, lack of benefits, rising wages in competing sectors, enhanced unemployment and COVID-19 concerns exacerbated workforce shortages that compromised consumer safety and well-being. The lack of budget authority for self-directed consumers in Kansas limited their ability to address these issues. Furthermore, the self-directed model was excluded from emergency funding sources that would have enhanced pay and benefits for workers, including sick pay for quarantine, pointing to the need for targeted funding. Emergency flexibility allowing paid family caregivers addressed care needs for some but is temporary and should be expanded. In the managed care model, MCOs still kept their capitated payment despite significant unfilled care hours, and thus pay-for-performance incentives need to be revisited.

SESSION 2730 (SYMPOSIUM)

WORKING WITH COMMUNITIES TO INCREASE DIVERSITY, EQUITY, AND INCLUSION IN GERONTOLOGICAL RESEARCH

Chair: Stephanie Chow, Co-Chair: Ronica Rooks

Gerontological researchers are encouraged to include older adults from underrepresented populations in their research and to think broadly about how they conceptualize diversity, equity, and inclusion (DEI) efforts in their work. This includes not only research on older adults from minority racial and ethnic communities, but also lesbian/gay/bisexual/trans*/queer+ (LGBTQ+) communities, as well as other cultural, religious, and socioeconomic groups. One of the most successful ways for reaching older adults in these populations is through community-based participatory research (CBPR). CBPR is a partnership approach to research that equitably involves community members, organizational representatives, researchers, and others in all aspects of the research process, with all partners in the process contributing expertise and sharing in the decision-making and ownership. Two papers in this symposium use CBPR to identify and include older adults from minority populations in their studies. A third paper reports on working with a Community Advisory Board to recruit bereaved dementia caregivers for research. The final paper walks us through steps to increase DEI efforts by meticulous research question development and thoughtful determinations regarding literature review terminology, recruitment efforts, data collection, and reporting and dissemination techniques.

CONDUCTING DIVERSITY, EQUITY, AND INCLUSION-INFORMED RESEARCH WITH OLDER ADULTS

Ashley Taeckens-Seabaugh, *University of Denver, Denver, Colorado, United States*

Researchers are encouraged to think broadly and holistically about how they conceptualize diversity, equity, and inclusion (DEI) efforts in their work. Each element of a research project must be rigorously devised to identify or address existing gaps in the literature, which will continue to be increasingly important as the US population of older adults continues to expand and diversify. Intentionality throughout every stage of a project is bound to result in a better understanding of the focus populations' needs, and how to best address those needs through their perspective. Moreover, consider weighing the pros and cons of working to implement culturally competent versus multiculturally competent research and whether either approach is as culturally appropriate and responsive as possible. This work summarizes guidance to increase DEI efforts by meticulous research question development and thoughtful determinations regarding literature review terminology, recruitment efforts, data collection, and reporting and dissemination techniques.

LGBTQ+ OLDER ADULTS AND COMMUNITY NEEDS IN METRO DETROIT: ADAPTING METHODS TO EVOLVING CONDITIONS

Angela Perone, *University of California - Berkeley, Berkeley, California, United States*

Gerontological researchers have long called for more research on diverse older adults, including diverse communities of lesbian/gay/bisexual/trans*/queer+ (LGBTQ+) older adults (e.g., race/ethnicity, economic status, religion). This paper identifies lessons learned from a community-based participatory action research (CBPR) project with LGBTQ+ older adults across four counties. Initiated by LGBTQ+ older adults of color and transgender older adults concerned about access to affordable and culturally responsive housing as they age, researchers worked with a coalition of 8 LGBTQ+ focused organizations to design, implement, and analyze a mostly online survey (n=270). Topics include: Capturing diverse perspectives in survey design (8 focus groups, N=35); addressing external threats to data integrity; implementing multiple types of outreach in phases to expand participant diversity; and working with the coalition and other partners through different stages of survey design, recruitment, data analysis, and identification/enactment of goals for change informed by data, while also navigating a pandemic.

CBPR: AN EFFECTIVE APPROACH TO RECRUIT AND RETAIN MINORITY OLDER REFUGEE ADULTS IN COMMUNITY-BASED RESEARCH

Sudha Shreeniwas, *UNC Greensboro, Greensboro, North Carolina, United States*

Community based participatory research (CBPR) builds mutually beneficial partnerships between diverse communities and researchers, yielding improved communication among stakeholders, more interest in research participation among community older adults, and improved insights on health disparities. CBPR approaches have great utility for culturally appropriate research design, data collection and analyses, and dissemination with minority underserved communities. We describe outreach, research methods, and community capacity-building from three projects with refugee communities in Greensboro, NC: the Montagnard Hypertension Research Project; The Refugee Older Adults Needs Assessment Project; and the Elder Abuse and Neglect exploratory study. These projects were initiated by community leaders, with technical partnership provided by university researchers and students. We used community-centric methods, and collected a range of data including interviews, photographs, oral histories, surveys, and biological specimens. These efforts have advanced social justice and health equity agendas for both academic and community partners, working to advance health of older adults.

RECRUITING THE ULTRA-INVISIBLE: COMMUNITY RECOMMENDATIONS FOR FORMER DEMENTIA CAREGIVER RECRUITMENT

Zachary Baker, *Arizona State University, Tempe, Arizona, United States*

Bereaved dementia caregivers often refer to themselves as "Ultra-Invisible" (contrasting with caregivers' "Invisibility"). We report on a series of open-ended discussions with the "Supporting Dementia Caregivers After Death" community advisory board (CAB) about how best to recruit bereaved dementia caregivers for research. The 12-member CAB includes current and former caregivers of

PLWD due to early- and normal-onset Alzheimer's, Lewy body, and Parkinson's, an Alzheimer's Association senior program manager, the Indian Health Board of Minneapolis Spiritual Health leader, the Engaging communities of Hispanics/Latinos for Aging Research Network leader, and a Federally Qualified Healthcare Center Equity Director. Strategies included: partnering with local religious institutions who may be primary source of bereavement services across cultures, multiple survey formats (e.g., recruiting Latino caregivers by phone; written surveys for Indians on rural reservations with limited phone/internet access). 3) Broadened age group considerations (e.g., one African American CAB-member's young children contribute meaningfully to caregiving).

SESSION 2740 (SYMPOSIUM)

INTERDISCIPLINARY PUBLIC POLICY DISCUSSION SESSION

Chair: George Taffet Discussant: Brian Lindberg

This interactive session is an interdisciplinary look at policy issues in aging with the speakers representing the four sections of GSA, ESPO, and AGHE. This session, organized by the GSA Public Policy Advisory Panel, will provide both GSA section leadership and attendees an opportunity to have an open dialogue on important public policy issues of significance in the field of aging.

SESSION 2750 (SYMPOSIUM)

HOW OLD DO YOU FEEL? CONSIDERING THE CONTEXTS, DYNAMICS, AND ASSESSMENT OF SUBJECTIVE AGE

Chair: Anna Kornadt Co-Chair: Jennifer Bellingtier

How old people feel is a highly effective predictor of later life health and well-being. Despite a wealth of research, the developmental dynamics of the construct as well as its antecedents and consequences are not well understood. Our symposium brings together research that models dynamic trajectories in subjective age over long- and short periods of time and links it to psychological constructs and objective indicators of health and functioning. First, Weiss and colleagues present longitudinal findings of subjective age trajectories in a lifespan sample that highlight the reciprocal dynamics between subjective age and social contexts. Bellingtier and colleagues link the age people feel on a daily basis to the age people want to feel and find that when people felt closer to the age they desired, their affect was more positive. Rupprecht and colleagues measured subjective age as well as affect, stress and physical activity on 21 consecutive days. Data attest to the relevance of daily experiences for subjective age. In a similar approach, Tingvold and colleagues show the relationship of momentary subjective age with subjective and physiological stress in late-midlife adults' daily lifes. Finally, Touron and Hughes found that momentary fluctuations in subjective age are associated with current task engagement and enjoyment. Together, the findings show that innovative perspectives and research designs are needed to understand how people respond to the question "How old do you feel" and why it predicts how well they actually age.

I WISH I MAY, I WISH I MIGHT FEEL THE AGE I WISH TONIGHT

Jennifer Bellingtier[1], Fiona Rupprecht[2], Shevaun Neupert[3], and Frieder Lang[4], *1. Friedrich Schiller University Jena, Jena, Thuringen, Germany, 2. University of Vienna, Vienna, Wien, Austria, 3. North Carolina State University, Raleigh, North Carolina, United States, 4. Friedrich-Alexander-Universität Erlangen-Nürnberg, Nürnberg, Bayern, Germany*

Subjective age has traditionally been considered by comparing felt age to chronological age, with those who feel younger reporting more adaptive developmental outcomes. Here we consider a new approach: subjective age discordance, which compares felt ages to the ideal ages of participants. Across eight study days, 116 older and 107 younger adults reported their daily felt and ideal ages. On the majority of days, both older and younger adults idealized ages younger than they felt. The opposite pattern, idealized ages older than felt ages, was rare and primarily seen in younger adults. Days when felt ages were less discordant from ideal ages were characterized by higher levels of positive affect than days with greater subjective age discordance. These findings suggest that positive developmental outcomes can occur not only from feeling younger, but through a greater alignment of ideal and felt ages.

THE DYNAMIC NATURE OF SUBJECTIVE AGE ACROSS THE LIFE SPAN

David Weiss, *Martin-Luther-University of Halle-Wittenberg, Halle, Sachsen-Anhalt, Germany*

A large body of research has confirmed that from childhood to old age most individuals feel significantly younger or older than their chronological age. Up to now, however, there is no clear theoretical understanding as to why younger adults tend to feel on average older and older adults tend to feel on average younger. We adopt a motivated social-cognition perspective on subjective age and examine age-differential antecedents and correlates of subjective age across the adult life span. Results from a cross-sectional study (N = 1652, 18-84 years) and a 9-month longitudinal study (N = 814; 18-84 years) highlight the dynamic link between subjective age bias and individual (motivation and emotion) as well as social factors (social comparison, meta stereotypes). We discuss the role of reciprocal dynamics between individuals and social contexts in explaining why individuals adopt a younger or older subjective age.

FEELING YOUNG TODAY, FEELING GOOD TOMORROW? MICROLONGITUDINAL DYNAMICS IN SUBJECTIVE AGE

Fiona Rupprecht[1], Laura Schmidt[2], Monika Sieverding[2], Jana Nikitin[1], and Hans-Werner Wahl[3], *1. University of Vienna, Vienna, Wien, Austria, 2. Heidelberg University, Heidelberg, Baden-Wurttemberg, Germany, 3. Universität Heidelberg, Heidelberg, Baden-Wurttemberg, Germany*

Insights into the short-term dynamics and microlongitudinal consequences of subjective age can drive our understanding of its long-term mechanisms across adulthood. Using data from 80 newly retired individuals (aged 59 to 76 years; 59% women) collected on 21 days, we made use of a recent methodological advance—multilevel dynamic structural equation modeling. As possible same-day correlates and micro-longitudinal consequences of subjective age, we investigated physical activity, step number, sleep quality, affect, and stress, which were either assessed via wearables (FitBit Charge HR) or daily diaries. Analyses suggest a weak autoregression of subjective age, indicating that how old one feels is determined via daily rather than lasting experiences. Indeed, there were significant same-day relations to all suggested correlates. The one effect lasting across several days was from an older subjective age on subsequent negative affect—a potential short-term mechanism contributing to the detrimental long-term influence of an older subjective age.

MOMENTARY VARIATION IN SUBJECTIVE AGE, PERCEIVED STRESS, AND PHYSIOLOGICAL REACTIVITY IN LATE MIDLIFE

Maiken Tingvold, Lisa Borgmann, and Anna Kornadt, *University of Luxembourg, Esch-sur-Alzette, Diekirch, Luxembourg*

The age people feel, their subjective age, can vary on both daily and momentary levels. Previous longitudinal and daily-diary studies have shown that hormonal and self-reported measures of stress covary with subjective age. Our study aims at exploring momentary fluctuations in subjective age and their relation to objective and subjective measures of stress assessed in people's daily lives. 54 participants aged 50 – 62 years (Mage = 56.1 yrs, 75% female) wore sensors recording their physiological reactivity and reported on perceived stress and subjective age six times per day for one week. We found that a lower subjective age was related to a greater heart rate variability and less perceived stress on a momentary level. Our findings confirm and expand studies showing the association of stress and subjective age and their importance for aging processes in late midlife.

THE EXPERIENCE OF SUBJECTIVE AGE DURING EVERYDAY LIFE

Dayna Touron, and Matthew Hughes, *University of North Carolina at Greensboro, Greensboro, North Carolina, United States*

Empirical work has shown that subjective age is susceptible to momentary fluctuation throughout the day, and in certain contexts like challenging cognitive evaluations. We propose and test a contextual model that describes how momentary experiences impact subjective age, which in turn impacts daily activities and well-being. Using an experience sampling approach, 200 participants were asked to complete 6 surveys per day for a week. Questions asked about the task they were engaged in, including mental, physical and social engagement, challenge, motivation, confidence, and enjoyment. Participants also completed a manipulation of mental challenge and reported their momentary subjective age. Preliminary multilevel models show that certain momentary factors, such as whether participants were enjoying a task or found the task engaging, predict fluctuations in subjective age. We will also discuss moderators, subjective age domains, time of day effects, and the cross-lagged influence of cognitive stressors over time.

SESSION 2760 (AWARD LECTURE)

IRVING S. WRIGHT AWARD, VINCENT CRISTOFALO AWARD, AND TERRIE FOX WETLE AWARD PRESENTATIONS AND LECTURES

Chair: James Kirkland

The Irving S. Wright Award of Distinction Lecture will feature an address by the 2022 recipient Thomas M. Gill, MD of Yale University. The Vincent Cristofalo Rising Star Award in Aging Research lecture will feature an address by the 2022 recipient Jamie Nicole Justice, PhD, of Wake Forest University. The Terrie Fox Wetle Award lecture will feature an address by the 2022 recipient Benjamin H. Han, MD, MPH, of the University of California San Diego. These awards are given by the American Federation for Aging Research, Inc.

2022 IRVING S. WRIGHT AWARD

Thomas Gill, *Yale School of Medicine, New Haven, Connecticut, United States*

Dr. Gill is a leading international authority on the epidemiology and prevention of disability among older persons. His nomination for the Wright Award lauded his groundbreaking research on the mechanisms underlying and interventions targeting functional decline and disability among community-living older persons., He collaborates with investigators throughout the country, is a leader of multisite clinical trials, and is a devoted mentor. He has published more than 350 original reports and has been continuously funded by the National Institutes of Health (NIH) and multiple foundations since 1997. Dr. Gill is the Humana Foundation Professor of Medicine (Geriatrics) and Professor of Epidemiology (Chronic Diseases) and of Investigative Medicine; Director, Yale Program on Aging; Director, Claude D. Pepper Older Americans Independence Center; Director, Yale Center for Disability and Disabling Disorders; and Director, Yale Training Program in Geriatric Clinical Epidemiology and Aging-Related Research.

BREAKING GROUND IN TRANSLATIONAL GEROSCIENCE: FROM BIOMARKERS TO CLINICAL TRIALS

Jamie Justice, *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*

The geroscience hypothesis posits that common biological mechanisms of aging drive susceptibility of aged individuals to functional decline, multi-morbidity, and death. The promise of geroscience is that some of these mechanisms may be intervenable, thereby preventing or delaying declines, and providing new therapeutic opportunities for hard-to-treat chronic diseases. This is supported by specific examples of translational research models, and interventions that are at the point of entering human clinical trials. This award presentation will review how we are reimagining existing resources and creating new translational frameworks to test the geroscience hypothesis in humans.

OPIOID USE DISORDER AMONG OLDER ADULTS: ADDRESSING MULTIMORBIDITY AND GERIATRIC CONDITIONS

Benjamin Han, *UC San Diego, La Jolla, California, United States*

Dr. Han will present multidisciplinary research focused on understanding the healthcare needs of older adults with opioid use disorder. Nationally, there is a sharp increase in older adults with opioid use disorder (OUD) and the number of older adults dying of opioid-related overdoses. This lecture will first describe the prevalence of geriatric conditions and comorbidities among older adults who receive care in opioid treatment programs. Then, Dr. Han will present patterns of acute healthcare utilization among older adults with opioid use disorder. Qualitative data from patient experiences of aging with opioid use disorder and the challenges of managing chronic diseases will then be presented. The lecture will conclude with a discussion about opportunities for developing multidisciplinary models of care to best deliver geriatric-based interventions for this population.

SESSION 3000 (PAPER)

ASSESSMENT AND MEASUREMENT

CONSUMERS AND PROVIDERS ON THE NEEDS OF LONG-TERM SURVIVORS AND PEOPLE AGING WITH HIV IN NEW YORK STATE

Maria Brown[1], Eugenia Siegler[2], Marz Albarran[3], John Wikiera[4], Angie Partap[5], Courtney Ahmed[6], Sheriden Beard[7], and Thomas Heslop[8], *1. Syracuse University, Syracuse, New York, United States, 2. Weill Cornell Medical College, New York, New York, United States, 3. HIVStopsWithMe.Org, Renssaelaer, New York, United States, 4. NY Statewide Peer Network, Rome, New York, United States, 5. Stony Brook Medicine, Patchogue, New York, United States, 6. NYSDOH AIDS Institute, Brooklyn, New York, United States, 7. NYSDOH AIDS Institute, New York, New York, United States, 8. Weill Cornell Medical College, Washgton, District of Columbia, United States*

Objectives: To document the practical needs, and develop quality initiatives to address those needs, of the growing population of long-term survivors (LTS) and older people with HIV (OPH) in New York State.

Methods: The HIV+ Aging/LTS/Perinatally Diagnosed Subcommittee of the NYS Quality of Care Consumer Advisory Council used community based participatory research methods to design a statewide survey based on categories identified in August 2020 virtual town halls with consumers and providers across New York. Syracuse University launched the survey, open to consumers aged 18 and over who were LTS or OPH, clinicians, and social services providers, in June 2021 using Qualtrics™. Participants chose the three most important barriers and recommendations for each category. Responses were characterized using basic descriptive statistics.

Results: Participants included 124 consumers from 26 counties, 20 clinicians, and 24 social service providers. Two thirds of participants were cisgender men (67%), 27% were African American, 80% identified as both LTS and OPH. On average, consumers were 58 years old, had been living with their HIV+ diagnosis for 27 years, and reported 4 additional conditions, most commonly depression (30%). LTS and OPH were concerned about clinical and financial needs, particularly coordination of clinical care, unmet housing needs, cultural representation in mental health services, and financial support of LTS and OPH. Implications: Community based participatory research can inform and stimulate changes in clinical care for LTS and OPH. Survey results are informing a plan for functional screening of OPH and LTS that can be performed by certified peer workers.

MODE EFFECTS ON COGNITIVE FUNCTIONING ASSESSMENTS IN THE HEALTH AND RETIREMENT STUDY

Jessica Faul[1], Ben Domingue[2], Ben Stenhaug[3], Brady West[1], Kenneth Langa[1], and David Weir[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Stanford, Stanford, California, United States, 3. Stanford, Sanford, California, United States*

As the population of the US ages, there is interest in assessing health conditions associated with age and longevity, such as age-related decline in cognitive functioning. As a result, there is an increased focus on measuring cognitive functioning in surveys of older populations. One challenge relates to conducting comparable measurement across survey modes (e.g., phone vs. web). Compounding this is that mode of survey administration is often not assigned randomly making inter-group comparison more difficult. This paper addresses these issues using a novel experiment embedded within the Health and Retirement Study (HRS). The HRS, a US-based cohort of people over 50, has measured cognition since its inception using both in-person and telephone modes. In 2018, a sample of approximately 3700 respondents was identified as web-eligible based on a prior report of internet access along with other selection criteria. Of these, 60% were randomly selected for the web sample with the remainder serving as controls, assigned to telephone mode for comparison purposes. We deploy techniques from item response theory (IRT) and differential item functioning (DIF) to estimate the difference in cognitive functioning between web and phone respondents in 2018 based on longitudinal cognition data collected prior to 2018. Second, we estimate the overall effect of taking the survey via the web as compared to the phone. Third, we examine item-level variation in the magnitude of the mode effect and suggest possible methods for adjustment to support longitudinal consistency. These results are important in guiding future research that utilizes web-based cognitive measures.

PERCEIVED AND OBJECTIVE EXECUTIVE DYSFUNCTION JOINTLY PREDICT BRAKING REACTION TIME IN OLDER DRIVERS

Caitlin Pope[1], Tyler Bell[2], Benjamin McManus[3], and Despina Stavrinos[3], *1. University of Kentucky, Lexington, Kentucky, United States, 2. University of California, San Diego, La Jolla, California, United States, 3. University of Alabama at Birmingham, Birmingham, Alabama, United States*

Motor vehicle crashes are a leading cause of injury and death for older adults in the United States. Braking reaction time (BRT), how quickly a driver responds to the situational demands of driving, is a known predictor of driver fitness and hypothesized as sensitive to difficulties with executive functioning. Unclear is how BRT may vary across different levels of executive functioning, including objective test performance and perceived executive dysfunction, and if awareness of executive dysfunction in the presence of objective difficulties jointly predicts BRT. Using data from a simulated driving study, 50 adults aged 65-94 years old (49.1% female) completed computerized EF tests (inhibition [Stroop], working memory [Automated Operation Span]), the Behavior Rating Inventory of Executive Function, the Big Five Inventory, and a simulated drive. Multilevel modeling analyses controlling for covariates of empirical and design relevance (simulated road segment, age, gender, and neuroticism) were performed. Our results show a significant interaction between perceived executive dysfunction and objective test performance on BRT. Specifically, associations with BRT were stronger for individuals who perceived more executive dysfunction in the presence of worse inhibition (b = 0.79, 95%CI = 0.27, 1.30) and worse working memory (b = 0.94, 95%CI = 0.26, 1.62). Findings provide further justification for the role of executive functioning in monitoring driver fitness in older age. Future directions and implications are discussed.

QUALITY OF LIFE IN ADULTS LIVING WITH COGNITIVE IMPAIRMENT: DEVELOPMENT OF A UNIVERSAL MEASURE

Keith Anderson[1], Lisa Peters-Beumer[2], Megan Westmore[3], and Rebecca Logsdon[4], *1. University of Mississippi, Oxford, Mississippi, United States, 2. Concordia University Chicago, River Forest, Illinois, United States, 3. University of Texas at Arlington, Arlington, Texas, United States, 4. University of Washington, Seattle, Washington, United States*

Quality of life is one of the most important and holistic measures of perceived overall well-being across the lifespan. For older adults living with cognitive impairment, quality of life has been conceptualized as consisting of an array of intertwined domains, such as relationship quality, physical health and ability, and opportunities for roles and activities. A subset of measures have been developed to gauge quality of life in older adults living with cognitive impairment, yet no “gold standard” in measurement has emerged. Quality of Life – Alzheimer’s Disease (QOL-AD) is one of the most commonly used and long-standing measures, yet it was developed in 2002 and has yet to be updated to reflect the evolution of our understanding of quality of life in adults living with cognitive impairment. Drawing from the literature on adults living with intellectual and developmental disabilities (IDD), the researchers identified several domains and items to update and expand the applicability of the QOL-AD measure. The proposed revised measure, Quality of Life – Alzheimer’s Disease/Intellectual and Developmental Disabilities (QOL-AD/IDD), is intended for adults living with cognitive impairment regardless of age or cause of impairment (e.g., dementia, IDD). The QOL-AD/IDD retains the format of the original measure, most notably the useful prompts that accompany each item and the supplemental proxy measure for caregivers. In this presentation, the researchers will discuss the development of the QOL-AD/IDD and ongoing (e.g., Delphi review) and planned steps to evaluate the reliability and validity of this promising measure.

GUIDELINES FOR DEVELOPING EVIDENCE-BASED RISKY DRIVING COUNTERMEASURES THAT INCLUDE OLDER DRIVERS

Jennifer Zakrajsek[1], Lisa Molnar[1], David Eby[1], Lidia Kostyniuk[1], Nicole Zanier[1], David J. LeBlanc[1], and Tina B. Sayer[2], *1. University of Michigan Transportation Research Institute, Ann Arbor, Michigan, United States, 2. Toyota Motor North America Research & Development, Ann Arbor, Michigan, United States*

Driver behavior will continue to play a critical role in driving safety for the foreseeable future. Utilizing behavior change theory appropriately presents opportunities to improve the effectiveness of risky driving countermeasures that have been under-utilized to date. Older drivers should not be excluded from consideration of risky behaviors. Forty-six drivers (33% age 65+) completed surveys, then drove for three weeks with data collection during all trips. The Theory of Planned Behavior guided a two-phased regression analysis approach: 1) behavioral intentions were predicted using attitudes about behaviors and demographics; 2) observed risky behavior was predicted using behavioral intentions, theory constructs, personality/psychosocial characteristics, demographics, and driving exposure. Results were synthesized and the emergent themes were used to formulate guidelines for developing theory-based education and communication risky driving countermeasures. Guidelines focused on four risky driving behaviors observed in a large proportion of participants (72% - 96%): holding/using a cellphone; eating/drinking; speeding; and tailgating. Twenty-six guidelines were developed across four categories: 1) relationships among risky behaviors; 2) characteristics or underlying dimensions of risky driving (e.g., time, location, emotion); 3) behavior change theory constructs; 4) audience and message factors. While older drivers self-reported low frequencies of risky behaviors, low intentions for future risky behaviors, and less favorable attitudes toward risky behaviors than younger drivers they were regularly observed engaging in risky behaviors: distracted behaviors in 79% of trips and 2.1 speeding events per trip. Risky driving countermeasures are appropriate for older drivers and the emergent guidelines will be presented with recommended variations for older drivers.

SESSION 3001 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

SEX DIMORPHISM IN AGING

Chair: Bérénice Benayoun

In this symposium, the speakers will discuss how sex can influence aging trajectories using complementary perspectives and approaches across multiple biological scales and systems. Indeed, accumulating evidence across species has revealed that aging is a highly sex-dimorphic process. On the one hand, women outlive men consistently across populations, and most supercentanarians are women. On the other hand, especially after the onset of menopause, women are at increased risk for most age-related diseases (e.g. Alzheimer's disease, osteoporosis, etc.). However, the molecular pathways underlying such sex-differences in aging and longevity are still largely unexplored and poorly understood. Dr. Austad will discuss how compatibility between the mitochondrial and nuclear genomes during aging is influenced as a function of sex. Dr. Dubal will discuss the impact of sex chromosome complement on cognition with aging in mouse models, and how sex chromosomes may underlie sex-differences in brain aging. Dr. Ucar will discuss work from her lab revealing that the genomic signatures of immune aging in humans are specific to sex. Finally, Dr. Benayoun will discuss how aging of innate immune cells (e.g. macrophages or neutrophils) is regulated by the female vs. male milieu, with sex-specific age-related trajectories remodeling the immune compartment in mice.

SEX-DIMORPHIC REGULATION OF INNATE IMMUNITY DURING AGING

Bérénice Benayoun, *University of Southern California, Los Angeles, California, United States*

Aging is accompanied by striking changes in chromatin and gene expression across cell types and species. Yet, how chromatin landscapes change with age and regulate transcription, and how epigenomic changes in turn influence aging in response to external or internal cues, is largely unknown. In addition, accumulating evidence indicates that sex hormones play a key role in driving aspects of cellular and molecular sex-dimorphism. In parallel to sex hormones, karyotypic sex (i.e. XX vs. XY) is also likely to have important impact outside of gonadal sex determination. A key compartment whose activity can be actively modulated by sex-dimorphic mechanisms throughout life is the immune system, whose function declines sharply with aging and may be actively modulated by sex. Indeed, aspects of the immune responses differ between sexes, with a more robust immune response in females and an increased susceptibility to infection in males. Thus, our main cell models of study are key components of the innate immune system and the inflammatory response: macrophages, which accomplish key tasks such as phagocytosis, antigen presentation and cytokine production, and neutrophils, the most abundant leukocyte type serving as a "first line of defense" against infection. Excitingly, we and others have observed strong sex-related differences in the transcriptional and functional phenotypes of these cells and have observed sex-dimorphic "omic" trajectories for these cells with aging. Based on our data and published literature, it is likely that mechanisms involving both gonadal hormones and sex chromosomes may fine-tune different aspects of immunity and, thus, overall health and lifespan.

THE ROLE OF MITOCHONDRIAL-NUCLEAR INTERACTIONS IN SEX DIFFERENCES IN AGING

Steven Austad, *University of Alabama at Birmingham, Birmingham, Alabama, United States*

Sex differences in longevity and the aging phenotype are rampant if not ubiquitous. They are also highly variable and content dependent. That is, although there appears to be an overall female longevity bias in many species, that pattern has many exceptions. In virtually all of the best-studied species, with humans being a notable exception, longevity sex bias is context-dependent. To try to understand sex differences in aging, it is useful to consider the impact of mitochondria, which are exclusively inherited through the female lineage. Mitochondria are endosymbiotic bacteria that have given away most of their genes to the nucleus. Therefore, mitochondrial function depends on compatibility and coordination of the mitochondrial genome with the nuclear genome. The evolutionary success of mitochondrial genomes, specifically, will depend on how effectively they interact with female nuclear genomes, male nuclear genomes being evolutionary dead-ends for them. This talk will employ this logic to examine observations of sex differences in the aging phenotype.

X CHROMOSOME-DERIVED MECHANISMS OF SEX DIFFERENCES IN LIFESPAN AND BRAIN AGING

Dena Dubal, *University of California San Francisco, San Francisco, California, United States*

Women live longer than men worldwide – and also show cognitive resilience in many aging populations. One major source of biologic difference between the sexes is that females have two X chromosomes and males have one. This difference in sex chromosome complement causes unique X-derived mechanisms that are sex-specific. In mammalian development, one X randomly inactivates in XX cells. One X-derived sex difference is that females are mosaics with the active X chromosome in each cell being either maternally-derived (Xm) or paternally-derived (Xp), whereas males harbor only a maternally-derived X (Xm) in all cells. Interestingly, some females show considerable or complete skew toward Xm or Xp. We utilized several genetic models of sex biology to understand mechanisms of sex difference in aging. We found that the X chromosome contributes to longevity and better cognition in male and female mice. In aging, a genetic manipulation in females to express only the maternally-derived X (Xm), like males, accelerated cognitive decline and epigenetic brain aging. This suggests that Xm is harmful and that female mosaicism (Xm+Xp) provides a buffer to deleterious processes in aging. To assess if Xm alters transcription, we used mice with nuclear localized genetic reporters and sorted Xm from Xp neurons from young and aging XX hippocampi. We found that Xm imprinted several genes within aging hippocampal neurons, suggesting silenced cognitive loci. Our data suggests that Xm – the maternal X – accelerates brain aging and causes cognitive deficits. Understanding how Xm impairs brain function could increase understanding of female heterogeneity and of sex differences in cognitive heath – and unlock new X-derived pathways against cognitive deficits and brain aging of males, females, or both.

SEXUAL-DIMORPHISM IN HUMAN IMMUNE SYSTEM AGING

Duygu Ucar[1], George Kuchel[2], Jacques Banchereau[3], Sathyabaarathi Ravichandran[1], Onur Karakaslar[4], Fernando Erra Diaz[5], Eladio Marquez[6], and Radu Marches[1], *1. The Jackson Laboratory for Genomic Medicine, Farmington, Connecticut, United States, 2. University of Connecticut, Farmington, Connecticut, United States, 3. Immunai - NY, New York City, New*

York, United States, 4. Leiden University Medical Center, Leiden, Zuid-Holland, Netherlands, 5. CONICET, Buenos Aires, Ciudad Autonoma de Buenos Aires, Argentina, 6. Dragonfly Tx, Waltham, Massachusetts, United States

Differences in immune function and responses contribute to health- and life-span disparities between sexes. However, the role of sex in immune system aging is not well understood. Here, we characterize peripheral blood mononuclear cells from 172 healthy adults 22–93 years of age using ATAC-seq, RNA-seq and flow cytometry. These data reveal a shared epigenomic signature of aging including declining naïve T cells and increasing monocyte and cytotoxic cell functions. These changes are greater in magnitude in men and accompanied by a male-specific decline in B-cell-specific loci. Interestingly, genomic differences between sexes increase after age 65, with men having higher innate and pro-inflammatory activity and lower adaptive activity. In a separate cohort (n=39) we studied how older adults respond to two available pneumococcal vaccines: T-dependent Prevnar and T-independent Pneumovax. How older adults respond to these vaccines at the molecular and cellular level, and whether there are pre-vaccination predictors for vaccine responsiveness, is poorly understood. To address this, we characterized serum antibody responses and peripheral blood leukocyte composition using flow cytometry and transcriptional profiles using RNA-seq, in healthy older adults before and after vaccination. The vaccines induced comparable serological responses and increases in the number of ICOS+ T follicular helper cells. A shared plasmablast transcriptional signature (IGHG2, IGHA1, IGHA2) was induced by both vaccines ten days after vaccination, which is distinct from influenza vaccine responses. Importantly, the pre-vaccination (baseline) ratio of Th1/Th17 cells predicted responsiveness to Prevnar but not to Pneumovax. Interestingly, women had higher levels of Th1/Th17; and responded stronger to Prevnar compared to men. This study uncovered how older adults respond to different pneumococcal vaccines and demonstrated the significance of considering biological sex and the immune cell composition for precision vaccinology.

SESSION 3010 (PAPER)

CAREGIVING AND CAREGIVER WELL-BEING: CULTURAL AND SOCIAL DETERMINANTS OF HEALTH EXAMPLES

DOES DISTANCE CARE MAKE A DIFFERENCE IN THE STATUS OF CARE RECIPIENTS OVER AN 18-MONTH PERIOD?

Tomoko Wakui[1], Ichiro Kai[2], and shuichi Awata[1], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Tokyo, Japan, 2. The University of Tokyo, Tokyo, Tokyo, Japan*

Aging in place is a priority for policy makers and individuals, and the continuity of care provided at home is one of the major concerns. Co-resident caregiving has been a dominant caregiving arrangement in Japan; however, the solitary residence of older care recipients has become more frequent. This study thus examined the impact of distance care on the status of care recipients over an 18-month period. Longitudinal data were collected from family caregivers of older adults in 17 municipalities of north-central Japan beginning in 2010. The status of care recipients after 18 months was categorized as receiving care at home, being institutionalized, deceased, hospitalized, moved out from the community, recovered, or untraceable. Care recipients' age, gender, activities of daily living, dementia symptoms, and caregivers' age, gender, health status, economic status, and caregiving burden were measured. We analyzed data of 2280 care recipients–caregiver dyads. Care recipients' mean age was 84.7 (SD=7.3), and 66.7% were women. Of those, 65.0% had some dementia symptoms. Multivariate logistic regression models predicting the status of care recipients after 18 months showed that distance care had significant effects on care recipients' status. Those who received distance care were more likely to be moved out, institutionalized, and deceased after 18 months, even after controlling for their care needs and caregiving situations. There were no significant effects on being hospitalized. This study suggests that the more difficult situation pertaining to staying at home is experienced by care recipients who received distance care, and support is required.

DYADIC EFFECTS ON DEPRESSIVE SYMPTOMS OF SPOUSE CAREGIVERS AND THEIR CARE RECIPIENTS: EVIDENCE FROM CHINA

Jinyu Liu[1], Yifan Lou[1], Lydia Li[2], Hongwei Xu[3], and Zhenmei Zhang[4], *1. Columbia University, New York, New York, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Queens College in the City University of New York, Queens, New York, United States, 4. Michigan State University, East Lansing, Michigan, United States*

Objectives: The likelihood of providing care to a spouse in middle and older ages has increased as life expectancy increases, but knowledge about how the caregiver and care recipient influence each other's mental health is limited. This study examined whether a partner's physical, cognitive, and mental health in a spousal caregiving dyad are associated with the other partner's depressive symptoms in China and whether the dyadic effects vary by gender.

Methods: This study used data from Wave 3 (2015) and Wave 4 (2018) follow-up surveys of the China Health and Retirement Longitudinal Study (CHARLS). The analytic sample featured 1,245 dyads of care recipients aged 45 or older and their spouse caregivers. The Actor-Partner Interdependence Model was used to test the dyadic effects among all couples in the analytic sample, couples with wife caregivers and couples with husband caregivers, respectively.

Results: We found that caregiver's depressive symptoms at Wave 3 were significantly associated with care recipient's depressive symptoms at Wave 4 in the full sample. Regardless of caregiver or care recipient roles, wives' mental health was impacted by their husbands' depressive symptoms, but not vice versa. Wife recipient's cognitive impairment was associated with husband caregiver's lower depressive symptoms. Discussion: This study sheds light on the mental health of couples in the context of caregiving in China. The findings indicate that interventions to support couples in a caregiving dyad need to consider the influence they have on each other, and the gender and health conditions of each in the dyad.

INCREASING RISK FOR ELDER MISTREATMENT? A QUALITATIVE STUDY OF CAREGIVER EXPERIENCES DURING COVID-19

Kelly Marnfeldt[1], Lilly H. Estenson[2], Julia Marinez[3], Zach Gassoumis[4], and Kathleen Wilber[3], *1. University of Southern California, Santa Monica, California, United States, 2. University of Southern California, Pasadena, California, United States, 3. University of Southern California, Los Angeles, California, United States, 4. Keck School of Medicine, USC, Los Angeles, California, United States*

Family caregivers (CGs) of community-dwelling older adults faced unprecedented psychosocial challenges in the face of the COVID-19 pandemic. Social isolation, lack of social support, truncated care networks, financial hardship and other factors put many older adults at risk for elder mistreatment (EM). Even in normal times, incidents of EM are only identified and formally reported in about one out of every 24 cases. Social distancing restrictions in the caregiving context, including decreased access to healthcare providers, rendered older adults with higher dependency needs inordinately vulnerable to abuse and neglect. We collected qualitative data on the experiences of 24 CGs receiving telephonic support sessions between March 2020 and February 2021. Data from 100 distinct post-session case notes were analyzed using thematic content analysis to generate codes and themes. Caregivers reported rapid deterioration of care receiver's (CRs) physical health, resulting in higher levels of dependency. Declines in mental health and cognitive impairment, including behavioral issues, were an indicator of stress for both CR and CG. CGs reported lack of access to services and social supports, fractured care networks, and increased feelings of isolation. Preliminary content analysis indicates that serious risk factors for EM were present across all 13 months of the study, and those risk factors continued or worsened over time. Findings suggest that the unintended consequences of the public health response to COVID-19 may have amplified the risk for EM in vulnerable community-dwelling older adults.

THE IMPACT OF CHILDHOOD ADVERSITY ON CAREGIVERS' HEALTH

Elizabeth Avent[1], Jeanine Yonashiro-Cho[2], and Zach Gassoumis[3], *1. University of Southern California, Los Angeles, California, United States, 2. Keck School of Medicine of USC, Alhambra, California, United States, 3. Keck School of Medicine, USC, Los Angeles, California, United States*

Caregivers tend to report fair or poor health compared to non-caregivers. Adverse childhood experiences (ACEs), which are traumatic events experienced before age 18, have been associated with several health conditions and overall poor health in adulthood. The additive effect of early-life stressors and caregiving stressors may have a compounded impact on the health of caregivers, contributing additional stress and burden to their caregiving situation. Data from the 2019 and 2020 Behavioral Risk Factor Surveillance System (BRFSS) were used to analyze self-rated health (SRH) in the context of caregiving and ACEs, based on responses from Florida, Georgia, Tennessee, Virginia, and Utah (N= 41,334). Of the 8,368 caregivers, nearly 23% reported 4 or more ACEs, compared with 13% of non-caregivers. Nested regression models showed that caregivers have lower SRH (b=-0.04, p=0.0002); however, after including the combination of ACEs and being a caregiver, there was no significant impact of being a caregiver alone on SRH. The effect of ACEs alone on SRH persisted, with the strongest effect for individuals with 4 or more ACEs (b=-0.41, p< 0001). The finding that caregivers' childhood adversity accounts for SRH moreso than their caregiver status highlights the importance of a lifespan approach when considering caregiver health and, potentially, burden. This has implications for practice, suggesting that screening caregivers on their history of ACEs may be a valuable tool to identify caregivers at higher risk for poor health outcomes who may benefit from additional resources to support their health and well-being.

TOOLS TO SUPPORT NEEDS ASSESSMENTS ON DEMENTIA, COGNITIVE HEALTH, AND CAREGIVING

John Shean[1], Talyah Sands[2], Priya Shah[2], and Kelsey Donnellan[3], *1. Alzheimer's Association, Chicago, Illinois, United States, 2. Association of State and Territorial Health Officials, Arlington, Virginia, United States, 3. Assoc. of State and Territorial Health Officials (ASTHO), Arlington, Virginia, United States*

Dementia, cognitive health, and caregiving are not always included in community health needs assessments, leading to their absence in public health improvement and strategic plans, and subsequent lack of action and funding to address these needs. In response, the Alzheimer's Association and the Association of State and Territorial Health Officials published the Needs Assessment Toolkit for Dementia, Cognitive Health, and Caregiving. Designed for state, local, and territorial public health and aging officials, this toolkit helps communities identify unmet needs of older adults, scale up existing community strengths, and promote healthy aging. The toolkit embeds health equity as a cornerstone to assessing community health. It offers approaches to operationalize equity in the assessment process by including wide representation of people from different racial and ethnic backgrounds, geographic locations, and levels of socioeconomic status and educational attainment. The toolkit's five steps are modular in design and allow jurisdictions to enter the process at any stage. It considers alignment with jurisdiction-wide plans including Alzheimer's plans, health improvement plans, aging plans, and the Healthy Brain Initiative Road Map, helping public health agencies advance attention to Alzheimer's through their networks. Developed through an iterative process, expert input from public health and aging practitioners guided the development and organization. Over 1,600 comments were reconciled to ensure usability among stakeholders, elevate equity to an essential component throughout the assessment process, and add value to allied strategic plans. This presentation complements Learn, Plan, Do: Public Health Planning to Address Dementia and Caregiving, abstract ID 1229181.

SESSION 3020 (SYMPOSIUM)

CAREGIVING AND COGNITIVE IMPAIRMENT IN MEXICO AND THE US

Chair: Phillip Cantu Co-Chair: Sunshine Rote Discussant: Joseph Gaugler

Dementia is one of the most common causes of disability and dependence in the world. The growing dementia population in Mexico is exemplary of many low- and middle-income countries (LMICs). While the U.S. has a highly developed formal long-term care system, the use of institutional care among Latinos has been low. Mexico lacks a publicly financed long-term care system, and it does not have a national-level mandatory registry of institutions, compulsory standards of care, nor a regulatory body to oversee management, quality of care standards for services, or the accreditation and evaluation of service providers. There are no policies, public programs, or services to provide dependency care, including support for people living with dementia and their family caregivers. As in other LMIC's, there is limited public support for the aging population in Mexico, leaving families with the main responsibility of providing care and economic security for older adults. "Informal" and family caregivers for older adults with cognitive impairment are critical components of how older adults with cognitive impairment are able to remain in the community. This symposium will reflect the broad spectrum of caregivers and care context in the U.S. and Mexico to shed light on sources of care for older adults living with cognitive impairment.

RACIAL AND ETHNIC DIFFERENCES IN HEALTH OF SPOUSES OF COGNITIVELY IMPAIRED OLDER ADULTS

Phillip Cantu[1], Rafael Samper-Ternent[2], and Lu Chen[3], *1. The University of Texas Medical Branch, Galveston, Texas, United States, 2. University of Texas Medical Branch, Galveston, Texas, United States, 3. UTMB, Galveston, Texas, United States*

Introduction: A large body of research in the U.S. shows that non-Hispanic black (black) and Hispanic older adults have higher rates of cognitive impairment and dementia compared to Whites. Little research has examined how cognitive life courses differentially affect spouses of cognitively impaired older adults.

Objectives: This paper will describe the different life courses of spouses of cognitively impaired older adults by race and ethnicity in the U.S.

Methods: Using data from the 2010 Health and Retirement Survey, we examine differences in the health of spousal dyads where one partner becomes cognitively impaired over follow up, by 2016. Spousal dyads are limited to Hispanic (n=464 dyads), i black (n=345 dyads), or white (n=2,409 dyads) couples who were both cognitively normal at baseline and had cognition information at follow up.

Results: Hispanic and Black dyads were more likely to have at least one partner become cognitively impaired over the follow up period despite being younger than White dyads. A total of 23% of Hispanic dyads, 26% of Black dyads and 16% of White dyads were N/CI at follow up. Despite fewer chronic conditions at baseline, a higher proportion of Hispanic dyads with no chronic conditions had at least one member become cognitively impaired (20%) compared to Whites (6.28%).

Conclusion: Our results show that health of couples changes differently by race and ethnicity. A higher proportion of Hispanic and Black dyads have partners with cognitive impairment and the cognitive impairment happens earlier in life.

MEXICAN AMERICAN CAREGIVER HEALTH AND TURNOVER: THE ROLE OF STRESSORS, RESOURCES, AND BACKGROUND FACTORS

Sunshine Rote[1], Jacqueline Angel[2], and Kyriakos Markids[3], *1. University of Louisville, Louisville, Kentucky, United States, 2. The University of Texas at Austin, Austin, Texas, United States, 3. UTMB, Galveston, Texas, United States*

The purpose of this study is to explore the role of caregiver background, stressors, and resources for Mexican American caregiver turnover and depressive symptoms. Using two waves of the Hispanic Established Epidemiologic Study of the Elderly Caregiver Supplement (H-EPESE CG, 2010/2011-2016 N=333) and informed by the sociocultural caregiver stress process model, we estimate logistic and OLS regressions of caregiver turnover and caregiver depressive symptoms over five years. Neuropsychiatric expressions of dementia were significantly associated with caregiver turnover and relative to caregivers who were adult children of the care recipient, grandchildren caregivers and other kin and non-kin caregivers were more likely to experience caregiver turnover. While depressive symptoms were relatively low at both waves, there was a greater increase in depressive symptoms for caregivers who completed the interview in Spanish, which was partially explained by lower caregiver resources (e.g., support from others). The findings demonstrate the need for dementia care supports for Mexican American caregivers, improving support systems for Spanish-speaking caregivers, and supporting Mexican American caregivers who may be entering the role unexpectedly (e.g., grandchildren or non-kin).

PATHWAYS OF CARE: THE EXPERIENCE AND COSTS OF CARING FOR FAMILY MEMBERS LIVING WITH DEMENTIA IN MEXICO

Mariana López-Ortega, *NATIONAL INSTITUTE OF GERIATRICS, NATIONAL INSTITUTES OF HEALTH, Mexico CIty, Distrito Federal, Mexico*

Introduction: Formal health and social security institutions are not unequipped to respond to significant dementia prevalence, and currently, no publicly funded national level dementia care policies are in place. However, little is known about the economic, social and health consequences for those providing care.

Methods: This paper presents families' health and social dementia care seeking trajectories and the structural factors that shape them. It is based on results of almost 2 years of highly inductive fieldwork, carried out before and during the ongoing COVID-19 pandemic, and includes 50 in-depth interviews with 23 unpaid family caregivers.

Results: Lack of awareness and knowledge about dementia and normalization of cognitive impairment as part of aging result in long delays in seeking care. When there is a diagnosis, health professionals concentrate on clinical aspects of illness, but seldom explain possible changes, behaviours, symptoms, or provide care strategies. For most carers, high opportunity costs are reported with high impact as they stop or change to more flexible employment, change living arrangements, in addition to the large economic impact of paying for most care inputs such as medicines or home adaptations.

Conclusions: In Mexico, these unpaid family carers struggle to navigate complicated care pathways, with little or no government or public support. Health system institutions should increase awareness and knowledge about dementia and prioritize developing and coordinating programs that provide timely diagnosis within primary care services and support strategies for people living with dementia and their carers, using person centred care.

LONGITUDINAL CHANGE IN LIVING ARRANGEMENTS AND COGNITIVE IMPAIRMENT

Jiwon Kim[1], Phillip Cantu[2], and Jacqueline Angel[3], *1. University of Texas at Austin, Austin, Texas, United States, 2. The University of Texas Medical Branch, Galveston, Texas, United States, 3. The University of Texas at Austin, Austin, Texas, United States*

Objective: To examine changes in living arrangements and cognition in the U.S. and Mexico.

Methods: Latent class analysis to document the joint progression of cognitive impairment and changes in living arrangements using the Hispanic -EPESE and the Mexican Health and Aging Study (MHAS)

Results: In the H-EPESE, vital status analyses reveal that those who died were more likely than survivors to report likely dementia and co-morbid physical conditions and one third of older adults lived alone. Almost one-fifth of the H-EPESE sample suffered a decline in cognition over time. Despite declines in cognitive function, there is a great deal of stability in living alone across waves. We expect even greater stability and change in living alone in the event of cognitive decline in the MHAS given cultural traditions and fewer options in care and a lower propensity to live alone in Mexico.

SESSION 3030 (AWARD LECTURE)

CLARK TIBBITTS AWARD AND HIRAM J. FRIEDSAM AWARD PRESENTATIONS AND LECTURES

Chair: Kara Dassel

The Clark Tibbitts Award Lecture will feature an address by the 2022 award recipient Laura M.K. Donorfio, PhD, FAGHE, of The University of Connecticut. AGHE's Clark Tibbitts Award was established in 1980 and named for an architect of the field of gerontological education. The award is given each year to an individual or organization that has made an outstanding contribution to the advancement of gerontology and geriatrics education. The Hiram J. Friedsam Award Lecture will feature an address by the 2022 award recipient Rona J. Karasik, PhD, FGSA, FAGHE, of Saint Cloud State University. Hiram J. Friedsam was the professor, co-founder, and director of the Center for Studies in Aging and dean of the School of Community Service at the University of Northern Texas. Dr. Friedsam was an outstanding teacher, researcher, colleague, and mentor to students, faculty, and administrators, as well as a past president of AGHE. The purpose of this award is to recognize those who emulate Dr. Friedsam's excellence in mentorship.

PEDAGOGY OF AGING: A JOURNEY TOWARD AUTHENTICITY AND WHOLENESS

Laura Donorfio, *University of Connecticut, Waterbury, Connecticut, United States*

Innovation in gerontological education has been a driving catalyst since the beginning of my career over 30 years ago. While sometimes seen as a curse, this catalyst has shaped my teaching pedagogy in unimaginable ways. Examples include field trips with 40+ students, developing an aging toolbox for students to make the material more concrete, creating a new interactive television teaching platform over multiple university campuses, developing experiential curriculum and an undergraduate minor in aging, and proudly, developing AGHE's first teaching institute now in its 11th year. Unexpectedly, at this stage of my career, I have become very aware that my teaching about aging has intersected with my personal aging, shaping my personal pedagogy in profound ways--increased empathy, sensitivity, and social awareness. I am living the subject matter I thought I intimately knew. I am the other. Has my teaching been inauthentic? Hypocritical? Ageist? Please join me for a healthy discussion on how this insight can be leveraged to teach the next generation of aging scholars.

FULL CIRCLE: MENTORING IN GERONTOLOGY AND GERIATRICS EDUCATION

Rona Karasik, *St. Cloud State University, St. Cloud, Minnesota, United States*

More than just a buzzword in business and education, mentoring is a complex interactional process that, at its best, fosters personal and professional development for all involved. In other words, a good mentoring relationship can be both transformative and reciprocal. This raises the question of what is (and is not) a good mentoring relationship? Moreover, how does one enter into and capitalize on the benefits of mentorship? While some mentoring relationships are intentionally created, others seem to evolve so organically that participants are not immediately aware of mentoring's presence. The current presentation looks at the nature of mentoring relationships within the context of gerontology and geriatrics education from both the mentor and mentee perspectives.

SESSION 3040 (SYMPOSIUM)

COGNITIVE AGING IN LOW- AND MIDDLE-INCOME COUNTRIES

Chair: Yuan Zhang Co-Chair: Joseph Saenz

Cognitive aging is a highly complex, dynamic, and context-dependent process; and is influenced by individual and community characteristics and experiences across the life course. Low- and middle-income countries (LMICs) are critical components of the international dementia research community because the burden of dementia is rapidly rising in LMICs, and low-resource settings may have unique social and economic determinants of cognitive health. However, little population-based research focuses on these regions. The papers in this symposium use high-quality population survey data from Mexico, Brazil, South Africa, and China to study critical social determinants of cognitive function in countries across the globe. These papers cover a range of social and economic factors, including food insecurity, education, household material resources, and urban-rural settings and policy. First, Saenz will present findings on how food insecurity, throughout life, relates with cognitive function among older Mexican adults. Next, Farina will present evidence on both indirect and direct pathways from education to cognitive function among older Brazilians. Third, Kobayashi will present longitudinal data evaluating level and change in household resources in relation to subsequent cognitive function in South Africa. Finally, Zhang will present evidence on the interplay of rural/urban residence and household registration system across the life-course in creating cumulative advantage/disadvantage in cognitive aging using longitudinal data from China. The papers in this symposium provide new insights into social determinants of cognitive health in diverse contexts and have significant policy implications for improving cognitive health in LMICs across the globe.

FOOD INSECURITY ACROSS THE LIFE COURSE AND COGNITIVE FUNCTION AMONG OLDER MEXICAN ADULTS

Joseph Saenz[1], Jamie Kessler[2], and Ehlana Nelson[1], *1. University of Southern California, Los Angeles, California, United States, 2. University Of Southern California, Los Angeles, California, United States*

Food insecurity is a global public health problem and is related with poorer cognition among older adults. Few have examined how food insecurity, throughout life, relates with cognition among older Mexican adults. Data came from the 2015 Mexican Health and Aging Study (n=11,507, aged 50+). Early- and late-life food insecurity were self-reported. We evaluated how food insecurity related with cognition (Verbal Learning, Verbal Recall, Visual Scanning, and Verbal Fluency), controlling for health and sociodemographic confounders. In descriptive analyses, respondents who experienced food insecurity in early- or late-life performed worse on all cognitive tasks compared to the food secure. When adjusting for health and sociodemographic confounders, early-life food insecurity predicted worse Verbal Learning performance and late-life food insecurity related with poorer Visual Scanning. Food insecurity negatively related with cognition among older Mexican adults. The significance of effects depended on cognitive task and when in life food insecurity was experienced

DIRECT AND INDIRECT PATHWAYS FROM EDUCATION TO COGNITIVE FUNCTIONING AMONG OLDER BRAZILIANS

Mateo Farina, *University of Southern California, Los Angeles, California, United States*

Cognitive impairment in Brazil is a growing population health concern. Studies suggest that Brazil may have one of the highest age-standardized prevalence of Alzheimer's disease and related dementias (ADRD) in the world. However, improving education attainment among older adults may lead to a decline in cognitive impairment across the population in the coming years. The purpose of this study is to examine the pathways that link educational attainment to cognitive functioning in Brazil, a highly unequal, resource rich society. I use the 2016 Brazilian Longitudinal Study of Aging, a nationally representative study of Brazilian older adults 50+. I use linear regression models to predict overall cognitive functioning as well as specific domains of cognition (memory vs. non-memory). Preliminary findings provide evidence of both indirect and direct pathways from education to cognitive functioning. The indirect pathways, however, were only found for adults with 8+ years of education.

TRENDS IN HOUSEHOLD MATERIAL RESOURCES AND COGNITIVE HEALTH IN A LONGITUDINAL COHORT STUDY OF AGING IN SOUTH AFRICA

Lindsay Kobayashi[1], Chodziwadziwa Kabudula[2], Mohammed Kabeto[1], Xuexin Yu[1], Stephen Tollman[2], Kathleen Kahn[2], Lisa Berkman[3], and Molly Rosenberg[4], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. MRC/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), University of the Witwatersrand, Johannesburg, Gauteng, South Africa, 3. Harvard Center for Population and Development Studies, Harvard T.H. Chan School of Public Health, Cambridge, Massachusetts, United States, 4. Department of Epidemiology and Biostatistics, Indiana University School of Public Health-Bloomington, Bloomington, Indiana, United States*

Material resources that affect daily living conditions may be salient for cognitive aging in low-income settings, but evidence is limited on this topic. We investigated relationships between long-term trends in household material resources and subsequent cognitive function among 4,580 adults aged ≥40 in a population-representative cohort in Agincourt sub-district, South Africa, from 2001-2015. Household material resources (dwelling materials, water, sanitation, sources of power, modern amenities, and livestock) were assessed biennially from 2001-2013. We evaluated mean resources, volatility in resources, and change in resources over this period in relation to cognitive function in 2014/2015. Higher mean household resources and larger improvements over time in resources were positively associated with subsequent cognitive function, independent of confounders. Findings were largely driven by modern amenities for food preparation, transportation, and communication outside of the household. Access to these amenities may support cognitive aging through boosting nutrition and cognitive reserve and should be investigated further.

CUMULATIVE (DIS)ADVANTAGE IN COGNITIVE HEALTH: RURAL/URBAN RESIDENCY, HUKOU, AND COGNITIVE AGING IN OLDER CHINESE

Yuan Zhang[1], Qian Song[2], and Jen-Hao Chen[3], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 2. Universiy of Massachusetts Boston, Boston, Massachusetts, United States, 3. National Chengchi University, Taipei City, Taipei, Taiwan (Republic of China)*

Urban residency benefits cognition in later life. In China, the household registration system (hukou) creates another place-based advantage/disadvantage for cognitive aging. We exam the interplay of rural/urban residence and hukou across the life-course in creating cumulative advantage/disadvantage in cognitive aging trajectories using longitudinal data from the 2011-2018 China Health and Retirement Longitudinal Study and its Life History Survey. Results from linear mixed effect models show that always urban dwellers with urban hukou exhibited the highest level of cognitive function and the slowest decline, and the always rural dwellers with rural hukou had the worst cognitive function and experienced a faster decline. Rural-to-urban shifts had better cognitive health than always rural dwellers, but the advantages depend on urban hukou attainment and specific mechanisms. This research suggests cumulative advantage/disadvantage in cognitive aging by residence and hukou throughout life and demonstrates that institutional discrimination and exclusionary policy may create inequality in aging processes.

SESSION 3050 (SYMPOSIUM)

DEMENTIA CARE REIMAGINED: THE MULTIMODAL PREVENTING LOSS OF INDEPENDENCE THROUGH EXERCISE (PLIÉ) PROGRAM

Chair: Deborah Barnes Co-Chair: Francesca Nicosia
Discussant: Theresa Allison

Over 6 million people in the United States and 50 million people worldwide are living with some form of dementia. Current pharmacotherapies for people living with dementia (PLWD) can provide some symptomatic relief but do not alter the disease course, have numerous side effects, and do not improve quality of life. Non-pharmacologic and behavioral interventions are increasingly recognized as inexpensive and effective ways to improve a wide range of outcomes for PLWD. Yet few interventions target multiple domains related to dementia quality of life. This symposium overviews the Preventing Loss of Independence through Exercise (PLIÉ) program, an evidence-based, integrative mind-body group movement program that targets key domains associated with better quality of life in PLWD: physical function, cognitive function, well-being, social connection, and self-esteem. This symposium provides an overview of the broad impact of this novel, non-pharmacologic, multimodal intervention on quality-of-life outcomes for PLWD, including expansion to include care partners and people with mild cognitive impairment and implementation in varied settings including adult day programs, nursing homes, and online delivery. It includes a participatory component for attendees to experience PLIÉ in action. Discussion focuses on the need for programs that support dementia quality of life through engagement in mind-body movement and social connection.

OVERVIEW AND EVIDENCE-BASE FOR PREVENTING LOSS OF INDEPENDENCE THROUGH EXERCISE (PLIÉ)

Deborah Barnes, Margaret Chesney, Linda Chao, and Wolf Mehling, *University of California, San Francisco, San Francisco, California, United States*

PLIÉ was initially developed and tested in the adult day setting. Caregivers reported qualitative improvements in PLWD in psychological, physical, cognitive, and social domains that were supported by class video-recordings. Paired PLIÉ was adapted for the community setting and expanded to include dyads of PLWD and care partners (CPs) who participated in group classes together. PLWD reported significant improvements in self-rated quality of life, and CPs reported psychological, physical, cognitive, and social benefits for PLWD as well as themselves. We then adapted PLIÉ for people with mild cognitive impairment (MCI) and found that it significantly increased default mode network connectivity on resting-state functional MRI scans, while improving quantitative measures of cognitive function, social isolation, physical performance and self-regulation. We also implemented PLIÉ in a VA skilled nursing facility, where a post-implementation evaluation determined that residents, staff and family members all reported psychological, physical, cognitive and social benefits.

DEVELOPMENT AND TESTING AN INTERPROFESSIONAL PLIÉ TRAINING PROGRAM FOR VA NURSING HOME STAFF

Jennifer Lee[1], Francesca Nicosia[2], Catherine Pham[3], Nikita Shirsat[4], Matthew Miller[2], Margaret Chesney[2], and Deborah Barnes[2], *1. San Francisco VA Health Care System / Together Senior Health, San Francisco, California, United States, 2. University of California, San Francisco, San Francisco, California, United States, 3. San Francisco VA Health Care System, San Francisco, California, United States, 4. UC Irvine School of Medicine, Irvine, California, United States*

In this study, we collected formative data from key stakeholders (nursing home staff and leadership, dementia care experts), developed, pilot tested, and refined a 10-week remote training program at 2 VA nursing homes with 15 interprofessional staff (e.g., recreation therapists, social workers, registered nurses). Training components included weekly livestreaming didactic sessions for staff that demonstrated PLIÉ guiding principles and themes. Weekly experiential sessions, facilitated by the lead PLIÉ instructor, included staff and residents with dementia participating together online. All training sessions were video recorded and available for review along with a training manual. Staff completed weekly surveys, post-training focus groups, and expressed high confidence using 6 of 8 PLIÉ principles; 100% rated their overall training satisfaction as "very good" or "excellent." The remote PLIÉ training was an efficient model for staff training that leveraged interprofessional knowledge and skills. This presentation includes an experiential demonstration of PLIÉ in action.

MOVING TOGETHER ONLINE FOR PEOPLE LIVING WITH MILD COGNITIVE IMPAIRMENT/DEMENTIA AND CARE PARTNERS

Francesca Nicosia[1], Amanda Lee[2], Margaret Chesney[1], Jennifer Lee[2], Cynthia Benjamin[2], Wolf Mehling[1], Rebecca Sudore[1], and Deborah Barnes[1], *1. University of California, San Francisco, San Francisco, California, United States, 2. Together Senior Health, San Francisco, California, United States*

This study used Human Centered Design methods to develop a digital platform tailored for PLWD and test an online version of PLIÉ, called Moving Together. We assessed feasibility and satisfaction of a 12-week online program using completion rates, attendance, and evaluation surveys. 39 people (18 PLWD, 7 MCI, 14 CP) attended 75% classes; 96% rated classes as excellent or good; and 88% were highly likely to recommend Moving Together. Participants reported benefits in social connection ("camaraderie," "like a family"), emotional well-being ("happier," "less stressed"), physical function ("stronger," "more range-of-motion"), cognitive function ("more focus," "learning new things"), and present-centered body awareness ("more conscious of breathing patterns"). PLWD/MCI experienced improved self-concept ("less immediate shame and more confidence"); and Care Partners reported improved caregiving efficacy ("greater purpose," "more comfortable"). Online delivery of Moving Together is feasible for people with dementia or mild cognitive impairment and care partners.

SESSION 3060 (SYMPOSIUM)

DESIGN AND DEVELOPMENT OF MHEALTH FOR DEMENTIA: CURRENT AND FUTURE DIRECTIONS

Chair: Tina Sadarangani Discussant: Richard Holden

Alzheimer's disease and related dementias (ADRD) represent an increasingly prevalent group of neurodegenerative chronic diseases for which there is no cure. Progressive functional and cognitive decline in individuals with ADRD places considerable demands on those involved in their care, including clinicians and care partners. Mobile health technology has the potential to support people living with dementia and their care team members, as well as potentially prevent the onset of dementia symptoms. In this symposium we first examine best practices in mhealth application development for dementia care based on applications developed for other chronic illnesses. We then examine mhealth applications being developed in three different NIH-funded studies that address the needs of clinicians, care partners, adult day centers involved in the care of people with dementia, as well as an application for people with mild cognitive impairment. The Aliviado Dementia Care app is a resource that enables clinicians to access best practices for managing behavioral and psychological symptoms of dementia at the point of service. CareMOBI streamlines communication between care partners, adult day centers, and primary care providers, allowing care team members to track and exchange information relevant to dementia care and identify emerging clinical problems. Finally, Spanish-language information and culturally relevant motivational messages to promote physical activity and delay progression to ADRD among those with mild cognitive impairment within the Tiempos Juntos intervention are presented. Our discussion summarizes the current and future direction of mhealth application development in ADRD, and key learnings from presenters' work.

CAREMOBI: AN APP CONNECTING CAREGIVERS, ADULT DAY CENTERS, AND HEALTHCARE PROVIDERS CARING FOR PEOPLE WITH DEMENTIA

Tina Sadarangani[1], Jonelle Boafo[2], and Jie Zhong[1], *1. New York University, New York, New York, United States, 2. Rory Meyers College of Nursing, New York, New York, United States*

Fragmented communication between care partners, health care providers, and adult day centers around the needs of persons living with dementia (PLWD) contributes to avoidable health care utilization. CareMOBI, is a user-centered mobile application that streamlines information exchange around datapoints relevant to the care of PLWD. CareMOBI facilitates team-based communication around emerging clinical problems by uniquely integrating the knowledge and day-to-day observations of adult day center staff and care partners. We present a stakeholder engaged approach to iteratively designing and validating an initial prototype. Through interviews and focus groups with adult day center staff (n=31), primary care providers (n=22), and family caregivers (n=13) we identified barriers to communication across settings. We then visually mapped the domains of a future app which we subsequently validated and refined with end-users (n=25). We present our current prototype which synthesizes these findings and addresses key barriers to information exchange across community settings serving PLWD.

DEVELOPING AND RAPIDLY SCALING AN MHEALTH APP IN A 25-SITE PRAGMATIC TRIAL OF ALIVIADO DEMENTIA CARE IN HOSPICE

Abraham Brody[1], Aditi Durga[2], Ariel Ford[3], and Shih-Yin Lin[2], *1. HIGN at the NYU Rory Meyers College of Nursing, New York, New York, United States, 2. New York University, New York, New York, United States, 3. New York University Rory Meyers College of Nursing, New York, New York, United States*

Following stakeholder engagement in our pilot phase of a large-scale 2-phase NIA funded pragmatic clinical trial in hospice (HAS-QOL Trial) of Aliviado Dementia Care, we utilized a co-design process to develop over a 6-month period and rapidly scale an mHealth application to assist clinicians in performing best practices in care for persons living with dementia receiving hospice. Throughout the 36 months of intervention period, the app has been utilized by at least 6,580 hospice team members, both to complete training, receive mobile push notification nudges, and: 1) perform 6,682 clinical assessment such as the PAINAD for pain and NPI-Q for behavioral symptoms; 2) develop 2,204 symptom specific care plans; and 3) Review specially developed education materials to 15,128 caregivers and send them to 671 directly. This session will also discuss the process of implementation and scaling, including the technological hurdles in working with a workforce with sometimes limited technical skills.

OPPORTUNITIES FOR MHEALTH IN DEMENTIA CARE/CARE MANAGEMENT: LESSONS LEARNED FROM OTHER CLINICAL DISCIPLINES

Hayley Belli, *New York University School of Medicine, New York, New York, United States*

The use of mHealth applications in dementia care/care management has recently become of increasing interest to patient stakeholders, clinicians, and researchers working in the field. However, there exists a rich literature of successful examples of the development, implementation, and efficacy of mHealth applications across a variety of health care disciplines. Thus there is high potential to take these lessons learned from other clinical fields and apply such successes to dementia care/care management. We will walk through several examples of mHealth tools used for managing hypertension, diabetes, migraines, and weight loss, while highlighting specific opportunities for dementia care/care management. Points of discussion will include optimizing the user-centered design process during the development phase of mHealth applications, increasing patient engagement with mHealth applications – especially among underrepresented individuals in research, promoting adherence to mHealth interventions via principles from behavioral economics, and scaling up mHealth interventions to test for efficacy at a population-level.

MHEALTH DESIGN AND IMPLEMENTATION IMPLICATIONS TO PROMOTE PHYSICAL ACTIVITY IN OLDER HISPANICS/LATINOS WITH MCI

G. Adriana Perez, *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Addressing physical inactivity for older Hispanics/Latinos with mild cognitive impairment (MCI) is a public health priority, since MCI increases the risk of developing Alzheimer's Disease and related dementias (ADRD). Compared to non-Latino Whites, Hispanics/Latinos are 2X more likely to develop ADRD. One promising approach to promoting physical activity includes use of mobile health (mHealth) strategies that may deliver Spanish-language information and culturally relevant motivational messages to enhance intrapersonal/interpersonal factors for health behavior change. The purpose of this study is to test mHealth strategies as a mechanism to deliver booster sessions for reinforcing physical activity goals/progress among older Latinos with MCI who complete the Tiempos Juntos intervention treatment. Our hypothesis is that culturally adapting mHealth strategies may improve efficacy and maintenance of physical activity effect; as well as cognitive health outcomes (6 months post-intervention). Results among the first wave of participants will be discussed, including challenges and opportunities for future research. While the use of mHealth is not new, these approaches commonly exclude individuals with limited-English proficiency and thus, designing interventions that center the needs of older Hispanics/Latinos with MCI/ADRD and other historically excluded communities, is an important first step in promoting physical activity and advancing cognitive health equity.

SESSION 3070 (SYMPOSIUM)

DIVERSITY MATTERS: INTERSECTIONAL INEQUITIES IN HEALTH AND WELL-BEING THROUGH AGING

Chair: Rachel Koffer Co-Chair: Johanna Drewelies
Discussant: Deborah Carr

Different positions within social hierarchies receive unequal access to resources, leading to health disparities in later life (Agenor, 2020). Research addressing inequities must increasingly account for the many social categorizations (e.g., race, gender, socioeconomic status) that affect individuals' lived experiences. This symposium examines the role of intersecting social contexts on health and well-being across the life course. Surachman and colleagues use the U.S.-based National Growth and Health Study to examine the intersectionality between early life socioeconomic context and race on women's metabolic syndrome severity. Their findings have implications for societal factors leading to accelerated aging across young adulthood and early midlife. Koffer and colleagues use the U.S.-based Study of Women's Health Across the Nation to demonstrate differential midlife exposure to types and number of major life events across race/ethnicity and education. They subsequently find that major life events increase risk of cardiovascular disease events, indicating the importance of studying the life experiences of diverse women across midlife. Drewelies and colleagues use the Germany-based Berlin Aging Study II to look at the associations among multidomain identity and social background factors on physical, cognitive, and psychological aging. Implications from their work demonstrate the interplay of diversity on health and well-being in older adulthood. Conjointly, findings indicate that intersectional identities play an important role in shaping key outcomes of human functioning across adulthood and aging. Dr. Deborah Carr will critically discuss the three contributions from a life course perspective and provide considerations for future research and policy promoting equity for diverse older adults.

LIFE EVENTS AND CARDIOVASCULAR DISEASE EVENTS: THE STUDY OF WOMEN'S HEALTH ACROSS THE NATION

Rachel Koffer[1], Rebecca Thurston[2], and Karen Matthews[2], *1. Arizona State University, Phoenix, Arizona, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Cardiovascular disease (CVD) is the number one cause of death for women, and major life events across midlife may contribute to CVD risk. The present study aimed to test whether greater exposure to major life events across nearly two decades of longitudinal follow-up would be associated with higher risk of clinical cardiovascular disease events. 3,222 middle-aged women from the multi-ethnic Study of Women's Health Across the Nation reported and provided up to 15 years of major life events, non-fatal incident CVD events, traditional biobehavioral and sociodemographic factors, and death certificates. Cox proportional hazards models were used to test the association between average annual life events and incident fatal and nonfatal CVD events. Each additional major life event was associated with a 1.16-fold (95% CI: 1.08-1.23) increase in CVD events. CVD risk will be discussed considering evidence of racial/ethnic disparities in exposure to major life events.

THE ROLE OF MULTIDOMAIN IDENTITY AND SOCIAL BACKGROUND FACTORS FOR AGING OUTCOMES

Johanna Drewelies[1], Sandra Duezel[2], Ilja Demuth[3], Elisabeth Steinhagen-Thiessen[4], Ulman Lindenberger[5], Jan Goebel[6], Gertraud Stadler[7], and Denis Gerstorf[8], *1. Humboldt University Berlin, Berlin, Berlin, Germany, 2. Max-Planck-Insitute for human developement, Berlin, Berlin, Germany, 3. Charité Universitätsmedizin Berlin,*

Berlin, Berlin, Germany, 4. Charité - Universitätsmedizin Berlin, Berlin, Berlin, Germany, 5. Max Planck Institute for Human Development, Berlin, Berlin, Germany, 6. German Institute for Economic Research, Berlin, Berlin, Germany, 7. Charité – Universitätsmedizin Berlin, Berlin, Berlin, Germany, 8. Humboldt Universität zu Berlin, Berlin, Berlin, Germany

Domains of social privilege are predictive of a number of key aging outcomes, such as physical and cognitive functioning. However, less is known about the dynamic interplay of - related but distinct- domains of privilege and how they are associated with cognitive and physical functioning. In the following project, we aim to close this gap by examining the role of multidomain identity and social background factors for initial levels and subsequent changes in psychological, cognitive and physical functioning. Specifically, we identified predefined social privileges within the Berlin Aging Study II (BASE-II) sample (e.g., gender identity, gender conformity, sexuality, education, socioeconomic status, religion) and related these categories, interactively, to markers of physical health (multimorbidity), perceptual speed (digit symbol), and psychosocial functioning (loneliness). Results highlight the dynamic interplay (i.e., intersectionalism) of multidomain identity and social background factors with aging related outcomes across a number of key domains.

CHILDHOOD SES IS ASSOCIATED WITH FASTER WORSENING METABOLIC SYNDROME SEVERITY FOR BLACK RELATIVE TO WHITE WOMEN

Agus Surachman[1], Nancy Adler[1], Barbara Laraia[2], and Elissa Epel[1], *1. University of California, San Francisco, San Francisco, California, United States, 2. University of California Berkeley, Berkeley, California, United States*

This analysis examined whether early life SES was associated with longitudinal changes in metabolic syndrome (MetS) severity among Black and white women. Data were from 531 women (non-Hispanic Black=263; non-Hispanic white=268, Mage=39) in the National Growth and Health Study (NGHS). Information about parental education was collected during the baseline survey when participants were 9. Information regarding MetS severity were collected during year-7 (Mage=16), year-10 (Mage=19), and year-30 (Mage = 39) follow-up studies. Controlling for baseline body mass index, smoking status, and marital status, Black participants showed a faster increase in MetS severity across two decades. Early life SES (b=.03, SE=.01, p<.05), independent of current SES, was associated with faster worsening MetS severity among Black relative to white women. The socioeconomic context of early rearing is an important factor for racial disparities in accelerated aging among these early midlife Black and white women.

SESSION 3080 (SYMPOSIUM)

DIVERSITY, DISCOVERY, AND AGING REIMAGINED: A CHAT WITH NIA SENIOR LEADERSHIP

Chair: Amy Kelley Discussant: Amy Kelley

The National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services, is the federally designated lead agency on aging research and supports research to understand the nature of aging and to extend the healthy, active years of life. In the last six years, NIA has experienced a tripling of its budget. In keeping with NIA's scientific mission, funding includes significant investments in Alzheimer's disease (AD) and AD-related dementias research, as well as in non-AD research. This symposium will provide a forum for exploration of the implications of the NIA budget for the general research community. NIA's senior staff will discuss research priorities and programs supported by the Institute. A question-and-answer session will follow these remarks on current funding and future priorities and research directions of NIA.

OVERVIEW OF NIA BUDGET

Richard Hodes, *National Institutes of Health, Bethesda, Maryland, United States*

Dr. Hodes will discuss budget and overall research priorities for the National Institute on Aging.

NIA DIVISION OF GERIATRICS AND CLINICAL GERONTOLOGY

Basil Eldadah, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Eldadah will discuss research priorities for the Division of Geriatrics and Clinical Gerontology. Dr. Eldadah will also be available for small group discussion.

NIA DIVISION OF AGING BIOLOGY

Ronald Kohanski, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Kohanski will discuss research priorities for the Division of Aging Biology. Dr. Kohanski will also be available for small group discussion.

NIA DIVISION OF NEUROSCIENCE

Molly Wagster, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Wagster will discuss research priorities for the Division of Neuroscience. Dr. Wagster will also be available for small group discussion.

NIA DIVISION OF BEHAVIORAL AND SOCIAL RESEARCH

Dana Plude, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Plude will discuss research priorities for the Division of Behavioral and Social Research. Dr. Plude will also be available for small group discussion.

NIA OFFICE OF SPECIAL POPULATIONS

Patricia Jones, *Natioal Institute on Aging, Bethesda, Maryland, United States*

Dr. Jones will discuss the work of the NIA Office of Special Populations. Dr. Jones will also be available for small group discussion.

NIA DIVISION OF EXTRAMURAL ACTIVITIES

Kenneth Santora, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Santora will discuss the work of the NIA Division of Extramural Activities. Dr. Santora will also be available for small group discussion.

SESSION 3090 (SYMPOSIUM)

EXPLORATORY STRUCTURAL PROCEDURES IN HEALTH SERVICES RESEARCH

Chair: Martina Roes Discussant: Barbara Resnick

When analysing data where little knowledge of relationships is available, exploratory structuring techniques, e.g., clustering and scaling techniques, are applied, using an inductive approach to construct analogies and thus suggest how to organize the data. These procedures in Health Service Research mainly focus on latent variables and are particularly used in the development of instruments or theories. Our symposium includes three presentations on research studies in which exploratory structural procedures were used for data analysis, that were considered appropriate for Health Service Research. Dr. Johannes Bergmann will present a concept mapping technique of the German Preferences for Everyday Living Inventory (PELI-D), for structuring the questionnaire from the perspective of professional nurses. This is a mixed methods participatory approach that combines interpretation and decisions by the researchers with a sequence of multivariate statistical analyses (multidimensional scaling, cluster analysis).. Jan Dreyer will present a Multiple Correspondence Analysis and Hierarchical Cluster Analysis as exploratory data reduction procedures. His aim was to identify types of home-based care arrangements for people living with dementia. To analyse the relationships between care arrangement variables, he performed Multiple Correspondence Analysis. To cluster the care arrangements, he performed Hierarchical Cluster Analysis. Anna Louisa Hoffmann will present an alternative, modified procedure of Multiple Correspondence analysis. Since Multiple Correspondence Analysis underestimates the true quality of data representation, she used Adjusted Multiple Correspondence Analysis to explore construct validity of the Dementia Policy Questionnaire (DemPol-Q). This procedure was considered appropriate to assign categorical variables to latent variables.

USING ADJUSTED MULTIPLE CORRESPONDENCE ANALYSIS TO EXPLORE LATENT VARIABLES FOR THE DEMPOL-Q

Anna-Louisa Hoffmann[1], Johannes-Michael Bergmann[2], Bernhard Holle[3], Martina Roes[1], and Rebecca Palm[4], *1. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 2. German Center for Neurodegenerative Diseases (DZNE), Göttingen, Nordrhein-Westfalen, Germany, 3. German Center For Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 4. University of Witten/Herdecke, Witten, Nordrhein-Westfalen, Germany*

Nursing home administrators are responsible to operationalize dementia-specific person-centred care into their care practice, e.g. by internal policies. To assess the degree of existence of internal policies on person-centred care for dementia-specific care in German nursing homes, we developed the Dementia Policy Questionnaire (DemPol-Q). After pretesting, the instrument consists of 19 dichotomous items. We aimed to explore the construct validity of the DemPol-Q. We used a secondary data set of a national survey with a representative sample of 134 nursing homes. For data analysis we conducted an Adjusted Multiple Correspondence Analysis. Results show that nine items of the DemPol-Q were significantly assigned to two latent variables. Since the items per latent variable vary in their content, they cannot be explicit denominated with a specific sub-dimension of dementia-specific person-centred care. Nonetheless, Adjusted Multiple Correspondence Analysis is an uncommon but appropriate exploratory data reduction procedure for nursing science.

USING MULTIDIMENSIONAL SCALING IN COMBINATION WITH CLUSTER ANALYSIS TO STRUCTURE THE PELI-D QUESTIONNAIRE

Johannes-Michael Bergmann[1], Tobias Stacke[2], Daniel Purwins[3], Christina Manietta[3], Mike Rommerskirch-Manietta[4], Armin Stroebel[5], and Martina Roes[6], *1. German Center for Neurodegenerative Diseases (DZNE), Göttingen, Nordrhein-Westfalen, Germany, 2. Community Bergkamen, Bergkamen, Nordrhein-Westfalen, Germany, 3. DZNE, Witten, Nordrhein-Westfalen, Germany, 4. German Center For Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 5. Center for Clinical Studies, Erlangen, Bayern, Germany, 6. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany*

Background: One way to contribute person-centered care is the use of a preference-based approach. In our project PELI-D the original PELI USA-version for Nursing Homes was (1) translated into German (2) and structured to explore construct validity of the instrument. Objective and Method: The PELI-D instrument (72-items) is used to illustrate how structuring procedures can be used for concept analysis. The approach allows to analyze the instrument from the perspective of the professional caregivers and to identify theoretical relations in further steps, which can be finally validated. For this purpose, the data of 58 professional nurses are analyzed.

Results: We computed a three-dimensional concept map of preferences enabled us in a second step to identify an appropriate cluster solution. The five-cluster solution, which explained 79 percent of the total variance, seemed to offer the best balance between statistical analysis and detailed categorisation through qualitative interpretation.

USING MULTICORRESPONDENCE ANALYSES AND CLUSTER ANALYSIS TO CONSTRUCT TYPES OF CARE ARRANGEMENTS

Jan Dreyer[1], Johannes-Michael Bergmann[1], Kerstin Koehler[2], Iris Hochgraeber[2], Christiane Pinkert[2], Martina Roes[3], and Bernhard Holle[4], *1. German Center for Neurodegenerative Diseases (DZNE), Göttingen, Nordrhein-Westfalen, Germany, 2. German Center For Nuerodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 3. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 4. German Center For*

Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany

Most persons with dementia live at home and are cared for by family carers and professional carers. Together, they form care arrangements to address the needs of persons with dementia. The aim of this study is to (1) uncover the underlying structures of home-based care arrangements for persons living with dementia, (2) construct types of these care arrangements, and (3) compare these types with regard to their stability. In this secondary analysis, data from 320 care arrangements for persons with dementia are analysed using multiple correspondence analysis and hierarchical cluster analysis. The multiple correspondence analysis identified 27 axis that explained the entire variance between all care arrangements. The subsequent cluster analysis identified four types of care arrangements. Two types included spouse-centred care arrangements, and two types included child-centred care arrangements at different phases of the dementia and care trajectory. The types differ with regard to their stability.

SESSION 3100 (SYMPOSIUM)

EXPLORING STRATEGIES FOR IMPROVED COORDINATION AND INNOVATION IN TRANSPORTATION FOR OLDER PEOPLE

Chair: Nina Silverstein Co-Chair: Taylor Jansen Discussant: Alycia Bayne

Communities across the nation have outgrown their capacities to meet the transportation needs of older people. While a struggle in the past, for many communities it now is a crisis given an increase in older people with impairments in critical driving skills that lead to driving cessation and/or limitations that preclude them from successfully navigating public transit. It is time for new strategies and innovations to meet these growing challenges. Jansen will describe a pilot study of a regional transit authority's use of customized software with four Councils on Aging to increase riders' trips and destinations, improve efficiencies in reporting and dispatching, and increase shared rides across the communities. Gleason will present results of a qualitative study of paratransit managers across the U.S. and their attempts to innovate and adapt to evolving market expectations spurred on by the emergence of transportation network companies (TNC) like Uber and Lyft. Schwartz describes a mixed-methods study of Project TRIP, a rural transportation program designed to increase access to healthcare and other locations for low income and vulnerable populations in rural eastern North Carolina. Lynott introduces AARPs RideSheet, an open-source ride scheduling software application designed for small, demand-responsive transportation providers that incorporates a transactional data specification (TDS) enabling two or more providers to interoperate more efficiently, improving service for their clients. Bayne concludes as discussant bringing in her own work with the CDC on barriers and facilitators to ride sharing and reflecting on the themes presented. Transportation and Aging and Qualitative Research IGs collaboration.

BRIDGING SILOS: EVALUATION OF AN INNOVATIVE REGIONAL SENIOR TRANSPORTATION SERVICE

Taylor Jansen, Nina Silverstein, Beth Dugan, Chae Man Lee, Shu Xu, and YanJhu Su, *University of Massachusetts Boston, Boston, Massachusetts, United States*

A pilot study was conducted for a regional transit authority (RTA) to evaluate the implementation of a customized software to increase ridership, trips, destinations and coordination of rides among four Councils on Aging (COA) using RTA vans to serve rural communities in north central Massachusetts. Baseline and follow up ride data were collected from each COA from Fall 2019 (N= 178 riders; N= 4,230 trips) and Fall 2021 (N= 131 riders; N= 2,020 trips) and from 59 stakeholder interviews with riders, drivers, dispatchers, and staff from the COAs, RTA, and software company. The evaluation found after 6 months that while the goals of the pilot were not yet achieved, due in part to external factors such as the COVID-19 pandemic and driver shortage, valuable lessons were learned including the importance of balancing provider goals of efficiency and reporting with rider needs of driver hands-on assistance and friendly scheduling support.

THE FUTURE OF PARATRANSIT: A STUDY OF PROVIDER EXPERIENCES AND HOPES FOR CHANGE

Shayna Gleason, and Nina Silverstein, *University of Massachusetts Boston, Boston, Massachusetts, United States*

The present study examined paratransit managers' perceptions of a changing transportation market, and what resources or supports they might need to adapt to evolving market expectations. As transportation network companies (e.g., Uber, Lyft) have emerged, the landscape of demand-responsive transportation has changed. However, the experiences of those closest to the operations of paratransit programs have been largely neglected in research. In-depth, semi-structured interviews were conducted with 16 managers of paratransit services. The resulting transcripts were coded iteratively using NVivo software, using both inductive and deductive approaches. We found that participants were already innovating and often wanted to be even more creative with their services, but were hampered by inadequate funding, driver shortages, regulatory or policy challenges, and other barriers. This study's findings advance the literature toward greater understanding of how policymakers can leverage existing paratransit infrastructure to better serve the transportation needs of older adults and other transportation disadvantaged groups.

A MIXED METHODS EVALUATION OF PROJECT TRIP: KEY FINDINGS AND EXPANSION

Abby Schwartz[1], Alice Richman[2], Mallary Scott[2], Haiyong Liu[2], Weyling White[3], and Caroline Doherty[3], *1. East Carolina University, School of Social Work, Greenville, North Carolina, United States, 2. East Carolina University, Greenville, North Carolina, United States, 3. Roanoke Chowan Community Health Center, Ahoskie, North Carolina, United States*

Project TRIP is an innovative individualized transportation program for low-income adults in rural eastern North Carolina (eNC), that aims to increase access to healthcare and reduce health disparities. This paper presents results from a 3-year grant which sought to evaluate TRIP and expand it to a neighboring eNC county. The concurrent mixed methods findings from the process/implementation, outcome/effectiveness, and economic evaluation, and qualitative interview data with TRIP stakeholders (N=40) will be presented. Findings include relationships between pre and post TRIP enrollment health data indicating improvements in health outcomes and decreases in health care utilization, including estimated costs savings of Project TRIP. Qualitative interview data will be discussed in substantiating the quantitative evaluation data. Interviews with stakeholders in the TRIP replication and expansion county site will also be presented including pilot test data in that county. The presentation will conclude with implications for sustainability and further expansion of TRIP.

SESSION 3110 (SYMPOSIUM)

GERONTOLOGIC BIOSTATISTICS: MERGING WITH DATA SCIENCE AND TOWARD PERSONALIZED MEDICINE

Chair: Michelle Shardell Co-Chair: Terrence Murphy
Discussant: Heather Allore

The sub-discipline of gerontologic biostatistics (GBS) was introduced in 2010 to emphasize the special challenges encountered in the design and analysis of research studies of older persons. These challenges center on the multifactorial nature of human aging, characterized by the parallel and progressive deterioration of diverse organ and cellular systems that eventually results in death. Ten years after the introduction of GBS, which initially focused on important aspects of design and analysis that ensure their statistical validity, we update how GBS has been enriched by evolving practices. We present individual sessions on three seminal developments in the practice of GBS: integration of data science and multiple streams of data, including those automated and or multidisciplinary in nature; enhanced methods of addressing the heterogeneity of treatment effects from health-related interventions for older patients; and how interactive visualization can help specific patients locate themselves along the continuum of individualized treatment effects. We conclude our presentation with a session that reviews three prominent trends in the validation of the heterogeneity inherent to the assessment of health among older adults. Reflecting this era of big gerontological data, we discuss several established modeling approaches for validation, the proliferation of signal intensive behavior phenotypes, and the deep characterization of phenotypes through OMICS studies and multimodal approaches. All talks discuss pitfalls and areas of future development and draw from published studies. We are submitting as an interest group collaborative panel submission between two interest groups: Epidemiology of Aging and Measurement, Statistics and Design.

GERONTOLOGICAL BIOSTATISTICS AS THE FOUNDATION OF INTERDISCIPLINARY DATA SCIENCE IN AGING

Thomas Travison, *Harvard Medical School, Boston, Massachusetts, United States*

Explosive growth in computing power has increased by orders of magnitude the complexity of data structures and the number of analyses that may be performed per unit time. Contemporary gerontology utilizes diverse data ranging from continuous longitudinal assessments (e.g. motion capture) to complex single-timepoint assessments (e.g. bioimages) to systems-level administrative descriptions of the healthcare delivery environment. Paradoxically, this abundance of resources presents a considerable challenge, as the availability of information threatens to overwhelm mechanistic models of aging supportive of intervention development. To inform precision medicine, gerontological biostatistics therefore embraces the opportunity of collaborating with allied quantitative disciplines to bolster the coherence, reproducibility, and generalizability of findings. This presentation will demonstrate the salient advantages of such interdisciplinary collaborations using the example of design and analysis of an intensely longitudinal study of wearable and environmental sensors, conducted with teams in exercise science and architectural design.

TIME TO EMBRACE HETEROGENEITY IN INTERVENTIONAL STUDIES OF OLDER ADULTS

Qian-Li Xue, *Johns Hopkins University, Baltimore, Maryland, United States*

Adopting evidence-based medicine in clinical care of older patients is challenging because the “best” evidence available may not be directly applicable due to exclusion or underrepresentation of older adults in clinical trials. Interventions shown to be beneficial in trial populations therefore often exhibit heterogeneous treatment effects (HTEs) in older adults, particularly among the most vulnerable. This talk will review the concept, causes, and estimation of HTEs. We distinguish clinical heterogeneity from methodologic heterogeneity, defined respectively as the variation in biological mechanisms leading to similar aging phenotypes and variation in study design, measurement, and analysis. We use examples drawn from geriatric medicine to introduce novel study designs and data analytics used to study HTEs. This talk highlights the importance of moving beyond post-hoc subgroup analysis to an approach that integrates theories, observational and experimental data, and data science in the study of HTEs.

FINDING YOURSELF: PERSONALIZED MEDICINE, DATA SCIENCE, AND INTERACTIVE VISUALIZATIONS

Michael Griswold[1], James Henegan[2], Chad Blackshear[2], Beverly Gwen Windham[3], and Thomas Mosley[3], *1. The MIND Center at UMMC, Jackson, Mississippi, United States, 2. UMMC MIND Center, Jackson, Mississippi, United States, 3. UMMC-The MIND Center, Jackson, Mississippi, United States*

Personalized medicine is care that is tailored to an individual patient. In contrast, randomized trials are designed to report evidence of benefits and harms "on average". The average trial participant though, is often healthier than older patients seen in clinical practice. A variety of methods have been proposed which offer improvements to traditional (but questionable) practices of one-subgroup-at-a-time examinations of treatment effect heterogeneity, but translating evidence from these advancements has received less attention. Data Science initiatives have allowed broader data sharing, data harmonization and data synthesizing approaches, as well as an enormous maturing of interactive visualization techniques. Motivated by the SPRINT study and using advanced approaches of marginalized standardization and the Predictive Approaches to Treatment effect Heterogeneity (PATH) statement, we show how researchers, regulators, clinicians and patients can "find themselves" on the treatment effect continuum and be better informed of potential individualized evidence through interactive visualizations.

SIGNAL DETECTION AND VALIDATION IN AN ERA OF BIG GERONTOLOGICAL DATA

Karen Bandeen-Roche, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Older adult health assessment long has posed measurement challenges—multidimensionality of sentinel outcomes like functioning and frailty, for example. This presentation discusses three developments creating opportunities for gerontologic biostatistics (GBS) over the past 10 years. Firstly, modeling to internally validate measurements or to quantify systematic heterogeneity in assessing older adult health has become considerably more widespread. Confirmatory latent variable modeling, harmonization, and mixture models will be addressed. Secondly, signal intensive behavioral phenotypes are proliferating, e.g. accelerometry, sleep actigraphy, and ecological momentary assessment. Functional data analysis is described as a data analytic technique to extract signal capturing main behavioral features or most relevant for health outcomes. Thirdly, "deep" characterization is under hot pursuit—whether by single- or multi-'omics studies, or by multimodal phenotyping as is increasingly common in the study of cognition. Techniques to accomplish this replicably are discussed. Throughout, potential pitfalls and implications for gerontologic data science development are identified.

SESSION 3115 (PAPER)

MENTAL HEALTH (PAPERS)

CHRONIC PHYSICAL HEALTH CONDITIONS, DEPRESSIVE SYMPTOMS, AND SELF-RATED HEALTH IN GRANDMOTHERS

Christina Henrich[1], Carol Musil[1], Jaclene Zausniewski[1], Christopher Burant[2], Elizabeth Tracy[1], and Alexandra Jeanblanc[1], *1. Case Western Reserve University, Cleveland, Ohio, United States, 2. Case Western Reserve University, Parma, Ohio, United States*

Grandmothers often participate in caregiving to grandchildren, ranging from informal caregiving to having responsibility for raising grandchildren, but health problems may affect their ability to do so. To better understand potential health problems in grandmother caregivers, this secondary analysis examined 1) longitudinal relationships between chronic physical health conditions, depressive symptoms, and self-rated health with race, age, & marital status, and 2) causal ordering of depressive symptoms and self-rated health, controlling for baseline race, age, marital status, and chronic conditions of 328 Ohio grandmothers across 3 time points over 2 years. The study was guided using Lenz's Theory of Unpleasant Symptoms. Measures included chronic physical health conditions (modified Charlson), depressive symptoms (CES-D), self-rated health (SF-36), and demographic variables of race (white/nonwhite), age, and marital status (married-partnered/not married). Analyses included correlations and structural equation modeling. Pearson product moment correlations indicated significant relationships (ranging from 0.26 to 0.56) between chronic conditions, depressive symptoms and self-rated health at all three time points. Next, a bivariate autoregressive model was tested using structural equation modeling. The data fit the model well. The goodness of fit results included: Chi square=55.39, TLI=0.94, CFI=0.97, and RMSEA=0.07. Results indicated consistency of depressive symptoms and self-rated health over time, and these were affected by chronic conditions; the causal order indicated that self-rated health impacts depressive symptoms. This study contributes new knowledge about the relationships and causal sequence of self-rated health and depressive symptoms. Implications on practice and research are discussed.

DEPRESSIVE SYMPTOMS AND MULTIMORBIDITY IN CONTEXT: INTERPERSONAL, SOCIOCULTURAL, AND TEMPORAL EFFECTS

Irina Mindlis[1], and Tracey Revenson[2], *1. The Graduate Center, City University of New York, New York City, New York, United States, 2. The Graduate Center, City University of New York, New York, New York, United States*

Among older adults with multimorbidity (MM), disease-related stressors (e.g., pain) are associated with greater depressive symptoms. However, the contextual factors influencing this relationship remain understudied. We explored the moderating effects of interpersonal, sociocultural, and temporal factors as buffers of this relationship. Adults ≥ 62 years with MM (n=366) recruited through a national health volunteer registry and an online panel platform completed validated scales assessing diagnoses, disease-related stressors (pain intensity, subjective cognitive function, physical function, somatic symptoms), depressive symptoms. Potential moderators: age, expectations regarding aging, perceived social support, and difficulty affording medications (proxy for SES). Data were analyzed with structural equation modeling. Participants were 62-88 years old and living with many illnesses (M = 3.5; range: 2-9); 15% reported moderate-to-severe depressive symptoms. Among those with low social support, the effect of disease-related factors on depressive symptoms was greater (B = .70, SE = .06, p <.001) than for those with high social support (B = .46, SE = .06, p < .001)]. The negative effect of disease-related factors on depressive symptoms was stronger for those with worse expectations of aging (B = .68, SE = .07, p <.001), compared to those with more positive expectations (B = .47, SE = .06, p < .001). Age and difficulties affording medications were not significant moderators. Among older adults with MM, garnering social support and addressing low expectations for old age may be key to preventing the detrimental effect of MM on mental health.

JOINT TRAJECTORIES OF SOCIAL ISOLATION AND LONELINESS AND THEIR EFFECTS ON ACCELERATED BIOLOGICAL AGING

Xiang Qi[1], Daniel Belsky[2], Yang Yang[3], Ted Ng[4], and Bei Wu[5], *1. New York University, New York City, New York, United States, 2. Mailman School of Public Health, Columbia University, New York City, New York, United States, 3. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 4. Arizona State University, Phoenix, Arizona, United States, 5. New York University, New York, New York, United States*

Social isolation and loneliness (SI/L) are associated with a variety of physical and mental health conditions. Biological aging is a proposed mechanism through which psychosocial factors drive health disparities. However, it is not known how SI/L separately and jointly affect biological aging. Using longitudinal data (N=1,965 adults, aged 50+) in Health and Retirement Study (2006 to 2016), we tested the joint trajectories of SI/L and their differential effects on biological aging as quantified by five DNA Methylation clocks (Horvath, Hannum, PhenoAge, GrimAge, and DunedinPoAm). A group-based mixture modeling approach was used to fit the joint trajectories of SI/L. Biological aging was measured using residuals from regressing each clock on chronological age. Linear regressions were used to test associations of joint trajectories of SI/L with biological aging. Four SI/L trajectories were identified, including Rarely isolated and rarely lonely (47.8%), Moderately isolated and rarely lonely (15.5%), Rarely isolated and severely lonely (20.2%), and Persistently isolated and lonely (16.5%). Of all joint trajectory groups, the Rarely isolated and rarely lonely group had the youngest biological age as estimated by the Hannum, PhenoAge, and GrimAge clocks. Compared with the Rarely isolated and severely lonely group, the Moderately isolated and rarely lonely group had higher age acceleration for PhenoAge (β=0.10; 95% CI=0.01, 0.19), and GrimAge (β=0.20; 95% CI=0.06,0.33), and DunedinPoAm (β=0.21; 95% CI=0.09,0.33). Different trajectories of SI/L convey differential risks to biological aging. Future research is needed to investigate the differences and similarities of SI/L trajectories and identify intervention targets for ameliorating aging.

PREDICTORS OF DEPRESSION AMONG MIDDLE-AGED AND OLDER MEN AND WOMEN IN EUROPE: A MACHINE LEARNING APPROACH

Stephen Aichele[1], Elizabeth Handing[2], Carolin Strobl[3], Yuqin Jiao[4], and Leilani Feliciano[5], *1. Colorado State University, Fort Collins, Colorado, United States, 2. Colorado State University, Golden, Colorado, United States, 3. University of Zurich, Zurich, Zurich, Switzerland, 4. Colorado State University at Fort Collins, Fort Collins, Colorado, United States, 5. University of Colorado Colorado Springs, Colorado Springs, Colorado, United States*

The high prevalence of depression in a growing aging population represents a critical public health issue. It is unclear how social, health, cognitive, and functional variables rank as risk/protective factors for depression among older adults and whether there are conspicuous differences among men and women. We utilized random forest analysis (RFA), a machine learning method, to compare 56 risk/protective factors for depression in a large representative sample of European older adults (N = 67,603; ages 45-105y; 56.1% women; 18 countries represented) from the Survey of Health, Ageing and Retirement in Europe (SHARE Wave 6). Self-rated social isolation and self-rated poor health were the most salient risk factors, jointly accounting for 22.0% (in men) and 22.3% (in women) of variability in depression. Difficulties in mobility (in both sexes), difficulties in instrumental activities of daily living (in men), and higher self-rated family burden (in women) accounted for an additional but small percentage of variance in depression risk (2.2% in men, 1.5% in women). To our knowledge, this is the first large, multi-country study to use machine learning to compare a broad range of social, health, functional, and cognitive variables as concurrent risk/protective factors for depression in middle-aged and older adults—and with analyses conducted independently for women and men. The results point to the importance of screening for depression risk within this age demographic during routine medical visits (i.e., when assessing general health status) and further indicate that such screening may be improved by inclusion of measures of perceived social isolation.

SESSION 3120 (SYMPOSIUM)

HEALTHY AGING: POLICIES AND RESOURCES TO SUPPORT AN AGE-FRIENDLY ECOSYSTEM

Chair: Patricia D'Antonio Discussant: Brian Lindberg

Our public health system is advancing activities to prioritize the health and well-being of older adults and recognizes the importance of policies to support us all as we age. Faculty will discuss national efforts underway to inform and support an age-friendly ecosystem.

HEALTHY PEOPLE 2030 AND HEALTHY AGING

Yen Lin, *Office of Disease Prevention and Health Promotion, Rockville, Maryland, United States*

The US Department of Health and Human Services, Office of Disease Prevention and Health Promotion (ODPHP) sets science-based health promotion and disease prevention objectives for the nation with 10-year targets through the Healthy People Initiative. In addition to objectives specific to older adults, many of our population-based objectives in other condition-specific topics also contain data for older adults. Healthy People also developed the Department of Health and Human Service's Social Determinants of Health model. This presentation will highlight ODPHP's policy initiatives and campaigns specifically for older adults, including the Dietary Guidelines for Americans 2020-2025, Move Your Way © for Older Adults and provide an update on the Physical Activity Guidelines Midcourse Report on Older Adults.

BUILDING OUR LARGEST DEMENTIA INFRASTRUCTURE FOR ALZHEIMER'S ACT: POLICIES ADVANCING HEALTHY AGING

Lisa McGuire, *CDC, Atlanta, Georgia, United States*

While public health experts cannot yet say how to prevent Alzheimer's disease and related dementias (ADRD), emerging science indicates that ADRD may be slowed through risk reduction strategies, early diagnosis, and better education and training of front-line health care professionals. Recognizing these scientific advances, the National Plan to Address Alzheimer's Disease: 2021 Update added a new goal, Goal 6, to the 10-year-old plan emphasizing risk reduction and healthy aging: Accelerate Action to Promote Healthy Aging and Reduce Risk Factors for Alzheimer's Disease and Related Dementias. CDC is authorized through Building Our Largest Dementia (BOLD) Infrastructure for Alzheimer's Act (P.L. 115-406) to create a uniform national public health infrastructure through BOLD Program and Public Health Centers of Excellence. This presentation will highlight CDC activities that not only build a uniform national public health infrastructure but also promote healthy aging consistent with Goal 6 of the 2021 National Plan.

ELEVATING HEALTHY AGING: HOW PUBLIC HEALTH IS SUPPORTING OLDER ADULTS

Karon Phillips[1], and Megan Wolfe[2], *1. Trust for America's Health, Silver Spring, Maryland, United States, 2. Trust for America's Health, Washington, District of Columbia, United States*

Trust for America's Health (TFAH) leads the national Age-Friendly Public Health Systems initiative which focuses on expanding the public health role in healthy aging. The roles of public health include creating and leading policy, systems, and environmental changes; connecting and convening multi-sector stakeholders to improve older adult health and well-being; and collecting and translating data on older adult health to inform interventions in communities and states. TFAH will share examples of how public health departments are elevating healthy aging as a core function.

SESSION 3130 (PAPER)

HOSPITAL TRANSITIONS, HEALTH CARE UTILIZATION, AND OUTCOMES OF CARE

ASSOCIATIONS BETWEEN SOCIAL ISOLATION AND HOSPITAL STAYS, NURSING HOME ENTRY, AND MORTALITY OVER TIME

Mary Louise Pomeroy[1], Gilbert Gimm[2], Alison Cuellar[3], Emily Ihara[3], and Thomas Cudjoe[4], *1. Johns Hopkins University, Fairfax, Virginia, United States, 2. George Mason University, Vienna, Virginia, United States, 3. George Mason University, Fairfax, Virginia, United States, 4. Johns Hopkins School of Medicine, Baltimore, Maryland, United States*

This study examined social isolation as a risk factor for hospitalization, nursing home stays, and mortality among a longitudinal sample of 12,860 community-dwelling older adults ages 65+ between 2006-2018. Using seven waves of Health and Retirement Study (HRS) data, we examined associations between social isolation and hospitalization, nursing home stays, and mortality. Social isolation scores ranged from 0-6 using an established typology with six objective measures of social interactions: 1) marital status; 2) living arrangement; 3) monthly communication with children; 4) family; 5) and friends; and, 6) monthly participation in groups, clubs, organizations, or religious services. Covariates included fixed demographics and time-variant characteristics including loneliness, depression, Medicaid enrollment, lifestyle behaviors, activities of daily living, number of chronic conditions, and Alzheimer's disease or related dementias. Logistic regression analyses were conducted with panel data and random effects to examine associations between social isolation and each outcome over time. About 15% of the sample was socially isolated, with an average isolation score of 1.29. Social isolation significantly increased the odds of having a nursing home stay (OR = 1.22, $p < 0.001$) and mortality (OR = 1.14, $p < 0.001$). However, it was not significantly associated with overnight hospitalizations (OR = 0.97, $p = 0.09$). Social isolation may put older adults at greater risk for nursing home stays and mortality over time, as compared to social integration. Policies and practices to reduce social isolation can support aging at home or the community, delay nursing home entry, and reduce the risk of mortality.

PREDICTIVE MODEL OF 30-DAY HOSPITAL READMISSION FOR PATIENTS WITH ALZHEIMER'S DISEASE

Elham Mahmoudi, Cyrus Najarian, Wenbo Wu, James Aikens, and Julie Bynum, *University of Michigan, Ann Arbor, Michigan, United States*

Hospitals are insufficiently equipped for patients with Alzheimer's disease and related dementia (ADRD). Thus, 30-day hospital readmission is higher and costlier among ADRD patients than the general population of older adults. Our objective was to develop a risk-assessment tool for hospitalized patients with ADRD. We used 2016-2019 electronic medical record (EMR) data from the University of Michigan health system and applied machine learning techniques to develop a readmission risk-assessment tool. We identified 2,899 individuals with ADRD who had at least one index hospital admission. All data features available in EMR – demographics, lab results, prior counts of healthcare use, and characteristics of index hospitalization – were included in our predictive models. Additionally, we geocoded the street address of patients using the National Neighborhood Data Archive using the U.S. Census tract-level information to include two composite measures of socioeconomic status: disadvantage and affluence. The readmission rate for ADRD patients was 22% versus 17% for the general population. The best predictive model was the Random Forest (area under the receiver operating characteristic curve=0.66; sensitivity=0.64; specificity=0.61). The accuracy of our model (0.61) was 42% higher than the LACE score (0.43), which is currently used by the hospital for all patients. The top 5 predictors of 30-day readmission among people with ADRD included length of hospital stay, frailty index, living in a disadvantaged neighborhood, and total prior-year healthcare charges. Our risk-assessment tool identifies ADRD patients at high risk of readmission and why they are at higher risk. The tool enables better decision-making before discharge.

SOCIAL DETERMINANTS OF HOSPITAL READMISSION FOR OLDER VETERANS

Portia Cornell[1], Christopher Halladay[2], Gina Chmelka[3], Caitlin Celardo[3], Robert Burke[4], Jennifer Silva[3], James Rudolph[5], and Kali Thomas[6], *1. Providence VA Medical Center / Brown University, Providence, Rhode Island, United States, 2. Providence VA Medical Center, Providence, Rhode Island, United States, 3. Veterans Health Administration, Washington, District of Columbia, United States, 4. University of Pennsylvania Perelman School of Medicine, Philadelphia, Pennsylvania, United States, 5. Veterans Health Administration, Providence, Rhode Island, United States, 6. Brown University, Providence, Rhode Island, United States*

The objective of this study was to estimate the effect of social risk on the likelihood of hospital readmission. Our study sample included 156,690 hospitalizations from 2016 - 2019 at one of 36 VA medical centers that participated in a national social-work staffing program. Using information from outpatient screenings, social workers' assessments, and diagnosis codes, We identified Veterans' social risks categorized into nine specific categories: intimate partner violence, financial need, housing instability, legal problems, social isolation, mental health, transportation, food insecurity, and functional need; and two general categories: nonspecific psychosocial and neighborhood deprivation. We estimated linear probability models of unplanned hospital readmission to a VA or a community hospital within 30 days of discharge, adjusted for demographics, clinical characteristics known to predict readmission (length of stay, primary diagnosis, admission from emergency department, chronic comorbidities, previous hospitalizations), and year and hospital fixed effects. 15.3 percent of hospital stays were followed by an unplanned readmission within 30 days. The prevalence of specific social risks ranged from 1.2% (food insecurity) to 13.9% (financial need). Social risk factors are important predictors of unplanned hospital readmission among Veterans after adjusting for medical risk. The risk categories with the strongest adjusted association with 30-day readmission were legal need, risk difference .033 (p=.015); interpersonal violence (r.d.=.022, p<.001); mental health (r.d.=.022, p=.002); social isolation (r.d.=.010, p<.001); and nonspecific psychosocial (r.d.=.017, p<.001). These social risk indicators could be used to target care-transition intervention and follow-up by a social worker to address social needs and avert unplanned hospital readmission.

THE INCREMENTAL EFFECTS OF DEMENTIA ON HEALTHCARE USE AND ECONOMIC STATUS IN THE US: A QUASI-EXPERIMENTAL APPROACH

HwaJung Choi[1], Kenneth Langa[1], Edward Norton[1], Tsai-Chin Cho[2], and Cathleen Connell[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. University of Michigan School of Public Health, Ann Arbor, Michigan, United States*

This research is to assess the impact of dementia on healthcare use and economic status over the course of dementia. We used a nationally representative, longitudinal study of older adults, specifying two propensity-score matched samples: 1) 3,476 adults aged 55+ at baseline who would have dementia in two years (hereafter "dementia group"), and 2) 3,476 adults who had never transitioned to dementia but had similar baseline sociodemographic and health status (hereafter "control group"). In two-year follow-up, the total care hours from unpaid helpers (44 hours per month vs. 20) and other in-home medical care (24% vs. 15%) were substantially higher with vs. without dementia. In the dementia group, the percentage of using nursing homes increased from 4% at the baseline to 27% at 8-year follow-up, compared to the increase from 3% to 10% in the control group. There was little change in OOP costs in the control group but a substantial increase in the dementia group over time (from $4,443 at baseline to $11,806 in an 8-year follow-up). The percent having Medicaid increased from 17% at baseline to 33% in 8-year follow-up in the dementia group. By using a quasi-experimental approach with longitudinal data, the study clarifies the incremental effects of dementia on health care and economic status. The effects of dementia on both home-based and facility-based care are substantial, with major changes occurring at the onset. Dementia exacerbated financial resources with increasing OOP medical costs, which may have profound impacts on families and society.

THE LOOMING POST-ACUTE REORGANIZATION: IMPLICATIONS FOR OLDER ADULTS TRANSITIONING FROM THE HOSPITAL

Taylor Bucy[1], John McHugh[2], and Dori Cross[1], *1. University of Minnesota School of Public Health, Minneapolis, Minnesota, United States, 2. Columbia University Mailman School of Public Health, New York, New York, United States*

Post-acute volume plays an important role in the care of millions of older adults transitioning from a hospital stay. To help reduce the total cost of care, many hospitals have been shifting more volume from institutional skilled nursing care to less expensive home health care. In fact, in 2017, home health volume eclipsed skilled nursing facility volume as the preferred post-acute destination for the first time. The COVID-19 pandemic further exacerbated this trend with many older adults preferring to avoid institutional care. Using 2016-2019 MedPAR data, we explored changes over time in hospital discharges to skilled nursing facilities versus to home health. We regress the ratio of home health to skilled nursing facility volume on a month-year variable. We find that the ratio of discharges to home health versus to skilled nursing facility increases by .07 percentage points per month (coefficient = .00073, 95% CI [.00063 to .00084]). This translates to a nearly one percentage point change in the ratio of home health to skilled nursing volume per year. These trends vary by patient characteristics (e.g. hospital diagnosis), organizational characteristics (e.g. hospital market relationships), and indicators of market capacity of post-acute services. This growing trend has implications on vulnerable older adults; health system leaders need policy guidance and incentives to invest in value-oriented care practices across this changing post-acute landscape.

SESSION 3140 (SYMPOSIUM)

INNOVATIONS IN AGING: CREATING A TRANSDISCIPLINARY RESEARCH COLLABORATIVE GRADUATE FELLOWSHIP PROGRAM

Chair: Diane Martin Co-Chair: Nia Latimer Discussant: Katherine Bowers

Social isolation impacts nearly one-quarter of community dwelling adults aged 65+ in the United States. It is associated with poor physical and mental health, cognitive decline, higher healthcare costs, and early mortality. Older adults are at greater risk because they are more likely to live alone, experience a shrinking social network from loss of family and friends, and encounter limitations with driving and mobility resulting from chronic health conditions and sensory impairments. Social isolation in later life is not new; however, the COVID-19 pandemic brought to light the increased risk for negative outcomes. Reducing social isolation is a priority area for our state's Department of Aging (DoA), and the updated State Plan on Aging highlights the need for innovative approaches to develop and strengthen initiatives addressing social isolation among older adults. The DoA is advancing multiple projects, including a partnership with our public university to create a transdisciplinary graduate fellowship program. The program brought together professional students from medicine, nursing, pharmacy, and social work and resulted in a community of practice in which fellows engaged with DoA and university faculty to share best practices and receive training in transdisciplinary research. In this session, the first presentation will focus on development of the fellowship program and highlight the success of the inaugural year; the second session will focus on the future goals of the fellowship program, and the third presentation will share how we plan to expand the partnership between our public university and our state's Department of Aging.

YEAR ONE AND BEYOND: SUSTAINING A COLLABORATIVE AGING FELLOWSHIP PROGRAM

Diane Martin, *University of Maryland, Baltimore Graduate School, Baltimore, Maryland, United States*

A graduate aging fellowship experience can provide participants with unique opportunities for professional development in interdisciplinary and transdisciplinary research, community engagement, and team science. Program success is contingent on multiple factors beyond participant recruitment and customizable curriculum to meet the educational goals of individual participants. Stakeholder buy-in, strategic planning, and identification of funding streams are all necessary to support an internal program beyond its first year. In this session, we will offer guidance in planning, building, and sustaining a fellowship program for current graduate students with a professional interest in supporting older adults.

LEVELING THE PLAYING FIELD: ONBOARDING AGING FELLOWS REPRESENTING DIVERSE DISCIPLINES

Catherine Kim[1], Nia Latimer[2], Katherine Bowers[3], Loretta Anderson[4], and Diane Martin[5], *1. Veterans Affairs Maryland Health Care System, Baltimore, Maryland, United States, 2. University of Maryland, Baltimore, Baltimore, Maryland, United States, 3. University of Maryland, Baltimore, Maryland, United States, 4. University of Maryland, Baltimore, Reisterstown, Maryland, United States, 5. University of Maryland, Baltimore Graduate School, Baltimore, Maryland, United States*

The transdisciplinary Innovations in Aging Graduate Fellowship program brought together graduate students from medicine, nursing, pharmacy, and social work. As a result, fellows entered the program with a range of exposure as to how aging impacts the body, social interactions, health needs, and society. Therefore, onboarding modules were utilized to provide an integrated perspective on aging. Topics for these onboarding modules included ageism, dimensions of wellness, and health and well-being in later life. Through these modules, fellows were able to customize their learning to meet their unique educational needs and goals related to their involvement in the fellowship program. In this session, we will share development of the fellowship program and highlight factors, such as the onboarding modules, that led to the program's success.

SESSION 3150 (SYMPOSIUM)

INSIGHTS INTO HEALTH-RELEVANT INTERPERSONAL DYNAMICS IN AGING COUPLES FROM THE LAB AND DAILY LIFE

Chair: Theresa Pauly Co-Chair: Karolina Kolodziejczak Discussant: Christina Röcke

Emerging research demonstrates that long-term and daily health indicators are closely linked in aging partners. Yet, not much is known about exactly how partners get under each other's skin. This symposium investigates different positive and negative interpersonal contexts, including physical intimacy, positive and negative emotional experiences, and couple conversations (e.g., conflict, recounting distressing memories, discussing enjoyable topics), and their link with neuroendocrine and cardiovascular markers. The four talks feature a variety of study designs ranging from laboratory research to ambulatory assessment methods which recruited couples in midlife and old age. Kolodziejczak et al. use ambulatory assessment data to examine links between (experienced and wished for) physical intimacy, affect, and cortisol in older couples. Pauly et al. pool data from three ambulatory assessment aging studies to analyze how own and partner positive and negative affective states are intertwined with everyday cortisol secretion in old age. Wilson et al. invited middle-aged to older couples to engage in two different conversations (recounting a difficult memory, conflict) and investigated concurrent changes in affect and cardiovascular activity. Meier and colleagues make use of automated language analysis to examine how positive and negative emotion word use during a positive and negative conversation in the laboratory relates to cardiovascular reactivity in middle-aged couples. The discussion by Christina Röcke will delineate insights gained from these four papers, discuss their strengths and limitations, and outline directions for future inquiry.

PHYSICAL INTIMACY IN DAILY LIVES OF OLDER ROMANTIC COUPLES: LINKS WITH MOMENTARY AFFECT AND DAILY CORTISOL LEVELS

Karolina Kolodziejczak[1], Johanna Drewelies[2], Theresa Pauly[3], Nilam Ram[4], Christiane Hoppmann[5],

and Denis Gerstorf[6], *1. Medical School Berlin, Berlin, Berlin, Germany, 2. Humboldt University Berlin, Berlin, Berlin, Germany, 3. University of Zurich, Zurich, Zurich, Switzerland, 4. Stanford University, Stanford, California, United States, 5. University of British Columbia, Vancouver, British Columbia, Canada, 6. Humboldt Universität zu Berlin, Berlin, Berlin, Germany*

Physical intimacy is assumed to benefit well-being through stress-buffering and mood-improving processes. Although partnered older adults often report wishing for and experiencing physical intimacy, inquiries about how intimacy is linked to affect and stress in older couples' daily lives remain scarce. We examined self-report and salivary cortisol data from 120 German couples (Mage= 71.6, SDage= 5.94) obtained up to seven times per day over seven consecutive days. In moments when participants experienced more physical intimacy, women reported less negative affect, and men more positive affect. Experiencing more overall physical intimacy was associated with more positive affect and less negative affect in women, and lower daily cortisol in men. More overall intimacy wished was related to more negative affect in women and men, and to higher daily cortisol in men. We conclude that physical intimacy relates to indicators of well-being in older couples' daily lives and consider routes for future inquiry.

"WHAT'S YOURS IS MINE": A DYADIC STUDY OF EVERYDAY EMOTIONAL EXPERIENCES AND CORTISOL IN OLDER COUPLES

Theresa Pauly[1], Karolina Kolodziejczak[2], Johanna Drewelies[3], Maureen Ashe[4], Kenneth Madden[5], Nilam Ram[6], Denis Gerstorf[7], and Christiane Hoppmann[5], *1. University of Zurich, Zurich, Zurich, Switzerland, 2. Medical School Berlin, Berlin, Berlin, Germany, 3. Humboldt University Berlin, Berlin, Berlin, Germany, 4. The University of British Columbia, Vancouver, British Columbia, Canada, 5. University of British Columbia, Vancouver, British Columbia, Canada, 6. Stanford University, Stanford, California, United States, 7. Humboldt Universität zu Berlin, Berlin, Berlin, Germany*

Older partners' health is linked; individuals' physiological arousal can be shaped by their own and their partner's emotional experiences. This study examines those associations using repeated daily life assessments (7 days) of physiological arousal (cortisol), positive affect (PA), and negative affect (NA) obtained from 321 older couples. Results from multi-level models revealed, at the between-person level, that individuals with higher average cortisol had partners with higher overall NA; and, at the within-person (momentary) level, that cortisol was lower in moments when the partner's PA was higher than usual and when one's own PA was higher and NA was lower than usual. On a day level, cortisol output was lower on days with lower own NA and with higher partner PA, particularly when relationship satisfaction was high, but unrelated to own PA. The findings emphasize the importance of considering how members of a dyad influence each other's health in old age.

FEELING BLUE WITH YOU: AGING COUPLES' REACTIVITY TO UPSETTING PERSONAL MEMORIES AND MARITAL CONFLICT

Stephanie Wilson[1], M. Rosie Shrout[2], and Janice K. Kiecolt-Glaser[3], *1. Southern Methodist University, DALLAS, Texas, United States, 2. Purdue University, Lafayette, Indiana, United States, 3. Ohio State University, Columbus, Ohio, United States*

Reactivity to marital conflict has long been considered a critical mechanism linking marriage to health and well-being. Yet, developmental theories suggest conflict may subside with age. To compare mood and cardiovascular responses to two novel contexts—both partners' upsetting personal experiences—with marital conflict reactivity, 107 couples ages 40-87 recounted a difficult personal memory to the partner, discussed a marital problem, and provided baseline and post-task mood, blood pressure (BP), and heart rate (HR). Although older adults relived their upsetting personal memories with less emotional intensity, negative mood and systolic BP increased most after this task. Compared to disagreement, the spouse's upsetting memory triggered larger increases in negative mood, HR, and among older adults, SBP. Results suggest that both partners' upsetting personal experiences are as relevant for mood and cardiovascular activity as marital conflict in aging couples, and that spousal distress may grow increasingly important with older age.

EMOTION WORD USE AND CARDIOVASCULAR REACTIVITY DURING MARITAL INTERACTIONS

Tabea Meier, Jacquelyn Stephens, and Claudia Haase, *Northwestern University, Evanston, Illinois, United States*

Cardiovascular reactivity in midlife may predict health problems in later life, but few studies have examined cardiovascular reactivity during marital interactions, as an important interpersonal context, and potentially modifiable linguistic correlates. This laboratory-based study examined emotion word use (i.e., positive and negative emotion words derived using automated language analysis) and cardiovascular reactivity (i.e., heart rate changes from baseline) across two marital interaction contexts (i.e., positive and conflict conversation) in 46 married couples (92 individuals; age: M = 42.6, SD = 8.5). Results showed that (1) spouses who used more negative emotion words during conflict showed higher cardiovascular reactivity. Moreover, (2) when husbands used a more diverse negative emotion word vocabulary during positive conversations, their wives showed higher cardiovascular reactivity and (3) when wives used a more diverse positive emotion vocabulary, their husbands showed lower cardiovascular reactivity. Findings highlight the relevance of couples' emotion word use for cardiovascular reactivity in midlife.

SESSION 3160 (PAPER)

PREDICTORS OF HELP-SEEKING AND SERVICE AND HEALTH CARE UTILIZATION

HEALTHCARE-SEEKING BEHAVIORS AMONG OLDER AMERICANS WITH SUBJECTIVE COGNITIVE DECLINE

Seoyoun Kim[1], Hyun Woo Yoon[2], and Yuri Jang[3], *1. Texas State University, San Marcos, Texas, United States, 2. Kongju University, Gongju-si, Ch'ungch'ong-namdo,* *Republic of Korea, 3. University of Southern California, Los Angeles, California, United States*

Subjective cognitive decline (SCD) in older adults is increasingly recognized as a harbinger of dementia. However, since SCD is, by definition, based on self-reports, it is unclear whether those who experience memory loss discuss these issues with physicians. Access to regular healthcare can be a catalyst for early detection of SCD because asymptomatic cognitive changes may not be apparent unless directly addressed with primary care physicians (PCP). Further, given the widely-known racial/ethnic disparities in healthcare access, minority adults might be further disadvantaged in healthcare seeking for SCD. Using a large national dataset, Behavioral Risk Factor Surveillance System (BRFSS) in 2019, the goals of the study are to a) examine the link between having a PCP and discussing memory issues with physicians and b) examine how race and ethnicity and the availability of PCPs are associated with discussion of SCD. The sample included 7,900 individuals 50 and older who reported SCD in the past year. We conducted a logistic regression adjusting for BRFSS survey weights, missing data, state-level clustering, and a set of covariates. Among those with SCD, those with a PCP were almost twice as likely to discuss their cognitive decline (OR=1.98, p<.001). There was also a significant interaction between Hispanic ethnicity and having a PCP (OR=0.25, p<.05, F=4.65, p=.03). Surprisingly, Hispanics with a PCP were less likely to discuss memory issues compared to Hispanics without one. The findings highlight the significance of routine healthcare service utilization for adults with SCD while providing a nuanced understanding of ethnic differences.

MEALS ON WHEELS UTILIZATION AND THE RISK OF HOSPITALIZATION AMONG MEDICARE ENROLLEES OVER TIME

France Weaver[1], Sarah Walsh[2], and Jennifer Chubinski[3], *1. West Virginia University, Morgantown, West Virginia, United States, 2. Eastern Michigan University, Ypsilanti, Michigan, United States, 3. Xavier University, Cincinnati, Ohio, United States*

Meals on Wheels (MOW) services provide nutritional and social support for clients and may influence acute care use as a result. This study estimates the associations between MOW utilization and the risk of hospitalization for Medicare enrollees aged 65 and over, according to the degree of home-boundness (an eligibility criterion for MOW access). Attention is paid to the heterogenous role of MOW according to gender, race, and ethnicity. The analysis uses the 2014-2020 National Health and Aging Trends Study (NHATS) and includes 17,345 person-year observations. The study uses longitudinal complex survey Probit models of the likelihood of hospitalization, including interaction terms between lagged MOW usage and the extent of homeboundness. Control variables include sociodemographic indicators, living arrangements, health status, region and time fixed effects. Over the study period, the mean probability of hospitalization for Medicare enrollees aged 65+ is 20.5 percent, and the proportion of MOW users is 5.2 percent. Some 11.4 percent report being partially homebound and 5.6 percent mostly/fully homebound. Results reveal that MOW utilization is associated with a lower risk of hospitalization for those who are partly homebound (p= 0.058). This negative association is the largest and statistically significant for males (p=0.034) and whites (p=0.035) only. Further investigations will assess whether these associations are explained by differences between MOW and non-MOW users. The findings suggest that MOW services may delay or limit, to some extent, hospitalizations among partly homebound Medicare enrollees.

OLDER ADULT PREFERENCES FOR THE FORMAT AND CONTENT OF PRESCRIPTION MEDICATION LABELS

Rahul Malhotra[1], Sumithra Suppiah[1], Yi Wen Tan[1], Semra Ozdemir Van Dyk[1], Pildoo Sung[2], Sarah Siew Cheng Tay[3], Ngiap Chuan Tan[3], and PROMISE Study Group PROMISE Study Group[1], *1. Duke-NUS Medical School, Singapore, Singapore, 2. Centre for Ageing Research and Education, Duke-NUS Medical School, Singapore, Singapore, 3. SingHealth Polyclinics, Singapore, Singapore*

The risk of misinterpreting prescription medicine labels (PMLs) is higher among older adults. Given the limited space on PMLs, their format and content should cater to older adults' medication information and legibility needs. We established the ranking of seven medication-related content variables (indication, precautions, interaction or paired medicines, food instructions, side effects, expiry date, and missed dose action; provision of these content is currently not legally mandated) to be prioritised on PMLs using best-worst scaling (BWS), and determined the relative utilities of five format attributes (presentation of dose-frequency instructions, font size, presentation of dose, presentation and colour of precautions) when incorporated onto PMLs using discrete choice experiment (DCE), from the perspective of older Singaporeans. The variables and attributes were informed by our prior qualitative study and best practices guidelines for PMLs. We recruited 280 older adults (mean age: 68.8±5.4 years). A BWS object case was used to evaluate the relative importance of medication-related content variables (range: 0 to 1). A mixed logit model estimated the relative utilities of attribute levels, which enabled calculation of importance scores for ranking the format attributes (range: 0% to 100%). The three most-preferred content variables were indication (1.000), precautions (0.853) and interaction or paired medicines (0.845). The top three format preferences were tabular presentation of dose-frequency instructions (43.7%), large font size (22.3%) and precautions in red colour (13.6%). The findings inform an actionable way to improve the content and format of PMLs in the real-world, which is aligned with the stated priorities of older adults.

REASONS OLDER ADULTS START ATTENDING CONGREGATE MEAL PROGRAMS AND WHO ATTENDS FOR SOCIALIZATION

Kristen Robinson[1], Lauren Palmer[2], Angela Gasdaska[3], Michael Hayes[4], and Sara Nderitu[5], *1. Social & Scientific Systems, Inc., a DLH Holdings Corp (SSS), Silver Spring, Maryland, United States, 2. RTI International, Waltham, Massachusetts, United States, 3. RTI International, Research Triangle Park, North Carolina, United States, 4. RTI International, Research Triangle, North Carolina,* *United States, 5. Accenture, Charlotte, North Carolina, United States*

The Older Americans Act Nutrition Services Program's congregate meals support food security and nutrition, promote socialization, and improve quality of life. Understanding what drives people to first attend a congregate meal program may support efforts to increase involvement. This study used the 2019 National Survey of Older Americans Act Participants to analyze the open-ended survey responses of congregate meal participants (N=1,072) on why they started attending the program. The top three reasons were that they sought socialization (36.3%), had a medical or age-related need (18.7%), or accompanied or were referred by a friend or relative (12.3%). We conducted descriptive analyses on differences in the demographic, socioeconomic, and health characteristics of those attending for socialization compared to others. Results indicated a relationship between attending congregate meals for socialization and several characteristics: these individuals are more often non-Hispanic white ($p< 0.05$), widowed ($p< 0.05$), aged 75 to 84 ($p< 0.05$), and have at least a high school education ($p< 0.01$). People who attend for socialization are also less likely to be lower income ($p< 0.01$), living in cities ($p< 0.001$), have food insecurity ($p< 0.01$), and living with three or more ADLs ($p< 0.01$). Findings suggest two subpopulations of congregate meal attendees: those who have the choice to attend and do so for socialization, and those who attend because of unmet needs (e.g., food insecurity or disability). Identification of different categories of participants and what drives them to attend congregate meal sites has implications for improvements to advertising congregate meal services, targeting of certain populations, and ultimately to increasing participation.

SIMULATING WELL-BEING AND LITERACY INTERVENTIONS TO REDUCE ELDER SCAM SUSCEPTIBILITY

Marguerite DeLiema[1], and Aparajita Sur[2], *1. University of Minnesota, Twin Cities, Minneapolis, Minnesota, United States, 2. University of Minnesota, Minneapolis, Minnesota, United States*

Finanical fraud targeting older adults is on the rise, with annual losses in the billions of dollars. There is little longitudinal research on the causal relationships between known risk factors and scam susceptibility, including poor psychological well-being and poor health and financial literacy. Interventions designed to enhance well-being and/or literacy may reduce scam susceptibly among older adults. In this study, we use repeated measures from the Rush Memory and Aging Project to simulate how different trajectories in well-being and literacy might impact scam susceptibility among older adults alive over a seven year period. We simulated the effects of interventions of varying degrees -- 10%, 50%, and 100% increase in well-being/literacy from baseline scores. Simulations were performed for all participants as well as by education and income subgroups. Simulation models show that intervening on well-being causes a greater reduction in average scam susceptibility over time compared to intervening on total literacy. Even a 10% increase in baseline well-being significantly reduces scam susceptibility over time, regardless of participants' baseline income or educational attainment. Both interventions caused slightly greater reductions in susceptibility for those who are not college educated and those with an annual household income of less than $30,000. This study suggests that interventions that target self-efficacy and sense of purpose may help reduce older adults' scam susceptibility even more than interventions that improve health and financial literacy, but that both are promising targets for intervention.

SESSION 3170 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: REIMAGINING AGING AND LONG-TERM CARE FOR HEALTH EQUITY DURING AND POST-COVID-19: A HEALTH SCIENCES FOCUS

Chair: Kirsten Corazzini Discussant: Deb Bakerjian

In line with the theme of the conference, this symposium highlights exemplars of health sciences scholars who are identifying key issues and opportunities to re-imagine aging and long-term care, through a health equity lens, as highlighted by COVID-19. This lens is inclusive of the wide range of long-term care stakeholders whose well-being and health outcomes have been affected throughout the COVID-19 pandemic, including older adults, family caregivers, and the healthcare workforce. We focus in particular on vulnerable aging populations, such as older adults who are living with neurocognitive disorders, racial/ethnic minority older adults, and older adults receiving palliative care. Finally, we consider these issues at both individual and systems-levels. Our first presenter examines person and family engagement in assisted living for older adults living with ADRD and the impact of COVID-19. The second presenter provides insights into palliative care needs in nursing homes, and the implications for transition to an endemic. The third presenter examines long-term care needs in the community, with a focus on the consequences of unmet needs for racial/ethnic minority older adults. The fourth presenter highlights the role and capacity of the nurse practitioner in nursing homes during COVID. Our final presenters provide a systems-level look at the COVID-19 response, focusing on self-organizing community coalitions to support nursing homes. Presentations reveal how re-imagining aging and long-term care in health sciences, requires consideration of health inequities experienced throughout COVID-19, whether newly emerging inequities, or long-standing challenges and inequities that have been exacerbated by COVID-19.

IMPACT OF COVID ON PERSON AND FAMILY ENGAGEMENT IN ASSISTED LIVING

Anna Beeber, *Johns Hopkins University, Baltimore, Maryland, United States*

Advancing person-centered care in assisted living (AL), while minimizing safety risks (e.g., injury, elopement, or medication errors), requires effective partnerships among residents, family members, and staff. The COVID-19 pandemic adversely affected capacity across and within AL settings to establish and nurture these relationships, ultimately affecting and changing person and family engagement in care. Using data from qualitative interviews, we will report findings about person and family engagement in the safety of AL from the perspectives of 104 residents, families, and staff. Particular attention will be given to examining the effect of COVID-19 on person and family engagement for residents at increased risk for disparities in assisted living, including residents who are living with mild cognitive impairment or dementia. The presentation highlights both challenges and promising practices that emerged from the COVID-19 pandemic. Implications for AL are presented to support the transition from pandemic to endemic.

PALLIATIVE CARE FOR NURSING HOME RESIDENTS: APPLYING LESSONS LEARNED FROM COVID-19

Kathleen Unroe, *Indiana University Center for Aging Research, Regenstrief Institute, Inc., Indianapolis, Indiana, United States*

Many people receive care near or at the end of life in nursing homes, including 70% of people with Alzheimer's Disease and Related Dementias (ADRD). Studies have documented unmet needs for symptom management and frequent transitions of care for nursing home residents. Despite this, access to palliative care for nursing home residents is inconsistent. The COVID-19 pandemic both highlighted and exacerbated inequities in access to care, including in US-based nursing homes, as well as globally. COVID-19 specific guidance for nursing homes at state and federal levels, while designed to protect residents, contributed to increased social isolation and functional decline. Drawing upon data from an ongoing study to advance palliative care for residents living with ADRD, this presentation will highlight promising practices and opportunities to deliver palliative care in this setting.

ADDRESSING UNMET LONG-TERM SERVICES AND SUPPORTS NEEDS FOR RACIAL/ETHNIC MINORITY OLDER ADULTS

Jasmine Travers, *NYU, New York City, New York, United States*

The COVID-19 pandemic magnified several long-standing problems with the delivery of long-term services and supports, including access to care in the community setting. A disproportionate rise in nursing home use among Black and Latino older adults reflects the inadequacy of existing programs and policies to support aging in place for these most at-risk populations. Enabling aging in the community and preventing avoidable nursing home placements is widely considered a priority by federal, state, and local entities along with families and older adults. Yet, it is unclear what is needed to support Black and Latino older adults to remain in the community. In this presentation, Dr. Travers will discuss unmet long-term services and supports needs among the Black and Latino population, issues particularly faced by these populations during COVID-19, and opportunities to move forward as we transition to an 'endemic' COVID-19 landscape.

THE LONG-TERM CARE STAFFING CRISIS AND COVID-19: ROLE OF THE NURSE PRACTITIONER

Katherine McGilton, *KITE Research Institute: Toronto Rehabilitation Institute-UHN, Toronto, Ontario, Canada*

The residential long-term care sector has historically suffered from seemingly intractable staffing challenges in terms of ensuring adequate clinical expertise and a supportive work environment to address the complex health care needs of residents. Considerable evidence has demonstrated the devastating effect of COVID-19 on this fragile residential long-term care staffing structure, resulting in adverse outcomes among staff and residents alike, with the potential for permanent devastation without directed intervention. Drawing upon data from an Ontario-based study of nurse practitioner deployment during COVID-19, this talk will share an emergent approach to re-shaping expertise and capacity in Ontario, Canada through embedding nurse practitioners in residential long-term care homes. Results of this work helped to inform health policy action in the province to scale-up the use of nurse practitioners in long-term care homes, in order to enhance staff expertise and tackle the significant inequities of access to care among nursing home residents.

A LOOK INSIDE THE MISSOURI NURSING HOME COVID-19 EXPERIENCE

Amy Vogelsmeier, and Lori Popejoy, *University of Missouri, Columbia, Missouri, United States*

The COVID-19 pandemic exposed the vulnerabilities of US nursing homes to manage widespread viral outbreaks including an ill prepared/under-resourced workforce, a physical environment not conducive to infection prevention or management, and isolation from community emergency response planning. In this session, we will share real-life, real-time experiences of diverse Missouri nursing homes as they responded to the COVID-19 pandemic. We will also report on emerging data about the impact of nursing homes' pandemic response on resident outcomes. Strategies such as community-based efforts to respond to resource scarcity, and creative workforce solutions to address staffing needs, will be shared. Critical next steps should focus on the implementation of community coalitions to create sustainable healthcare partnerships at the local and state level and enhanced workforce solutions that include registered nurses and advanced practice registered nurses working within nursing homes to guide clinical care and infection prevention and management strategies.

SESSION 3180 (SYMPOSIUM)

READY, FIRE, AIM: DOES INTEGRATING ACUTE AND LONG-TERM SERVICES WORK?

Chair: Robert Applebaum Discussant: Richard Browdie

Due to the increasing costs of Medicaid and Medicare and concerns about how these two programs fail to work together to deliver quality care, there has been a growing enthusiasm for integrated care programs. The Financial Alignment Initiatives (FAI), implemented by the Centers for Medicare and Medicaid Services (CMS) in 2011 and tested in 13 states were designed to test the impacts of a program that offers Medicare and Medicaid services under one organization to individuals who are dually eligible for both programs. Previous studies of the expansion of managed long-term services have generated considerable interest over the last two decades however, research results have been mixed. There is also limited information about the implementation of these efforts, as demonstrations have served varying target populations with very different intervention strategies. The lack of conclusive results means that states, now faced with decisions about continued implementation of these initiatives do not have good information to make sound policy decisions. The national evaluation of the FAI states did not include Medicaid costs. Our study is designed to gain a better understanding of Ohio's FAI MyCare Demonstration. This symposium provides data from a comprehensive impact analysis that examined both Medicaid and Medicare claims data using a difference- in- differences treatment and comparison analysis (n= 390,000) and an in-depth process evaluation (using interviews with 487 participants) to gain an understanding of program effects. After reviewing results the symposium will discuss the future of these and other reform efforts to integrate Medicaid and Medicare services.

WHEN YOU GET TO A FORK IN THE ROAD, TAKE IT: SHOULD STATES FOLLOW YOGI'S ADVICE ON MANAGED LONG-TERM SERVICES?

Robert Applebaum, *Miami University, Oxford, Ohio, United States*

Today's Medicaid challenges, coupled with the baby boom demographics, have every state in the nation recognizing the need to do something different in their Medicaid programs. Although achieving a better balance between institutional and home and community-based services has been an important reform in many states, it does not appear to be enough to create a working system. Medicaid managed long-term care and efforts to integrate Medicare and Medicaid is a growing option. Designed to control the acute and long-term care costs of older people and individuals with disability, the approach also is directed at linking the two disparate systems. A review of the array of studies examining this area shows mixed results, despite the popularity of this option at the state level. This paper introduces the evaluation of Ohio's MyCare integrated care demonstration, raising questions about the important elements of these initiatives for policy makers, providers, and consumers.

EVALUATING EXPENDITURES AND UTILIZATION OF OHIO'S INTEGRATED MEDICARE AND MEDICAID PROGRAM

John Bowblis, Robert Applebaum, and Matt Nelson, *Miami University, Oxford, Ohio, United States*

In 2014, 29 of 88 Ohio counties implemented MyCare, which integrated Medicare and Medicaid for dually eligible Ohioans. Using an intent-to-treat, difference-in-difference framework we examined medical expenditures and utilization associated with the implementation of MyCare. Specifically, we compared dually eligible Ohioans in MyCare counties to those in non-MyCare counties from 2012 to 2018. Overall medical expenditures were lower in the MyCare counties post implementation compared to non-Mycare counties, with most of the difference attributed to Medicaid. The effects were larger for individuals in the community compared to long-term services and supports (LTSS) users. The implementation of MyCare is associated with a decrease in the use of nursing homes, a large increase in hospice, and among LTSS users not in a nursing home decreases in the utilization of home and community-based services. Interestingly, the proportion of individuals in MyCare counties classified as an LTSS user increased after the implementation of MyCare.

PROGRAM THEORY VERSUS IMPLEMENTATION: THE IMPORTANCE OF PROCESS IN UNDERSTANDING PROGRAM IMPACT

Jennifer Heston-Mullins[1], Athena Koumoutzis[2], Katherine Abbott[2], Dayna Bennett[2], and Karen Williams[2], *1. Scripps Gerontology Center, Miami University, Oxford, Ohio, United States, 2. Miami University, Oxford, Ohio, United States*

An extensive MyCare Ohio process evaluation was conducted to understand factors affecting everyday implementation. This involved a review of MyCare membership enrollment data and qualitative interviews and focus groups with state-level stakeholders (n=29), regional stakeholders comprised of Area Agency on Aging and MyCare Ohio Plan personnel and HCBS service providers (n=418), and MyCare members (n=40); which were audio-recorded, transcribed, and checked for accuracy prior to coding in Dedoose. Results show that while MyCare was originally envisioned as a program to coordinate Medicare and Medicaid services for dual-eligible, physically-disabled older adults, many MyCare members are under age 65 (47%), have opted out of the Medicare Advantage portion of MyCare (42%), and live with behavioral health diagnoses. This presentation will discuss how process evaluation is instrumental to understanding program impact and how younger members, members with behavioral health concerns, and opted-out members have shaped the implementation of MyCare Ohio.

THE BLACK BOX OF CARE MANAGEMENT IN MANAGED LONG-TERM SERVICES AND SUPPORTS

Katherine Abbott[1], Jennifer Heston-Mullins[2], Athena Koumoutzis[1], Dayna Bennett[1], Karen Williams[1], and Robert Applebaum[1], *1. Miami University, Oxford, Ohio, United States, 2. Scripps Gerontology Center, Miami University, Oxford, Ohio, United States*

Within Ohio's MyCare demonstration, two distinct care management models were selected by the participating MyCare Ohio health plans (MCOPs): fully-delegated waiver care management and waiver service coordination. The purpose of this presentation is to describe the components of care management operating in MyCare Ohio. Qualitative interviews with n=91 Area Agency on Aging (AAA) and n=131 MCOP care management personnel were audio-recorded, transcribed, and checked for accuracy prior to thematic coding in Dedoose. Results indicate that comprehensive care management is the core element of MyCare Ohio. Fully-delegated care management models were viewed by participants as beneficial to reducing confusion for members however 'scope creep' challenged the already strained AAAs. Effective teamwork was identified for waiver service coordination models but the division of labor and communication needed between the AAA and MCOP care management personnel created tensions. The discussion will focus on practice recommendations for training, caseloads, and support staff.

SESSION 3190 (SYMPOSIUM)

REVISITING THE ROLE OF PERCEIVED TIME HORIZONS IN SOCIOEMOTIONAL SELECTIVITY THEORY

Chair: Li Chu Discussant: Laura Carstensen

This symposium will consider the ways that time horizons may influence motivation and emotional well-being. Socioemotional selectivity theory postulates that goals and motivation shift from ones about learning and exploration to ones about emotional meaning as time horizons grow constrained as people age. This theory maintains that a focus on emotional goals explains why older adults tend to show better emotional well-being compared to younger adults. Many studies use the Future Time Perspective scale developed by Carstensen and Lang (1996) to measure perceived time left in life. However, several studies find more limited future time perspective does not contribute to better emotional well-being nor more positivity bias in cognitive processing and in some cases predicts poorer emotional well-being. The first presentation will focus on the future time perspective scale and its underlying structure. The second presentation will discuss the association between future time perspective and psychosocial well-being during the COVID-19 pandemic. The third presentation will review different measures of time perception and examine the relationship between future time perspective on age-related positivity effect. The last presentation will introduce a new concept and measurement, time savoring. Laura Carstensen will synthesize findings and offer insights regarding future life-span research on motivation and well-being.

THE DIMENSIONALITY OF FUTURE TIME PERSPECTIVE

Daniel Grühn, and Rebekah Knight, *NC State University, Raleigh, North Carolina, United States*

There have been suggestions that the measure of future time perspective shows a two-factor structure. However, the two-factor structure coincides with positively- and negatively-framed items potentially indicating a method factor rather than a content factor. By using reversed-scored items in an adult sample (N = 1421, aged 19 to 79, M = 39.1, SD = 11.1), we found evidence that the two-factor structure is mainly due to the framing of the items representing method factors rather than representing separate content factors. Item framing might be more important in aging-related research than expected.

LIMITED FUTURE TIME PERSPECTIVE IS ASSOCIATED WITH LOWER EMOTIONAL WELL-BEING DURING THE COVID-19 PANDEMIC

Yochai Shavit[1], Jessica Barnes[2], and Laura Carstensen[2], *1. Stanford Center on Longevity, Stanford University, Stanford, California, United States, 2. Stanford University, Stanford, California, United States*

Socioemotional selectivity theory postulates that limited future time perspective (FTP) motivates older adults to prioritize emotionally meaningful goals, explaining documented age advantages in emotional well-being. During the early months of the COVID-19 pandemic, we collected data from 945 community dwelling adults and 156 assisted living facilities residents living in the United States (N= 1101, age-range: 18-98). Participants reported their FTP using the scale developed by Carstensen and Lang (1996), as well as the frequency and intensity of sixteen positive and thirteen negative emotions. Age association with limited FTP was comparable to past studies. Contrary to our hypotheses, limited FTP was associated with lower emotional well-being across ages and suppressed (rather than mediated) a general trend towards higher emotional well-being in older ages. Findings suggest that there may be conditions under which perceptions of limited time horizons have negative implications. Theoretical implications are discussed.

EXAMINING THE RELATIONSHIP BETWEEN FUTURE TIME PERSPECTIVE AND POSITIVITY EFFECTS

Sarah Barber[1], Hyunji Kim[1], and Noelle Lopez[2], *1. Georgia State University, Atlanta, Georgia, United States, 2. San Francisco State University, San Francisco, California, United States*

When compared to younger adults, older adults favor positive over negative information in attention and memory. This positivity effect is typically interpreted through the lens of socioemotional selectivity theory. According to this view, older adults often have a limited future time perspective (FTP), which leads them to prioritize emotional well-being goals. However, data from our lab suggest that a limited FTP is actually associated with increased negativity, rather than with increased positivity. More specifically, we found that older adults with a limited FTP (self-reported on the Carstensen and Lang FTP scale) rated their autobiographical memories more negatively. We also found that among older adults with high executive function abilities, a limited FTP was associated with reduced positivity in an episodic memory task. In discussing why these counterintuitive relationships occurred, we will also present data showing that a limited FTP is associated with negative attitudes about the future and the present.

TIME HORIZONS VERSUS TIME SAVORING: WHICH BEST PREDICTS AGE-RELATED IMPROVEMENTS IN EMOTIONAL WELL-BEING?

Tyler Matteson[1], Li Chu[2], and Laura Carstensen[1], *1. Stanford University, Stanford, California, United States, 2. Stanford University, Menlo Park, California, United States*

Previous research has shown that time horizons, as measured by the future time perspective (FTP) scale, yields mixed findings about the relationship between perceived time and emotional well-being. Expansive time horizons often predict better well-being than limited time horizons, raising questions about a core postulate of socioemotional selectivity theory (SST). The present study introduces a more nuanced construct about perceived time and introduces a new scale, time savoring, which captures the heightened value of time as time becomes more limited. Based on 1,384 participants (Mage = 54.55, age range = 18-96), time savoring and age are positively correlated (r(1,382) = .23, p < .001). Time savoring partially mediates age and well-being (i.e., greater happiness, lower depressive symptoms, and higher life satisfaction). Parallel mediation with multiple mediators demonstrated the measure's discriminant validity from FTP and personality measures (e.g., agreeableness and conscientiousness), offering a promising way to measure heightened value of time.

SESSION 3200 (PAPER)

UNDERSTANDING PEOPLE'S PERCEPTIONS OF PALLIATIVE CARE AND PRACTICES IN ASSISTED LIVING

ANTIPSYCHOTIC MEDICATION USE IN ASSISTED LIVING/RESIDENTIAL CARE: DO ORGANIZATIONAL CHARACTERISTICS MATTER?

Sarah Dys[1], Ozcan Tunalilar[2], and Paula Carder[2], *1. Vital Research, LLC, Los Angeles, California, United States, 2. Portland State University, Portland, Oregon, United States*

This study investigates how assisted living/residential care (AL/RC) and memory care (MC) contexts are associated with the prevalence of antipsychotic medication use (APU). Primary data were collected from a statewide representative sample of AL/RC settings through the Oregon Community-Based Care study from 2017-2019 and combined with publicly available administrative data. Framed by Donabedian's model of care quality, we examine associations among 90-day prevalence of APU, organizational, care process, and AL/RC resident population characteristics using random intercepts regression models. Every licensed AL/RC setting in Oregon receives an annual mailed survey to provide aggregate resident demographics, health acuity, health service use, payment type and organizational policies. Organizational measures (e.g., profit status, license type, geographic designation) were collected from state websites. The average 90-day prevalence of APU among all Oregon AL/RC settings is 30.7%, though rates differ by MC endorsement (23.9% in AL/RC and 42.7% in MC). Compared to care processes and resident population characteristics, organizational characteristics were associated with larger magnitudes of difference in rates of APU. Nonprofit settings were associated with lower rates of APU in both AL/RC (β= -4.4 percentage points, [95% CI: -8.4, -0.4]) and MC (β= -12.4, [95% CI: -21.2, -3.6]. Compared to low-Medicaid settings, settings with very high proportions of Medicaid residents were associated with higher prevalence of APU, +8.9 in AL/RC (95% CI: 1.7, 16.1) and +11.0 in MC (95% CI: 2.3, 19.8). Policymakers might consider how organizational resource capacity influences APU in AL/RC settings, especially if APU prevalence is treated as a quality indicator.

CAUSAL ANALYSES OF PALLIATIVE CARE OUTCOMES USING OBSERVATIONAL DATA: A REVIEW OF CURRENT LITERATURE

Narae Kim[1], Jingjing Jiang[2], Melissa Garrido[3], Mireille Jacobson[1], David Mockler[4], and Peter May[2], *1. University of Southern California, Los Angeles, California, United States, 2. Trinity College Dublin, Dublin, Dublin, Ireland, 3. Boston University School of Public Health, Boston, Massachusetts, United States, 4. University of Dublin, Dublin, Dublin, Ireland*

People with serious medical illnesses disproportionately account for health care spending, and the last year of life is typically the most costly. Economic evidence to inform improvement efforts in care for this population is long recognized as thin relative to policy importance. Palliative care studies rely heavily on routinely collected data since conducting randomized controlled trials with subjects nearing the end of life is particularly challenging; however, observational studies face high risk of bias. We conducted a systematic review of the peer-reviewed and grey literature to identify quasi-experimental studies evaluating palliative care's effect on costs and health care utilization. Eligible study designs were those that controlled for unobserved confounding using causal inference methods (e.g. difference-in-differences). Eligible outcomes were costs, health care use, and quality-of-life. Among 806 search results, we included 17 studies: seven used difference-in-differences methods, five used interrupted time series analysis, and five used instrumental variables. Reporting quality was variable. Studies reported a general pattern of improved outcomes associated with palliative care. However, the incidence of studies finding a significant difference was lower than cohort studies that don't attempt to control for unobserved confounding. Studies that don't control for unobserved confounding may be overestimating true effects due to bias. Given the large volume of routine data collection in end-of-life care, there exists clear potential to increase the application of the causal inference methods to palliative care research. Such studies would strengthen the evidence base on an understudied topic and potentially inform other types of economic analysis in palliative care.

PROFILE OF DECEDENTS FROM A NATIONAL COHORT OF ASSISTED LIVING RESIDENTS

Emma Belanger[1], Nicole Rosendaal[1], Xiao (Joyce) Wang[1], Joan Teno[2], Pedro Gozalo[1], David Dosa[1], and Kali Thomas[1], *1. Brown University, Providence, Rhode Island, United States, 2. Oregon Health & Science University, Portland, Oregon, United States*

An increasing number of older adults reside in assisted living (AL) toward the end of life, and it remains unclear if this trend represents an additional place of care and end-of-life transition before eventual nursing home admission. Our objective was to examine the characteristics and healthcare utilization of AL residents who died during a two-year follow-up. We conducted a prospective cohort study of Medicare beneficiaries residing in large AL communities (25+ beds) in January 2017, and followed them until the end of 2018 using a variety of administrative healthcare claims data. The national population of Medicare beneficiaries in AL included 273,722 fee-for-service (FFS) beneficiaries, and 143,258 Medicare Advantage beneficiaries. From 2017 to the end of 2018, 23.7% of residents died. Of the 66,605 FFS Medicare beneficiaries who died during follow-up, 77.0% were 85 years old or older, 72.2% were diagnosed with Alzheimer's disease and related dementia (ADRD) and 80.8% were diagnosed with heart failure or chronic obstructive pulmonary disease. Most FFS decedents (97.3%) resided in AL during their last 12 months of life, with 23.0% leaving AL before the last month of life. Half of FFS decedents died in AL, while another 24.1% died in a nursing home. AL communities represent an increasingly common place of end-of-life care for dying Medicare beneficiaries. These findings point to the need for state and federal policies to protect a growing population of frail and vulnerable AL residents.

REGULATORY PROFILES AND POTENTIALLY BURDENSOME TRANSITIONS AMONG ASSISTED LIVING DECEDENTS

Xiao (Joyce) Wang, Lindsey Smith, Joan Teno,
Nicole Rosendaal, David Dosa, Pedro Gozalo,
Kali Thomas, and Emma Belanger, *Brown University, Providence, Rhode Island, United States*

Potentially burdensome transitions at the end of life (i.e. repeated hospitalizations or transitions in the last 3 days of life) are common among assisted living (AL) residents, and are associated with lower care satisfaction by family members. AL regulations vary widely within and between states. This study aimed to describe the rate of burdensome transitions by AL regulatory profile, using a retrospective cohort study combining state AL regulations and multiple administrative claims data. The sample included 4,911 ALs serving 67,319 residents, who 1) died between 2017 and 2019; 2) resided in AL 120 days before death; 3) were continuously enrolled as fee-for-service one-year before death; and 4) resided in ALs with 25+ beds. The independent variable was a categorical variable indicating AL regulatory profile (i.e. housing, hybrid, hospitality, healthcare, rebalancing, hybrid healthcare), identified with a previously published methodology. These profiles differ in the allowance of third-party services, skilled nursing, medication administration, and requirements for medication review and licensed nursing staff. We first ran regression models to estimate the rate of burdensome transitions, accounting for AL-level resident demographic, socioeconomic, case-mix, and market characteristics. Results showed 'hybrid' ALs (i.e. low prevalence of skilled nursing allowed) had the highest rate of burdensome transitions (24.9%), whereas 'healthcare' ALs (i.e. high specificity for all types of services) had the lowest rate (22.2%). The rate of potentially burdensome transitions did not differ much by AL regulatory types, requiring more work to determine the drivers for burdensome transitions beyond AL regulations.

UNDERSTANDING THE PALLIATIVE CARE INFORMATION CIRCULATING ON TWITTER DURING THE CORONAVIRUS PANDEMIC

Megumi Inoue, Mahdi Hashemi, Meng-Hao Li,
Rajendra Kulkarni, and Naoru Koizumi, *George Mason University, Fairfax, Virginia, United States*

Palliative care is a growing medical specialty. While its value has become particularly evident during the pandemic, it faces various challenges including misconceptions among the general public, a lack of awareness of its benefits, and limited/sporadic access and coverage by Medicare. Given the increasing number of people sharing their health information and seeking healthcare information on social media where misinformation is widely spread, this study examined types of information on palliative care circulated on Twitter. A total of 26,495 English Tweets were collected 01/01/2020 – 12/30/2021 using the keywords "Palliative" and "Covid" or "Corona". We manually developed a framework for coding/classifying the first 6,000 Tweets. Of those, 5,308 were unrelated Tweets (e.g., advertising palliative care seminars/conferences). Among the remaining Tweets, persistent myths were observed (e.g., palliative care is only for dying people) and were labeled accordingly. In addition, while some people mentioned negative impact of the pandemic on palliative care (e.g., shortage of beds), others found value in palliative care and reported positive changes due to the pandemic (e.g., telehealth in palliative care). Consequently, the following categories were defined for Tweets: i) Recognized benefits (203 Tweets); ii) Positive impact of the pandemic on palliative care (120 Tweets); iii) Negative impact of the pandemic on palliative care (333 Tweets); iv) Myth (63 Tweets). We will use these manually classified Tweets to train machine-learning algorithms to automatically classify the remaining tweets, aiming to obtain a comprehensive understanding of palliative care information circulating on Twitter and seek ways to promote palliative care use.

SESSION 3210 (SYMPOSIUM)

THE EXPERIENCES OF OLDER PEOPLE IN ENGLAND DURING THE COVID-19 PANDEMIC: EVIDENCE FROM ELSA

Chair: Paola Zaninotto

In this session we will present results from the English Longitudinal Study of Ageing (ELSA) Covid-19 substudy. Data were collected during the pandemic at two separate occasions to capture the experiences of older people and to compare them to pre-covid periods. The session will include results among people with cognitive impairment, people who contracted infections and explore the consequences on their mental health, well-being and health in general

MENTAL HEALTH AND FINANCIAL HARDSHIP AMONG OLDER ADULTS WITH PROBABLE COVID-19 INFECTION

Paola Zaninotto[1], Eleonora Iob[1], and Andrew Steptoe[2], *1. UCL, London, England, United Kingdom, 2. University College London, London, England, United Kingdom*

We investigated the immediate and longer-term impact of probable COVID-19 infection on mental health, wellbeing, and financial hardship among older people living in England. Data were analysed from 5146 older adults participating in the English Longitudinal Study of Ageing who provided data before the pandemic (2018-19) and at two COVID-19 assessments in 2020 (June-July and November-December). The associations of probable COVID-19 infection (first COVID-19 assessment) with depression, anxiety, poor quality of life (QoL), loneliness, and financial hardship at the first and second COVID-19 assessments were tested using linear/logistic regression and were adjusted for pre-pandemic outcome measures. Participants with probable infection had higher levels of depression and anxiety, poorer QoL, and greater loneliness scores compared with those without probable infection at both the first (ORdepression=1·62 [95%CI:1·16,2·26];ORanxiety=1·59[95%CI:1·00,2·51]; bpoorQoL=1·34[95%CI:0·66,2·02]; bloneliness=0 ·49[95%CI:0·25,0·74]) and second (ORdepression =1·56[95%CI:1·17,2·09];ORanxiety=1·55[95%CI:1·02 ,2·37];bpoorQoL=1·38[95%CI:0·74,2·03]; bloneliness= 0·31[95%CI:0·04;0·58]) assessments. Participants with probable infection also experienced greater financial difficulties than those without infection at the first assessment (OR=1·50[95%CI:1·10,2·05]).

THE EXPERIENCES OF PEOPLE WITH COGNITIVE IMPAIRMENT DURING THE COVID-19 PANDEMIC IN ENGLAND

Brian Beach[1], and Paola Zaninotto[2], *1. UCL (University College London), London, England, United Kingdom, 2. UCL, London, England, United Kingdom*

The COVID-19 pandemic presented challenges that may have impacted people with cognitive impairment in disproportionate ways. Using the ELSA COVID-19 substudy collected in 2020, we examined the experiences of people across three cognitive function groups (no impairment, mild impairment, and dementia) with respect to a range of social and health outcomes, including: shielding and self-isolation; access to health and care services; changes in lifestyle behaviours during the pandemic, and the impacts on mental health, wellbeing, and other psychosocial measures. Differences among cognitive function groups varied according to both outcomes and time. For example, people with dementia were around 2.4 times more likely to be shielding in June/July than those with no impairment, but no difference was found for November/December. On many measures, people with dementia fared similarly to those with no impairment once controlling for other factors.

ASSOCIATION OF HEALTH BEHAVIORS WITH WEIGHT AND OBESITY DURING THE COVID-19 PANDEMIC AMONG THE UK OLDER POPULATION

Jingmin Zhu, Giorgio Di Gessa, and Paola Zaninotto, *UCL, London, England, United Kingdom*

Using a sample of 4,182 UK adults aged 50 and above, this study explored the association of changes in health behaviours with weight and obesity during UK lockdown in Jun/Jul and Nov/Dec 2020. Over 30% adults reported more sitting, more TV watching or less exercise. Around 20% adults were engaged in eating more or sleeping less. More alcohol drinking happened in 12.3% adults. Results suggested that more sedentariness, more TV watching, less exercise, more eating and more alcohol drinking were associated with a significant increase in weight. Meanwhile, less sedentariness or less eating significantly reduced weight in Nov/Dec 2020. A higher risk of obesity was found in adults sitting, eating, or sleeping more than usual. Considering potential health risks associated with obesity in older population, weight management is necessary nationwide.

THE CORONAVIRUS JOB RETENTION SCHEME AND MENTAL HEALTH AMONG OLDER WORKERS: EVIDENCE FROM ENGLAND

Giorgio Di Gessa, and Paola Zaninotto, *UCL, London, England, United Kingdom*

The COVID-19 pandemic has led to major economic disruptions. In March 2020, the UK implemented the Coronavirus Job Retention Scheme –known as furlough –to minimize the impact of job losses. So far, little is known on the mental health impact of this scheme on older workers, and on whether this varies by job characteristics. Exploiting longitudinal data from Wave 9 (2018/19) and two COVID-19 sub-studies (June/July 2020; November/December 2020) of the English Longitudinal Study of Ageing we use logistic and linear regression models to investigate associations between changes of employment and mental health during the pandemic. About 10% of respondents aged 52-67 were furloughed in the initial phase of the pandemic. Overall, employment disruption was associated with changes in mental health, although results suggest differences by pre-pandemic job characteristics (i.e. hours worked, physical effort, social class, and stress measured by the effort-reward imbalance model).

SESSION 3220 (SYMPOSIUM)

UNDERSTANDING SOCIAL AND CULTURAL DIVERSITIES AND AGING FOR HEALTH AND WELL-BEING IN KOREAN AND KOREAN AMERICANS

Chair: Seunghye Hong Co-Chair: Michin Hong Discussant: Kathryn Braun

Guided by the socio-ecological model and the cultural diversity perspective, this symposium aims to enhance the understanding of critical issues in health and well-being among Koreans and Korean Americans with three primary focuses: aging, social-ecological and multi-level factors, and identifying social and cultural contexts.

Five studies examined multilevel factors—individual, relational/interpersonal, community, and societal—that are associated with health and well-being, conducted in Korea as well as in the United States. Study 1 examined psychological well-being among older Koreans, specifically its association with intergenerational relationships and social support using longitudinal multilevel modeling to estimate depression trajectories. Study 2 examined childhood experiences and midlife cultural engagement associations among middle-aged Korean couples, considering the influences of their spouses' experiences and cultural resources. Study 3 explored the experiences of the nature-based virtual reality program among older Korean Americans, using in-depth interviews and providing an innovative approach using technology as a therapeutic tool. Study 4 examined social determinants of health associated with Korean American immigrants' willingness for end-of-life discussions and the factors affecting willingness (awareness of hospice, communication with family/doctors, and social isolation). Study 5 examined health insurance coverage and its association with immigration-related factors (English proficiency, generational status, and age at immigration) among Korean Americans using national data. The various health, mental health, and well-being issues in Koreans and Korean Americans will be discussed from contextually responsive approaches. This symposium will provide implications for practices, education, research, and policy to promote health, mental health, and well-being in the Korean and Korean American populations.

HEALTH INSURANCE COVERAGE, AGE, AND IMMIGRATION-RELATED FACTORS AMONG KOREAN AMERICANS

Seunghye Hong[1], Ki Tae Park[2], Yeonjung Lee[3], Mei Linn Park[4], and Nan Sook Park[5], *1. University of Hawaii at Manoa, Thompson School of Social Work & Public Health, Honolulu, Hawaii, United States, 2. Regional Skills Council, Seoul, Seoul, Seoul-t'ukpyolsi, Republic of Korea, 3. University of Hawai'i at Mānoa, Honolulu, Hawaii, United States, 4. University of Hawai'i at Mānoa, Thompson School of Social Work & Public Health, Honolulu, Hawaii, United States, 5. University of South Florida, Tampa, Florida, United States*

The purpose of this study was to examine health insurance coverage and its association with demographic and immigration-related factors (English proficiency, generational status, and age at immigration) among Korean Americans (KAs, n=11,462). Data were drawn from the 2017 American Community Survey. KA older adults aged 65+ had significantly higher odds of having any health insurance compared to those aged 41 to 64. KAs who speak English well or only speak English were more likely to have any health insurance compared to those with limited English proficiency (i.e., don't speak English well or at all). First-generation KAs had lower odds of having any health insurance compared to those born in the U.S. Those who immigrated after 41 years of age were less likely to have health insurance compared to those born in the U.S. These findings underscore the need to consider immigration-related factors in efforts to increase healthcare accessibility for KAs.

CHILDHOOD AND MIDLIFE CULTURAL ENGAGEMENT AMONG KOREAN MARRIED COUPLES

Kyungmin Kim[1], Jeffrey Burr[2], Gyounghae Han[1], and Bon Kim[3], *1. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea, 2. University of Massachusetts Boston, Boston, Massachusetts, United States, 3. Jeju National University, Seoul, Gyeonggi, Republic of Korea*

Cultural reproduction theory posits that cultural resources transmit to the next generation, suggesting a lingering effect of parental influences on cultural experiences in adulthood. Further, middle-aged adults' cultural engagement may not only be influenced by their own childhood experiences but also their spouses' experiences. This study extends our understanding of childhood and midlife cultural engagement of married couples, using a sample of 1,271 couples (age 49–66) from the 2012 Korean Baby Boomer Panel Study and Korean Forgotten Generation Study. Results from Actor Partner Interdependence Models showed that beyond one's own childhood cultural engagement, spouse's childhood cultural engagement was associated with levels of perceived cultural engagement at midlife (for both husbands and wives) and number of arts and cultural activities at midlife (only for husbands). Given the cross-spousal associations in cultural engagement among Korean middle-aged couples, both spouses' cultural resources need to be considered for policy implications.

MOBILE-BASED MULTIDOMAIN LIFESTYLE INTERVENTION AND HEALTH PROMOTION IN OLDER KOREAN AMERICANS

Junhyoung Kim, *Indiana University, Bloomington, Indiana, United States*

Prior studies have suggested that the nature-based virtual reality (VR) program serves as a therapeutic tool to increase health and wellbeing among older adults. While much research on virtual reality indicates their health benefits among older adults, there are research gaps in the current literature on the nature-based VR experiences of older Korean Americans. The objective of this study was to gather preliminary information on the health outcomes of the program as well as challenges to participation. Based on in-depth interviews with five participants, three main salient themes as positive outcomes emerged: (a) enjoyment, (b) stress reduction, and (c) cognitive function. On the other hand, there were three main challenges that participants experienced: (a) challenges in the immersion experience itself, (b) difficulties with the controllers, and (c) cybersickness. This finding suggests that the nature-based virtual reality program can serve older immigrant population as a therapeutic tool to increase their mental and cognitive health.

SOCIAL DETERMINANTS OF HEALTH AND WILLINGNESS FOR END-OF-LIFE DISCUSSION AMONG KOREAN AMERICAN IMMIGRANTS

Hyunjin Noh[1], Eunyoung Choi[2], Lewis Lee[3], and Hee Lee[4], *1. The University of Alabama School of Social Work , Tuscaloosa, Alabama, United States, 2. School of Global Public Health, New York University, Los Angeles, California, United States, 3. School of Social Work, The University of Alabama, Tuscalossa, Alabama, United States, 4. University of Alabama, Birmingham, Alabama, United States*

This study aimed to examine social determinants of health (SDH) associated with Korean American (KA) immigrants' willingness for end-of-life discussions with family and doctors. A self-administered, cross-sectional survey was conducted with 259 KAs in Alabama. Demographic, health, acculturation, and SDH information were collected. Binary logistic regression analyses were conducted to examine associations between SDH and willingness for end-of-life discussion. Most participants were willing to discuss with family (94%) and doctors (82%). Those aware of hospice care were more likely to have willingness for discussion with family and doctors. Those who could not see a doctor because of cost and who had higher threats to interpersonal safety were less likely to have willingness for discussion with family. Those with more chronic conditions and higher social isolation were less likely to have willingness for discussion with doctors. Interventions aimed to promote KAs' end-of-life discussions should consider the SDH identified in this study.

SESSION 3230 (SYMPOSIUM)

USING REAL-WORLD EVIDENCE TO SUPPORT THE FDA REGULATORY APPROVAL: METHODOLOGICAL CONSIDERATIONS

Chair: Kevin Lu Discussant: Patricia Slattum

Evidence from clinical trials has traditionally been used to support regulatory drug approval, whereas real-world evidence (RWE) has been used for post-marketing surveillance studies. With the enaction of the 21st Century Cures Act, the Food and Drug Administration (FDA) is evaluating the potential use of RWE to support new indications for an approved product or to satisfy post-approval study requirements. Yet the substantial evidence standard remains unchanged for FDA approval. To date, the FDA has issued guidelines or frameworks for using RWE for regulatory decisions. However, many methodological challenges remain unanswered when using RWE in gerontology research. This Pharmaceutical Care and Outcomes Research Interest Group-sponsored symposium consists of leading experts in the country to address these problems. The four papers in this symposium will address methodological challenges that are unique in gerontology research. Specifically, The first paper will introduce the FDA drug evaluation process, focusing on the key considerations for evaluating RWE in regulatory decision making; the second paper will discuss possible challenges related to data sources from which RWE are generated in aging research; the third paper will provide a case example of some of the challenges in using RWD sources to generate RWE in the Alzheimer's Disease setting; and the fourth paper will provide recommendations for improving gerontology research based on RWE going forward.

CHALLENGES RELATED TO DATA SOURCES FOR RWE IN AGING RESEARCH

Kevin Lu, *University of South Carolina, Columbia, South Carolina, United States*

Numerous challenges remain in research to generate RWE for FDA approvals and other health care decision-makers or stakeholders. This is particularly true for research to evaluate the effectiveness of pharmaceutical care and patient outcomes in older populations. For example, data sources available for RWE in the older populations are limited and data access can be daunting; identifying appropriate data sources for FDAapprovals remain challenging. Most of the FDA approvals are based on RWE rely on multiple data sources instead of a single database. In addition, pharmacoepidemiologic studies in older adults using RWD are often limited in capturing important clinical information and prognostic factors that are useful for decision-makers. Polypharmacy, frailty, and patient outcomes measures are often inconsistent depending on specific databases and thus produce controversial results. We will discuss different data sources appropriate for pharmacoepidemiology research and make comparisons and contrasts of different research approaches using different databases.

KEY CONSIDERATIONS FOR EVALUATING REAL-WORLD EVIDENCE IN SUPPORT OF FDA REGULATORY DECISION-MAKING

Jie (Jenni) Li, *FDA CDER Office of Surveillance and Epidemiology, Silver Spring, Maryland, United States*

For decades, FDA has been using RWE to monitor and evaluate the safety of drug products in the post-marketing setting. Under the FDA RWE Program, FDA has accepted RWE in support of effectiveness claims. For example, the approval of tacrolimus (Prograf) for the prophylaxis of organ rejection after lung transplant was based on RWD from a national transplant registry. The key considerations for evaluating RWE for safety and effectiveness assessments include: (1) whether the RWE are fit for use (e.g., data relevance and reliability); (2) whether the study design can provide adequate scientific evidence to answer the regulatory question of interest (e.g., whether the lack of blinding impacts the reporting of the outcome events); and (3) whether the study conduct meets FDA regulatory requirements (e.g., study monitoring and standardization of data collection). FDA has issued draft guidances on EHR/Claims data, registries, data standards, and regulatory considerations, respectively, to detail these key considerations. Carefully designed and analyzed RWE studies can be used to support safety and effectiveness claims.

USE OF RWD TO GENERATE RWE IN THE ALZHEIMER'S DISEASE SETTING: CHALLENGES AND FUTURE DIRECTIONS

Julia DiBello, *Merck & Co., Inc., West Point, Pennsylvania, United States*

There is considerable interest by many stakeholder groups in developing new therapies in Alzheimer's disease (AD). Increasing interest in the treatment of pre-clinical disease and measurement of associated long term outcomes using RWD is being explored as the use of RCTs in this context can be limited. Many challenges exist in generating RWE to support regulatory submissions in this disease population including lack of important clinical variables such as disease severity and progression in existing data sources. We will discuss the AD RWD landscape with a focus on challenges and future directions for the use of RWD to generate RWE supportive of regulatory submissions for pharmaceutical products.

USE RWE TO IMPROVE DRUG INFORMATION FOR GERIATRIC PATIENTS

Minghui Li, and Chelsea Watts, *University of Tennessee Health Science Center, Memphis, Tennessee, United States*

Older adults are the main users of medications. However, they are usually excluded from clinical trials due to comorbidity and polypharmacy. Older adults, especially those 75 years and older, are underrepresented in clinical trials. This creates a unique opportunity to use RWE to improve the quantity and quality of drug information for geriatric patients. The quality of RWD is critical to have information on patient population, comparator, measurement, and endpoints. Data linkage is encouraged if key variables are not included in one data source. In addition, external controls based on RWE can be used when clinical trials are unethical or impractical. They can be applied for older adults, rare diseases, and under-represented minorities. For conditions common in older adults (e.g. Alzheimer's disease, lung cancer, and osteoporosis), RWE is greatly needed for all geriatric age groups. The entire spectrum of geriatric populations could identify age differences in efficacy and safety outcomes.

SESSION 3240 (SYMPOSIUM)

CAREGIVING NETWORKS OF DIVERSE FAMILIES: CONTEXT AND CULTURE INFLUENCES ON DEMENTIA CARE

Chair: Karen Roberto Co-Chair: Jyoti Savla

Older adults living with dementia and their primary caregivers are embedded within larger family and formal care networks that are shaped by cultural and contextual influences. Yet information about diverse caregiving networks is sparse. This symposium focuses on the composition, structure, responsibilities, and influences of caregiving networks in supporting persons living with dementia and their primary family caregivers. Savla and colleagues identify six distinct care networks among dementia family caregivers living in economically diverse areas of rural Appalachia. Networks varied by caregivers' emotional connectivity with family/friends, caregiver strain, role overload, loneliness, and service attitudes and utilization. Ashida and colleagues focus on changes in rural and urban dementia family caregiving networks during the COVID-19 pandemic. Network members engaging in negative social interactions increased while those engaging in uplifting interactions decreased over time, especially among urban caregivers. Bonds Johnson and colleagues examine shared decision making between African American caregivers and their relative living with dementia. Dyadic analysis revealed that while care recipients were involved in the decision-making processes, their care network's level of the involvement varied. Angel and colleagues explore the role of caregiver characteristics, stressors, and resources for Mexican American caregivers. Depressive symptoms were significantly associated with dementia caregiver turnover, with adult children and grandchildren caregivers more likely to experience turnover than spouses. Collectively, the findings presented extend prior research on community-based dementia caregiving, broadening the focus from a single caregiver to a network of caregivers and capturing the complexities of place-based context and culture variations in care provision.

CARE NETWORKS OF RURAL APPALACHIAN FAMILY CAREGIVERS AND PERSONS LIVING WITH DEMENTIA

Jyoti Savla[1], Karen Roberto[2], and Rosemary Blieszner[1],
1. Virginia Tech, Blacksburg, Virginia, United States,
2. Virginia Polytechnic Institute & State University, Blacksburg, Virginia, United States

Dementia care research typically focuses on primary family caregivers with limited consideration of their engagement with a broader care network and the geographic area in which they reside. Using a mixed-methods approach, we analyzed care networks of 163 primary caregivers and their relative living with dementia in rural Virginia. Six distinct care network types emerged based on the primary caregiver's gender, relationship to the person living with dementia, and presence of other informal caregivers. Networks differed by the caregiver's emotional connectivity with family/friends and feelings of caregiver strain, role overload, and loneliness. Caregivers' service use attitudes and support service utilization varied across network types and across divergent economic resources of the rural counties in which families resided. Findings establish a framework for understanding the types and influences of care networks and tailoring services to support dementia family caregivers in diverse rural areas.

CHANGES IN RURAL AND URBAN FAMILY CAREGIVING NETWORKS IN THE MIDWEST DURING THE COVID-19 PANDEMIC

Sato Ashida[1], Hyunkeun Cho[2], Lena Thompson[2], Kristine Williams[3], Laura Koehly[4], Haley Schneider[1], Maria Donohoe[1], and Lubna Hossain[1], *1. University of Iowa College of Public Health, Iowa City, Iowa, United States, 2. University of Iowa, Iowa City, Iowa, United States, 3. University of Kansas Medical Center, Lawrence, Kansas, United States, 4. National Institutes of Health, Bethesda, Maryland, United States*

This study elucidates the changes in family caregiving networks during the COVID-19 pandemic and its implications on caregiver well-being. Eighty-two caregivers of individuals diagnosed with dementia within the past 2 years participated in this study to test a post-diagnosis intervention that provides a community care planning service that connects caregivers directly to community-based services. Caregivers completed telephone surveys at baseline and 3- and 6-month follow-up. The number of network members engaging in malfeasant (negative) social interactions increased by 0.798 every 3 months (p=0.002). Members engaging in uplifting interactions decreased, especially among intervention participants, by 1.93 every 3 months (p=0.047); urban caregivers reported greater decrease than rural (p=0.006). Participants in intervention group showed a trend for greater decrease in COVID-19 related distress (10-point scale) over time compared to control group (p=0.059); those with more members engaging in uplifting interactions reported lower distress (p=0.017) regardless of intervention status, network size, and rurality.

CONTEXT MATTERS IN DECISION-MAKING: CAREGIVING NETWORKS OF AFRICAN AMERICAN DEMENTIA DYADS

Kalisha Bonds Johnson[1], Fayron Epps[2], MinKyoung Song[3], Karen Lyons[4], Kenneth Hepburn[1], and Martha Driessnack[3], *1. Emory University, Atlanta, Georgia, United States, 2. Emory University, Fairburn, Georgia, United States, 3. Oregon Health & Science University, Portland, Oregon, United States, 4. Boston College, Chestnut Hill, Massachusetts, United States*

Limited research explores the contextual and cultural nuances within African American dementia dyads within the United States and how these factors influence decision-making processes. Through a secondary data analysis of semi-structured interviews, we examined decision-making processes in five African American dementia dyads related to how they navigated decisions for the person living with Alzheimer's disease and related dementias (ADRD) across five unique contexts (e.g., mother with multiple daughters, mother with son and daughter where the son was the "primary" caregiver). Analysis revealed that within dyads, persons living with ADRD were involved in the decision-making processes, but the level of the involvement in decision making by the caregiving networks varied across dyads. Understanding the context in which decisions are made (i.e., within the dyad, across multiple family members in a caregiving network) has important implications in clinical practice and research. Interventions should be tailored to reflect these contextual and cultural nuances.

TURNOVER AND DEPRESSIVE SYMPTOMS AMONG MEXICAN AMERICAN CAREGIVERS OF PERSONS LIVING WITH DEMENTIA

Jacqueline Angel[1], Sunshine Rote[2], and Kyriakos Markides[3], *1. The University of Texas at Austin, Austin, Texas, United States, 2. University of Louisville, Louisville, Kentucky, United States, 3. UTMB, Galveston, Texas, United States*

This study explored the role of caregiver background, stressors, and resources for Mexican American caregiver turnover and depressive symptoms. Using two waves of the Hispanic Established Epidemiologic Study of the Elderly (H-EPESE, 2010/2011-2016 N=333) Caregiver Supplement and informed by the sociocultural caregiver stress process model, we estimate logistic and OLS regressions of change in dementia and change in caregiver over five years. Neuropsychiatric expressions were significantly associated with caregiver turnover. Adult children and grandchildren caregivers were more likely to experience caregiver turnover than spouses. While depressive symptoms were relatively low at both waves, there was a greater increase in depressive symptoms occurred for caregivers who completed the interview in Spanish rather than English, which was partially explained by greater perceived stress at baseline. Findings demonstrate the need to provide dementia care supports for Mexican American caregivers, reduce stress for Spanish-speaking caregivers, and support Mexican American grandchildren who unexpectedly become caregivers.

SESSION 3241 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

SENESCENCE AND INFLAMMATION

Chair: Marissa Schafer

Cell senescence and inflammation are interconnected mediators of aging and age-related disease. Recent advances in molecular and cellular profiling methods and research models are aiding in our ability to decipher mechanisms through which senescent cells drive inflammatory dysfunction, and inversely, to discover mechanisms through which aging immune cells may drive senescence, inflammation, and pathology. This symposium will feature exciting advances that span the emerging conceptual framework of how senescence and inflammation influence mammalian aging. Dr. Birgit Schilling will discuss the use of advanced mass spectrometric methods for profiling the senescent cell proteome, which reveal new insights into protein pathways and mechanisms of aging and disease. Dr. Matt Yousefzadeh will share how endogenous DNA damage can invoke cellular senescence, which enhances inflammation in both a cell autonomous and non-autonomous manner to drive tissue dysfunction and impact health. Dr. Daniel Tyrrell will discuss discovery of a novel population of age-associated CD8 T-cells that enhance local tissue senescence and inflammation and promote atherosclerosis. Dr. Xu Zhang will share a characterization of senescent cells in skeletal muscle using single-cell RNA-sequencing and the potential recruitment of immune cells by senescent fibroadipogenic progenitors. Dr. Marissa Schafer will discuss cell senescence as a mediator of age-related brain inflammatory cell composition and senescent cell targeting as a strategy to prevent cognitive decline. Importantly, discoveries discussed in this symposium may reveal new avenues for therapeutic development, to ultimately improve human healthspan.

CELL SENESCENCE IS A FEATURE AND MODULATOR OF THE AGED INFLAMMATORY BRAIN CELL LANDSCAPE

Marissa Schafer, Xu Zhang, Chase Carver, Vesselina Pearsall, Elizabeth Atkinson, Benjamin Clarkson, Ethan Grund, and Nathan LeBrasseur, *Mayo Clinic, Rochester, Minnesota, United States*

New strategies to preserve cognitive function could broadly benefit the aging population. Cellular senescence is a hypothesized mediator of inflammation-related tissue dysfunction in aging. Using single-cell RNA-sequencing, we discovered an age-related brain myeloid population exhibiting overlapping senescent and disease-associated activation signatures, including upregulation of chemoattractant factors. We confirmed senescent brain myeloid cells promote peripheral immune cell chemotaxis in vitro. Through mass cytometry, we demonstrate age- and sex-dependent increases in activated resident and infiltrating brain immune cells are reduced through systemic targeting of p16-positive senescent cells, which is associated with improvements in executive function and spatial learning tasks. Our high-dimensional results reveal dynamic remodeling of the age-dependent brain immune cell landscape and implicate senescent cell targeting as a strategy to counter inflammatory changes and cognitive decline.

SENESCENCE-DERIVED PROTEIN BIOMARKERS DURING AGING AND OSTEOARTHRITIS

Birgit Schilling[1], Sandip Patel[2], Jacob Rose[2], Judith Campisi[2], Joanna Bons[2], Christina King[2], and Charles Schurman[2], *1. Buck Institute for Research on Aging, Novato, California, United States, 2. Buck Institute, Novato, California, United States*

Aging is a complex biological process associated with progressive loss of physiological function and susceptibility to several diseases, such as cancer and neurodegeneration. As senescence burden increases with aging and becomes a risk factor for many age-related diseases we are specifically interested in senescence-derived aging signatures. We use cutting-edge proteomic workflows to investigate both the senescence-associated secretory phenotype (SASP) in tissue cultures. We are subsequently examining exosome proteins as well as lipid cargo in plasma from human young (20–26 yrs) and old cohorts and old (60–66 yrs) individuals. We will also present current work assessing senescence markers in cartilage and bone targeting underlying mechanisms and options for intervention for osteoarthritis. Overall, our focus is specifically directed towards senescence-derived biomarkers of aging.

ENDOGENOUS DNA DAMAGE AS A DRIVER OF AGING AND TISSUE DYSFUNCTION

Matt Yousefzadeh, *University of Minnesota, Minneapolis, Minnesota, United States*

Aging is a complex multifactorial process that enhances stress or impairs the ability to cope with it, whereby increasing the risk of morbidity and mortality. Many factors can contribute to aging, such as macromolecular damage (including DNA damage) that accumulates in a time-dependent manner. DNA damage is also known to induce cellular senescence, a cell fate that is known to play a causal role in aging. To investigate the effects of DNA damage and cellular senescence on aging, animal models lacking Ercc1, an important DNA repair gene, were utilized. Ercc1-deficient mice age faster than wild-type littermates and exhibit the senescent cell burdens that are comparable to that of a naturally aged mouse. To investigate cell autonomous and non-autonomous effects of DNA repair deficiency on senescence and aging, Ercc1 was deleted in mice in a tissue-specific manner. Increased senescent cell burden and dysfunction were present in tissues specifically targeted for Ercc1 deletion. However, enhanced senescence was also present in some non-targeted tissues, suggesting that these occur through cell non-autonomous mechanisms.

AGE-ASSOCIATED GRANZYME K-EXPRESSING CD8+ T-CELLS ENHANCE ATHEROSCLEROSIS IN MICE

Daniel Tyrrell[1], and Daniel Goldstein[2], *1. University of Alabama at Birmingham, Birmingham, Alabama, United States, 2. University of Michigan, Ann Arbor, Michigan, United States*

A novel population of age-associated Granzyme K (GZMK)-expressing CD8 T cells was found in mice and humans. These cells enhance local tissue senescence and inflammation and are distinct from central memory and conventional Granzyme B- or Interferon γ-producing effector memory CD8 T cells. It is unknown whether these cells drive chronic disease; thus, we induced atherosclerosis in young (3-mo) and aged (18-mo) wild-type mice via the PCSK9-AAV model and used scRNAseq to demonstrate that this GZMK-CD8 T cell population homes to atherosclerotic lesions exclusively in aged mice. Neutralizing CD8 T cells demonstrates that GZMK-CD8 cells drive age-enhance atherosclerosis. Finally, we transferred GZMK-CD8 cells from different aged donors into young CD8-/- hosts and demonstrate that GZMK-CD8 cells from aged but not young donors drive atherosclerosis. In conclusion, we identified a novel role for this recently described population of aging-specific GZMK-expressing CD8+ T cells as a critical driver of chronic disease.

IDENTIFICATION AND INVESTIGATION OF SENESCENT CELLS IN SKELETAL MUSCLE AGING

Xu Zhang, Leena Habiballa, Zaira Aversa, Yan Er Ng, Joao Passos, and Nathan LeBrasseur, *Mayo Clinic, Rochester, Minnesota, United States*

Skeletal muscle aging is marked by the loss and atrophy of resident fibers, and the accumulation of functionally diverse cell types including fibroblasts, adipocytes, and immune cells. Senescent cells amass in multiple tissues with advancing age where they contribute to aging, chronic disease, and physical decline. The role of senescence in mediating muscle aging has become a popular and sometimes contentious topic. However, to date, this concept has not been methodically tested. In this study, we characterized the changes in cell abundance and, importantly, cell-specific transcriptional profiles with skeletal muscle aging using scRNAseq. Interestingly, we identified a small population of p16 positive fibro-adipogenic progenitors (FAPs) which, upon further investigation using immunohistochemical methods, were found to express other senescence markers. This subpopulation of FAPs did not exhibit elevation in p21 levels with age. Instead, terminally differentiated myofibers were the source of the p21 increase. Myofibers with high p21 expression exhibit a strong inflammatory phenotype, which includes activated p53 signaling pathways together with strong cytokine-cytokine receptor interactions. We further identified large amounts of cross-talk between different cell types, suggesting that senescent FAPs and myofibers could contribute to skeletal muscle aging in a paracrine manner. Importantly, these observations in mice were confirmed in human samples, suggesting the strong translational power of these findings.

SESSION 3250 (PAPER)

COGNITION

AN AGE-RELATED POSITIVITY EFFECT IN HUMOR: AN ASIAN CONTEXT

Zoe Ziyi Ng[1], and W. Quin Yow[2], *1. Raffles Institution, Singapore, Singapore, 2. Singapore University of Technology & Design, Singapore, Singapore*

Humor plays a pivotal role in our interaction with people. According to the age-related positivity effect, older adults (OA) demonstrate more positive emotions and are better able to modulate negative emotions than younger adults (YA), suggesting an increase in humor appreciation with age. However, given the heterogeneity and complexity of humor, it is unknown if this effect holds across various types of humor in a culture with ambivalent attitudes toward humor (Yue, 2016). We explored age-related effects in the perception of four types of humor with Asian adults: incongruity-resolution/benign humor, aggressive humor, local-slang humor, and self-vs.-other-deprecating humor. Fifty-six Singaporean-Chinese OA (n=26;M=64.33) and YA (n=30;M=22.48) watched four short videos depicting the four types of humor in a randomized order. Participants rated how funny each video was (from a scale of 1-not funny-at-all to 5-very-funny), ranked them in the order of most-to-least-entertaining and answered questions on Future-Time-Perspective-scale and self-rated humor.Repeated-measures ANOVA found significant main effects of age, F(1,59)=6.60, p=.013, where OA gave higher ratings than YA (M=3.00 vs. 2.47), and humor-type, F(3,177)=26.87, p<.001. There was a significant linear contrast in humor-type where aggressive and benign humor had the lowest ratings while self-vs.-others-deprecating humor had the highest ratings. Ranking analyses revealed that OA preferred local-slang and others-deprecating humor while YA preferred other-deprecating humor significantly above chance. Interestingly, there was no relationship between self-rated humor and future time perspective with age. Overall, OA displayed a greater appreciation of humor than YA, supporting an age-related positivity effect in an Asian context, despite preference differences. We would like to thank Prof Suzanne Flynn, Department of Linguistics and Philosophy, MIT, for her guidance, and the MOE Tier 2 Academic Research Fund Tier 2 (T2MOE2005) and SUTD Growth Plan Grant for Healthcare (SGPHCRS1902) awarded to the last author.

COGNITIVE RESERVE AND RISK OF MOBILITY DISABILITY IN OLDER ADULTS

Roee Holtzer[1], Xiaonan Zhu[2], Andrea Rosso[2], and Caterina Rosano[2], *1. Yeshiva University and Albert Einstein College of Medicine, New York, New York, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Background: Cognitive Reserve (CR) protects against cognitive decline and dementia but its relation to mobility disability has not been established. To address this important gap in the literature, we conducted a longitudinal investigation to test the hypothesis that higher baseline CR was associated with a lower risk of developing mobility disability in older adults.

Methods: Participants were dementia-free older adults who received a brain magnetic resonance imaging and had gait speed assessments during follow-up. Using the residuals approach, CR was derived from the modified-Mini-Mental Status Examination (3MS) total score by removing variance accounted for by measures of structural brain integrity, education and race. Mobility disability was defined using a validated cutoff score in gait speed of 0.8 m/s. Logistic regression models using General Estimating Equations (GEE) were utilized to examine longitudinal associations between baseline CR and the risk of developing of mobility disability across repeated assessments.

Results: Of the participants (n=237; mean age=82ys; %female=56%) who were free of mobility disability at baseline, 103 developed mobility disability during follow-up (mean=3.1ys). Higher CR at baseline was associated with lower risk of developing incident mobility/disability [odds ratio (OR)=.819, 0.67 to 0.98, p=.038 (unadjusted); OR=.815, 0.67 to 0.99, p=.04 (adjusted for sociodemographic variables and depression); OR=.819, 0.68 to 0.88, p=.035 (adjusted for illness history); OR=.824, 0.68 to 0.99, p=.045 (adjusted for white matter hyperintensities); OR= .795, 0.65 to 0.95, p=.016 (adjusted falls history)].

Conclusion: We provided first evidence that higher CR was associated with lower risk of developing mobilitydisability in older adults.

CONCURRENT CHANGES IN COGNITIVE FUNCTION AND FUNCTIONAL LIMITATIONS: A BIVARIATE LATENT TRAJECTORY ANALYSIS

Elizabeth Handing[1], and Stephen Aichele[2], *1. Colorado State University, Golden, Colorado, United States, 2. Colorado State University, Fort Collins, Colorado, United States*

With a rapidly aging global population, declines in cognition and functional abilities are an increasingly salient challenge and fear among many older adults. Researchers and clinicians often study changes in cognition and changes in functional limitations as separate trajectories although they frequently co-occur. In this study, we used two-stage structural equation modeling (SEM) to estimate longitudinal trajectories of cognitive and functional limitations using data from the Health and Retirement Study (2010-2016) (N = 12,431, aged 50–91). First, individuals' longitudinal factor scores (at three measurement occasions, spanning 6 years) were estimated for cognition (indicated by verbal fluency, numeracy, and recall memory) and functional limitations (indicated by difficulties performing daily living activities, instrumental activities, and mobility). A bivariate latent trajectory model was then fit to these scores. Model fit was acceptable (CFI = .91; RMSEA = .036). Parameter estimates showed that, on average, cognition declined slightly (-.08SD/decade) and functional limitations increased gradually (0.38SD/decade). Importantly, individual cognitive declines were significantly correlated with increases in functional limitation (r = -.19, p < .001). This study fills an important research gap by using advanced statistical modeling (bivariate latent growth models) to examine the joint trajectory of cognition and functional decline which underscores the need to consider the interplay of these two abilities. Methods that quantify both individual and group trajectories can aid in better identification of aging patterns and lead to new ways of thinking about interventions to reduce the burden of concurrent decline.

CUEING EFFECT ON DUAL TASK COORDINATION AMONG YOUNGER AND OLDER ADULTS

Yue Hu, and Helene Fung, *The Chinese University of Hong Kong, Hong Kong, Hong Kong*

Dual task coordination, which refers to the ability to coordinate the cognitive processes involved in performing two tasks with a temporal overlap, is evident in many if not all situations in the daily life of the older adults. The dual-task performance of older adults has been shown to be associated with driving performance, risk of falls, risk of car accidents and the absence of mild cognitive impairment. However, some researchers found that healthy older adults had worse dual-task performance than their younger counterparts, whereas other researchers found no age difference in dual-task performance. To address the mixed findings, the present work examined the effect of cue words on dual task coordination based on the selection, optimization, and compensation model. A total of 65 younger adults (24 females, mean age 21.80±1.99) and 91 older adults (36 females, mean age 65.38±5.61) were recruited via the platform Prolific. All participants judged the orientation of two arrows displayed with a shorter or longer temporal overlap. Before the onset of the first arrow, “difficult”, “easy” or a blank screen occurred on the computer screen. A significant cue effect was detected among younger adults regardless of the cue word. Yet, older adults had better dual-task performance under the condition of “difficult” cue word as compared with the other conditions. The findings highlight the potentially crucial role of higher expected task difficulty in preparing older adults to compensate for their age-related decline in dual-task coordination.

STATE AND TRAIT INFLUENCES OF REPETITIVE NEGATIVE THINKING ON WORKING MEMORY PERFORMANCE

Karra Harrington[1], Riki Slayday[1], Stacey Scott[2], and Martin Sliwinski[1], *1. The Pennsylvania State University, University Park, Pennsylvania, United States, 2. Stony Brook University, Stony Brook, New York, United States*

Repetitive negative thinking (RNT) has been associated with faster cognitive decline and accumulation of Alzheimer’s disease pathology in otherwise healthy older adults. According to the cognitive debt hypothesis, RNT functions as a psychological mechanism that depletes cognitive resources and increases vulnerability for dementia. The aim of this project was to examine trait and state RNT influences on working memory performance in daily life. Data for this project were drawn from the ESCAPE study, a systematic probability sample recruited from residents of the Bronx, NY. Participants (n = 265, aged 25-65, 64.9% female) completed brief ecological momentary assessments on a smartphone five times per day for 14 days, including ratings of current thought valence (pleasant-unpleasant) and a brief working memory task. Multi-level models were used to disaggregate trait (between-person) and state (within-person) effects of thought valence on working memory performance, while controlling for demographic and contextual covariates. The models also included linear and quadratic functions of time and session number to account for time of day and retest effects on working memory performance across the assessment period. At moments when individuals were experiencing more unpleasant thoughts than usual (state RNT), they made significantly more errors on the working memory assessment (β= 0.013, SE = 0.004, p = .002). However, there was no significant relationship between trait RNT and working memory performance. The results of this study provide support for the potential for RNT to deplete cognitive resources in the moment, thus contributing to poorer cognitive performance.

SESSION 3251 (SYMPOSIUM)

APA GUIDELINES FOR THE EVALUATION OF DEMENTIA AND AGE-RELATED COGNITIVE CHANGE: OVERVIEW AND CLINICAL APPLICATION

Chair: Benjamin Mast Discussant: Peter Lichtenberg

Dementia is a leading cause of cognitive and functional decline and the number of people living with dementia or involved in caring for another person with dementia continues to rise. There is a growing need for health professionals who are well trained in dementia assessment and intervention. In 2021, the American Psychological Association and its Committee on Aging (CONA) published a revision of the APA Guidelines for the Evaluation of Dementia and Age-Related Cognitive Change with the goal of promoting proficiency and expertise in this growing practice area. This symposium presents an overview of the APA Guidelines and their clinical application in various practice situations and settings. The first presentation (Mast) provides an overview of the guidelines and highlights areas of significant revision, including greater attention to multicultural competence, person-centered principles, and assessment of family caregivers. The second presentation (Steffen) presents the application of the APA Guidelines to working with older adults before formal assessment and diagnosis has been initiated. The third presentation (Allen) describes use of the APA Guidelines in the post-evaluation period and integrates GSA’s revised KAER Toolkit for Primary Care Teams. The final presentation (Bush) presents ethical considerations before, during, and after dementia assessment.

APA GUIDELINES FOR THE EVALUATION OF DEMENTIA: OVERVIEW AND KEY UPDATES

Benjamin Mast[1], and Shellie-Anne Levy[2], *1. University of Louisville, Louisville, Kentucky, United States, 2. University of Florida, Gainesville, Florida, United States*

This presentation will provide a historical background and a broad overview of the APA Guidelines for the Evaluation of Dementia and Age-Related Cognitive Change. This will begin with an overview of general and procedural guidelines pertaining to dementia assessment and will be followed by an in-depth discussion of key updates in the 2021 revision. The newly revised guidelines recognize racial and cultural disparities in dementia outcomes, and emphasize the importance of multicultural competence in all aspects of dementia assessment. The revised guidelines also integrate person-centered principles into the assessment process and place greater emphasis on understanding the person living with dementia. New guidelines were included to address (1) the assessment of behavioral and psychological changes in the context of dementia, and (2) the importance of assessing the health and well-being of family caregivers.

BEFORE A NEUROCOGNITIVE EVALUATION: ROLES AND COMPETENCIES OF BEHAVIORAL HEALTH PROVIDERS

Ann Steffen[1], and Rebecca Allen[2], *1. University of Missouri-St. Louis, St. Louis, Missouri, United States, 2. The University of Alabama, Tuscaloosa, Alabama, United States*

Neurocognitive disorders are among the most stigmatized medical conditions in the USA and across the globe. Cultural beliefs about cognitive aging also impact how individuals, families and healthcare teams respond to concerns about cognitive impairment. GSA's revised KAER Toolkit for Primary Care Teams (Fall, 2020) provides useful information for the early stages of this process, including kickstarting the conversation about brain health concerns and conducting screenings. This presentation outlines additional competencies for behavioral health clinicians involved in patient, family, and health care team discussions regarding cognitive health concerns. Culturally responsive strategies and resources are suggested to help clinicians explore the decision for a formal evaluation and shape the nature of the referral question(s).

AFTER A NEUROCOGNITIVE EVALUATION: ROLES AND COMPETENCIES OF BEHAVIORAL HEALTH PROVIDERS

Rebecca Allen[1], and Ann Steffen[2], *1. The University of Alabama, TUSCALOOSA, Alabama, United States, 2. University of Missouri-St. Louis, St. Louis, Missouri, United States*

GSA's revised KAER Toolkit for Primary Care Teams (Fall, 2020) provides useful information for referring individuals and families to community resources following a neurocognitive disorder diagnosis. Mental health practitioners must develop competencies and professional identities within integrated care teams to facilitate this process. This presentation outlines post-assessment suggestions for clinicians across disciplines (psychology, social work, nursing, medicine, pharmacy, +) in building such teams. There may be needs for serial assessment of specific individual capacities, treatment plans to facilitate shared decision-making between individuals and family care partners, and evaluations of the family care partner's capacity to provide care. Behavioral health providers assist patients, families, and health care teams across a range of residential settings in understanding and implementing treatment recommendations. Emerging science indicates the value of initiating planning discussions with lifestyle modifications to enhance functioning within dyads. Culturally responsive strategies will be suggested for engagement in planning for future care.

SESSION 3260 (PAPER)

COVID-19 II

AGE AS ONE OF THE DETERMINANTS OF RESILIENCE TO THE COVID-19 PANDEMIC AND ITS IMPACTS ON SEX LIFE

Liza Berdychevsky, *University of Illinois at Urbana-Champaign, Champaign, Illinois, United States*

Recent research started exploring the impacts of the COVID-19 pandemic on sex life. However, there is a dearth of research on the roles of age in the overall adjustment to the pandemic and its impacts on sex life. The purpose of this study was to address this gap. Data collection was based on the online survey methodology (N=675, age range:18-76yo). Data analysis included one-way ANOVA and multivariate multiple regression. Age differences were found in the participants' overall ability to adjust to the pandemic-related lockdown conditions, with older adults (51+yo group) adjusting better than the rest of the sample and young adults (18-30yo group) adjusting significantly worse. Resilience to the impacts of COVID-19 on sex life also varied by age. Sexual desire deteriorated the worst among middle-aged participants (31-50yo group); likely, due to increased childcare responsibilities. However, the issues with physical sexual difficulties have worsened the most among older adults. Regression results also showed that age had negative effects on the frequencies of intimate and sexual behaviors (sexual touching and caressing, sexual intercourse, and oral sex) and sexual desire and satisfaction with sex life during the pandemic. While older adults' overall adjustment capacity to the pandemic's conditions was the highest in the sample, the pandemic's impacts on their sex lives and sexual health were the worst. The pandemic has exacerbated existing vulnerabilities and further jeopardized older adults' sexual wellbeing. This study provides age-specific insights for sexual counseling and age-targeted sexual health education for older adults during the pandemic and its aftermath.

EXAMINING AGE, RACE, AND COMMUNITY ON PREVENTIVE HEALTH AND COVID-19 VACCINATION AMONG ADULTS 65+

Taylor Patskanick[1], Sophia Ashebir[2], Alexa Balmuth[2], Sophia Lee[2], Joie Le[2], Lisa D'Ambrosio[2], and Joseph Coughlin[2], *1. Massachusetts Institute of Technology, Somerville, Massachusetts, United States, 2. Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

During the ongoing spread of COVID-19 and its variants, older adults remain an age group particularly at-risk for poorer health outcomes, not only related to infection with COVID-19, but also due to disruptions in access to preventive health services, including routine vaccination. In the U.S., older adults have generally had high uptake of the COVID-19 vaccines, but differences persist regionally and between older adults from minority racial backgrounds. The purpose of the following study was to better understand how groups of Black and white-identifying adults ages 65+ described the impact of the COVID-19 pandemic on their preventive health behavior and healthcare use, including what contributed to their decision to receive or not receive a primary COVID-19 vaccination series. Seventy-five participants were purposively sampled and stratified into virtual focus groups based on their age, racial identity, vaccination status, and relationship to a local community. Findings leverage data from a pre-group questionnaire and focus groups conducted in November 2021. Analyses revealed differences among sub-groups about how the pandemic has impacted their relationship to their local community. Participants described the extent of the pandemic's disruption to their healthcare access, including modifications to in-person care, use of telehealth, and engagement in new health behaviors. Decision-making related to the COVID-19 vaccine differed among the vaccinated and unvaccinated and white and Black-identifying groups, including factors related to interpersonal and systemic trust, independent research, and bodily autonomy. Implications of this research for public health and practitioners working with older adults will be discussed.

RACIAL AND ETHNIC DISPARITIES IN COVID-19 DISRUPTIONS TO SOCIAL ACTIVITIES AMONG OLDER ADULTS IN THE UNITED STATES

Felicia Wheaton[1], Farhana Islam[1], Matilda Johnson[2], and Sai Raj Kappari[3], *1. Xavier University of Louisiana, New Orleans, Louisiana, United States, 2. Bethune Cookman University, Daytona Beach, Florida, United States, 3. HEMA Inc, Harahan, Louisiana, United States*

Racial disparities in COVID-19 exposure, illness, hospitalization and mortality have been well-documented, however, less is known about potential disparities in the pandemic's effect on social activities. Data from the early release of the 2020 Health and Retirement Study (HRS) were used to examine the relationship between race (White/African American/ other) and ethnicity (Hispanic/Non-Hispanic) and COVID-19 disruptions to social activities (N=4,500). Participants were asked, "due to the coronavirus pandemic, did you experience any of these changes in activities: 1) unable to visit a family member in a care facility, nursing home or group home, 2) family celebrations canceled/restricted, 3) unable to visit a close family member in the hospital, 4) unable to attend in-person funeral or religious service for a family member or friend, 5) unable to visit family after birth of a baby (1=yes, 0=no/not relevant) and, "overall, how stressful have changes in contacts with family and friends been for you?" (1=not at all stressful, 5=extremely stressful). Results from logistic regression controlling for age and gender showed that relative to Whites, African Americans had significantly higher odds of all disruptions except for family celebrations and relative to non-Hispanics, Hispanics had significantly higher odds of three types of disruptions. OLS regression results showed that only Hispanics had higher average stress due to these changes. These findings indicate that in addition to the previously documented disparities in COVID-19, older African Americans and Hispanics experienced greater disruptions to social activities. These impacts could further influence both short and long-term physical and mental health.

SHIFT IN ACTIVITY PATTERNS AMONG OLDER ADULTS BEFORE AND AFTER THE COVID-19 PANDEMIC: A SEQUENCE ANALYSIS

Wenxuan Huang[1], and Jiao Yu[2], *1. Johns Hopkins University, Baltimore, Maryland, United States, 2. University of Minnesota, Minneapolis, Minnesota, United States*

Background: Previous research has discovered significant heterogeneity in older adults' activity patterns, as well as its associations with well-being. Studying activity pattern during the COVID-19 pandemic sheds new light on infection risks and coping strategies stratified by socioeconomic status. This study answers two research questions: (1) what are the typical activity patterns among older adults in the U.S.? and (2) how do different sociodemographic groups react to the COVID-19 pandemic by alternating activity pattern? Data: This study used data from the American Time Use Survey (2019 and 2020) to create an analytic sample of 5,068 older adults aged 65 and older. Method: First, we classified daily activity sequences into five typical activity patterns using cluster analysis. Second, we conducted multinomial logistic regression by including survey year and key covariates interactions to examine shifts between sociodemographic characteristics and activity pattern. Findings: We identified five distinct activity patterns including versatile (involves diverse types of activities), housework (daytime occupied by housework activities), work-centered (daytime dominated by paid work), leisure-intensive (long time spent in social and leisure activities), and inactive (intensive TV watching). Our findings show that SES does not affect predicted membership of the versatile group in pre-pandemic time, while an educational gradient becomes salient in 2020. Highly educated older adults are more likely to maintain the diversity of daily activities. Furthermore, the racial difference is more pronounced in the inactive group during the COVID-19 pandemic.

Conclusion: Our findings suggest a buffering effect of social advantages on the impact of public health crisis.

TRENDS IN RISK FACTORS FOR DISABILITY AND REDUCED PHYSICAL FUNCTIONING AMONG US ADULTS DURING THE COVID-19 PANDEMIC

Theresa Andrasfay[1], and Eileen Crimmins[2], *1. University of Southern California, Leonard Davis School of Gerontology, Los Angeles, California, United States, 2. University of Southern California, Los Angeles, California, United States*

The COVID-19 pandemic has caused widespread societal disruptions that may have impacted risk factors for disability and functional limitations. Current research suggests that physical inactivity, BMI, and smoking increased during the early phase of the pandemic, but less is known about whether these risk factors remained elevated as the pandemic progressed and mitigation measures were less disruptive. In this study, we assess trends in exercise frequency, BMI, and smoking among American adults aged 45 and over during the first year of the COVID-19 pandemic. We use data from the Understanding America Study (UAS) Coronavirus in America study, a nationally representative online survey that followed American adults from March 2020 to July 2021. We find that exercise frequency was highly seasonal throughout the pandemic, increasing during warmer months and decreasing during the colder winter months. Throughout this period, exercise frequency was highest among those with more education and those who were retired. Average BMI remained similar throughout this period, but less educated individuals and those working away from home and those who were unemployed experienced increases in BMI. Consistent with media reports suggesting increased interest in quitting smoking during the pandemic, we find decreases in smoking prevalence and frequency of smoking over this period. Decreases in smoking prevalence were concentrated among less educated individuals, who had higher prevalence of smoking to begin with. In sum, changes in risk factors for disability and reduced physical functioning during the pandemic were mixed and varied by education and employment status.

SESSION 3270 (SYMPOSIUM)

DETERMINANTS AND CONSEQUENCES OF LEISURE ACTIVITY ENGAGEMENT AND CONSTRAINTS IN OLDER ADULT POPULATIONS

Chair: Angie Sardina Co-Chair: Alyssa Gamaldo
Discussant: Alyssa Gamaldo

Older adults engage in approximately 7.1 hours/day in leisure activities; however, much of the leisure activity engagement comprises of passive activity engagement (e.g., watching TV). An increasing amount of literature suggests that regular engagement in cognitively and physically stimulating activities, rather than strictly passive activity engagement, is associated with better physical and mental health as well as maintenance of social networks. As the aging population continues to increase and levels and types of activity engagement are shifting across our more diverse older adult populations, it is imperative to understand levels and types of activities older adults are participating in, as well as the psychosocial and contextual factors related to leisure activity engagement. This symposium will include presentations from studies that explore the following: (1) leisure activity interests, engagement, and constraints; and (2) determinants and/or consequences of leisure activity engagement. Specifically, Sardina and colleagues examined daily variability between affect and leisure engagement, and explored potential sociodemographic moderators for these associations. Tian and colleagues explored the association between leisure activities and modes of transportation. Tian and colleagues explored leisure activity engagement with prospective daily diary methods, and examined associations between leisure activities and physical health. Janke and colleagues explored associations between facilitators, constraints, and constraint negotiation and self-reported physical activity levels for older adults with arthritis.

DAY-TO-DAY VARIABILITY BETWEEN AFFECT AND LEISURE ACTIVITY ENGAGEMENT IN BLACK ADULTS

Angie Sardina[1], Alyssa Gamaldo[2], Jason Allaire[3], and Keith Whitfield[4], *1. UNC Wilmington, Wilmington, North Carolina, United States, 2. Pennsylvania State University, State College, Pennsylvania, United States, 3. North Carolina State University, Raleigh, North Carolina, United States, 4. University of Nevada, Las Vegas, Las Vegas, Nevada, United States*

This study examined daily variability in affect and leisure engagement, within community-dwelling Black adults (age range=50-80 years). Associations between affect and leisure engagement, and moderating sociodemographic factors, were explored. Fifty adults (78% women; M education=11.62) reported affect and leisure engagement across 8-occasions over 2-3 weeks. Participants averaged 3-leisure activities/day with more engagement in watching TV, walking, reading, and visiting others. Significant within-person variation across daily affect and domains of leisure engagement were observed. Greater negative affect was significantly associated with lower social and total leisure engagement, particularly for adults with lower levels of education (p's<.05). Results demonstrate within-person changes in the type of leisure engagement among Black adults, with potential factors related to interconnections between affect and sociodemographics (e.g., education). This study reveals promising directions for future research to implement models estimating both between- and within-person effects of daily leisure engagement, within minority populations and across racial groups.

RELATIONSHIPS BETWEEN LEISURE CONSTRAINTS AND MODES OF TRANSPORTATION AMONG OLDER ADULTS IN SUBSIDIZED HOUSING

Junyan Tian[1], Shyuan Ching Tan[2], Angie Sardina[3], Alyssa Gamaldo[4], and Lesley Ross[5], *1. Penn State University, State College, Pennsylvania, United States, 2. California State University San Marcos, San Marcos, California, United States, 3. UNC Wilmington, Wilmington, North Carolina, United States, 4. Pennsylvania State University, State College, Pennsylvania, United States, 5. Clemson University, Clemson, South Carolina, United States*

Transportation needs among lower-income older adults is understudied, particularly regarding how transportation utilization is related to leisure constraints. This preliminary study included 39 adults residing in subsidized housing in North Carolina and Pennsylvania (M=68.03, SD=10.26, female=74.4%) and assessed reported modes of transportation for daily activities and perceived leisure activity constraints. Much of the sample reported driving (57.9%) or relying on others to drive (70.3%) with a significant sample reporting use of public transportation (48.6%). Transportation utilization was differentially correlated with leisure constraints. Perceived difficulties getting to/from activities in the community was associated with greater utilization of having ‘others drive you’ (r=0.43, p=.011), but lower utilization of ‘driving oneself’ (r=-0.40, p=.019). Walking as a mode of transportation was associated with lower (r=-0.41, p=.014) perceived difficulties getting to/from activities in the housing complex. These results indicate the importance of further exploring the association between transportation and leisure needs of these lower-income older adults.

CHARACTERISTICS OF OLDER ADULTS' LEISURE ACTIVITIES: A DAILY DIARY INVESTIGATION

Junyan Tian[1], Abigail Stephan[2], and Lesley Ross[2], *1. Penn State University, State College, Pennsylvania, United States, 2. Clemson University, Clemson, South Carolina, United States*

Leisure activity engagement in older adults’ daily lives is well-documented, however, relatively few studies include participant-reported activities using prospective daily diary methods. The goal of the study was to examine the proportion of three types of reported leisure activities and how physical health moderated such activities. Two weeks of self-reported leisure activities examined among healthy sedentary community-dwelling adults from the Cognitive and Physical Exercise Study (N=33, 65-81 years, 442 unique data points). Each day, participants listed leisure activities performed, estimated time spent on each activity, and labeled the activities as cognitive, physical, and/or social. Physical health was assessed by the SF-12 at baseline. Across 14 days, 25.14% of reported activities were labeled as cognitive activities, 26.61% were labeled as social activities, and 22.97% were labeled as physical activities. Multilevel models indicated participants’ engagement in different domains of activities were not influenced by physical health and did not change over time.

FACILITATORS AND CONSTRAINTS TO SPORT ACTIVITY AMONG ADULTS WITH ARTHRITIS

Jill Juris[1], Julie Son[2], Jen Wong[3], Guangzhou Chen[4], Toni Liechty[5], Stephanie West[6], and Megan Janke[7], *1. Appalachian State University, Boone, North Carolina, United States, 2. University of Idaho, Moscow, Idaho, United States, 3. The Ohio State University, Columbus, Ohio, United States, 4. University of Illinois at Urbana Champaign, Champaign, Illinois, United States, 5. University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 6. James Madison University, Harrisonburg, Virginia, United States, 7. Berry College, Mount Berry, Georgia, United States*

This study examines types of facilitators, constraints, and constraint negotiation strategies and their associations with self-reported physical activity levels for older adults with arthritis. A national sample of U.S. adults (N=288; age range =50-85, M=64.8) who participated in a larger study of sport participation completed an online questionnaire on their involvement in leisure activities. The sample was predominantly White (91.3%), female (65.2%), and unmarried (55.6%). As expected, individuals reporting more constraints engaged in significantly less physical activity (β=-.19, p=.01) while those using greater constraint negotiation strategies reported significantly more activity engagement (β =.18, p=.03). Facilitators were examined (intrapersonal, interpersonal, and structural), but only interpersonal facilitators significantly predicted greater levels of physical activity (β =-.07, p=.03). Adults reporting sport engagement during the past year were also more active (β =.24, p<.001). The discussion will focus on the implications of findings and how barriers to activity in this population can be addressed.

SESSION 3280 (SYMPOSIUM)

DIVERSITY, DISCOVERY, AND AGING REIMAGINED: NIA SESSION FOR EARLY-CAREER RESEARCHERS

Chair: Melinda Kelley Discussant: Melinda Kelley

The National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services, supports biomedical and behavioral research with a lifespan focus. NIA research seeks to understand the basic processes of aging, improve prevention and treatment of diseases in later life, and improve the health of older persons, in addition to a focus on Alzheimer's disease and related dementias. NIA also supports the training and career development of scientists focusing on aging research and the development of research resources. This symposium, meant for junior faculty and emerging scholars, will provide an update on the latest research findings from NIA followed by a segment on funding mechanisms and strategies. An opportunity will be provided to meet and consult with NIA extramural staff.

OVERVIEW OF NIA MISSION AND RESEARCH

Richard Hodes, *National Institutes of Health, Bethesda, Maryland, United States*

Dr. Hodes will provide an overview of NIA's structure and mission, in addition to discussing research foci from across the Institute's scientific divisions.

HOW TO GET AN NIA GRANT

Kenneth Santora, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Santora will provide an overview of the NIA application process and will share information on relevant policy changes.

SESSION 3290 (PAPER)

ENVIRONMENT, HEALTH, EQUITY, DIVERSITY, AND INCLUSION

A COMPARISON OF SUBJECTIVE COGNITIVE DECLINE AND RELATED LIMITATIONS AMONG TRANSGENDER COMMUNITIES IN THE US

Ethan Cicero[1], Michael Goodman[1], Lisa Barnes[2], Molly Perkins[3], Jason Flatt[4], and Vin Tangpricha[1], *1. Emory University, Atlanta, Georgia, United States, 2. Rush Alzheimer's Disease Center, Rush University Medical Center, Chicago, Illinois, United States, 3. Emory University School of Medicine, Atlanta, Georgia, United States, 4. University of Nevada, Las Vegas, School of Public Health, Las Vegas, Nevada, United States*

Background: The transgender population is composed of subgroups that are diverse in gender identity (e.g., transgender women[TW], transgender men[TM], nonbinary[NB] individuals). Compared to cisgender adults, transgender adults are more likely to report subjective cognitive decline (SCD). It remains unclear if SCD prevalence and related limitations vary by transgender subgroups.

Methods: 2015-2020 Behavioral Risk Factor Surveillance System data, representing 38 U.S. states that assessed SCD (confusion/memory loss happening more often/getting work over previous 12months) and gender identity were used to examine differences in SCD prevalence and SCD-related limitations by transgender subgroups, TW(n=442), TM(n=298), and NB(n=183). Age-adjusted odds ratios (OR) along with 95% confidence intervals (CI) were calculated to investigate group differences in SCD prevalence. Separate analyses compared SCD-related limitations, demographics, and health across groups among participants reporting SCD.

Results: SCD prevalence was highest among NB(21.3%), followed by TW(16.3%) and TM(14.1%). After accounting for age, subgroup differences remained; odds of SCD were 1.6x higher among TW compared to TM (CI:1.1–2.4, p=0.012). Among those with SCD, TW were less likely to receive help they needed with day-to-day activities when compared to TM (OR=7.9; CI:0.1–0.2, p< 0.001) and NB (OR=5.0; CI:0.1–0.4, p=0.001); and TW were more likely to be deaf (OR=4.2; CI:1.7–10.1, p=0.002) and have asthma (OR=2.8; CI:1.4–5.7, p=0.005) when compared to NB adults. No other differences were found.

Conclusion: Health and social inequities are not uniformly experienced across transgender subgroups, and it is important to understand how these factors impact the brain health of TW, TM, and NB adults.

BLACK PLACEMAKING: THE BODY, HOME, AND PUBLIC SPACE THROUGH THE LENS OF OLDER WOMEN

Laurent Reyes[1], Jarmin Yeh[2], and H. Shellae Versey[3], *1. UC Berkeley, Berkeley, California, United States, 2.*

University of California, San Francisco, San Francisco, California, United States, 3. Fordham University, Bronx, New York, United States

African American communities are frequently depicted as victims of urban conditions. However, a rich culture of grassroots community development and organizing, often led and stewarded by Black women, exists. Many of these efforts involve enhancing economic, political, and educational opportunities and centering ethics of care and caregiving. This is the notion of Black placemaking, which is explicitly community-focused, shaping the social fabric of everyday life and allowing for the development of Black vernacular spaces that became vital to African-American culture. This paper examines how Black older women engage in placemaking by presenting three select case studies. Using a narrative inquiry approach, we conducted secondary data analysis of interviews drawn from larger qualitative studies about aging in communities that took place in San Francisco and New York City. Black feminist spatial imagination, embodiment, and intersectionality theory were our guiding frameworks. Our analysis revealed how the aging Black body is a site that is subjected to socio-political regulation and violence and illuminates how Black women are agents of community resilience, creativity, and transformation. Creating and holding space (i.e., placemaking) with bodies and physical structures that center the Black community is an act of care, self-determination, and resistance to white supremacy. These embodied processes of placemaking have wide-ranging implications for the ways Black neighborhoods are framed and discussed in popular media, empirical research, and policy. Furthermore, they invite a shift in our current approach to placemaking in later life, one that centers the strengths, history, and traditions of the Black community.

COGNITIVE DIFFICULTIES AMONG ASIAN AMERICAN OLDER ADULTS: RESULTS FROM THE AMERICAN COMMUNITY SURVEY

Duy Nguyen[1], Rui Liu[2], and Yookyong Lee[3], *1. Sacred Heart University, Teaneck, New Jersey, United States, 2. Sacred Heart University, Fairfield, Connecticut, United States, 3. University of Alabama at Birmingham, Birmingham, Alabama, United States*

While Asians are the fastest growing racial group in the United States, limited research exists on their health needs, especially among older adults. Cognitive difficulties increase disease and caregiving burdens, but little is known about patterns of cognitive health among Asian American older adults. This study fills the knowledge gap by using data from the 2015-2019 American Community Surveys to examine the relationship between Asian ethnicity and gender on cognitive health. This analysis focuses on respondents aged 65 and over from the six most populous Asian American groups: Chinese, Filipino, Indian, Japanese, Korean, and Vietnamese (n=100,538). Weighted, adjusted logistic regression analyses tested for the effects of Asian ethnicity and gender on cognitive difficulties. Multivariate analyses showed Filipino, Indian, and Vietnamese older adults were more likely than Chinese to report cognitive difficulties. Additionally, Asian American women were more likely to report cognitive difficulties compared to Asian American men. Joint effect analyses were statistically significant, thus we examined separate regression analyses by Asian ethnicity. Results showed that Vietnamese women were more likely than Vietnamese men to report cognitive difficulties. Across Asian ethnic groups, family relationships and economic factors play a major role in having a cognitive difficulty. Overall, the results suggest that ethnic-specific analysis of the Asian American reveals a fuller picture of health in older adulthood. Future research needs to dive more deeply into the sociocultural and economic dimensions of health. Further, culturally appropriate policy and practices are needed to promote successful aging among older Asian Americans.

HOW DO INTERGENERATIONAL RELATIONSHIPS IMPACT THE HEALTH OF ASIAN AMERICAN OLDER ADULTS?

Duy Nguyen[1], Yookyong Lee[2], and Rui Liu[3], *1. Sacred Heart University, Teaneck, New Jersey, United States, 2. University of Alabama at Birmingham, Birmingham, Alabama, United States, 3. Sacred Heart University, Fairfield, Connecticut, United States*

Intergenerational relationships and filial piety are important values common to many Asian-ethnic groups. While a limited literature exists examining the health outcomes of older adults living with grandchildren in Asian countries, Asians in America have received less attention from researchers and policymakers. This study fills the knowledge gap by using data from the 2015-2019 American Community Surveys to examine the relationship between Asian ethnicity and living with grandchildren on health outcomes. This analysis focuses on respondents aged 65 and over from the six most populous Asian American groups: Chinese, Filipino, Indian, Japanese, Korean, and Vietnamese (n=100,538). Roughly half the sample lived with grandchildren. Weighted, adjusted logistic regression analyses tested for the effects of Asian ethnicity and living with grandchildren on 4 health outcomes: ambulatory, independent living, hearing, and vision difficulties. Multivariate analyses showed Filipino and Vietnamese older adults were more likely than Chinese to report difficulties across health outcomes. Additionally, individuals living with grandchildren were less likely to report ambulatory, independent living, and hearing difficulties. Joint effect analyses revealed Indian, Filipino, and Japanese Americans living with grandchildren reported more difficulties compared to the reference group. Overall, the results suggest that living with grandchildren can be a protective factor for the health outcomes of older Asian Americans, while having different impacts depending on ethnic origin. Future research needs to differentiate the impact of living with grandchildren across Asian ethnic groups. Further, culturally appropriate policy and practices are needed to promote successful aging among older Asian Americans living with grandchildren.

KEEPING COMMUNITY DURING A PANDEMIC: LGBTQ+ OLDER ADULTS AND THE VIRTUAL SENIOR CENTER

Suzanne Marmo[1], Manoj Pardasani[2], and David Vincent[3], *1. Sacred Heart University, Fairfield, Connecticut, United States, 2. Adelphi University, Garden City, New York, United States, 3. SAGE Advocacy and Services for LGBTQ+ Elders, New York, New York, United States*

During the initial stages of the pandemic, 96% of all senior centers ceased in-person programming, leaving many older adults without resources for meals, socialization, and critical services (NCOA, 2020). As a result of this shutdown, risk factors such as being a member of the underserved LGBTQ+ community, identifying as part of a racial or ethnic minoritized group, and/or experiencing poverty contributed to an increased likelihood of experiencing difficulties in meeting basic needs, reduced immunity to COVID and experiencing isolation (Berg-Weger and Morley, 2020; Kuehn, 2021). Despite the closure of many senior centers, some organizations were well positioned to strategically utilize pre-existing resources to help the community (Pendergrast, 2021). One organization, SAGE Advocacy and Services for LGBTQ+ Elders, the first publicly funded senior advocacy organization for LGBTQ+ older adults in the US, was one of the first to effectively transition to becoming a virtual senior center within days after the start of the pandemic (NYC DOA, 2020). Having a group of front-line workers who were highly embedded in their community, helped facilitate effective organizational adaptation and transition to a virtual senior center. This presentation seeks to describe how staff and program facilitators became vital resources for maintaining connection to the community of LGBTQ+ older adults. Focus groups with SAGE senior center employees and program facilitators were conducted in summer of 2021. Data identified resiliencies and barriers for maintaining community, providing vital services, and mitigating isolation with LGBTQ+ elders. Lessons learned and implications for organizations facing crises will be shared.

SESSION 3300 (SYMPOSIUM)

GSA'S CONGRESSIONAL UPDATE

Chair: Brian Lindberg

This popular annual session will provide cutting-edge information on what the 117th Congress has and has not accomplished to date, and what may be left for the lame duck session to address. Speakers will discuss key issues such as Social Security, Medicare, Medicaid, Older Americans Act, Build Back Better Act, social isolation, serious illness care, and funding. Predictions for the 118th Congress may be provided.

SESSION 3310 (SYMPOSIUM)

IMPLEMENTATION SCIENCE IN DEMENTIA CARE: METHODOLOGICAL, CULTURAL, AND SOCIODEMOGRAPHIC CONSIDERATIONS

Chair: Joseph Gaugler Co-Chair: Laura Gitlin Discussant: Beth Prusaczyk

The gap between aging science and practice persists. Getting the best possible evidence into the real world is a particular challenge in gerontology because of the complex needs of older persons, the family caregiving experience, the workforce shortage, and underlying structural concerns with how services for older people are regulated, paid for, and valued. The purpose of this symposium is to consider contextual dimensions to facilitate implementation, methodological considerations, strategies to inform cultural adaptation of evidence-based innovations, and how creativity and innovation in low- and middle-income countries can better inform implementation practices in resource rich countries and vice-versa. Specifically, Dr. Marie Boltz and colleagues will examine the conceptual and theoretical underpinnings of organizational readiness for implementation and the operationalization of the construct. Dr. Joseph Gaugler and co-authors will provide case examples of three "hybrid effectiveness" trials in dementia care in different care settings including community-based and residential long-term care settings, each of which incorporate implementation methods alongside traditional evaluations of effectiveness. Dr. Lauren Parker and her team will demonstrate how cultural adaptation strategies were applied to facilitate the implementation of a community-based, evidence-based dementia care intervention. Dr. Baker and colleagues consider implementation issues and innovations in low- and middle-income countries. Dr. Beth Prusaczyk, an implementation expert, will serve as Discussant and highlight future implementation issues to advance best practices that facilitate and expedite the translation of aging science.

USING HYBRID EFFECTIVENESS DESIGNS TO FACILITATE IMPLEMENTATION: THREE CASE STUDIES IN DEMENTIA CARE RESEARCH

Joseph Gaugler[1], Rosa Baier[2], Richard Fortinsky[3], Allison Gustavson[4], Nancy Hodgson[5], Miranda McPhillips[5], Justine Sefcik[6], and Laura Gitlin[6], *1. University of Minnesota, Minneapolis, Minnesota, United States, 2. School of Public Health, Brown University, Providence, Rhode Island, United States, 3. University of Connecticut Center on Aging, Farmington, Connecticut, United States, 4. Minneapolis VA Health Care System, Minneapolis, Minnesota, United States, 5. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 6. Drexel University, Philadelphia, Pennsylvania, United States*

This individual symposium presentation will provide case examples of three "hybrid effectiveness" trials in dementia care in different care settings including community-based and residential long-term care settings, each of which incorporate implementation methods alongside traditional evaluations of effectiveness. We offer considerations related to conceptualization, study design, sampling, data collection, and analysis that may guide gerontologists who aspire to adopt hybrid effectiveness designs in their own work. We conclude with methodological recommendations to incorporate an implementation science lens throughout the lifecycle of gerontological (and/or dementia care) intervention development. By applying key principles from implementation science throughout the intervention development process, a truncated and more efficient implementation pipeline may be achievable in gerontological research. Moreover, incorporation of implementation science methods into standard intervention development and testing methodologies will result in older persons, their families, healthcare providers, and communities having the best evidence available at their disposal.

A CONCEPTUAL MODEL OF ORGANIZATIONAL READINESS FOR IMPLEMENTATION OF EMBEDDED PRAGMATIC DEMENTIA RESEARCH

Marie Boltz[1], Kimberly Van Haitsma[2], Rosa Baier[3], Justine Sefcik[4], Nancy Hodgson[5], and Ann Kolanowski[6], *1. Penn State, Pennsylvania State University, Pennsylvania, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States, 3. School of Public*

Health, Brown University, Providence, Rhode Island, United States, 4. Drexel University, Philadelphia, Pennsylvania, United States, 5. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 6. Penn State University, Penn State University, Pennsylvania, United States

Organizational readiness for implementation refers to the collective willingness and efficacy of people, processes, and internal and external contexts within study sites to implement an intervention; it is a salient consideration when planning and conducting embedded pragmatic trials. This paper examines the conceptual and theoretical underpinnings of organizational readiness for implementation and the operationalization of the construct. We synthesize the literature to offer a conceptual model for explicating and measuring organizational readiness for implementation and describe the unique characteristics and demands of implementing evidence-based interventions targeting persons with dementia and/or their care partners. Our model was derived from the Consolidated Framework for Implementation Research (CFIR), and Weiner's Determinants and Outcomes of Organizational Readiness for Change. We discuss how it can serve as a guide when planning and conducting embedded pragmatic implementation trials in settings that care for persons with dementia.

CULTURAL ADAPTATION OF THE ADULT DAY SERVICE PLUS PROGRAM FOR HISPANIC/LATINO DEMENTIA CAREGIVERS

Lauren Parker[1], Katherine Marx[2], manka Knimbeng[3], Elma Johnson[4], Sokha Koeuth[5], Joseph Gaugler[3], and Laura Gitlin[5], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins School of Nursing, Baltimore, Maryland, United States, 3. University of Minnesota, Minneapolis, Minnesota, United States, 4. University of Minnesota School of Public Health, Minneapolis, Minnesota, United States, 5. Drexel University, Philadelphia, Pennsylvania, United States*

Although Hispanic/Latinos are at disproportionate and increased risk for Alzheimer's disease and related dementias, few evidence-based supportive care interventions have been specifically developed for or adapted for this population. Adapting a supportive care intervention requires more than Spanish language translation and necessitates an understanding of cultural nuances and care preferences of Hispanic/Latino families and staff who implement the intervention. This paper reports on the cultural adaptation of the Adult Day Service Plus (ADS Plus) intervention for delivery by staff to Hispanic/Latino caregivers which was guided by the Cultural Adaptation Process Model. Also, using the Framework for Reporting Adaptations and Modifications-Enhanced (FRAME),we discuss: 1) when modifications were made, 2) who determined modifications needed, 3) what aspects of the intervention were modified, 4) the relationship to fidelity and how fidelity was maintained, and 5) reasons for modifications. Modifications to the delivery and content were changed to reflect values and norms of both the Hispanic/Latino staff and the caregivers they serve. As supportive interventions for dementia caregivers are developed and implemented into real world settings, inclusion of cultural elements may enhance research participation from Hispanic/Latino provider sites and caregivers. We suggest in this paper that cultural adaptation is an essential consideration in developing an intervention as well as adapting evidence-based previously tested interventions, and in implementation science. Cultural adaptation offers an important lens by which to identify contextual factors impacting intervention adoption interventions and needed adaptations to assure equity in the reach of evidence-based programs.

DESIGNING INTERVENTIONS FOR OLDER ADULTS WITH LOW- AND MIDDLE-INCOME COUNTRIES SETTINGS IN MIND

Zachary Baker[1], Manka Nkimbeng[2], Pearl G. Cuevas[3], Ana Quiñones[4], Karmeet Kang[5], Joseph Gaugler[2], Ladson Hinton[6], and Tetyana Shippee[2], *1. Arizona State University, Tempe, Arizona, United States, 2. University of Minnesota, Minneapolis, Minnesota, United States, 3. Centro Escolar University, Manilla, Sta Rosa City, Laguna, Philippines, 4. Oregon Health and Science University, Portland, Oregon, United States, 5. Chitkara University, Rajpura, Punjab, India, 6. University of California Davis, Sacramento, California, United States*

Most people living with dementia (PLWD) live in low- and middle-income countries (LMIC) and the proportion in LMICs is poised to continue growing. But 99.9% of dementia funding is awarded to researchers in high-income countries (HIC). Our team of scientists from India, Cameroon, the Philippines, the USA, Ukraine, and Germany draw on our involvement in interventions in 12 countries to suggest one way to help meet the needs of PLWD living in LMICs. We suggest that researchers in HICs who are developing new interventions might consider the needs of LMICs during intervention development. By thinking through implementation scenarios in different settings or countries where barriers and facilitators to implementation vary in type, or in importance, it might speed future adaptation of those interventions to LMICs. We outline anticipated challenges, case studies from our own work, benefits for individual researchers, benefits for public health, and recommendations for employing this strategy.

SESSION 3320 (SYMPOSIUM)

INTEGRATING HOUSING, HEALTH, AND SUPPORTIVE CARE IN AFFORDABLE SENIOR HOUSING: EVALUATION OF THE R3 PROGRAM

Chair: Edward Miller Co-Chair: Marc Cohen

This symposium reports evaluation findings from the Right Care, Right Place, Right Time (R3) program. The initiative is designed to integrate housing, health, and supportive care to residents of affordable senior housing using a wellness team (nurse and social worker). The embedded team works directly with residents to address health-related, educational, and informational needs and access to services - focusing on proactive outreach and prevention, coordination with providers, constant contact with residents, and targeting high-risk residents. The initiative aims to create a replicable, scalable, and sustainable model of housing with supportive services that enables independent living while reducing health care costs. Two wellness teams served approximately 400 participants at seven Boston-area buildings. The R3 program was implemented in two phases. The 18-month pre-intervention period was January 2016-March

2017, while the 18-month Phase 1 intervention period was July 2017-December 2018. The 21-month Phase 2 implementation period (known R32), which introduced a targeting strategy to identify high risk residents, was January 2019-September 2020. Evaluation activities included quantitative and qualitative components. Program participants and non-participants at intervention and comparison sites were surveyed on program-related experiences. Program, housing, and community partners were interviewed. Key performance indicators were tracked. Medicare claims data were analyzed using comparison groups. Focus groups were completed with payers, housing providers, and community stakeholders. The purpose of this symposium is to identify the experiences of program participants and key stakeholders with the R3 program, and to assess program impact. Edward Miller and Marc Cohen will serve as chair and co-chair, respectively.

THE EXPERIENCES OF PROGRAM PARTICIPANTS WITH THE R3 PROGRAM

Elizabeth Simpson, Edward Miller, Yan Lin,
Pamela Nadash, and Marc Cohen, *University of Massachusetts Boston, Boston, Massachusetts, United States*

The voluntary nature of the R3 program means that the experiences of residents who enroll in the program are critical to program success. Surveys were distributed to participants and non-participants in the intervention and control buildings during R32. Findings indicate that most enrollees are interacting with R32 staff; they trust them and feel that they provide important information; and they feel safer, less alone, and healthier because of their participation in the program. Roughly nine-in-ten are satisfied with the program and three in five would recommend it to a friend. Fully one-third believe that the program is helping them avoid medical emergencies necessitating a trip to the emergency room. When faced with a serious medical concern, residents in R32 buildings are far less likely to view calling 911 or going to the emergency room for treatment as a way to address their issue compared to individuals living in control buildings.

HOUSING AND COMMUNITY PARTNER VIEWS ON THE BENEFITS OF THE R3 PROGRAM

Edward Miller, Elizabeth Simpson, Pamela Nadash,
Natalie Shellito, Yan Lin, Taylor Jansen, and Marc Cohen,
University of Massachusetts Boston, Boston, Massachusetts, United States

Housing with services programs have potential to benefit residents and operators of affordable senior housing communities. This study aimed to understand housing and community partner views on the benefits of the R3 program. Data derived from 31 interviews with R3 program managers and wellness team members, executives and direct service staff at the intervention sites, and community partners. Overwhelmingly positive overall assessments of the R3 program were reported. Concrete benefits to residents included receiving additional attention and support; connecting with family and health care resources; enhancing group programming; preventing ambulance transports; helping with transitions; and improving health and quality of life. Psychosocial benefits to residents included: empowering program participants; providing socio-emotional support; and alleviating psychosocial distress. Benefits to housing sites included augmenting staffing levels, skills, and capabilities; proactively tracking and responding to resident needs; lowering resident turnover; and learning from and adopting procedures and processes underlying the R3 philosophy.

TARGETING PARTICIPANTS AT HIGH RISK FOR ADVERSE HEALTH OUTCOMES IN THE R3 PROGRAM

Marc Cohen, Edward Miller, and Pamela Nadash,
University of Massachusetts Boston, Boston, Massachusetts, United States

The R32 program seeks to ensure that individuals at high risk for adverse health outcomes are identified, engaged, and linked to needed services. The program pays particular attention to identifying individuals with risks related to mental health, memory, nutrition, food insecurity, and emergency department or inpatient hospitalizations. Key performance indicators were tracked, including the number and proportion of participants whose needs were addressed by R32. Results indicate that the program has succeeded in engaging the vast majority (>90%) of individuals with specific risk factors and connecting them with needed services. Viewed in the context of managed care plans, this level of performance is noteworthy and would earn the program a 5 Star rating – the highest rating available. Findings underscore the strong advantage offered by having a wellness nurse and wellness coordinator embedded on site in senior housing and using this platform to manage prevention and care services to residents.

THE IMPACT OF THE R3 PROGRAM ON HEALTH SERVICES UTILIZATION AND COSTS

Jane Tavares, Elizabeth Simpson, Edward Miller,
Pamela Nadash, and Marc Cohen, *University of Massachusetts Boston, Boston, Massachusetts, United States*

Relatively few housing with services evaluations use rigorous designs when assessing program impacts on health services utilization. This study thus employed a pre/post difference-in-difference quasi-experimental design, including building-level comparisons using Medicare fee-for-service claims data across two stages of the R3 intervention. Intervention sites included seven buildings with roughly 1,200 individuals. Key outcomes included hospital admissions, 30-day hospital readmission, and emergency department admissions. Results indicate that adding the R3 intervention to low-income housing sites led to meaningful reductions in service utilization and costs when compared to buildings where the program was not operating. The introduction of risk-targeting in the second stage of the intervention further strengthened this effect. Findings demonstrate that residents of affordable senior housing communities, who tend to be in poorer health than their counterparts in the community, benefit from the R3 program and that additional investment in this type of initiative would benefit the health care system.

ACHIEVING SUSTAINABILITY IN HOUSING WITH SERVICES: INSIGHTS FROM R3 PROGRAM

Pamela Nadash, Edward Miller, Elizabeth Simpson,
Molly Wylie, Natalie Shellito, Yan Lin, Taylor Jansen, and
Marc Cohen, *University of Massachusetts Boston, Boston, Massachusetts, United States*

There has been a long-standing interest in developing housing models that integrate the supportive services that older people need to remain at home as long as possible. This approach has boomed for better-off people who can afford the cost of private-pay independent living and assisted living environments. For those with fewer resources, however, options are limited, given that they are largely dependent on public financing. This study focuses on how to develop sustainable models of housing with services for low-income older people. Using data from 31 key informant interviews and three focus groups, it reports and analyzes expert perspectives on how programs such as R3 can achieve financial sustainability. Four major themes emerged: (1) funding as the key to sustaining housing with services; (2) funding housing with services through participating health plans; (3) other potential funding sources for housing with services; and (4) gaining buy-in for housing with services.

SESSION 3330 (SYMPOSIUM)

INTEGRATION OF DIGITAL TECHNOLOGY IN RESEARCH INVOLVING OLDER ADULTS: LESSONS FROM COMMUNITY-BASED TRIALS

Chair: Hae-Ra Han

Working with study participants in community-based clinical trials during COVID-19 pandemic has created diverse challenges to study teams. Globally, COVID-related restrictions were implemented including country-wide lockdowns and social distancing, and study teams had to quickly adjust their study protocols to work in a virtual environment. Meeting virtually for recruitment activities or intervention delivery may be particularly challenging when the target group is older adults—one of the vulnerable populations to experience the digital divide due to limited digital access and limited digital literacyThis symposium covers the lessons learned related to use of digital technology in participant recruitment and intervention delivery across a range of populations, including community-dwelling Korean American older adults to African American older women living with pain and low mood, caregivers of persons living with heart failure, and low-income cancer survivors with multiple chronic conditions. The discussion will include 1) findings from screening over 1,000 older Korean Americans to enroll them into a multi-site community-based trial, 2) lessons in diversifying intervention delivery methods to African American older women, 3) the integration of virtual modality into a self-care and social support intervention for caregivers of persons with heart failure, and 4) the deployment of mHealth to deliver a home-based exercise program to ethnically diverse low-income cancer survivors with co-morbid conditions in the setting of the COVID-19 pandemic. This symposium seeks to build the evidence related to recruitment and intervention delivery targeting diverse groups of older adults in community settings using technology by sharing common challenges, experiences, and opportunities.

WEB-ENABLED RECRUITMENT STRATEGIES FOR COMMUNITY-DWELLING OLDER ADULTS

Deborah Min[1], Ja'Lynn Gray[2], Chad Parslow[2], Anushka Jajodia[3], Ji-Young Yun[2], and Hae-Ra Han[4], *1. NYU Grossman School of Medicine, New York, New York, United States, 2. Johns Hopkins School of Nursing, Baltimore, Maryland, United States, 3. MICA Center for Social Design, Baltimore, Maryland, United States, 4. Johns Hopkins University, Baltimore, Maryland, United States*

Older adults are vulnerable to experiencing the digital divide. Identifying effective web-enabled recruitment strategies to target older adults is an important research focus. Web-enabled recruitment strategies have become increasingly popular amidst virtual working environments due to unprecedented challenges of the COVID-19 pandemic. Yet, it is unclear which web-enabled recruitment strategies have been successful among older adults in community-based intervention trials. We describe lessons learned in using web-enabled strategies to recruit Korean American older adults with probable dementia and their caregivers in a community-based intervention trial and compare our findings with the web-enabled recruitment strategies targeting older adults reported in relevant published studies. Data sources included: study team meeting minutes, community consultant interviews, and a PubMed search. Five themes emerged: unfamiliarity with technology, differences in internet access across older age groups, providing technological support to promote recruitment, successful and unsuccessful recruitment using social media, and other diverse online methods of recruitment.

DEPRESSION AND PAIN PERSEVERANCE THROUGH EMPOWERED RECOVERY (DAPPER) PILOT PROGRAM: A CASE STUDY ON TECHNOLOGY

Catherine Clair[1], Tonisha Melvin[2], Sarah Szanton[3], Martha Abshire Saylor[3], Roland J. Thorpe, Jr.[4], and Janiece Taylor[4], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins School of Nursing, Baltimore, Maryland, United States, 3. Johns Hopkins University School of Nursing, Baltimore, Maryland, United States, 4. Johns Hopkins University, Baltimore, Maryland, United States*

There is a paucity of work focusing on the engagement of older African American women with technology. The aim of the pilot study was to test the Depression and Pain Perseverance through Empowered Recovery (DAPPER) program in a sample of older African American women living with pain and low mood (N=19). The research team hypothesized that most of the women would prefer virtual visits, thus both in-person and virtual options were available for program delivery. So far, of 11 participants, five women have opted to do in-person visits. When asked why, one participant said that having the nurse come to her house was "rewarding, [especially] when you live alone." Another participant commented that she did not have a computer in her home. These findings demonstrate that older adults exist on a spectrum of comfort with and access to technology.

WHEN AND WHERE: LESSONS LEARNED ABOUT TECHNOLOGY FROM AN INTERVENTION FOR CAREGIVERS OF PERSONS WITH HEART FAILURE

Martha Abshire Saylor[1], Catherine Clair[2], Noelle Pavlovic[1], Katie Nelson[3], Lyndsay DeGroot[1], Janiece Taylor[3], and Sarah Szanton[1], *1. Johns Hopkins University School of Nursing, Baltimore, Maryland, United States, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States*

Use of technology in older adult populations is growing, therefore it is important to understand opportunities for healthcare initiatives that support older adults using technology. The aim of the pilot study was to test Caregiver Support, a self-care and social support intervention, for caregivers of persons living with heart failure (N=24). Originally, the protocol was designed with in-person visits. We expected this option to reduce participant burden: the caregiver would not have to travel, and the interventionist would gain more insight about the home context to aid with intervention delivery. However, due to the COVID-19 pandemic, it became necessary to conduct the visits virtually. All participants completed the 5-component intervention via virtual meeting and there were no dropouts related to technology use. When asked about the virtual modality, participants emphasized the flexibility of virtual meetings. In summary, the intervention visits conducted virtually were perceived as a caregiver-centered approach.

CHALLENGES AND SOLUTIONS FOR MOBILE HEALTH INTERVENTION RESEARCH IN OLDER ADULTS WITH MULTIPLE CHRONIC CONDITIONS

Nada Lukkahatai, and Junxin LI, *Johns Hopkins University, Baltimore, Maryland, United States*

Advances in smart phone technologies resulted in exponential growth in the use of mobile technology in health care. The mobile health or mHealth became a tool in engaging patients in self-care, monitor symptoms and provider-patients communication. Older adults living with Multiple Chronic Conditions (MCCs) are required to self-manage their complex conditions. These health demands are greater in low-income older adults. The mHealth can be beneficial in supporting health and increase access to care for this population. Our study examined a feasibility of combination of the mHealth and tailored exercise program for low SES older adults. We found that age-related physical and cognitive decline, acceptance of technology, complexity of user interface, and financial burden hinder the benefit and accessibility of the mHealth. The research team purpose solutions include improve user interface, create training session and technical support, provide incentives and technology and involve caregivers for these challenges.

SESSION 3340 (SYMPOSIUM)

INTRODUCTION TO THE STUDY OF MUSCLE, MOBILITY, AND AGING (SOMMA) AND PRELIMINARY RESULTS

Chair: Steven Cummings Co-Chair: Anne Newman

SOMMA is a new cohort study conducted at Wake Forest and University of Pittsburgh, coordinated by the San Francisco Coordinating Center, with management of biological specimens by Adventist Health Research Institute. We aim to discover the biological basis of mobility disability and have collected tissues and measurements for future studies of the biology of human aging. SOMMA has enrolled ~875 older men and women (aged □70 years), and will follow-up participants by phone and in-person every six months for up to three years. An additional cohort of younger adults (aged 30-69) is being enrolled. In this symposium, we will describe the underlying conceptual construct for the study; the baseline characteristics of the cohort; recruitment techniques to enroll participants. We will present preliminary data from ~425 participants, including the association between mitochondrial energetics and muscle function (strength and power); the interrelationship between physical and cognitive measures; and the association of D3Cr muscle mass with strength and walking speed. Finally, we will describe how to obtain data and specimens for analyses and ancillary studies.

INTRODUCTION TO SOMMA: CONCEPTUAL CONSTRUCT AND PARTICIPANT CHARACTERISTICS

Steven Cummings[1], Peggy Cawthon[2], Theresa Mau[3], Stephen Kritchevsky[4], Russell T. Hepple[5], Paul Coen[6], Bret Goodpaster[6], and Anne Newman[7], *1. San Francisco Coordinating Center, San Francisco, California, United States, 2. California Pacific Medical Center Research Institute, San Francisco, California, United States, 3. California Pacific Medical Center, San Francisco, California, United States, 4. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 5. University of Florida, Gainesville, Florida, United States, 6. AdventHealth, Orlando, Florida, United States, 7. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

SOMMA aims to characterize key muscle characteristics and their longitudinal association with declines in mobility. To assess mitochondrial energetics in muscle, respiration assays were performed on biopsies of the vastus lateralis and the capacity to generate ATP (ATPmax) was determined by 31P MR spectroscopy. Other properties examined in biopsies include denervation, fiber type and size, capillary density and oxidative damage. We archive ~150mg for ancillary science. In a subset, we obtained biopsies of subcutaneous adipose for measurements including cell senescence and for archiving. To assess body composition, SOMMA used whole body MR for quadriceps volume and D3 Creatine dilution for total skeletal muscle mass. We measured fitness by cardiopulmonary exercise testing. Participants also had many other assessments of physical and cognitive performance including chair stands, balance, gait speed, leg power, stair climbing, Trails B, MOCA, and patterns of physical activity by actigraphy.

RECRUITMENT OF SOMMA PARTICIPANTS: TECHNIQUES TO ENROLL OLDER ADULTS IN A COMPLEX STUDY

Anne Newman[1], Peggy Cawthon[2], Theresa Mau[3], Stephen Kritchevsky[4], Russell T. Hepple[5], Paul Coen[6], Bret Goodpaster[6], and Steven Cummings[7], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. California Pacific Medical Center Research Institute, San Francisco, California, United States, 3. California Pacific Medical Center, San Francisco, California, United States, 4. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 5. University of Florida, Gainesville, Florida, United States, 6. AdventHealth, Orlando, Florida, United States, 7. San Francisco Coordinating Center, San Francisco, California, United States*

We screened approximately 4200 individuals to enroll 881 including 41% men and 59% women with a mean age =73.4 ± 5SD years; 13% were Black, 85% White and 2% of other race and ethnic groups. We will add 80 individuals aged 30-69 years. Exclusions included unstable medical conditions and inability to walk 400 meters(m). The median baseline 400m gait speed at usual pace was 1.05 ± 0.18SD m/s. Techniques to recruit and enroll a diverse population for this complex project included the use of in-person and video-conference information sessions to explain the complicated study to interested adults and to screen potential participants as needed The COVID pandemic created numerous challenges; while SOMMA was able to meet its recruitment goals, the enrollment period lasted 33 months (instead of the originally planned 18 months). Attendance at follow-up in-person and phone-based assessments is excellent.

PRELIMINARY SOMMA DATA: MITOCHONDRIAL ENERGETICS, LEG POWER, AND CARDIORESPIRATORY FITNESS

Theresa Mau[1], Paul Coen[2], Stephen Kritchevsky[3], Anne Newman[4], Giovanna Distefano[5], Russell T. Hepple[6], Bret Goodpaster[2], and Steven Cummings[7], *1. California Pacific Medical Center, San Francisco, California, United States, 2. AdventHealth, Orlando, Florida, United States, 3. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 5. Advent Health Translational Research Institute, Orlando, Florida, United States, 6. University of Florida, Gainesville, Florida, United States, 7. San Francisco Coordinating Center, San Francisco, California, United States*

To assess mitochondrial function, max OXPHOS (maximal complex I and II supported state 3 respiration) was determined in vitro by high-resolution respirometry of permeabilized muscle fibers from thigh muscle (vastus lateralis) biopsies, and ATPmax was determined in vivo by 31P magnetic resonance spectroscopy (n=468, mean=76.9yr). Max OXPHOS was strongly associated with leg power (β= 10.7 Watts per 1 SD increment, p<0.001) and peak VO2 (β= 83.7 mL/min, p<0.001). ATPmax had weak associations with leg power (β= 4.2 Watts per SD increment, p=0.13). In contrast to its weaker relationship with leg power, ATPmax was strongly associated with VO2 peak (β= 70.1 mL/min per SD increment, p<0.001). Skeletal muscle mitochondrial energetics were significant determinants of leg power and VO2 peak in older adults.

PRELIMINARY SOMMA DATA: COGNITIVE AND PHYSICAL FUNCTION RELATIONSHIPS IN OLDER ADULTS

Stephen Kritchevsky[1], Anne Newman[2], Peggy Cawthon[3], Theresa Mau[4], Russell T. Hepple[5], Paul Coen[6], Bret Goodpaster[6], and Steven Cummings[7], *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 3. California Pacific Medical Center Research Institute, San Francisco, California, United States, 4. California Pacific Medical Center, San Francisco, California, United States, 5. University of Florida, Gainesville, Florida, United States, 6. AdventHealth, Orlando, Florida, United States, 7. San Francisco Coordinating Center, San Francisco, California, United States*

We used canonical correlation (n=424) to examine the relationships between a set of physical function measures (400m usual pace, chair stands/sec, 4m walk pace, standing balance times, VO2 peak, muscle power, four-square step test (FSST) time, stair climb time and stair climb power) and a set of cognitive measures (Trail Making Test B (sec), Digit Symbol Substitution Test (DSST), the Montreal Cognitive Assessment, and California Verbal Learning Test). Canonical correlation derives synthetic variables comprised of linear combinations within each set of variables (physical and cognitive) that maximize the correlations between synthetic variables. The FSST was most strongly correlated with the cognitive synthetic variable (- 0.42). The DSST score was the cognitive measure most strongly correlated with the physical synthetic variable (0.48). It is notable that only the timed cognitive and physical tests are inter-associated

PRELIMINARY SOMMA DATA: D3CR MUSCLE MASS AND STRENGTH AND WALKING SPEED IN OLDER MEN AND WOMEN

Peggy Cawthon[1], Stephen Kritchevsky[2], Anne Newman[3], Theresa Mau[4], Russell T. Hepple[5], Paul Coen[6], Bret Goodpaster[6], and Steven Cummings[7], *1. California Pacific Medical Center Research Institute, San Francisco, California, United States, 2. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 4. California Pacific Medical Center, San Francisco, California, United States, 5. University of Florida, Gainesville, Florida, United States, 6. AdventHealth, Orlando, Florida, United States, 7. San Francisco Coordinating Center, San Francisco, California, United States*

D3Cr muscle mass, grip strength, leg extension 1-rm max (Keiser), and walking speed (400m usual walk) were collected with standardized protocols. We calculated sex-stratified unadjusted Pearson correlation coefficients, and partial Pearson correlation coefficient adjusted for body size (height, weight). D3Cr muscle mass was positively correlated with grip strength (men: unadjusted r=0.28, p<.001; women: unadjusted r=0.16, p=0.02) and leg extension strength (men: unadjusted r=0.44, p<.001; women: unadjusted r=0.31, p<.001). D3Cr muscle mass was correlated with 400-m walk speed only after adjustment for body size among both men (partial r=0.29, p<.001) and women (partial r=0.16, p=0.02). Associations of total thigh muscle volume by MRI with strength and walking speed were of similar magnitude to the association between D3Cr muscle mass with strength and walking speed.

SESSION 3350 (AWARD LECTURE)

JOSEPH T. FREEMAN AWARD AND EXCELLENCE IN REHABILITATION OF AGING PERSONS AWARD PRESENTATIONS AND LECTURES

Chair: Cynthia Brown

The Joseph T. Freeman Award lecture will feature an address by the 2022 Freeman Award recipient Neil M. Resnick, MD, FGSA, of the University of Pittsburgh. The Joseph T. Freeman Award is a lectureship in geriatrics awarded to a prominent clinician in the field of aging, both in research and practice. The award was established in 1977 through a bequest from a patient's estate as a tribute to Dr. Joseph T. Freeman. The Excellence in Rehabilitation of Aging Persons Award lecture will feature an address by the 2022 Excellence in Rehabilitation Award recipient Patricia C. Heyn, PhD, FGSA, FACRM, of Marymount University. The Excellence in Rehabilitation of Aging Persons Award is designed to acknowledge outstanding contributions in the field of the rehabilitation of aging individuals.

INTO THE VOID: A CAREER IN INCONTINENCE… AND BEYOND

Neil Resnick, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Long-believed inevitable with age, urinary incontinence (UI) --like dementia – has proved neither ineluctable nor untreatable. Moreover, older adults remain continent despite abnormal lower urinary tract (LUT) function! The key is that the LUT is just one risk factor, and incontinence results from contributors at every level: from drugs and diseases beyond the LUT, to problems of brain and physical function, to multiple issues within the LUT itself. Such insights have provided the rationale for a nontraditional diagnostic and therapeutic strategy, one that has not only improved outcomes but also enabled creation of previously-believed heretical approaches that address the LUT last and only if necessary. In addition, this approach enabled development of Medicare's Minimum Data Set for frail elderly and, more importantly, may facilitate development of scalable ways to raise the floor of care for other geriatric syndromes as well.

TWO DECADES EVALUATING EXERCISE TREATMENTS FOR ALZHEIMER'S DISEASE: THE ANECDOTES OF AN EVIDENCE-BASED PATH

Patricia Heyn, *Center for Optimal Aging, Marymount University, Fairfax Station, Virginia, United States*

The last 20 years have produced accumulative evidence supporting the benefits of regular exercise to improve cognition in older adults with cognitive impairments (OAwCIs). Thus, multiple systematic reviews, including meta-analyses, have contributed to the current literature. Although the field advanced significantly our understanding of the role of exercise on AD, still there is limited information on the overall prescription effectiveness. Thus, a novel overview review to evaluate the available meta-analysis studies from the randomized exercise trials for OAwCI will help in synthesizing the best evidence to generate prescription precision. Dr. Heyn will discuss her path, her studies, and the future of AD research and exercise prescription.

SESSION 3360 (SYMPOSIUM)

MEET THE END-OF-LIFE CARE EXPERTS: INSIGHTS FROM FORMER CAREGIVERS OF OLDER ADULTS LIVING WITH SERIOUS ILLNESS

Chair: Emily Mroz Co-Chair: Emika Miller Discussant: Karen Moss

High-quality end-of-life care relies on the collective efforts of professional care providers and family caregivers; however, care practice development is rarely guided by experiential perspectives of former family caregivers (i.e., those whose care recipient has died). Former family caregivers typically carry rich, untapped insight into what works well, and what still does not, in end-of-life care. While current caregivers sometimes describe being over-burdened and unable to engage meaningfully in research, former caregivers express the desire to share insights and lessons learned to improve the experiences of future caregivers. Grounded in research methodologies which leverage insights from participants (e.g., qualitative analysis, community-based participatory research), this symposium draws on perspectives of former caregivers of seriously ill older adults to enhance end-of-life care practices, improve intervention designs, and enrich research agendas. First, Dr. Emily Mroz will describe the pathways by which recent caregiving experiences for parents living with dementia shape former caregivers' perspectives on, and engagement in, their own end-of-life care planning. Next, Emika Miller will characterize the advance care planning perspectives of former family caregivers of African Americans who lived with dementia, highlighting areas for improvement in culturally-tailored interventions. Lastly, Jennifer Dickman Portz will present on caregivers' use of patient portals near their care recipient's end-of-life. Our discussant, Karen Moss, will lead us in conversation by outlining the unique value added to end-of-life care research when incorporating perspectives of former caregivers from diverse backgrounds. She will also describe future directions in caregiver-informed end-of-life interventions, practices, and policies to improve end-of-life care outcomes.

REFLECTION AND INTENTION: END-OF-LIFE PLANNING IN FORMER CAREGIVERS OF PARENTS LIVING WITH DEMENTIA

Emily Mroz[1], Tara Matta[2], Talha Ali[3], Amanda Piechota[4], Anissa Abboud[5], Shubam Sharma[6], Joan Monin[4], and Terri Fried[3], *1. Yale University, New Haven, Connecticut, United States, 2. University of South Florida, Tampa, Florida, United States, 3. Yale School of Medicine, New Haven, Connecticut, United States, 4. Yale School of Public Health, New Haven, Connecticut, United States, 5. Yale School of Public health, New Haven, Connecticut, United States, 6. Kennesaw State University, Kennesaw, Georgia, United States*

Family caregivers for parents living with Alzheimer's Disease or Related Dementias (ADRD) provide support through health decline, care planning, and death. Guided by the Consensual Qualitative Research method and grounded in a life story framework, this study examines recalled caregiving experiences and descriptions of personal end-of-life planning in 32 midlife former caregivers of parents with ADRD (range: 40-65; 44% male). Former caregivers often expressed appreciation for end-of-life planning but varied in their engagement in planning since their loss. Descriptions of hesitation with planning were rooted in salient challenges from caregiving experiences and reflected relational concerns (e.g., about burdening others with care needs), planning complexity (e.g., perceiving too many factors to account for), or mortality denial (e.g., aversion to thinking more about death). These caregiving experiences may clarify the value of end-of-life planning while, in some cases, impeding decision-making, leading to gaps between former caregivers' planning intentions and engagement.

REIMAGINING ADVANCE CARE PLANNING: FORMER CAREGIVERS OF AFRICAN AMERICANS WITH DEMENTIA PERSPECTIVES

Emika Miller[1], Karen Moss[2], Kathy Wright[3], Kimberly Wilson-Lawson[4], Mary Beth Happ[2], Karen Rose[2], Todd Monroe[5], and Celia Wills[5], *1. Ohio State University, Columbus, Ohio, United States, 2. The Ohio State University, Columbus, Ohio, United States, 3. The Ohio State University College of Nursing, Columbus, Ohio, United States, 4. African American Alzheimer's and Wellness Association, Columbus, Ohio, United States, 5. Ohio State University College of Nursing, Columbus, Ohio, United States*

Advance care planning disparities persist among lower socioeconomic status African American older adults living with dementia despite multiple decades of research. The perspectives of former family caregivers are rarely used in developing effective interventions. This study aims to characterize the advance care planning and other health-related decision-making perspectives of former family caregivers of African Americans who lived with dementia. This qualitative study is part of an ongoing mixed-methods study to co-create a culturally tailored advance care planning intervention. Former caregivers (n=11) participated in semi-structured interviews and identified the following needs: Caregiver education, caregiver recognition by healthcare providers, and removal of caregiving obstacles. Participants also acknowledged their need to restore identity following the death of their care recipient and a desire to assist other caregivers through research participation. This study fills a critical gap by including former caregivers' perspectives in co-creating a culturally tailored advance care planning intervention.

HOW CAN PATIENT PORTALS SUPPORT CAREGIVERS PROVIDING END-OF-LIFE CARE?: A MIXED-METHODS STUDY

Jennifer Dickman Portz[1], John David Powers[2], Megan Baldwin[2], Kathy Gleason[2], Rebecca Boxer[2], Ted Palen[2], and Elizabeth Bayliss[2], *1. University of Colorado Anschutz, Aurora, Colorado, United States, 2. Kaiser Permanente Colorado, Denver, Colorado, United States*

Patient portal design is rarely centered around patient caregivers—family members, friends and other designated persons who may access these digital tools for the patient's health needs. This study examines: (a) portal features used by caregivers during their loved-one's end-of-life; and (b) caregiver perceptions regarding the use of patient portals for caregiving near the end-of-life.Using sequential mixed-methods, we conducted a retrospective cohort analysis of caregiver proxy (N=137) use from 2016-2019 during their loved-ones' (N=5,284) last 12 months of life and interviews with (N=31) 16-former and 15-current caregiver proxies. Caregiver proxy portal use in this population was lower than expected; however, caregivers who used the portal as proxies found value in tools for caregiving near the end-of-life. To leverage the patient portal to better support caregivers, future strategies should target caregiver portal adoption, awareness of beneficial portal tools, and the addition of caregiver specific resources and education.

SESSION 3380 (SYMPOSIUM)

ON THE THRESHOLD: CREATIVITY IN MID-LIFE

Chair: Carolyn Adams-Price Co-Chair: Desmond O'Neill

While late-life creativity has attracted significant scholarly inquiry, it is not clear that the same focus has applied to creativity in midlife and its relationship to creativity across the lifespan. Allied to a proposed symphonic concert by the Indianapolis Symphony of works from late midlife creativity with gerontologically-themed pre-concert talks occurring alongside GSA 2022, an activity curated by the Humanities, Arts and Cultural Gerontology Advisory Panel of GSA, this symposium will provide insights into a relatively under-explored aspect of creativity and aging, that of midlife creativity and its relationship to creativity at other stages of life. For many artists the most significant breakthroughs in style and critical reception are found in the works of midlife, and the symposium will explore the phenomenology and underlying themes of midlife creativity. This will include a review of the literature, a focus on midlife breakthrough and development in the creativity of Brahms and Janacek, interaction with the program of the parallel symphony concert, and a focus on arts and crafts creativity in people newly undertaking arts and crafts in mid-life. This will be complemented by a review of creativity and well-being from the age of 50 onwards.

MIDLIFE CREATIVITY AMONG COMPOSERS AND NOVELISTS

Desmond O'Neill, *Trinity College Dublin, Dublin, Dublin, Ireland*

Although the study of midlife has increased in recent years, it still lags behind study of life at the extremes of age. As a key threshold stage in the lifespan, our understanding can be enhanced by exploration of novelists and composers whose most substantive work began to be produced in midlife. This presentation will draw off the works of midlife works of composers who also composed into later life - Giussepe Verdi, Richard Strauss and Johannes Brahms - from the concert proposed by the Indianapolis Symphony during GSA 2022, as well as reflecting on the works of Anita Brookner as representative of other novelists and poets whose work and careers came to prominence in midlife.

WE'RE ALL MAKERS NOW: ARTS AND CRAFT PARTICIPATION IN MIDLIFE

Carolyn Adams-Price, *Mississippi State University, STARKVILLE, Mississippi, United States*

Recent research has focused on the benefits of participation in creative activities for older adults, even those who experiencing cognitive deficits. However, many people begin participating in creative activities in midlife, and continue their participation into later life. Research in my lab suggests that middle aged people turn to crafts that involve making things to reduce stress and increase feelings of productivity. Glaveanu's sociocultural theory will be introduced to explain the benefits middle aged people get from creating crafts, and how those benefits are accrued from the beginner stage through the development of expertise.

ARTS AND CREATIVITY AND THEIR IMPACT ON HEALTH AND WELL-BEING: A SYSTEMATIC REVIEW OF THE EVIDENCE

Roger O'Sullivan[1], and Laura McQuade[2], *1. Institute of Public Health in Ireland, Belfast/Dublin, Not Applicable, Ireland, 2. Institute of Public Health, Belfast, Northern Ireland, United Kingdom*

Aim: The aim of this mixed method systematic review was to develop a better understanding of the evidence on the impact of arts and creativity on the physical health and well-being of people aged 50+. Method: 73 studies were eligible for inclusion within the review and were appraised using the Mixed Methods Appraisal Tool.

Results: Dance was associated with improved balance, lower body physical strength and flexibility, aerobic fitness. Promising evidence showed that music and singing were associated with improved cognitive function, quality of life, affective states, and a sense of well-being. Preliminary evidence showed that visual and creative arts were associated with reduced feelings of loneliness, improved sense of community and social connectedness. Initial evidence showed that theatre and drama were associated with emotional well-being.

Conclusion: These findings highlight the value of participation in the arts and have implications for both public health and the arts and creativity agenda.

SESSION 3390 (PAPER)

PALLIATIVE CARE MODELS AND PROGRAMS

AN INNOVATIVE MEDICAL LEGAL PARTNERSHIP TO SERVE COMMUNITY-DWELLING OLDER ADULTS

Rachel Lessem, and Tamara Kushnir Groman, *CJE SeniorLife, Chicago, Illinois, United States*

According to the Legal Services Corporation, each year, 56% of older adults have at least one civil legal problem yet 87% receive inadequate or no professional legal help for their civil legal problems. Unmet legal needs can have cascading catastrophic effects on the health and well-being of older adults. To address this, we took the innovative approach of creating a Medical-Legal Partnership (MLP) within a community based social service agency on aging. MLPs have been successful by addressing the social determinates of health. However, previous studies have not investigated MLPs aimed at older adults. We used a single arm, pretest-posttest design to investigate the effects and feasibility of providing legal services to community dwelling older adults. The MLP served over 88 clients referred both internally from the agency as well as external partners. The participants had a mean age of 73, (age range 45-98, n=88), were 60% female. African Americans represent 9% of the clients, 7% are Hispanic/Latino and 74% Caucasian. Additionally, 5% were veterans. 52% of clients were at or below the Federal Poverty line at baseline. 50% of clients reported greater financial stability as a result of legal services. 75% reported improved health of between 1 and 3 points on a 5 point likert scale (pre-test=2.75; post-test 3.9 p<.01). This pilot project demonstrates a successful intervention to work across professional silos coordinating lawyers, medical providers and social workers to better meet the legal needs of older adults by creating MLPs in social service agencies to support their well-being.

BEST PRACTICES IN COMMUNICATING ABOUT PALLIATIVE CARE TO PATIENTS AND PHYSICIANS

Alexis Coulourides Kogan[1], Anna Rahman[2], Sindy Lomeli[2], and Susan Enguidanos[2], *1. Keck School of Medicine of USC, Alhambra, California, United States, 2. University of Southern California, Los Angeles, California, United States*

Home-based palliative care (HBPC) programs are proliferating across the U.S, yet face significant, documented challenges in promoting uptake of services and sustaining sufficient patient referrals. There is a tremendous need to understand effective methods for engaging physicians, patients, and caregivers in palliative care. Thus, the purpose of this study was to elicit best practices in how to communicate about HBPC to both healthcare providers and patients/caregivers. Focus groups with nine California-based HBPC organizations were conducted between January and April 2020. Discussions lasted approximately 54 minutes, were guided by a semi-structured protocol, audio recorded, and transcribed verbatim. Thematic analysis was used to identify themes and codes from the data. Twenty-five interdisciplinary HBPC staff members participated in a focus group. Most identified as white (76%), female (76%), and working in their current position for five years or less (56%). Three themes were identified from the data: (1) value of relationships; (2) communication do's and don'ts; and (3) need for education. Participants discussed actionable recommendations for each theme. Study findings highlight several best practices for HBPC programs to communicate- and foster relationships with healthcare professionals and patients/families about palliative care, with education at the crux. Lessons learned about key words and phrases to say and to avoid are particularly valuable for budding HBPC programs. Our results suggest that HBPC providers exert enormous efforts to increase patient referrals and enrollment through strategic, continuous outreach and education to physicians, patients, and their caregivers; however, palliative care educational interventions are needed.

DOES RACE MATTER IN HEALTH MESSAGING? IMPACT OF RACE CONCORDANCE ON PALLIATIVE CARE KNOWLEDGE SCORE

Deborah Hoe[1], Mutian Zhang[2], and Susan Enguidanos[1], *1. University of Southern California, Los Angeles, California, United States, 2. University of Southern California, Los Angele, California, United States*

Palliative care (PC) programs have expanded rapidly across the United States in the last decade. However, there remains a wide disparity in access to PC among ethnic minorities. Therefore, it is necessary and critical to develop specific health-related educational tools targeted for the vastly diverse, community-based older adult population. This study seeks to investigate how race concordance in health-related messaging might affect changes in PC knowledge scores among Black and White, English-speaking, community-based adults aged 50 and older. We recruited 406 Black and White adults online and from community-based sites. Sixty-four percent were shown race concordant patient stories, the remainder were shown videos of opposite race patients. Pretest-posttest study design was employed and participants completed a 20-question survey about PC knowledge, intent to seek PC, and perceptions about the videos. Regression analysis was conducted to test if race concordance improved knowledge after viewing patient stories.PC knowledge score (max=13) improved from an average of 5.70 to 11.23 (t=23.2, p< 0.001). Participants that watched same-race videos for both Black and White registered greater significant score increases (White:1.26±0.36 points, p=0.001; Black:0.95±0.38 points, p< 0.05) compared with those who watched different-race videos. Further, intent to enroll oneself in PC revealed statistically significant relationships in all groups except among White participants who viewed different-race videos (p=0.157, Fisher's exact test, two-tailed). This study suggests that while PC role model stories improved PC knowledge across the board, the improvement is greater in race concordant groups, which also has implications for changes in intent to enroll in PC.

EVALUATING IMPLEMENTATION COSTS FOR A TRANSITIONAL PALLIATIVE CARE INTERVENTION TO SUPPORT RURAL CAREGIVERS

Brystana Kaufman[1], Diane Holland[2], Catherine Vanderboom[2], Cory Ingram[2], Alice Chun[1], Erica Langan[1], Henry Baer-Benson[2], and Joan Griffin[2], *1. Duke University, Durham, North Carolina, United States, 2. Mayo Clinic, Rochester, Minnesota, United States*

Compared to urban caregivers, rural caregivers experience greater burdens accessing coordinated care for their loved ones during and after hospital discharge. The impact of technology-enhanced transitional palliative care (TPC) on patient and caregiver outcomes is currently being evaluated in a randomized control trial. This study evaluates resource use and health system costs of this caregiver-focused TPC intervention. Rural caregivers of hospitalized patients in Minnesota, Wisconsin, and Iowa were enrolled in an 8-week intervention consisting of video visits, conducted by a registered nurse, supplemented with phone calls and texts (n=207). Labor costs were estimated using the Bureau for Labor Statistics median hourly rate for a registered nurse and compared to a scenario analysis using a nurse practitioner or social worker wages. Hours spent conducting the visits and charting were calculated using study data. A one-way sensitivity analysis estimated resource use over a range of visits per caregiver and time per visit. Caregivers received 8.8 visits on average over the study period at 45 minutes per visit. In the base case, TPC cost $330 per caregiver facilitated by a registered nurse, compared to $281 and $489 if facilitated by a social worker or nurse practitioner, respectively. The number of visits had the greatest influence on total costs of the intervention (low of $198, high of $463). TPC is a feasible, low cost strategy to enhance caregiver support in rural areas. These results pose an opportunity to consider reimbursement mechanisms to evaluate the sustainability of transitional palliative care interventions to support caregivers.

IMPACT OF SUBSIDY ON THE USE OF PERSONALIZED MEDICINE IN BREAST CANCER

Cynthia Chen[1], Jue Tao Lim[2], Swee Ho Lim[3], Ern Yu Tan[4], Veronique Kiak Mien Tan[5], Su Ming Tan[6], Tira Tan[7], and Mikael Hartman[8], *1. National University of Singapore, Singapore, Singapore, 2. National University of Singapore, Singapore, Singapore, 3. KK Women's and Children's Hospital, Singapore, Singapore, 4. Tan Tock Seng Hospital, Singapore, Singapore, 5. Singapore General Hospital, Singapore, Singapore, 6. Changi General Hospital, Singapore, Singapore, 7. National Cancer Centre Singapore, Singapore, Singapore, 8. NUS Yong Loo Lin School of Medicine, Singapore, Singapore*

Advances in adjuvant therapy have led to increased survival rates after cancer prognosis. Herceptin, a targeted therapy, had first been introduced to Singapore in 2006. We aimed to assess whether subsidies for Herceptin from 2012 will lead to changes in uptake among Human Epidermal Growth Factor Receptor 2 (HER2) positive patients by socio-economic groups. Two-level random-intercept logistic regression was used to model diagnostic test and Herceptin uptake using the Singapore Breast Cancer Cohort from 2006 to 2018, adjusting for covariates such as education, housing type and marital status before and after subsidies. Interrupted time series (ITS) analysis was used to evaluate the impact of Herceptin subsidy on treatment uptake. The concentration index was also computed to measure inequality in uptake by ethnicity and education. We found that the odds of diagnostic testing were not associated with socioeconomic factors. However, before subsidies, the highest education attained (OR = 4.57, 95% CI= (1.90, 11.02), P< 0.01) significantly increased the odds of Herceptin uptake. These odds were levelled after the introduction of subsidies to Herceptin treatment in 2012. After subsidy, we also found that Herceptin uptake increased significantly by 11.4% (95% CI= (3.47%, 19.4%), P=0.016). Also, inequality of Herceptin use decreased especially amongst the Indians, where at least 40% were used in the higher educated group prior to the subsidy. Subsidies have lowered the barriers to Herceptin uptake for marginalized individuals. Having targeted subsidies for socio-economically disadvantaged groups may work more efficiently in providing ease of access than a blanket subsidy in Herceptin.

SESSION 3400 (PAPER)

PHYSIOLOGICAL MECHANISMS AND AGING

AGING-RELATED HUMAN MONOCYTE TRANSCRIPTOMIC PATHWAYS PREDICT WORSENING MULTIMORBIDITY

Jingzhong Ding[1], Kurt Lohman[2], Alain Bertoni[3], Steven Shea[4], Wendy Post[5], James Pankow[6], Stephen Kritchevsky[3], and yongmei Liu[2], *1. Wake Forest University, Winston Salem, North Carolina, United States, 2. Duke University School of Medicine, Durham, North Carolina, United States, 3. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 4. Columbia University, New York, New York, United States, 5. Johns Hopkins University, Baltimore, Maryland, United States, 6. University of Minnesota, Minneapolis, Minnesota, United States*

In a cross-sectional analysis, we identified aging-associated monocyte transcriptional modules associated with the multimorbidity in the Multi-Ethnic Study of Atherosclerosis (MESA) study. Here we examine whether these modules predict worsening multimorbidity over time. Transcriptomic profiles were determined in circulating monocytes from 1,264 MESA participants aged 55-94 (51% female, 53% minority). The multimorbidity index was defined as the number of prevalent diseases: cardiovascular disease, type-2 diabetes, hypertension, cancer, dementia, chronic kidney disease, chronic obstructive pulmonary disease, and hip fracture. The mean index at baseline was 1.0 (33%, 45%, and 22% with 0, 1, and 2-6 diseases respectively). At baseline, the index was associated with 5 co-expressed transcriptional modules (FDR< 0.05). During a 6-year follow-up, 449 individuals developed new morbidities. In Cox proportional hazards regression models, 4 (p< 0.05) of these 5 modules including those enriched for downregulation of apoptosis (RH=1.11 per SD increment, p=0.03) and upregulation of complement subcomponent C1q (RH=1.14, p=0.005) predicted incident morbid diseases after adjusting for age, sex, race/ethnicity, study site, and the baseline multimorbidity index. Persons having above the median expression of both modules developed an average of 0.63 new diseases, while those with both below the median developed an average of 0.40 new diseases. These two modules predicted increasing morbidities independently of one another and IL6 levels (p< 0.05). In conclusion, transcriptomic analysis of human immune cells provided evidence that decreased apoptosis and increased immune response predict the onset of a variety of age-related diseases. Whether targeting these pathways will change morbidity risk remains to be demonstrated.

EIGHT-YEAR CHANGES IN DEFICIT ACCUMULATION FRAILTY: RELATION TO GLYCEMIC CONTROL AND DIABETES MEDICATION USE

Felicia Simpson[1], Edward Boyko[2], Chloe Ferris[3], Jamie Justice[4], Stephen Kritchevsky[4], Jeanne Mccaffery[5], Scott Pilla[6], and Mark Espeland[4], *1. Winston-Salem State University, Winston-Salem, North Carolina, United States, 2. University of Washington School of Medicine, Seattle, Washington, United States, 3. Washington University School of Medicine, St. Louis, Missouri, United States, 4. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 5. University of Connecticut, Storrs, Connecticut, United States, 6. The Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Type 2 diabetes mellitus (T2DM) has been linked to accelerated biological aging and the accumulation of health deficits. It is unknown whether glycemic control can slow the progression of aging, as expressed by deficit accumulation frailty indices (FIs). We examined the cross-sectional and longitudinal associations that glycemic control, diabetes medication use, and weight change (predictors) had with a FI calculated as the percent of 36 deficits in behavioral, functional, and clinical characteristics (outcome). We drew data from 4177 participants across 8 years of follow-up in the Look AHEAD clinical trial of a multidomain intensive lifestyle intervention in individuals aged 45-76 years with T2DM and overweight or obesity. At baseline, the means(SD) FI(as a percent) for participants grouped as HbA1c< 7%, 7-7.9%, and >8% were: 19.93(6.45), 20.82(6.89), and 21.53(7.27), p< 0.001. Compared with HbA1c>8%, HbA1c< 7% at baseline was associated with 23% less mean 8-year FI progression: 2.42(7.35) vs 3.14(8.02), p< 0.001). Maintaining average HbA1c< 7% vs >8% during follow-up was associated with 47% less 8-year FI progression: 2.05(7.35) vs 3.14(8.02), p< 0.001. With adjustment for HbA1c, sustained weight loss >5% compared with weight gain >5% was associated with an 81% reduction in 8-year FI progression: 1.18(7.25) vs 3.89(8.09), p< 0.001. Use of metformin across >50% of annual visits was associated with a 30% reduction in 8-year progression of FI as compared with less use or no use: 2.25(7.27) vs 3.22(7.90), p=0.002. We conclude that better control of HbA1c, and sustained weight loss (>5%) and metformin use, may slow the accelerated aging associated with T2DM.

EPIGENETIC AGING IN OLDER BREAST CANCER SURVIVORS: THE THINKING AND LIVING WITH CANCER (TLC) STUDY

Kelly Rentscher[1], Traci Bethea[2], Wanting Zhai[2], Harvey Cohen[3], Brent Small[4], Tim Ahles[5], Jeanne Mandelblatt[2], and Judith Carroll[6], *1. Medical College of Wisconsin, Milwaukee, Wisconsin, United States, 2. Georgetown University, Washington, District of Columbia, United States, 3. Duke University, Durham, North Carolina, United States, 4. University of South Florida, Tampa, Florida, United States, 5. Memorial Sloan Kettering Cancer Center, New York, New York, United States, 6. University of California, Los Angeles, Los Angeles, California, United States*

Cancer and its treatments increase risk for age-related disease, and biological aging may be a key mechanism; however, no research to date has examined epigenetic markers of aging in long-term breast cancer survivors. We used data from a national, prospective cohort to test whether older breast cancer survivors had accelerated epigenetic aging compared to non-cancer controls. Non-metastatic breast cancer survivors ages 62–84 years who received chemotherapy with or without hormonal treatment (n=29) or hormonal treatment alone (n=51), and controls frequency-matched on age, race, education, and time between blood draws (n=101), provided two blood samples between 24- and 60-months post-diagnosis (time between samples average=1.8 years). DNA methylation profiling (Illumina Infinium EPIC array) derived epigenetic aging measures: extrinsic, intrinsic, phenotypic, Grim, and Dunedin Pace of Aging (PoAm). Mixed-effects models tested effects of treatment group and change over time on epigenetic aging, adjusting for chronologic age and comorbidities. Survivors who received chemotherapy +/- hormonal treatment had a biological age 1.9–2.6 years older than controls based on extrinsic, intrinsic, and Grim estimates (p=.045, .045, and .001, respectively). Survivors who received hormonal treatment alone had an extrinsic biological age 1.6 years older than controls (p=.032) and a faster Dunedin PoAm (p=.040). Survivors who received chemotherapy +/- hormonal treatment had a trend for accelerated extrinsic aging over time compared to controls (p=.087). Older breast cancer survivors, especially those receiving chemotherapy, showed an accelerated epigenetic aging profile compared to matched women without cancer. Future research is needed to examine associations with age-related survivorship outcomes.

GENOME-WIDE ASSOCIATION META-ANALYSIS OF PHYSICAL PERFORMANCE IN OLDER ADULTS

Adam Santanasto[1], Douglas Kiel[2], David Karasik[3], Ryan Cvejkus[4], Mary Biggs[5], Kathryn Lunetta[6], Joanne Murabito[7], and Joseph Zmuda[4], *1. School of Public Health, University of Pittsburgh, Oakmont,* *Pennsylvania, United States, 2. Harvard Medical School, Boston, Massachusetts, United States, 3. Hebrew SeniorLife, Roslindale, Massachusetts, United States, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 5. University of Washington, Seattle, Washington, United States, 6. Boston University School of Public Health, Boston, Massachusetts, United States, 7. Boston University, Boston, Massachusetts, United States*

Although measures of physical function such as walking speed and time to complete chair-rises are highly heritable, the genetic architecture underlying these phenotypes remains poorly defined. To identify potentially novel genes and pathways underlying physical performance in older adults, we conducted a genome-wide association meta-analysis of the short physical performance battery (SPPB) (Score 0-12) and one of its components, chair-rise time (seconds) in 24,033 Caucasian adults aged 60+ from 13 cohorts (mean cohort age 66.2 ± 5.3 to 84.3 ± 4.1 years; 56.5% women). Cohorts had a genome wide scan imputed to either the Haplotype Reference Consortium or Trans-Omics for Precision Medicine imputation panels. Single nucleotide polymorphism (SNPs) with a minor allele frequency ≥0.1% and imputation quality score ≥0.7 were included (range 7.5-10.5 million per cohort). Analyses were adjusted for age, sex, height, and population substructure. Meta-analysis was performed using a fixed-effects model. Although no genome-wide significant loci were identified, 67 and 60 suggestive loci ($p< 5*10^{-5}$) were detected for SPPB score and chair-rises time, respectively. Pathway-based analyses indicated significant enrichment of genes affecting negative regulation of calcium channel activity (Bonferroni corrected p-value < 0.05). Sex-stratified gene-based analyses identified clathrin vesicle-associated sec14 protein 1 (CLVS1), significantly associated with chair-rise time in women ($p= -1.5*10^{-7}$). CLVS1 is highly expressed in the cerebellum, which is involved in postural and motor function control. A larger sample size is needed to confirm and extend our findings, but our results potentially implicate a novel pathway and locus for physical performance in older women.

PLASMA PROTEOMIC SIGNATURE OF DECLINE IN GAIT SPEED AND GRIP STRENGTH

Xiaojuan Liu[1], Stephanie Pan[2], Vanessa Xanthakis[2], Vasan Ramachandran[2], Anne Newman[3], Jason Sanders[4], Thomas Austin[5], and Michelle Odden[1], *1. Stanford University, Stanford, California, United States, 2. Boston University School of Public Health, Boston, Massachusetts, United States, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 4. Vertex Pharmaceuticals, Boston, Massachusetts, United States, 5. University of Washington, Seattle, Washington, United States*

Physical function predicts health-related quality of life. The biological mechanisms underlying declines in physical function with age remain unclear. We examined the plasma proteomic profile associated with longitudinal changes of physical functions measured by gait speed and grip strength in community-dwelling adults. We applied aptamer-based platform to assay 1,161 plasma proteins on 2,871 participants (60% women, aged 76 years) in Cardiovascular Health Study (CHS) in 1992/1993 and 1,550 participants (55% women, aged 54 years) in Framingham Offspring Study (FOS) in 1991-1995. Gait speed and grip strength were measured annually for 6 years in CHS and at cycles 7 (1998-2001) and 8 (2005-2008) in FOS. The associations of individual protein levels (log-transformed and standardized) with longitudinal changes of gait speed and grip strength in two populations were examined separately by linear mixed effect models. Meta-analyses were implemented using random effect models with a Bonferroni correction for multiple testing. We found that plasma levels of 18 and 12 proteins were associated with changes in gait speed and grip strength, respectively (Bonferroni-corrected p < .05). The proteins most strongly associated with gait speed decline were growth/differentiation factor 15 (GDF-15) (uncorrected Meta-analytic p = 1.60E-15), pleiotrophin (PTN) (1.29E-08), and metalloproteinase inhibitor 1 (TIMP-1) (2.02E-08). For grip strength decline, the strongest associations were for GDF-15 (1.39E-07), carbonic anhydrase III (6.60E-07), and TIMP-1 (3.21E-06). Several statistically significant proteins are involved in the alternative complement pathway, extracellular matrix remodeling or immune function. These novel proteomic biomarkers may inform our understanding of the pathophysiology of functional decline.

SESSION 3410 (SYMPOSIUM)

PREPARING FOR THE FUTURE OF TECHNOLOGY TO SUPPORT OLDER ADULTS: PERSPECTIVES FROM THE CREATE CENTER

Chair: Patricia Heyn

The rapid advancement of technology promises new opportunities to help older adults maintain health, wellbeing, community and productive engagement, and purpose in life. However, the potential of technological innovation will not be met unless technology solutions account for the needs, preferences, and abilities of older users and involve older adults in all stages of the design process. This has been the primary focus of the Center for Research and Education on Aging and Technology Enhancement (CREATE). This symposium will discuss threats to the promise of these solutions and approaches to overcome these barriers. This session will start with N. Charness presenting an overview of digital inequity and the current state of the age-related "digital divide." J. Sharit will then present an experimental study examining older adults' willingness to adopt new technologies and attitudinal barriers to adoption. W. Boot will discuss CREATE research that has focused on the potential of virtual reality to improve the lives of older adults and potential facilitators and barriers to successful virtual reality experiences among older adults. W. Rogers will discuss the potential of voice interfaces for emerging technologies, challenges related to the success of this approach, and research gaps. Finally, S. Czaja will conclude with a broad discussion of future applications of technology to support older adults, including how developments in artificial intelligence, sensing technologies, and robotics that can be used to foster everyday activities, cognitive, physical, and emotional health.

ACHIEVING DIGITAL EQUITY FOR OLDER PERSONS WITH EMERGING TECHNOLOGY: THE CASE OF NORTH AMERICA

Neil Charness, *Florida State University, Tallahassee, Florida, United States*

The United Nations' theme for the International Day of Older Persons 2021 was "Digital Equity for All Ages". I define digital equity, then compare progress in North America, focusing on Canada, the USA, and Mexico for internet, smartphone, and broadband access. An age-related digital divide for internet and computer use, first identified in the USA in 1999, persists. Where year-to-year comparisons are available, I also discuss the impact of the pandemic on technology adoption. National data sets measuring internet use show that there are similarities and differences in the USA and Canada in factors influencing adoption. For smartphone ownership, Mexico showed gender differences favoring men, unlike the case in the USA and Canada. For broadband access in the USA inequity was seen as a function of age, race/ethnicity, education and income, and urban/rural residence. I discuss potential reasons for inequitable access and potential approaches to achieve greater equity.

OLDER ADULTS' WILLINGNESS TO ADOPT TECHNOLOGIES: AN EXPERIMENTAL STUDY

Joseph Sharit[1], Jerad Moxley[2], and Sara Czaja[3], *1. University of Miami, Davie, Florida, United States, 2. Weill Cornell Medicine, New York, New York, United States, 3. Weill Cornell Medicine, New York City, New York, United States*

Understanding why older adults are willing to consider using technology is critical for ensuring that that the advantages of technology for improving the quality of their lives can be realized. Prior emphasis in this area has primarily been on questionnaire studies directed at capturing relatively general attitudes older adults have toward technology. We report on an empirical study that included 187 male and female adults 65-92 years of age who were given presentations on each of five technologies spanning domains that included transportation, leisure, health, and new learning. Each presentation was followed by a series of ratings on measures hypothesized to influence participants' willingness to adopt the technology. We will overview the Technology Assessment Procedure, the methodology developed to evaluate willingness to adopt a technology, and measures that were collected. We will also present a model used to predict willingness to adopt the technology and provide some initial findings.

POTENTIAL AND PITFALLS IN THE USE OF EXTENDED REALITY TO SUPPORT OLDER ADULTS

Walter Boot, and Andrew Dilanchian, *Florida State University, Tallahassee, Florida, United States*

Extended Reality (XR), including Virtual Reality (VR) and Augmented Reality (AR), holds tremendous potential with respect to being able to support older adults' performance of Instrumental Activities of Daily Living (IADLs), activities crucial for independence, and Enhanced Activities of Daily Living (EADLs), activities that promote enjoyment, wellbeing, and quality of life. This presentation will draw from multiple empirical studies conducted within the CREATE Center, and other studies from the literature, on potential barriers older adults may face to obtaining these benefits. In particular, this presentation will focus on the construct of presence, the sense of "being there" in a virtual environment, which has been described as the defining characteristic of successful VR experiences, usability challenges, and challenges related to cybersickness.

EXPLORING THE POTENTIAL OF VOICE INTERFACES FOR EMERGING TECHNOLOGIES: OPPORTUNITIES AND CHALLENGES

Wendy Rogers[1], George Mois[2], Kenneth Blocker[3], and Raksha Mudar[1], *1. University of Illinois Urbana Champaign, Champaign, Illinois, United States, 2. University of Illinois Urbana-Champaign, Urbana Champaign, Illinois, United States, 3. University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Successful human-technology interactions require that people be able to communicate their intentions to the technology. Emergent technologies such as virtual assistants, digital home assistant, smart phones, robots, and smart appliances are enabling voice activation and communication. This is potentially a positive trend as people often express a preference for using familiar methods of communicating with other people in their interactions with technologies. Presumably they expect these methods to be easier to learn and more effective. However, current voice technology interfaces are often dependent on specific language, cadence, and terminology that pose challenges for older adults to master. Moreover, age-related changes in voice characteristics, speech patterns, and the variability between individuals may lead to comprehension failures on the part of the technology. We have utilized research findings to develop implementation guidelines for use of voice interfaces with older adults. We also identify research gaps to provide a roadmap for future efforts.

TECHNOLOGY TO SUPPORT AGING ADULTS: FUTURE APPLICATIONS

Sara Czaja[1], Walter Boot[2], Neil Charness[2], Wendy Rogers[3], and Joseph Sharit[4], *1. Weill Cornell Medicine, New York City, New York, United States, 2. Florida State University, Tallahassee, Florida, United States, 3. University of Illinois Urbana Champaign, Champaign, Illinois, United States, 4. University of Miami, Davie, Florida, United States*

The aging of the population is projected to continue for the upcoming decades. Thus, innovative strategies are needed to support current and future cohorts of older adults. In this regard, there are exciting developments in technology that have the potential to meet the needs of population aging. This summary presentation will discuss emerging technology applications such as developments in artificial intelligence, sensing technologies, and robotics that can be used to foster everyday activities, cognitive, physical, and emotional health. A framework will be provided to characterize current and emerging technology applications for older adults within life domains. Current research examining the efficacy, feasibility, and acceptability of these technologies with older adult populations will be also summarized. Recommendations for needed future research in the aging and technology domain will also be provided to ensure that the emerging technology applications are designed to meet the needs, abilities, and preferences of aging adults.

SESSION 3420 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: EMBRACING OUR DIVERSITY IN GERONTOLOGY EDUCATION: PERSPECTIVES ON STRATEGIES AND LEARNERS

Chair: Joann Montepare Co-Chair: Dana Bradley
Discussant: Tamara Baker

Our populations are not only becoming older, but also becoming more diverse on several fronts. Our new social structures call for new strategies for embracing our diversity in how we design and deliver education about aging in and beyond the classroom. In this AGHE Presidential Symposium, educators will discuss innovative and needed ways we can integrate diversity in gerontological pedagogical practices. To begin, Rona Karasik (St. Cloud State University) will discuss the call for integrating anti-racist strategies in classroom practices, and offer examples of several such strategies. Next, Brian Carpenter (Washington University in St. Louis) will discuss shrinking geropsychology pipelines, especially for students from racial and ethnic groups, and will share recommendations for expanding these pipelines. Aaron Guest (Arizona State University) will then discuss the need to extend diversity and education efforts to include LGBTQ individuals and issues. Karen Lincoln (University of Southern California) will discuss the need to move educational efforts beyond our classrooms to diverse learners in our communities. To this end, she will describe a dynamic academic–community partnership that provides aging-focused education to African-American older adults. Dana Burr-Bradley (University of Maryland, Baltimore County) will give the final presentation with a discussion about the need for an international lens that appreciates the global diversity of the aging experience. Tamara Baker (University of North Carolina, Chapel Hill) will serve as the discussant and offer her perspective on how the need to embrace our diversity in gerontology education cuts across all GSA units and connects them with AGHE's educational mission.

STRATEGIES FOR INTEGRATING ANTIRACIST PEDAGOGY INTO GERONTOLOGICAL EDUCATION

Rona Karasik, and Kyoko Kishimoto, *St. Cloud State University, St. Cloud, Minnesota, United States*

Talking about diversity in gerontology is not new. Documenting racial disparities among older adults is not new. So what is different about applying antiracist pedagogy to teaching about aging and why should gerontology educators embrace it? Anti-racist pedagogy seeks to move beyond simply incorporating racial content into gerontology coursework. It involves acknowledging structural racism's existence and relation to aging, uncovering its root causes in historical and political context, and studying its impact not just over the life course, but from generation to generation. Anti-racist pedagogy challenges students to learn how racial disparities among older adults emerged, why they persist, and what can be done about them. Applying anti-racist pedagogy can also challenge gerontological educators, who must find/prepare appropriate materials, as well as engage students in work that is potentially unfamiliar and/or uncomfortable. This presentation offers some strategies, examples, and pitfalls to avoid when incorporating anti-racist pedagogy into the gerontological curriculum.

DIVERSIFYING THE PATHWAY: A MULTIFACETED APPROACH WITHIN GEROPSYCHOLOGY

Brian Carpenter[1], Flora Ma[2], and Kimberly Hiroto[3], *1. Washington University in St. Louis, St. Louis, Missouri, United States, 2. Stanford HealthCare Psychology, Palo Alto, California, United States, 3. VA Palo Alto Health Care System, Palo Alto, California, United States*

Like other health services disciplines, geropsychology is facing a paucity of diverse intersectional identities within a larger shortage of interest in aging across all levels of training. We need an incisive and comprehensive plan to enhance the representation of historically marginalized groups within geropsychology and address systemic factors limiting entrance into the field. In this presentation, we review the projected need for mental health services attuned to equity, diversity, and inclusion and current trends in the geropsychology pathway. Then we describe several initiatives to expand attention to cultural humility and antiracism. These include the development of foundational competencies that include attention to diverse representations, which can be disseminated to pre- and post-licensure generalists and specialists; diversity-infused offerings within recent conferences and webinars; and efforts to intensify the focus on diversity within psychology's aging-related professional organizations. Finally, we conclude with additional suggestions to expand and sustain attention to diversity.

ENSURING COMPETENCE: ADDRESSING THE NEED FOR LGBTQ+ AGING EDUCATION

Aaron Guest, *Arizona State University, Phoenix, Arizona, United States*

The continued demographic shifts in population aging are coupled with an increase in self-identified, LGBTQ+ individuals entering older age. While they share some common age-related experiences with non-LGBTQ+ individuals, they also face unique challenges as they age, including additional intersectional pressures beyond their sexual or gender identity. These challenges are exacerbated by pre-existing health inequities and heteronormative social support systems. Of particular concern is the ability to locate affirming and accessible social and health services. Gerontologists have a critical role in assisting older LGBTQ+ individuals in navigating complex social systems. To do so requires they have the appropriate education to develop the cultural humility needed to understand and assist these individuals. It necessitates the engagement of gerontology and geriatric education programs in educating future gerontologist professionals about LGBTQ+ older individuals. Critically, it requires the identification of appropriate instructors who are equipped to educate on LGBTQ+ aging topics.

IF THEY BUILD IT, THEY WILL COME: ENGAGING OLDER AFRICAN AMERICANS IN EDUCATION AND RESEARCH

Karen Lincoln, *University of Southern California, Los Angeles, California, United States*

Engaging African Americans in health education and research is a mechanism for addressing health disparities and achieving health equity. The science of engagement and retention requires strong community partnerships, authentic leadership, and educational opportunities for students and the broader community. In this presentation, Karen Lincoln will discuss how findings from her research on health and mental health disparities laid the foundation for her community-based health education program and public scholarship. She will highlight Advocates for African American Elders (AAAE), the health education program that she founded and directs. AAAE provides culturally competent health education for older African Americans throughout Los Angeles County and has become a hub for her research, training and mentoring.

EXPLORING DEI IN A GLOBAL PERSPECTIVE: AGHE INSIGHTS INTO OUR WORK SUPPORTING GERONTOLOGY AND GERIATRIC EDUCATORS

Dana Bradley[1], and Judith Howe[2], *1. University of Maryland, Baltimore County, Baltimore, Maryland, United States, 2. Ichan School of Medicine at Mount Sinai, Bronx, New York, United States*

Gerontologists across the globe make a sincere effort to create a learning, teaching, and research space that promotes the dignity of older persons. Indeed, this impetus imbues our work where all are treated with dignity and respect. The authors (AGHE chair and past chair) reached out to international educators to better understand how AGHE is supporting their efforts and how we may do so in the future. Our starting point was the GSA policy on Diversity, Equity, and Inclusion (2021). These policies laid out a groundwork that embraces inclusive membership cultivates practices that build a culturally inclusive workforce, foster research practices, and ensure that people from disproportionately affected and marginalized communities thrive in GSA. This paper offers insight into how our international community is thinking about DEI and incorporating it into teaching, research and engagement work.

SESSION 3430 (SYMPOSIUM)

REIMAGINING ADRD IN CONTEXT

Chair: Kristine Ajrouch Co-Chair: Toni Antonucci
Discussant: Damali Martin

This symposium embraces diversity and discovery to address contextual issues in aging, specifically issues of race and ethnicity in the study of cognitive health and Alzheimer's Disease and Related Dementia (ADRD). Rooks and colleagues compare dementia risk among African American and White men and women in the context of work using the longitudinal Health, Aging, and Body Composition data. They consider the effects of productive activities on dementia risk in gender stratified models, adjusting for socio-demographic and genetic factors. Siddiq and colleagues consider the contexts of migration. Using a multi-method approach, they establish priorities for interventions addressing ADRD risk among older adult immigrants and refugees from Afghanistan and the Middle-East and North Africa (MENA) in California. Sayed also investigates the context of migration, and uses qualitative data (N=31) to identify the psychosocial impact of COVID-19 on cognitive aging in Middle Eastern/Arab Americans immigrants and refugees in Michigan. Finally, Meier and colleagues consider contexts of metal exposure for cognitive decline among Latinos aged 65 and older using the Sacramento Area Latino Study on Aging. In total, this symposium highlights the benefits of reimagining contextual factors that influence ADRD to improve our understanding and the potential to reduce health disparities research in underrepresented racial and ethnic populations.

ALZHEIMER'S DISEASE AND RELATED DEMENTIAS RISK AND PSYCHOSOCIAL HEALTH NEEDS OF OLDER ADULT IMMIGRANTS AND REFUGEES

Hafifa Siddiq[1], Nahla Kayali[2], and Kristine Ajrouch[3], *1. Charles R. Drew University, Garden Grove, California, United States, 2. Access California Services, Anaheim, California, United States, 3. Eastern Michigan University, Ypsilnati, Michigan, United States*

To establish priorities for an intervention addressing Alzheimer's Disease and Related Dementias (ADRD) risk among older adult immigrants and refugees from Afghanistan and the Middle-East and North Africa (MENA). A multi-methods Community-Based Collaborative Action Research design was employed to gather qualitative and quantitative data. Twenty community leaders and stakeholders participated in interviews and community needs survey responses of 124 ethnically diverse adults over age 55 were examined. We analyzed community needs survey data using descriptive statistics. A step-wise Thematic Analysis was used to analyze interview transcripts. A major theme and standout priority was identified: needing culturally-sensitive services and resources addressing social isolation among the elderly. Other psychosocial priorities included: accessibility needs, caregiving support, safety and end-of-life resources, digital literacy, and English language services. This study exemplifies a priority-setting partnership between clinician-researchers and refugee service providers. The priorities highlighted ADRD risk factors and guide the collaborative development of a community-based intervention.

RACE, GENDER, AND LATE-LIFE PRODUCTIVE ACTIVITIES AND DEMENTIA IN THE HEALTH ABC STUDY

Ronica Rooks[1], Wassim Tarraf[2], Lindsay Ryan[3], and Toni Antonucci[4], *1. University of Colorado Denver, Denver, Colorado, United States, 2. Wayne State University, Detroit, Michigan, United States, 3. The University of Michigan, Ann Arbor, Michigan, United States, 4. University of Michigan, Ann Arbor, Michigan, United States*

We hypothesized productive activities, e.g., working and volunteering, would reduce dementia risk and mitigate racial disparities using longitudinal Health, Aging, and Body Composition data (n=3,069). We ran gender-stratified logistic regression models for dementia with socio-demographic and APOE adjustments. Among older men, no significant relationships existed between dementia with work, volunteering, or race in any models. Among older women, in unadjusted models, working vs. not (Yr1) was significantly related to 30% lower odds of dementia ($OR=0.70, p\leq0.05$), and volunteering vs. not (Yr1) was significantly related to 24% lower odds of dementia ($OR=0.76, p\leq0.05$). But, these activities were not significant in other models. Black vs. White women had 35% ($OR=1.35, p\leq0.05$) and 32% ($OR=1.32, p=0.052$) higher odds of dementia in working and volunteering models with socio-demographic adjustments, respectively, but race was not significant after APOE adjustment. Productive activities are possible contextual interventions to reduce racial disparities in incident dementia among older women.

METALS EXPOSURE AND COGNITIVE DECLINE IN LATINO ELDERS: RESULTS FROM THE SACRAMENTO AREA LATINO STUDY ON AGING

Helen Meier[1], Kelly Bakulski[2], and Allison Aiello[3], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. University of Michigan School of Public Health, Ann Arbor, Michigan, United States, 3. Carolina Population Center, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

Latinos have a higher risk of Alzheimer's disease and related dementias (ADRD) and clinical presentation could take place 7 years earlier, on average, than non-Hispanic whites. This health disparity will likely intensify as the US Latino population over 65 years is predicted to grow from 4 million in 2016 to 19.9 million in 2060. Environmental exposures, such as metals, are of interest as contextual factors contributing to ADRD due to their known neurotoxic effects, particularly in early life. Using data from the Sacramento Area Latino Study on Aging, we examined the association between blood concentrations of five metals and cognitive outcomes. We hypothesized that Latino elders with higher concentrations of non-essential metals will have greater cognitive decline than those with lower concentrations of non-essential metals. Initial results suggest non-essential blood metal levels are not sociodemographically patterned in SALSA participants. Higher lead and mercury concentrations was associated with cognitive decline.

THE PSYCHOSOCIAL IMPACT OF COVID-19 ON COGNITIVE AGING ARAB AMERICAN IMMIGRANTS IN MICHIGAN

Linda Sayed, *Michigan State University, East Lansing, Michigan, United States*

This study examines the psychosocial impact of COVID-19 on cognitive aging Middle Eastern/Arab Americans immigrants and refugees in Michigan. Sociopolitical experiences as an immigrant and/or refugee may have unique effects on late-life cognitive health. Given that social engagement reduces the risk of ADRD, this study sought to examine the consequences of COVID-19 socialization restrictions on familial and communal support systems for aging Middle Eastern/Arab immigrants and refugees. Three focus groups discussions with 8-10 participants each (N=31) conducted at local Arab organizations and religious institutions were conducted followed by inductive analysis. Preliminary results indicate two prominent themes: 1) Social and Familial Hardships; and 2) Isolation. Narratives illustrate the prevalence of psychosocial ADRD risk from COVID-19. Findings are discussed within a stress framework to advance universal and unique elements of Arab immigrant and refugee cognitive aging.

SESSION 3440 (PAPER)

SOCIAL DETERMINANTS OF HEALTH (PAPERS)

COHORT EFFECTS IN OLD-AGE COGNITIVE AGING: A STUDY OF SOCIAL CONTEXT IN CHILDHOOD IN 140,030 OLDER ADULTS

Stacey Scott[1], Zared Shawver[1], Sean Clouston[1], Yun Zhang[1], Stacey Voll[2], Patrick O'Keefe[3], Joeseph Rodgers[4], and Scott M. Hofer[2], *1. Stony Brook University, Stony Brook, New York, United States, 2. University of Victoria, Victoria, British Columbia, Canada, 3. Oregon Health and Science University, Portland, Oregon, United States, 4. Vanderbilt University, Nashville, Tennessee, United States*

Researchers have reported that later-born cohorts often have higher scores on cognitive tests, potentially indicating that some of the differences normally attributed to cognitive aging may reflect developmental differences. The present study examined the hypotheses that social factors at birth and in early adolescence might partially explain birth cohort effects. This secondary analysis of data collected prospectively as part of four internationally comparable and nationally representative studies of individuals aged 50 and older residing in 17 European countries and the United States (N=140,030). Cognition was prospectively measured longitudinally 360,150 observations spanning, on average, 4.27 (SD=5.12) years allowing us to leverage age/cohort variability. Multilevel longitudinal modeling was used incorporated random intercepts and slopes at the country and individual levels to model lifetime cognition while adjusting for contextual factors. Birth cohort was associated with height (B=0.095, SE=0.002, P< 1E-06), episodic memory (B=0.105, SE=0.001, P< 1E-06), and verbal fluency (B=0.217, SE=0.002, P< 1E-06). Approximately 7.72% (95% C.I.=[7.60-7.86]) of participants were exposed to at least two years of famine in childhood, and were born into countries with moderate levels of income inequality. Multivariable adjustment accounted for 15.10-24.96% of birth cohort effects in episodic memory and verbal fluency respectively. Longitudinal modeling revealed that after adjusting for famine, war, income inequality, educational attainment, and height, these factors explained 81.58-63.65% of the birth cohort effect in episodic memory and verbal fluency respectively. Global research has reported that early life factors can have an impact on development, so this study extends this to suggest these factors have a lifelong impact.

GRANDPARENTS' EDUCATION IS ASSOCIATED WITH GRANDCHILDREN'S EPIGENETIC AGE IN THE NGHS STUDY

Agus Surachman[1], Elissa Hamlat[1], Anthony Zannas[2], Barbara Laraia[3], and Elissa Epel[1], *1. University of California, San Francisco, San Francisco, California, United States, 2. University of North Carolina, Chapel Hill, North Carolina, United States, 3. University of California Berkeley, Berkeley, California, United States*

We leveraged information solicited from three generations (grandparents, mothers, and grandchildren) to examine the association between mothers' childhood SES (based on grandparents' educational attainment) and their children's epigenetic age and whether the association was mediated by mothers' life course socioeconomic and health-related factors. Mothers were recruited to the NHLBI Growth and Health Study when they were 9 or 10 and followed for ten consecutive years (1987-1998). Grandparents reported their highest education during the baseline interviews. Mothers were then re-contacted three decades later (ages 37-42) to participate in the National Growth and Health Study (NGHS), and health information of their youngest children (i.e., grandchildren; N = 241, ages 2-17) were collected, including their saliva samples to calculate epigenetic age. Two epigenetic ages were estimated (Horvath and Hannum), and DNA methylation age accelerations (DNAmAAs) were calculated using residuals from regressing chronologic age on each epigenetic age metrics. Mothers' life course socioeconomic and health-related mediators included childhood BMI trajectories (from age 9 to 19), highest education level, adult health behavior, and adult c-reactive protein (CRP). Adjusted for age and sex, grandchildren with college degree grandparents showed significantly slower Horvath's DNAmAA than those with no college degree. The association between grandparent's education level and grandchildren's DNAmAA was partially mediated by mothers' life course socioeconomic and health-related factors, especially mothers' education, health behavior, and CRP. Grandparents' educational attainment is a critical socioeconomic context of mothers' early rearing, and it might have a long-lasting impact on their grandchildren's epigenetic marker.

IMPACT OF OBJECTIVE AND SUBJECTIVE SEP ON AGING TRAJECTORIES OF FUNCTIONAL CAPACITY

Deborah Finkel[1], Charlotta Nilsen[2], Shireen Sindi[3], and Ingemar Kåreholt[2], *1. Indiana University Southeast, New Albany, Indiana, United States, 2. Jönköping University, Jönköping, Jonkopings Lan, Sweden, 3. Karolinska Institutet, Solna, Stockholms Lan, Sweden*

Long-term stress is associated with adverse health outcomes in aging. It is important to identify not only factors that influence functioning in late adulthood, such as accumulated stress, but also the timing of such factors. The aim of the current analysis was to examine how socioeconomic stressors throughout the life course are associated with aging in functional capacity. Data were available from 740 adults ranging in age from 40 to 83 at intake (mean = 62.4, SD = 8.2) who participated in up to 8 waves of data collection (mean = 3.9, SD = 2.4). A Functional Aging Index (FAI) was created by combining measures of sensory, pulmonary, gait, and grip functioning. Both childhood and adulthood measures of objective socioeconomic position (SEP) and perceived SEP (financial strain) were available. Latent growth curve models (corrected for twinness) were used to estimate the trajectory of change in FAI over age and the impact of child and adult SEP measures on the trajectories. Results indicated that both childhood and adult objective SEP independently influenced rates of change in FAI in adulthood: higher SEP was associated with higher mean functioning and slower rates of decline. In combination, model fitting indicated that if SEP is above the median in adulthood, then childhood SEP has no impact on FAI trajectories; however, if SEP is below the median in adulthood, then childhood SEP can play a role. In addition, results indicated possible long-term effects of childhood financial strain on rates of change in FAI in adulthood.

IN THE EYES OF THE BEHOLDER: RACE, PLACE, AND HEALTH

Alfredo Velasquez[1], Jason Douglas[1], Fangqi Guo[2], and Jennifer Robinette[2], *1. Chapman University, Orange, California, United States, 2. Chapman University, Chapman/Orange, California, United States*

Racial and ethnic health disparities are fundamentally connected to neighborhood quality. For example, racial and ethnic minorities are more likely to live in neighborhoods with signs of physical disorder (e.g., graffiti, vandalism), and physically disordered environments have been noted to associate with increased risk for chronic illness. Given that older adults may spend more time in their neighborhoods than younger adults as they transition out of the workforce, examining associations between neighborhood physical disorder and health among older minorities is of critical importance. Using 2016-2018 Health and Retirement Study (HRS) data, a representative sample of US adults aged 51 years and older (n= 9,080, mean age 68 years), we conducted a series of weighted linear regressions to examine links between neighborhood disorder as rated by third parties and both participant-perceived neighborhood safety and self-rated health. Study results indicated that higher neighborhood physical disorder was significantly related to more neighborhood safety concerns among non-Hispanic White and Hispanic residents, but not among non-Hispanic Blacks. On the other hand, neighborhood physical disorder was significantly associated with poorer health among all racial/ethnic groups. These patterns persisted after adjusting for education, sex, age, and census tract concentrated disadvantaged, population density, and racial/ethnic diversity. Our results indicate that community level interventions targeting neighborhood physical disorder may improve community health and minimize racial/ethnic health disparities.

SOCIAL STRESSORS ASSOCIATED WITH AGE-RELATED T LYMPHOCYTE PERCENTAGES IN OLDER US ADULTS: EVIDENCE FROM THE HRS

Eric Klopack[1], Eileen Crimmins[2], Steve Cole[3], Teresa Seeman[3], and Judith Carroll[4], *1. University of Southern California, Leonard Davis School of Gerontology, Los Angeles, California, United States, 2. University of Southern California, Los Angeles, California, United States, 3. University of California Los Angeles, Los Angeles, California, United States, 4. University of California, Los Angeles, Los Angeles, California, United States*

Exposure to stress is a risk factor for poor health and accelerated aging. Immune aging, including declines in naïve and increases in late memory and terminally differentiated T cells, plays a role in immune health and tissue specific aging, and may contribute to elevated risk for poor health among those who experience high psychosocial stress. Past data have been limited in estimating the contribution of life stress to the development of accelerated immune aging and investigating mediators such as lifestyle and CMV infection. This study utilizes a national sample of 5744 US adults over age 50 to assess the relationship of social stress (viz., everyday discrimination, stressful life events, lifetime discrimination, life trauma, and chronic stress) with flow cytometric estimates of immune aging, including naïve and terminally differentiated T cell percentages and the ratio of CD4+ to CD8+ cells. Experiencing life trauma and chronic stress was related to a lower percentage of CD4+ naïve cells. Discrimination and chronic stress were each associated with a greater percentage of terminally differentiated CD4+ cells. Stressful life events, high lifetime discrimination, and life trauma were related to a lower percentage of CD8+ naïve cells. Stressful life events, high lifetime discrimination and chronic stress were associated with a higher percentage terminally differentiated CD8+

cells. High lifetime discrimination and chronic stress was related to a lower CD4+:CD8+ ratio. Lifestyle factors and CMV seropositivity partially reduced these effects. Results identify psychosocial stress as a contributor to accelerating immune aging by decreasing naïve and increasing senescent T cells.

CORRELATES OF ELEVATED C-REACTIVE PROTEIN AMONG BLACK OLDER ADULTS: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

Heather Farmer[1], Courtney Sinclair Tobin[2], and Roland J. Thorpe, Jr.[3], *1. University of Delaware, Newark, Delaware, United States, 2. Fielding School of Public Health, University of California Los Angeles, Los Angeles, California, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States*

Substantial evidence documents gender and racial disparities in C-reactive protein (CRP), a measure of systemic inflammation, among older adults. Yet, the comparative approaches of these studies may obscure distinct risk and protective factors associated with elevated CRP among older Black Americans. To pinpoint opportunities for intervention, this study utilizes a “within-group approach” to identify the sociodemographic, psychosocial, behavioral, and health-related determinants of elevated CRP among older Black women and men. The sample consisted of 2,420 Black respondents aged 51+ in the Health and Retirement Study (2006-2016). Gender-stratified, random effects logistic regression models were used to examine determinants of elevated CRP (>3.0 mg/L). More than 50% of Black women had elevated CRP, and we found that younger age, Medicaid, lower mastery, religiosity, overweight/obesity, physical inactivity, and ADLs contributed to elevated CRP among this group. In contrast, elevated CRP was reported among only 37.25% of Black men, for whom financial distress was associated with lower odds of elevated CRP; religiosity, less neighborhood cohesion, current smoking, overweight/obesity, ADLs, and more chronic conditions were associated with greater odds of elevated CRP among this group. Sociodemographic factors had a limited association with elevated CRP among older Black Americans. Rather, a range of psychosocial, behavioral, and health-related factors were more influential determinants of elevated CRP among older Black Americans. Most notably, findings demonstrate distinct determinants of CRP among Black women and men, underscoring the critical need to further evaluate the risk and protective mechanisms undergirding disparities among this aging population.

SESSION 3450 (PAPER)

SUCCESSFUL AGING (PAPERS)

COMMUNITY DISADVANTAGE AND WORKFORCE PARTICIPATION AMONG LATE MIDDLE-AGED MEDICAID BENEFICIARIES

Rodlescia Sneed, *Wayne State University, Detroit, Michigan, United States*

There have been numerous efforts to increase workforce participation among Medicaid beneficiaries in an effort to reduce program costs. We know little, however, about whether Medicaid beneficiaries with low workforce participation live in communities that support employment. The purpose of the current study was to determine if community disadvantage was associated with workforce participation among late middle-aged Medicaid beneficiaries, an age group that commonly faces difficulty entering the workforce. Participants were 1418 Medicaid beneficiaries ages 51-64 who participated in the 2016 wave of the Health and Retirement Study, a population-based study of community-dwelling adults aged >50. Community disadvantage was measured using the Social Vulnerability Index (SVI). We evaluated the association between community social vulnerability and reduced workforce participation (defined as working < 20 hours per week). We performed additional analyses to determine if the association between community disadvantage and reduced workforce participation was driven by any one of four subthemes of the SVI:(1) community socioeconomic status, (2) household composition/disability, (3) minority status & language and (4) housing type & transportation. Community disadvantages was associated with reduced workforce participation (OR: 2.82; 95% CI: 1.05-7.56). Analyses by SVI theme showed that the association between community disadvantage and reduced workforce participation was largely driven by community socioeconomic status (SES). Those living in low SES communities were more likely to report reduced workforce participation than those living in high SES communities: (OR: 5.48; 95% CI: 3.28-8.18). Policy interventions that focus on disadvantaged communities are likely needed to improve employment rates among late middle-aged Medicaid beneficiaries.

FRAILTY-FOCUSED COMMUNICATION (FCOM) FOR OLDER ADULTS

Cathy Maxwell[1], Sally Miller[2], and Deborah Lee[3], *1. Vanderbilt University, Hermitage, Tennessee, United States, 2. Vanderbilt University, Nashville, Tennessee, United States, 3. Middle Tennessee State University, Murfreesboro, Tennessee, United States*

Frailty-focused communication (FCOM) equips older adults with a better understanding of factors and biological mechanisms related to decline, frailty, and eventual end-of-life, while also empowering them to engage in proactive measures for healthy aging in 8 domains (physical activity, nutrition, safety, mind/body health, relationships/community, sleep/rest, finances, health care decision-making). We aimed to develop and test: 1) an educational tool targeted to older adults, and 2) a FCOM workshop to train health care clinicians on how to explain the concept of frailty and facilitate goal-setting for proactive aging. We tested the tool and workshop in 2 prospective observational studies among community-dwelling older adults (N= 126) and clinicians (N=29) who provide care to older adults. Testing of the FCOM tool revealed that content on bioenergetics of aging increased motivation to make a plan for proactive aging (N=60, 68%), particularly among adults age 55-64 as compared to other age groups (p=.024). Testing of the training workshop demonstrated increased knowledge of frailty (pre score: 5.8, post score: 7.6; d= .55, p=.006) and increased self-reported competency with patient/clinician interaction (pre score: 33.2, post score: 42.0; d=.63, p=.001). Post course evaluations regarding understanding of best practice empathic skills was rated 3.6 (range: 1-4). FCOM promotes awareness of the importance of measures to mitigate development of chronic conditions and frailty, and provides a resource for clinicians in multiple settings to engage in conversations with older adults while physiologic compensatory mechanisms are still intact. FCOM discussions can facilitate a shift from disease-oriented discussion to patient-centered, holistic care.

LESSONS ON LEARNING IN LATER LIFE WITH THE MIT AGELAB 85+ LIFESTYLE LEADERS

Taylor Patskanick[1], Julie Miller[2], Lucas Yoquinto[2], Lisa D'Ambrosio[2], and Joseph Coughlin[2], *1. Massachusetts Institute of Technology, Somerville, Massachusetts, United States, 2. Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

Previous research has established the role of lifelong learning in promoting psychological wellbeing and active aging. Population aging necessitates an understanding of the unique opportunities and challenges around formal and informal learning in later life. This paper will share findings from a mixed methods study with the MIT AgeLab 85+ Lifestyle Leaders, a panel comprised of octogenarians and nonagenarians from across the United States. Drawing on an online survey and virtual focus groups with 29 Lifestyle Leaders from January 2021, findings suggest the Lifestyle Leaders most often learned new things from talking with others (46%) and reading print (54%) or online (54%) sources. The majority were familiar with attending in-person lectures or classes (89.7%) and were now using videoconferencing to do these (78.6%). A majority (56.7%) had or are currently participating in a lifelong learning program. Most consider themselves lifelong learners and described this around remaining curious and engaged with life, choices around what one learns, and greater enjoyment of learning. In the survey, a plurality of Lifestyle Leaders indicated the top two challenges affecting their ability to learn were sensory burdens (e.g., hearing loss, declining eyesight) (35%) and their energy level (32.4%); focus group data revealed that recall also is a barrier. Focus group data further highlighted generational experiences around early life learning and career paths, specifically how gender roles, diagnoses of learning disabilities, and evolving digital technology have affected these and changed over the course of their lifetimes.

METHODOLOGICAL AND ETHICAL REFLECTIONS FROM RESEARCH ON NEIGHBOURHOOD-BUILT ENVIRONMENT AND DEMENTIA

Kishore Seetharaman[1], Habib Chaudhury[1], Lillian Hung[2], Shannon Freeman[3], Mark Groulx[3], and Cari Randa[1], *1. Simon Fraser University, Vancouver, British Columbia, Canada, 2. University of British Columbia, Vancouver, British Columbia, Canada, 3. University of Northern British Columbia, Prince George, British Columbia, Canada*

The neighbourhood is widely regarded as a setting that affords emotional and practical support and opportunities to maintain community-based activities and social participation for people living with dementia (PLWD). Creating a supportive neighbourhood built environment that facilitates outdoor mobility, wayfinding, and access to community destinations is key to making our communities dementia-inclusive. Research on the built environment and dementia-inclusive planning is relatively sparse in the broader research domain of neighbourhoods and dementia. Further, how PLWD perceive, interpret, and interact with the neighbourhood built environment is not adequately understood. Although it is acknowledged that PLWD should be more meaningfully included and engaged in research in this area, there is a lack of guidance on methodological and ethical considerations necessary to explore people-place relations in the neighbourhood built environment through the lens of the lived experience of PLWD. To address this gap, our paper draws from the Dementia-inclusive Streets and Community Access, Participation, and Engagement (DemSCAPE) study to highlight reflections on conducting walk-along interviews, embodied videography, photo documentation, semi-structured sit-down interviews, and visual elicitation to explore the influence of the neighbourhood built environment on the outdoor walking experience of PLWD. We discuss 1) methodological strengths, including the triangulated strategy of capturing experiential data in-situ in real time and in retrospect, and flexibly working around memory and communication-related challenges experienced by PLWD, 2) ethical challenges and measures for mitigation, 3) logistical difficulties in undertaking complex fieldwork with PLWD, limitations of the research methods, and potential alternative methods to explore in future research.

OLDER PEOPLE'S ACTIVITY PARTICIPATION (OPAP): FACTOR STRUCTURE AND PSYCHOMETRIC PROPERTIES OF A SCALE

Daniel Rong Yao Gan[1], Yuxin Cao[2], Wen Liu[3], John Chye Fung[2], and Tze Pin Ng[2], *1. Simon Fraser University, Vancouver, British Columbia, Canada, 2. National University of Singapore, Singapore, Singapore, 3. University of Iowa, Iowa City, Iowa, United States*

Older people's participation in activities is critical to their health and well-being. Active lifestyle in old age reduces the risk of mortality, prevents chronic diseases, promotes physical and mental wellbeing, and is conducive to active and healthy aging. While various measures of participation have been proposed, a holistic measure that includes both social and individual activity participation is currently unavailable. To enable lifestyle medicine recommendations, we developed the Older People's Activity Participation (OPAP) scale to understand the constituent factors of older people's everyday activities. This study examined OPAP's internal consistency using Cronbach's alpha, convergent validity using regression analysis, as well as factor structure using exploratory and confirmatory factor analyses in a dense urban setting. Preliminary items assessed engagement in 27 health-related, fitness, recreational, social, productive, and cognitive activities, and were administered to 270 community-dwelling adults aged 50 and older in Singapore. The 17-item OPAP showed acceptable internal consistency (Cronbach's alpha= .69), and demonstrated convergence with a validated measure of social cohesion (B=.27, p<.001) and Instrumental Activities of Daily Living (B=.32, p<.001). It has a 5-factor structure, namely socializing (alpha=.63), physical training (alpha=.56), listening (alpha=.69), home-making (alpha=.59), and outing (alpha=.58). Acceptable model fit was obtained (RMSEA=0.48, SRMR=0.06, CFI=.90). The OPAP scale is valid and reliable to assess activity participation in Asian older adults. It can be a useful tool to understand older people's everyday life and lifestyles, relationships between activity participation and health outcomes, and further guide the development and use of effective interventions to promote active and healthy aging.

SESSION 3460 (SYMPOSIUM)

THE POWER OF RURAL PARTNERSHIP: MEETING NEEDS AND FOSTERING INNOVATION THROUGH THE WYOMING GWEP

Chair: Christine McKibbin Co-Chair: Catherine Carrico

The challenges of supporting the health and social needs of older adults and caregivers in rural and frontier areas are well-documented. It is common for rural older adults to experience barriers in accessing geriatric specialists, care coordination services, and caregiver support and education programs. The Wyoming Geriatric Workforce Enhancement Program (WyGWEP) is an innovative partnership comprising an academic geriatrics program, primary care delivery sites, single-unit on aging representing community-based organizations, and a tribal health program. This partnership, funded by the Health Resources and Services Administration, provides the infrastructure to assess needs, provide education and training, create programs to address gaps in care, implement practice innovation, and advocate for needs of rural older adults. This symposium includes five presentations detailing the unique projects of the WyGWEP partnership and the impact of this collaborative work on a variety of stakeholders. The results of a mixed-methods evaluation of the WyGWEP partnership will describe the benefits to the partners and areas for growth. A collaborative effort to assess the needs of older adults informs recommendations to support rural aging in place. Schenck et al. will describe the adaptation of the widespread ECHO model for use with dementia caregivers in rural and remote locations. Representatives from Wyoming's only Program for All-Inclusive Care of the Elderly (PACE) will explain the cost of a recent decision to de-fund and close this important program. Finally, the impact of a novel Chronic Care Management implementation program will be discussed, including sustainable billing revenue produced by rural primary care clinics.

EVALUATING THE WYOMING GWEP PARTNERSHIP

Catherine Carrico[1], Irene Lujan[2], Trena Anastasia[3], and Christine McKibbin[1], *1. University of Wyoming, Laramie, Wyoming, United States, 2. Eastern Shoshone Tribal Health, Ft. Washakie, Wyoming, United States, 3. Thrive Alive, Masonville, Wyoming, United States*

The goal of the Wyoming Geriatrics Workforce Enhancement Program (WyGWEP) is to utilize partnerships to improve health outcomes for older adults by developing a healthcare workforce trained to address unmet health and social determinant needs of Wyoming's older residents. The purpose of this presentation is to report results from the novel mixed-methods evaluation of the WyGWEP partnership. Data were gathered from WyGWEP stakeholders through the Partnership's Self-Assessment Tool (n=17; Center for the Advancement of Collaborative Strategies in Health, 2002), which assesses domains of Synergy, Leadership, Resource Sharing — Non-financial and Financial, Benefits and Drawbacks, Decision Making, and Administration/Management and Satisfaction. Semi-structured interviews (n=12) with partnership participants provided additional information and context. Evaluation results indicate that WyGWEP partners are highly satisfied across all domains of the Partnership's Self-Assessment Tool. WyGWEP partners from Eastern Shoshone Tribal Health will share what has contributed to a successful collaborative. Additional results related to how this type of partnership has influenced participants' ability to complete objectives and activities will be reviewed.

ADAPTING THE ECHO MODEL TO MEET THE NEEDS OF RURAL DEMENTIA CAREGIVERS

Sabine Schenck, Catherine Carrico, and Stacy Carling, *University of Wyoming, Laramie, Wyoming, United States*

Caring for an individual with dementia may result in caregiver stress and burden (Cassie & Sanders, 2008), which can lead to detrimental health outcomes if not managed with effective coping skills and support (Shulz & Martire, 2004). Access to support and psychoeducation is limited in rural and frontier communities, and solutions are needed to reach caregivers across sparsely populated regions. Project ECHO (Extension for Community Health Outcomes) is an evidence-based model designed to improve patient outcomes through healthcare provider education. The Wyoming Dementia Together Caregiver Network is the first of its kind to adapt the ECHO model for family caregivers of persons with dementia. This presentation details evaluation results of 24 session across 52 weeks (n=162). Results suggest that adaptation of Project ECHO for family caregivers is feasible and palatable. In addition, the adapted program shows promise for improving caregiver outcomes such as depressive symptoms and caregiver burden.

CONNECTING THE DOTS: CHRONIC CARE MANAGEMENT PROGRAM IMPLEMENTATION IN RURAL PRACTICES

Faith Jones[1], Kevin Franke[2], Tonja Woods[2], Emma Bjore[3], and Elizabeth Punke[4], *1. HealthTech, Brentwood, Tennessee, United States, 2. University of Wyoming, Laramie, Wyoming, United States, 3. Ivinson Medical Group, Laramie, Wyoming, United States, 4. University Of Wyoming, Laramie, Wyoming, United States*

As the focus of healthcare changes from a "sick" care model to a population health model, primary care and specialty clinic practices have new opportunities supported through Medicare reimbursement. The incorporation of team-based care coordination programs into clinic practices is an important step towards value-based care and achieving the Triple Aim: better health for the population, better care for individuals, and lower costs through improvements. Since 2019, six rural Wyoming primary care practices have completed training to implement and expand care coordination programs. HealthTechS3 provides participating clinics with team-based training in the implementation of the Chronic Care Management Program, Behavioral Health Integration, and other billable care coordination services. To date, 301 patients have enrolled in care coordination services. These practices have generated $350,000 in revenue. Using a consolidated implementation framework as a guide, critical components of successful rural care coordination program implementation are discussed.

COLLABORATIVE NEEDS ASSESSMENT OF RURAL OLDER ADULTS AND PRIORITIES FOR AGING IN PLACE

Bernard Steinman[1], Jennifer Tabler[1], Jeff Clark[2], and Lisa Osvold[3], *1. University of Wyoming, Laramie, Wyoming, United States, 2. Wyoming Department of Health Aging Division, Cheyenne, Wyoming, United States, 3. Wyoming Department of Health - Aging Division, Cheyenne, Wyoming, United States*

To assess aging-related needs of state residents, the Wyoming GWEP collaborated with the state's Department of Health--Aging Division to conduct a state-wide survey as the basis for Wyoming's 4-year state plan on aging. Survey items addressed concerns related to community living and caregiving, as well as general concerns related to aging in Wyoming's rural setting. Results suggest older residents are committed to aging at home; and when that is not feasible, wish to remain in their communities when possible. Concerns were identified regarding attributes of the state that place older residents at risk for poorer physical/mental health, dependence, financial jeopardy, social isolation, and negative secondary outcomes that are comparatively more costly to address in institutional settings. We discuss the collaborative needs-assessment process, as well as priorities for future service delivery that promote good social support, transportation options, and home modifications to increase independence and safety.

THE END OF PACE: OPPORTUNITY FOR ADVOCACY AND EDUCATION

Gregory O'Barr[1], Lindsay Bonazinga[2], Rebecca Carey[2], Tracy Brosius[3], Anne Alexander[4], and Barbara Dabrowski[4], *1. Cheyenne Regional Medical Center, Windsor, Colorado, United States, 2. Cheyenne Regional Medical Center, Cheyenne, Wyoming, United States, 3. Wyoming Healthworks, Cheyenne, Wyoming, United States, 4. University of Wyoming, Laramie, Wyoming, United States*

The Program for All-Inclusive Care for the Elderly (PACE) is a Medicare/Medicaid Managed Care benefit for frail older adults age 55 years or older who, although certified by the state as long-term care (LTC) eligible, choose to live independently in the community. PACE features comprehensive medical and social services coordinated by an interdisciplinary team whose goal is to promote independence. Cheyenne Regional Medical Center has served as Wyoming's only PACE site since 2007. However, an effort to reduce Medicaid expenditures resulted in elimination of funding and closure of the program by the state. The purpose of this study was to examine the impacts of PACE closure on transition to LTC, concomitant Medicaid expenditures, as well as impacts on participant well-being. Results showed, as expected, that nursing home placement exceeded that projected, thereby increasing Medicaid expenditures in Wyoming. Additional impacts on participant well-being and advocacy benefits of GWEP partnership are discussed.

SESSION 3480 (SYMPOSIUM)

WELL-BEING DURING THE COVID-19 PANDEMIC: THE ROLES OF DEMOGRAPHICS, PERSONALITY, AND SOCIAL TIES

Chair: Lindsay Ryan Co-Chair: Heather Fuller Discussant: Aurora Sherman

The COVID-19 pandemic continues to exert widespread impacts on individuals, particularly older adults (Tyrrell & Williams, 2020). This symposium capitalizes on a variety of data sources to advance our understandings of the psychosocial impact of the pandemic on older adults. The first two papers consider the importance of personality characteristics in understanding the effects of social distancing. Fiori et al. highlight the potential for sociability to act as a liability during times of social distancing, finding that sociability exacerbated the effects of social distancing on mental health outcomes in a sample of community-dwelling older adults. Ryan's paper focuses on the Big Five Personality traits, age, and population density as key characteristics explaining differences in subjective well-being during the pandemic. Next, Van Vleet et al. apply a mixed-methods approach to investigate when older adults expect life to go back to normal, finding that expectations about the future became more positive with the passage of time. The final two papers consider the importance of adults' home social context during the pandemic. Newton examines relationships between living alone and well-being outcomes among older Canadian women, finding that perceived COVID-19 impact was significant only at T1 and living alone was linked to poorer well-being by T2. Birditt et al. examine how individuals' and partner's COVID-19 stress and couples' racial composition are related to affective experiences measured via ecological momentary assessments, finding that husbands' stress impacted both partners' well-being, and that associations differed by race. Sherman will lead a discussion to synthesize these new findings.

WELL-BEING DURING THE COVID-19 PANDEMIC: A FUNCTION OF PERSONALITY, AGE, AND URBANICITY

Lindsay Ryan, *The University of Michigan, Ann Arbor, Michigan, United States*

The COVID-19 pandemic has differentially impacted population sub-groups over the last two years. For example, engagement in social isolation may have been particularly difficult for extroverted adults. The virus spread widely in densely populated regions and is more risky to health with increasing age. This paper explores the ways in which personality, age, and urbanicity are associated with subjective well-being during the pandemic. Longitudinal data from the Health and Retirement Study (N = 4316; M age = 69.0, Range 31 - 99) investigates Big Five personality characteristics from 2016 and interactions with age on life satisfaction and loneliness during the pandemic. Models are then stratified by Beale Rural-Urban Continuum codes denoting urban, suburban, and ex-urban residence. Results indicate the benefit of high conscientiousness on life satisfaction is weaker among older adults (p<.05) and associations of extroversion and age on loneliness are driven by individuals living in urban areas (p<.05).

OLDER CANADIAN WOMEN'S LIVING ARRANGEMENTS AND WELL-BEING DURING COVID-19

Nicky Newton, *Wilfrid Laurier University, Waterloo, Ontario, Canada*

Living alone has been associated with lower COVID-related well-being over the course of the pandemic, although the results for women – particularly older Canadian women – depend on myriad factors. This study examines relationships between COVID-19 impact, living arrangement, and two types of well-being – psychological well-being and meaning in life – among Canadian women (N = 106) with Mage = 70.11 in two waves of data (July-September 2020 and March-May 2021). There were no differences in levels of well-being between T1 and T2, although regression analyses showed that correlates differed for type of well-being measured. Surprisingly, COVID-19 impact was only significant for psychological well-being at T1. Additionally, while levels of well-being did not differ by living arrangement at T1, by T2 both were lower for those living alone. Findings suggest adaptation to COVID-19 constraints and highlight changes in factors associated with well-being as well as the necessity of measuring well-being in multiple ways.

PANDEMIC-RELATED STRESS AND DAILY WELL-BEING AMONG MIDDLE-AGED AND OLDER COUPLES: RACE AND GENDER DIFFERENCES

Kira Birditt, Angela Turkelson, and Akari Oya, *University of Michigan, Ann Arbor, Michigan, United States*

Pandemic-related stress may have important implications for well-being among middle-aged and older couples and these effects may vary by race. Participants included 30 married/cohabiting couples (10 Black, 23 White, 2 Mixed race) ages 44 to 84 who completed baseline interviews and 5 days of ecological momentary assessment (EMAs) 6 times a day. Every three hours individuals reported how stressed they felt about COVID-19 and negative affect. Actor-partner interdependence models revealed that greater pandemic stress among Black husbands was associated with their own and their wives greater negative affect ($b = 0.22$, $SE = 0.08$, $p < .01$; $b = 0.16$, $SE = 0.08$, $p < .05$). Greater pandemic related stress among White husbands was associated with wives' lower negative affect ($b = -0.15$, $SE = 0.07$, $p < .05$). Findings are consistent with structural racism theory indicating that Black individuals may be more negatively affected by pandemic-related stress than White individuals.

THE ROLE OF SOCIABILITY IN OLDER ADULTS' ADAPTATION TO COVID-19

Katherine Fiori[1], Amy Rauer[2], Christina Marini[1], Christine So[1], and Amna Khan[1], *1. Adelphi University, Garden City, New York, United States, 2. University of Tennessee Knoxville, Knoxville, Tennessee, United States*

Some older adults may be particularly sensitive to the negative effects of social disruptions due to COVID-19 (Tyrrell & Williams, 2020). For example, the unique circumstances of the pandemic may have made greater sociability a liability (Wijngaards et al., 2020). The current study used a community sample of 136 older adults (M age = 67.77, range 50-91; 69.3% females; 93% White) to explore whether sociability moderated links between disruptions to contact with friends and family and indicators of mental health. Using a series of hierarchical linear regressions, we found that sociability moderated the association between disruptions in family interactions and depressive symptoms. For more sociable individuals, disruptions in family interactions were more strongly positively associated with depressive symptoms. Given the potential for future social disruptions due to COVID-19, our findings point to the importance of considering the role of sociability in developing interventions targeting older adults.

"IT'S GOING TO BE A NEW NORMAL": OLDER ADULTS' FUTURE PERCEPTIONS DURING COVID-19

Bryce Van Vleet, Heather Fuller, Brittany Hofmann, and Andrea Huseth-Zosel, *North Dakota State University, Fargo, North Dakota, United States*

This study explores older adults' perceptions of the future related to COVID-19. Participants (N=76) of a larger study aged 70-97 were asked four times throughout the first year of the pandemic when they thought life would return to normal. Their open-ended responses were coded, and themes were identified at each timepoint. A resilient future perspective was identified at each timepoint; themes of a negative or unstable view of the future emerged over time. Additionally, responses were quantified into a 5-point scale for perceived timescale of a return to normal (5 = very long time) and attitude towards the future (5 = very positive). Repeated measures ANOVA revealed that perceived time to normal increased between the beginning and six months into the pandemic, then decreased by 12 months. Attitudes towards the future became more positive over time. These findings indicated that older adults were largely resilient, if uncertain, about the future.

SESSION 3490 (SYMPOSIUM)

"COUNT YOUR AGE BY FRIENDS, NOT BY YEARS": AN INTERPERSONAL PERSPECTIVE ON SUBJECTIVE VIEWS OF AGING

Chair: Amit Shrira Co-Chair: Yoav Bergman Discussant: Anna Kornadt

Humans are social beings, and as we age, meaningful and close relationships become increasingly important. However, the literature on older adults' subjective views of aging (VoA) tends to focus on the link between such views and health outcomes, overlooking important interpersonal correlates. This symposium consists of four presentations that focus on various concepts, study designs, and populations, and offers novel insights regarding how VoA operate in the social domain. The first presentation (Bergman et al.) establishes, using a diary study, the mediating role of understanding others' emotional states (i.e., Theory of Mind) in the connection between VoA and positive social relationships. The second presentation (Mejía & Hooker) examines, through daily assessment, how VoA differentiate the processes by which older adults construct interactions with their closest social partners to progress toward health goals in daily life. The third presentation (Neupert & Can) employs a diary study and demonstrates that daily fluctuations in both subjective age and ageist attitudes are important determinants for older adults' well-being. The fourth presentation (Shrira), a clinical study, focuses on how orthopedic patients' rehabilitation is affected by their own and their healthcare professionals' VoA. Together, the findings highlight the relevance of VoA to interpersonal functioning and health, and offer valuable information for both researchers and clinicians regarding the importance of this direction in future explorations of older adults' VoA and physical/psychological well-being.

SUBJECTIVE VIEWS OF AGING AND SOCIAL RELATIONSHIPS AMONG OLDER ADULTS: THEORY OF MIND AS A MEDIATOR

Yoav Bergman[1], Amit Shrira[2], and Orel Swisa[3], *1. Ashkelon Academic College, Ashkelon, HaDarom, Israel, 2. Bar-Ilan University, Ramat Gan, HaMerkaz, Israel, 3. Bar-Ilan University, Ramat-Gan, HaMerkaz, Israel*

Research has demonstrated the importance of subjective views of aging (VoA) for older adults' well-being. However, little is known regarding how understanding others' emotional states may affect this association. Accordingly, we examined whether Theory of Mind (ToM), or the ability to comprehend others' emotions, may mediate the effect of VoA on older adults' social functioning. Thirty community-dwelling older adults (mean age= 71.23, SD= 8.57, 50% women) filled out daily questionnaires concerning ageist attitudes, attitudes toward aging, and satisfaction with social relationships for two weeks. Positive VoA (i.e., low ageist attitudes and positive attitudes toward aging) were associated with increased ToM and higher satisfaction with social relationships. Moreover, ToM was a significant mediator for the VoA-social relationships link, as positive VoA on a given day were indicative of higher ToM levels, which were associated with increased positive social relationships. Results are discussed from the perspective of Socioemotional Selectivity Theory.

REHABILITATION OUTCOMES AS A FUNCTION OF PATIENTS' AND HEALTHCARE PERSONNEL'S VIEWS OF AGING

Amit Shrira, *Bar-Ilan University, Ramat Gan, HaMerkaz, Israel*

The effect of subjective views of aging (VoA) on health outcomes is well established, yet this effect was rarely examined among older adults undergoing hospitalization or rehabilitation. Moreover, the additive effect of healthcare personnel's ageist attitudes on treatment outcomes is unknown. Accordingly, these effects were examined within older adults hospitalized for osteoporotic fractures – a frequent late-life condition with cardinal functional implications. Study 1 (N=147 patients, mean age=79.3) found that feeling younger at admission predicted better rehabilitation outcomes. The reverse effect of functional independence at admission on subjective age at discharge was non-significant. Study 2 (N=52 patients, mean age=81.8, and N=55 hospital staff members, mean age=32.3) replicated these findings with additional VoA indices, and further demonstrated that rehabilitation outcomes were better when occupational and physical therapists reported low levels of ageist attitudes. Findings suggest that successful rehabilitation may be promoted by reducing negative VoA among patients as well as healthcare personnel.

SELF-PERCEPTIONS OF AGING, SUPPORT FROM CLOSE SOCIAL TIES, AND HEALTH GOAL PROGRESS IN EVERYDAY LIFE

Shannon Mejía[1], and Karen Hooker[2], *1. University of Illinois at Urbana-Champaign, Champaign, Illinois, United States, 2. Oregon State University, Corvallis, Oregon, United States*

Subjective aging is interpersonal, it embodies processes of thinking about the self in relationship to others. We utilize data from the 100-day microlongitudinal Personal Understanding of Life and Social Experiences Project (N = 99; observations = 7,049; Mage = 63, range = 52-88) to explore how self-perceptions of aging differentiate the processes by which older adults shape interactions with close social ties to support progress toward a meaningful health goal in everyday life. Those with more positive self-perceptions of aging identified more friends among their closest social ties and reported a higher levels of goal progress and support toward that goal during the study period. Further, multilevel random coefficient models showed that goal progress on a given day was more sensitive to received support on that day among those with more positive self-perceptions of aging. The implications for adult development and shared experiences of aging within friendship networks is discussed.

DAILY EMOTIONAL AND PHYSICAL WELL-BEING PREDICTED BY PERSONAL AND OTHER VIEWS OF AGING

Shevaun Neupert, and Reyyan Can, *North Carolina State University, Raleigh, North Carolina, United States*

Individual differences in personal views of aging and how older adults perceive others contribute to health. We examined these relationships as they unfold within persons over time. A 14-day daily diary study of 428 participants aged 50-85 (M = 63.51) assessed subjective age (how old one feels), ageism, negative affect, and physical health each day. Increases in daily subjective age corresponded to increases in negative affect, but there was no effect of daily ageism. In contrast, increases in daily subjective age and daily ageism were each uniquely associated with increases in daily physical health problems. Further, these views of aging interacted; daily increases in ageism were especially detrimental to physical health when accompanied by increases in subjective age. These results suggest that daily fluctuations in personal views of aging are important for emotional and physical well-being, whereas personal views as well as perceptions of others work together for physical well-being.

SESSION 3495 (SYMPOSIUM)

HEALTHY AGING DURING THE PANDEMIC AND BEYOND: LESSONS FROM FIVE YEARS OF THE NATIONAL POLL ON HEALTHY AGING AND AARP

Chair: Erica Solway Co-Chair: Teresa Keenan Discussant: Brian Lindberg

The past five years have brought enormous changes in the lives of older adults and their families. During this time the University of Michigan National Poll on Healthy Aging (NPHA), co-sponsored by AARP and Michigan Medicine, has gathered the experiences and perspectives from nationally representative samples of US adults age 50-80 on a range of topics related to healthy aging. These polls have been used to elevate the voices of the older adults in the development of policies and practices to improve the health of people as they age. During the past two years, poll reports have captured how changes in lifestyle and behaviors during the COVID-19 pandemic have impacted the health and well-being of older adults. Members of the NPHA team from the University of Michigan and AARP will begin with an overview of the poll including its goals and methods. The session will then highlight key findings from the first five years of the NPHA that have important implications during and beyond the COVID-19 pandemic, with special attention to poll findings related to joys and stresses and aging in place. The presenters will also discuss how to access publicly available NPHA data. The session will wrap up with a discussion of how the perspectives and experiences of older adults gathered through the NPHA and AARP polling can be used to inform policy and advocacy to support healthy aging.

LESSONS FROM FIVE YEARS OF POLLING THROUGH THE NATIONAL POLL ON HEALTHY AGING

Erica Solway[1], Teresa Keenan[2], Cheryl Lampkin[2], Matthias Kirch[1], Dianne Singer[1], Jeffrey Kullgren[1], and Preeti Malani[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. AARP, Washington, District of Columbia, United States*

Since 2017, the National Poll on Healthy Aging (NPHA) has surveyed older adults on a vast array of topics related to health, health care and health policy. With robust nationally representative samples of 2,000 adults age 50-80, the poll's format allows for the fielding of timely questions with important public health and policy implications. For example, polls examining delayed care during the COVID-19 pandemic and experiences of physical deconditioning and falls helped to demonstrate the ways in which the pandemic may have long-lasting effects if strategies are not implemented to address them. In this presentation we will discuss how the NPHA has increased awareness of the facilitators and barriers to healthy aging and where gaps exist in supporting older adults to live with optimal health and well-being. This presentation will also describe how researchers can access publicly available NPHA data to inspire their own future research.

REIMAGINING AGING: LESSONS ON HEALTHY AGING FROM AARP

Teresa Keenan, and Cheryl Lampkin, *AARP, Washington, District of Columbia, United States*

This presentation will include insights on healthy aging based on data obtained from multiple recent AARP surveys fielded among nationally representative samples of midlife and older adults. Samples were weighted to reflect population estimates (i.e., gender, ethnicity, etc.). Studies also included oversamples of Black/African American and Hispanic/Latino respondents when possible, enabling enhanced analyses. This multi-analysis presentation will provide valuable insights on healthy aging in general, the impact the COVID-19 pandemic has had on the older populations' ability to maintain healthy habits, and how our "new normal" suggests the need to reimagine healthy aging. This presentation will showcase exciting new findings from AARP Research on diet, exercise, resiliency, and mental health, among others. Augmented with qualitative data, this presentation will also allow participants to hear the voices of older adults on these issues. Additionally, new data collected in late fall 2022 will provide a preview of up-to-the-minute insights.

OLDER ADULTS' PREPAREDNESS TO AGE IN PLACE: FINDINGS FROM THE NATIONAL POLL ON HEALTHY AGING

Sheria Robinson-Lane[1], Erica Solway[2], Dianne Singer[2], Matthias Kirch[2], Jeffrey Kullgren[2], and Preeti Malani[2], *1. University of Michigan School of Nursing, Ann Arbor, Michigan, United States, 2. University of Michigan, Ann Arbor, Michigan, United States*

Though aging in place is a stated goal for many older adults, complications of advanced disease or disability can derail these plans. Little is known about the current preparedness of older adults to age in place. The January 2022 National Poll on Healthy Aging surveyed adults age 50-80 (n=2,277) about their home and available supports. Findings indicate that while 80% of adults believe they have the necessary features in their home to support aging in place, less than one in five had homes that were wheelchair accessible and fewer than half had other common safety and accessibility features. Older adults were most confident they could obtain help with household chores (51%) and were least confident about getting assistance with personal care (33%). Persons with disabilities (n=683) and those living alone (n=639) reported the most concerns. Several opportunities exist to better prepare older adults to successfully age in place.

JOY AND STRESS DURING THE COVID-19 PANDEMIC: FINDINGS FROM THE NATIONAL POLL ON HEALTHY AGING

Jessica Finlay, Lindsay Kobayashi, Erica Solway, Dianne Singer, Matthias Kirch, Jeffrey Kullgren, and Preeti Malani, *University of Michigan, Ann Arbor, Michigan, United States*

This poll aimed to better understand the complex impacts of the COVID-19 pandemic on the emotional and mental health of older adults. In August 2021, the National Poll on Healthy Aging surveyed a national sample of adults age 50–80 about joys, stresses, and resilience during the pandemic. Most reported feeling a lot (30%) or some (53%) joy these days, while 17% reported feeling very little or no joy. Reports of joy and stress differed substantially by age, sex, physical health, mental health, and household income. For example, people age 50–64 were more likely to report feeling a lot of stress compared with those age 65–80 (25% vs 13%), as were women compared with men (24% vs 15%). The findings may inform public health and policy efforts to support older adults at-risk for poor emotional and mental health, and help cultivate resilience during and after the pandemic.

SESSION 3500 (PAPER)

CAREGIVING AND FAMILY ISSUES

COMPETENCY DEVELOPMENT FOR A PROGRAM TO SUPPORT CAREGIVERS OF OLDER ADULTS WITH DEMENTIA: A MODIFIED E-DELPHI METHOD

Madison Huggins, Gloria Puurveen, and Barb Pesut, *UBC, Kelowna, British Columbia, Canada*

Nav-CARE is a program that utilizes volunteer navigators to support older adults with life-limiting illnesses who are living in the community. Currently, Nav-CARE is being adapted and expanded to support family and/or friend caregivers of older adults with dementia. In order to begin the process of adapting this program a modified e-Delphi method was utilized. This method consisted of presenting three sequential questionnaires to an expert panel (n=50) of individuals with knowledge of and/or experience in caregiving, dementia, volunteerism and/or navigation. Consensus was established regarding the importance of various caregivers' needs and the competencies volunteer navigators require in order to meet these needs. This process resulted in a final list of 46 caregivers' needs and 41 volunteer navigator competencies. Two key findings suggest that there is a crucial need for increased access to respite, which influences the caregivers' ability to benefit from additional supports, and that dementia stigma is prominent, which negatively impacts the caregiving experience. Additional findings highlight the need for increased knowledge of dementia among providers, caregivers, and community members, the importance of establishing strong volunteer navigator-caregiver relationships, and the need to balance the agency of older adults living with dementia and their caregivers. Findings from this study informed the development of training curriculum for volunteer navigators, and will be used to guide the ongoing development of the adapted Nav-CARE program.

DEPRESSIVE SYMPTOM TRAJECTORIES AND COGNITIVE FUNCTION AMONG OLDER COUPLES: A DYADIC PERSPECTIVE

Dexia Kong[1], Peiyi Lu[2], Jean Woo[3], and Mack Shelley[4], *1. The Chinese University of Hong Kong, Hong Kong, Hong Kong, 2. Columbia University, New York, New York, United States, 3. Faculty of Medicine, Hong Kong, Hong Kong, 4. Iowa State University, Ames, Iowa, United States*

Despite the well-documented health interdependence in the spousal context, empirical evidence on how psychological wellbeing of one's partner might affect one's cognitive function remains limited. Using dyadic data, the objective of this study is to examine trajectories of depressive symptoms and associated cognitive function outcomes among U.S. older married couples. Longitudinal Health and Retirement Study data (2004-2016) were used (N=6,289 heterosexual couples). Latent class growth analysis characterized depressive symptom trajectories for wives and husbands, separately. Structural equation models examined the actor and partner effects of depressive symptom trajectories on cognitive function in 2016 after adjusting for covariates. Four distinct depressive symptom trajectories were identified, including persistently low (wives: 73.61%; husbands: 79.59%), increasing (wives: 8.60%; husbands: 8.27%), decreasing (wives: 12.80%; husbands: 8.32%), and persistently high (wives: 4.99%; husbands: 3.81%). Compared to the low trajectory, increasing and high depressive symptom trajectories were associated with poorer cognitive function for wives and husbands (β_(wife,increasing,actor)=-0.92,95%CI=-1.30,-0.54; β_(wife,high,actor)=-0.71,95%CI=-1.19,-0.23; β_(husband,increasing,actor)=-0.81,95%CI=-1.16,-0.45; β_(husband,high,actor)=-1.20,95%CI=-1.78,-0.63). Notable gender discrepancies in partner effects were observed. Specifically, wife's depressive symptom trajectories were not associated with husband's cognitive function (P>0.05). However, husband's decreasing depressive symptom trajectory was linked to wife's better cognitive function. One's own depressive symptom trajectories predicts his/her own cognitive function. Specifically, older adults with increasing and persistently high depressive symptoms over time may experience poorer cognitive function, and thereby warrant additional policy and clinical attention. Psychosocial interventions targeting depressive symptoms among older men may be beneficial to their spouses' cognitive function. Future studies need to validate such gender differences.

PERCEPTIONS OF DISCHARGE READINESS AND ENGAGEMENT IN DISCHARGE PLANNING FOR SPOUSAL VERSUS NONSPOUSAL CAREGIVERS

Catherine Elmore, Alycia Bristol, Lisa Barry, Eli Iacob, Erin Johnson, and Andrea Wallace, *University of Utah, Salt Lake City, Utah, United States*

Informal caregivers are frequently excluded during hospital discharge planning, potentially impacting their ability to effectively care for older adults at home. Few studies have examined experiences of spousal versus non-spousal caregivers during hospital discharge planning. In a secondary analysis of a mixed-method study, we quantitatively examined how spousal relationships impact caregivers' (n=266; 51.8% identified as a spouse or partner) scores of patient discharge readiness using the Readiness for Hospital Discharge Scale (RHDS-CG). We then conducted semi-structured interviews with a participant subset (n=23), and analyzed transcribed interviews using content analysis. First, comparing scores on the RHDS-CG, spouses/partners (88.4%) were more likely than non-spouses (75%) to report RHDS scores of 7+ corresponding with moderate to high readiness (X2 (1) = 8.070, p=.005). Among those interviewed, spouses/partners (65.2%) described their role as long-term, and shared strategies they had learned over time regarding how to seek involvement with healthcare professionals (HCPs). In contrast, non-spousal caregivers (34.8%) viewed their role as short term and struggled with how to communicate with HCPs, citing patient privacy rules and patient autonomy as perceived barriers. Overall, spousal caregivers had more experience with the healthcare system and felt better prepared to assume post-discharge care duties. Exploring the experiences of non-spousal caregivers, which make up more than one-third of our sample, is important since caregiving roles shift away from spouses to adult children and others as people age. Further consideration is necessary regarding how to support non-spousal caregivers in navigating the healthcare system.

RESILIENCE IN FAMILY CAREGIVERS OF ASIAN OLDER ADULTS WITH DEMENTIA: AN INTEGRATIVE REVIEW.

Thitinan Duangjina[1], and Valerie Gruss[2], *1. university of illinois Chicago, Chicago, Illinois, United States, 2. College of Nursing, University of Illinois Chicago, Chicago, Illinois, United States*

Resilience is the ability to rebound from adversity and the amount of resilience varies depending on the sociocultural contexts. Little is known about resilience in Asian family caregivers of older adults with dementia, although Asian countries show the fastest growth of dementia. An integrative review focused on resilience in Asian family caregivers was guided by Whittemore and Knafl (2005). A systematic search of five databases (CINAHL, EMBASE, PsycINFO, MEDLINE, PubMed) was conducted and limited to English-language empirical studies published between 2016 and 2021. A constant comparison approach was used for the data analysis. A total of 15 studies conducted in nine Asian countries were selected for review. Results revealed Asian family caregivers were most commonly adult children, female, and providing home care. Resilience was impacted by multiple interrelated factors. Two influences emerged from this review including risk factors (burden, stigma, family stress, social stress) and protective factors (positive aspect of caregiving [PAC], religiosity/spirituality, social support). Filial piety, derived from religiosity/spirituality, played a role in both risk and protective factors. Asian caregivers with a deep-rooted belief in filial piety exhibited more depression than US caregivers (d=.21, p <.05), as Asian caregivers restricted their other activities and dedicated themselves to caregiving. Other Asian caregivers who balanced a belief of filial piety experienced a PAC and were resilient. Future interventional research should focus on minimizing risk factors (burden) and maximizing protective factors (PAC and religiosity/spirituality) to promote resilience among Asian family caregivers. A culturally aligned family-centered approach to care should be considered.

TYPOLOGIES OF PARENT-CHILD RELATIONSHIPS AND ASSOCIATED HEALTH OUTCOMES: A CROSS-CULTURAL COMPARISON

Dexia Kong[1], Peiyi Lu[2], and Merril Silverstein[3], *1. The Chinese University of Hong Kong, Hong Kong, Hong Kong, 2. Columbia University, New York, New York, United States, 3. Syracuse University, Syracuse, New York, United States*

Background: This study investigates types of parent-child relationships and associated health outcomes among older adults of U.S. and China. Method: Cross-sectional data from Health and Retirement Study in the U.S. and Health and Retirement Longitudinal Study in China were used (N_(U.S.)=3918, N_China=4058). Relationship indicators included co-residence, living nearby, having weekly contacts, receiving assistance with daily activities, providing grandchild care, and having financial transfer from/to children. Latent class and regression analyses were conducted.

Results: Four classes were identified for older Americans, including (1) distant and uninvolved (6.58%); (2) geographically proximate with frequent contacts and downward support (47.04%); (3) co-resident with frequent contacts and upward support (13.1%); and (4) geographically proximate with frequent contacts (33.28%). By contrast, three classes were identified among older Chinese, including (1) co-resident with frequent contacts and upward support (37.46%); (2) coresident/interdependent (25.65%); (3) geographically proximate with frequent contacts and upward financial support (36.89%). For both countries, providing downward support was associated with fewer functional limitations and better cognitive function. Receiving instrumental support from children was associated with more depressive symptoms and functional limitations, and poorer cognitive function among Chinese older adults only.

Conclusions: Cultural contrasts were evident in parent-adult child relationship types and their associations with health outcomes. Overall, child-parent relationships in China tend to be more tight-knit than that of the U.S. Receiving financial support from children and co-residence are unique features of child-parent relationships in China. Cultural differences in child-parent relationships call for culturally-relevant strategies to address needs of older adults from various cultures.

SESSION 3510 (PAPER)

COGNITIVE ASSESSMENTS AND FUNCTION

ADAPTATION OF FACE-TO-FACE COGNITIVE ASSESSMENTS FOR TELEPHONE ADMINISTRATION: A POTENTIAL THREAT TO VALIDITY

Jason Smith[1], Laura Gibbons[2], Dan Mungas[3], Maria Glymour[4], Laura Zahodne[5], Elizabeth Mayeda[6], Richard Jones[7], and Alden Gross[1], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. University of Washington, Seattle, Seattle, Washington, United States, 3. University of California, Davis, Sacramento, California, United States, 4. University of California, San Francisco, San Francisco, California, United States, 5. University of Michigan, Ann Arbor, Michigan, United States, 6. University of California, Los Angeles Fielding School of Public Health, Los Angeles, California, United States, 7. Warren Alpert Medical School, Brown University, Providence, Rhode Island, United States*

Telephone-administered cognitive assessments are a cost-effective, feasible, and sometimes necessary alternative to in-person assessments. However, there is a scarcity of information in large cohort studies concerning mode effects, or differences in cognitive performance attributable to assessment method instead of underlying cognition, as a potential measurement threat. We evaluated mode effects on individual cognitive items and overall cognitive score using a population-based sample of community-living older adults aged 65-79 in the US in the 2014 Health and Retirement Study for whom interview mode was randomized (n=6825). We assessed mode differences in test means and reliability, whether mode modifies associations of cognition with criterion variables, and formal measurement invariance testing by mode. Relative to those assessed face-to-face, people assessed by telephone tended to have higher scores for memory and calculation items (0.06 to 0.013 standard deviations (SD)) and lower scores for non-memory items (-0.09 to

-0.01 SD). We also found evidence that estimated cognition was significantly differentially related to IADL score depending on mode of assessment, observing a stronger association among participants completing telephone interviews. Measurement invariance testing identified the largest mode differences in memory and attention items: immediate noun recall, delayed noun recall, and serial 7s scores were higher when administered by telephone. Differences by telephone vs face-to-face mode of administration are apparent in cognitive measurement in older adults, and most pronounced for tests of memory and attention that can be easier to answer via telephone. Future investigations are warranted to further evaluate methods to correct for such differences.

AFFECTIVE TRAJECTORIES: RISK OF DEMENTIA AND UNDERLYING STRUCTURAL BRAIN VARIABLES IN OLDER WOMEN

Andrew Petkus[1], Xinhui Wang[2], Susan Resnick[3], Daniel Beavers[4], Mark Espeland[5], Joshua Millstein[2], Margaret Gatz[2], and Jiu-Chiuan Chen[2], *1. University of Southern California, LOS ANGELES, California, United States, 2. University of Southern California, Los Angeles, California, United States, 3. National Institute on Aging, Baltimore, Maryland, United States, 4. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 5. Wake Forest School of Medicine, Winston Salem, North Carolina, United States*

Understanding how trajectories of positive and negative affect relate to dementia risk and underlying structural brain variables is important for dementia prevention. We examined associations between annually assessed Positive and Negative Affect Scale subscales and dementia risk (2000-18) among cognitively-intact community-dwelling women (N=948; aged 72.9±3.7) from the Women's Health Initiative Study of Cognitive Aging (years 2000-2010) and Magnetic Resonance Imaging Study (2005-2006). Joint latent class mixture models were constructed to identify latent classes of women with similar trajectories of affect and dementia risk over time. Multinomial and logistic regressions examined whether structural MRI measures predicted latent class membership (adjusted for sociodemographic, lifestyle, clinical characteristics, and intracranial volume). Two latent classes of positive affect (high stable:88% and decreasing:12%) and four classes of negative affect (Minimal stable:75%; high stable:4%; emerging:12%; moderate decreasing:9%) were identified. With the high stable trajectory as referent, women with decreasing positive affect were more likely to develop dementia (HR=4.33;p<.001). The odds of being classified as this high-dementia risk group were increased among women with more (per SD) global small vessel ischemic disease (SVID;OR=1.42;p<.001), deep white matter SVID (OR=1.93;p<.001), and smaller parahippocampal volumes (OR=1.41;p=.016). For negative affect, with minimal stable negative affect as referent, women with smaller hippocampal volumes were more likely to be classified as having moderate decreasing negative affect (OR=1.45;p=.024) while emerging negative affect was associated with higher dementia risk (HR=2.00;p=.014). These findings highlight the importance of changes in affect in later-life with dementia risk and potential underlying role of cerebrovascular disease and medial temporal lobe structures.

COGNITIVE FUNCTION CONTRIBUTES TO THE NONLINEAR RELATIONSHIP BETWEEN AGE AND DUAL-TASK GAIT IN MID-AGED POPULATION

Junhong Zhou[1], Gabriele Cattaneo[2], Wanting Yu[3], Natalia Gouskova[3], Lewis Lipsitz[4], Alvaro Pascual-Leone[3], David Bartres-Faz[5], and Brad Manor[6], *1. Harvard Medical School/Hebrew SeniorLife, Roslindale, Massachusetts, United States, 2. Universitat Autònoma de Barcelona, Barcelona, Catalonia, Spain, 3. Hebrew SeniorLife, Roslindale, Massachusetts, United States, 4. Hebrew SeniorLife, Brookline, Massachusetts, United States, 5. Institut Universitari de Neurorehabilitació adscrit a la UAB, Barcelona, Catalonia, Spain, 6. Hebrew SeniorLife/Harvard Medical School, Roslindale, Massachusetts, United States*

The capacity to maintain safe walking is critical to functional independence in older adults. However, the timing/stage when such capacity starts to diminish, and its potential contributors have not been well characterized. To explore that, we here conducted analysis based upon the data of 651 participants of age between 40 and 65 years from Barcelona Brain Health Initiative Study. Each participants completed: 1) one 45-second trial of walking normally (single-task) and while performing a serial-subtraction-by-three task (dual-task), of which gait was measured using a smartphone-based gait-assessment application; and 2) a battery of cognitive tests. The dual-task cost (DTC) (i.e., percent changes from single- to dual-task condition) to mean stride time (ST) and stride time variability (STV) and the score of global cognitive function were obtained. The LOESS analyses demonstrated nonlinear relationships between age and DTCs with a turning point at age of 54 years (R2>3%). Regression models showed significantly greater associations (p=0.01~0.03) between age and DTCs (i.e., older age, worse gait) (β=0.22~0.28, p< 0.006), as well as between global cognitive function and DTCs (β=-0.28~-0.18, p< 0.002), in older group (i.e., age≥54 years) compared to younger group. The structural-equation-modeling suggested that in older group, cognitive function mediated the relationship between age and dual-task gait (p< 0.02) with a contribution of 43~47% to such relationship. The observations here revealed that as early at age of 54 years, dual-task gait starts to significantly diminish, and its dependence on cognitive function dramatically increases, providing critical knowledge for the management of mobility and cognitive aging in mid-age population.

RACIAL/ETHNIC DIFFERENCES IN SUBJECTIVE COGNITIVE DECLINE AMONG US ADULTS AGED ≥45 YEARS, 2015–2020

Benjamin Olivari[1], Karen Wooten[1], Eva Jackson[2], Lisa McGuire[1], and Janet Croft[1], *1. CDC, Atlanta, Georgia, United States, 2. Alzheimer's Association, Chicago, Illinois, United States*

Recent studies report that older minorities have a higher prevalence of subjective cognitive decline (SCD), the self-reported experience of worsening or more frequent memory loss or confusion, than older non-Hispanic Whites. This study describes the prevalence of SCD by race/ethnicity and select demographic and social characteristics among U.S. adults aged ≥45 years and whether those reporting symptoms of SCD talked with a health care professional about them. Data collected from 215,406 respondents by the Behavioral Risk

Factor Surveillance System (BRFSS) in 2015-2020 were used in the analyses. Statistical comparisons were made using chi-square tests and p value of < 0.05. SCD was reported by nearly 10% of the study population. Asian/Pacific Islanders (5.0%) were least likely to report experiences of SCD and American Indian/Alaska Natives (16.7%) were most likely to report the experience compared to other racial/ethnic groups. Among adults with SCD, Asian/Pacific Islander (34.5%) and Hispanic (40.5%) adults were less likely to talk with a health care professional about their SCD symptoms compared to non-Hispanic White (48.5), non-Hispanic Black (49.5%), and American Indian/Alaska Native (50.5%) adults. Early detection of SCD symptoms can be important to identify early signs of dementia or other potentially treatable conditions and establish a care plan to help people remain as healthy and independent for as long as possible. Health care professionals, especially those working with groups with increased prevalence of SCD, could consider initiating discussions with adults as young as 45 years of age to identify early signs of dementia-like symptoms.

THE FLYNN EFFECT IN SHORT-TERM COGNITIVE DECLINES OF AMERICANS AGED 65 YEARS AND OLDER: SMARTER AND MAYBE SLOWER

Yun Zhang[1], Joeseph Rodgers[2], Patrick O'Keefe[3], Graciela Muniz Terrera[4], Stacey Voll[5], Frank D. Mann[6], Scott Hofer[5], and Sean Clousten[1], *1. Stony Brook University, Stony Brook, New York, United States, 2. Vanderbilt University, Nashville, Tennessee, United States, 3. Oregon Health and Science University, Portland, Oregon, United States, 4. Ohio University, Athens, Ohio, United States, 5. University of Victoria, Victoria, British Columbia, Canada, 6. Stony Brook University, New York, New York, United States*

To contribute to our understanding of cohort differences and the Flynn Effect in cognitive declines, this study aims to: 1) describe and compare cognitive decline trends of two nationally representative American older cohorts; 2) investigate significant determinants of cognitive declines and the cohort differences. The analysis used data from the National Health and Aging Trends Study (NHATS, 2011-2019), including one nationally representative cohort of older Americans in 2011 and another from 2015. We used mixed-effect models adjusted for cohort, wave, baseline age, sex, education, race, familiarity, and follow-up years, as well as survey designs, to describe and compare the intercepts and slopes in cognitive functions of the two NHATS cohorts. We included Cohort 1 (N=7,325) respondents (2011-2015), and Cohort 2 (N=7,330) respondents (2015-2019). Compared to Cohort 1, Cohort 2 has a significantly higher intercept and a slower decline for episodic memory, and a significantly higher intercept but a significantly faster decline for global cognition, orientation function, and executive function. Consistently, older age, poorer educational attainment, and minority races/ethnicity are associated with worse cognitive performances. Our results provide a comprehensive image of cohort declines for Americans aged 65 years and older. Our findings are consistent with the Flynn Effect in that the general levels of cognition of later cohorts improved. Furthermore, we found support for the Flynn Effect in a short term. We also found significant effects of older age, poorer educational attainment, and minority race/ethnicity on cognitive function.

SESSION 3520 (SYMPOSIUM)

DELIVERING PERSON-CENTERED CARE IN TIMES OF CRISIS

Chair: Liza Behrens Discussant: Tonya Roberts

Preference-based person-centered care (PCC) is the gold standard for delivering high quality care in nursing homes (NH). A public health crisis makes it difficult for NH leaders to make decisions that honor residents' preferences for care and activities while balancing the safety of others in the NH community. Based on the Operational Framework to Guide Decision-making During the COVID-19 Pandemic, the purpose of this symposium is to discuss several projects that are growing the evidence-base for person-centered risk management during a public health crisis. Data presented can guide NHs in balancing safety and risk during a public health crisis. Our first presentation speaks to the adoption of preferences as an important measure of care quality prior to a crisis, the next two presentations speak to how risk perceptions of NH staff and residents can support PCC delivery during a crisis, and the final presentation provides a potential evidence-based quality improvement strategy for integrating PCC in the pandemic recovery phases. First Dr. Abbott will present on the impact of using the preferences for everyday living inventory as a quality and safety indicator in NHs, then Dr. Carpenter will present on direct-care staff members risk perceptions while during the COVID crisis, followed by Dr. Behrens who will discuss residents' risk perceptions around having their preferences honored during the COVID crisis, and finally Ms. Heilbrunn will discuss an ongoing clinical trial evaluating the impact of using the ECHO platform to improve infection control and care quality during the COVID crisis.

"I'M NOT A RISK-TAKER": RISK PERCEPTIONS OF NURSING HOME RESIDENTS WITH DEMENTIA

Liza Behrens[1], Hannah Anderson[2], Kalei Kowalchik[1], Jacqueline Mogle[3], Kimberly Van Haitsma[1], and Marie Boltz[4], *1. Pennsylvania State University, University Park, Pennsylvania, United States, 2. Children's Hospital of Philadelphia, Philadelphia, Pennsylvania, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. Penn State, Pennsylvania State University, Pennsylvania, United States*

Persons living with dementia (PLWD) in nursing homes (NH) are often left out of care conversations about their health and safety. These omissions impinge on their personhood and rights to have care preferences heard and honored. PLWD maintain the ability to communicate values and preferences long after their decision-making abilities are affected by cognitive changes. This study explored risk perceptions of PLWD associated with their care preferences. As part of a larger focused ethnography conducted during the COVID-19 pandemic, in-depth interviews explored risk perceptions of residents (N=7) with dementia (BIMS M=9.29). Using a risk propensity survey, residents self-identified as risk avoiders (M=3.2) and content analysis of interviews revealed that PLWD perceive physical and psychosocial harms (e.g., high blood sugar, falls, choking) and benefits (e.g., feeling good, social interactions, reminiscing) related to care preferences. Results suggest it is possible for PLWD with varying levels of cognitive decline to participate in discussions about their health and safety.

THE IMPACT OF IMPLEMENTING THE PREFERENCES FOR EVERYDAY LIVING INVENTORY (PELI) ON SURVEY DEFICIENCY OUTCOMES

Katherine Abbott[1], John Bowblis[1], Jane Straker[2], and Kimberly Van Haitsma[3], *1. Miami University, Oxford, Ohio, United States, 2. Scripps Gerontology Center at Miami University, Oxford, Ohio, United States, 3. Pennsylvania State University, University Park, Pennsylvania, United States*

The Ohio Department of Medicaid added the PELI as one of five quality incentive points used to determine Medicaid per diem reimbursement rates with the goal of improving person-centered care among Ohio's nursing homes (NHs). The purpose of this study was to explore if the degree of PELI implementation had an impact on quality as defined by deficiencies and star rating. Multinomial logistic regression of 1,300 NH-year observations was used to understand the relationships between survey star ratings/deficiency scores on PELI implementation controlling for organizational characteristics of the NH. We find complete PELI implementation statistically significantly increased the probability of being a 4- or 5-star survey-rated facility. Complete PELI implementation is associated with small improvements each year that add up. Organizational change takes commitment and persistent effort over time to see changes in quality as reflected by star ratings and deficiencies. Recommendations for practice and policy will be discussed.

PROJECT ECHO FOR NURSING HOMES: A PATIENT-CENTERED, RCT TO IMPLEMENT INFECTION CONTROL BEST PRACTICES IN NHS

Emily Heilbrunn[1], William Calo[2], Erica Francis[3], Lan Kong[2], Ellie Hogentogler[3], Abbey Fisher[3], Nancy Hood[4], and Jennifer Kraschnewski[5], *1. Project ECHO, Penn State University College of Medicine, Hershey, Pennsylvania, United States, 2. Penn State College of Medicine, Department of Public Health Sciences, Hershey, Pennsylvania, United States, 3. Penn State College of Medicine, Department of Medicine, Project ECHO, Hershey, Pennsylvania, United States, 4. University of New Mexico, Project ECHO, Albuquerque, New Mexico, United States, 5. Penn State College of Medicine, Department of Medicine, Hershey, Pennsylvania, United States*

Nursing homes (NHs) have been devastated by COVID-19. Only 3% of designated infection preventionists in NHs have taken a basic infection control course. Little is known about the implementation of effective infection control practices in NHs. This study utilizes Project ECHO (Extension for Community Health Outcomes), an evidence-based tele-mentoring model, to connect subject matter experts with NH staff to proactively support evidence-based infection control guideline implementation. This study will determine how guidelines can be implemented effectively in NHs, including reducing COVID-19 diagnoses and improving other key patient-centered outcomes (e.g., quality of life) NHs (N=136) were recruited and assigned to ECHO or ECHO Plus using a randomized design. A multi-pronged approach to improving infection control and emergency preparedness in NHs is important. The ECHO model has significant strengths allowing for remote learning delivered by a multi-disciplinary team and utilizes case discussions that match the context and capacity of NHs.

NURSING HOME STAFF RISK PERCEPTIONS DURING THE COVID-19 PANDEMIC

Joan Carpenter[1], Nia Kooiman[2], Kalei Kowalchik[3], Jacqueline Mogle[4], Jasmine Newman[2], and Liza Behrens[3], *1. University of Maryland School of Nursing, Baltimore, Maryland, United States, 2. University of Maryland, Baltimore, Maryland, United States, 3. Pennsylvania State University, University Park, Pennsylvania, United States, 4. The Pennsylvania State University, University Park, Pennsylvania, United States*

Nursing home (NH) staffs' risk perceptions related to NH residents' health and safety are a barrier to honoring residents' preferences for care and activities; this was exacerbated during the COVID-19 pandemic. This study intended to describe NH staffs' self-perceived risk perceptions during the COVID-19 crisis as measured by the validated Risk Propensity Scale. Participants (N=27) included licensed and unlicensed nursing staff (e.g., RN, LPN, CNA), social workers, and activities directors, were mostly female (85%), White (74%), non-Hispanic (93%), and had more than three years of experience working in NHs (78%). Survey results indicated that males considered themselves risk seekers (M=7.5 out of 9) and females risk avoiders (M=4.0). Despite identifying as a risk seeker or risk avoider, the majority of participants agreed with "safety first", preferred to avoid risk, and viewed risks as "a challenge." Findings will be discussed considering implications for person-centered risk management during a public health crisis.

SESSION 3530 (SYMPOSIUM)

DEMENTIA IN INCARCERATED SETTINGS: MAKING A DIFFERENCE IN OHIO'S PRISON SYSTEM

Chair: Margaret Sanders

The number of individuals living in incarcerated settings with dementia will double by 2030 and triple by 2050. Older adults are the fastest growing demographic in incarcerated settings and age is the number one risk factor for dementia. The HRSA-sponsored Geriatric Workforce Enhancement Program, Ohio Council for Cognitive Health, Benjamin Rose Institute on Aging and the Ohio Department of Rehabilitation and Correction (ODRC) worked together to develop Dementia Friends for Incarcerated Settings to impact the lives of those living with dementia within the correctional setting. This pilot furthered the development of this Dementia Friends programming and measured ODRC staff knowledge/attitudes about dementia, as well as uncovered the experiences and needs of staff within the ODRC. Online Dementia Friends sessions were conducted in all 27 Ohio prisons with voluntary, anonymous pre- and post-session surveys based on the Brief Tool for Dementia-Friendly Education and Training Sessions developed to measure the impact of dementia-friendly education efforts on knowledge, attitudes/perceptions, and interacting with people living with dementia and their caregivers. The results of this pilot underscored the need, usefulness and applicability of dementia education throughout the ODRC system, indicating teaching effective communication techniques within a correctional facility are helpful for those working within such settings. The results indicate benefits on both a personal and professional level. These sessions provide a starting point for potential future educational sessions to serve all members of the correctional sector. Future proposed projects will focus on people living in incarcerated settings and those transitioning back into the community.

DEVELOPMENT OF DEMENTIA FRIENDS FOR INCARCERATED SETTINGS CURRICULUM

Bonnie Burman[1], and Elizabeth Kinzig[2], *1. Ohio Council for Cognitive Health, New Albnay, Ohio, United States, 2. Ohio Council for Cognitive Health, New Albany, Ohio, United States*

This presentation describes the working relationships and steps that were taken to develop Dementia Friends for Incarcerated Settings. This included identifying population needs, approval processes, curriculum development specific to this population, learner coordination, implementation, measurement and reporting. Dementia Friends, a one-hour session to help everyone in a community understand five key messages about dementia, was used as the framework for an educational program targeting staff at correctional facilities. Dementia Friends is a standardized program that can be modified depending on the target audience or sector. Our sector-specific program was piloted in all 27 Ohio prisons to ensure that all staff are knowledgeable about ways to make a difference in the lives of those living with dementia.

THE DEVELOPMENT AND IMPLEMENTATION OF PILOT PROGRAM EVALUATION MEASURES

Denise Kropp, *Northeast Ohio Medical University, Rootstown, Ohio, United States*

This presentation describes measurement tools and techniques for the pilot. Anonymous pre- and post-surveys were based on the Brief Tool for Dementia-Friendly Education and Training Sessions, modified for the ODRC population. The Brief Tool is a 7-item scale measuring the impact of dementia education sessions on knowledge, attitudes/perceptions, and interacting with people living with dementia. Based on ODRC feedback, we added an item on recognizing dementia. The pre-session survey asked about experiences with dementia prior to the session. The post-session survey included items on satisfaction, including the usefulness of the session in their work within the ODRC, whether they learned new information, and whether they would recommend the training. Open-ended items asked about dementia-related topics participants wanted to learn more about. All four online pilot sessions were led by the Ohio Council of Cognitive Health. Recordings of the sessions were made available for people unable to attend a scheduled session.

PILOT PROGRAM EVALUATION RESULTS OF DEMENTIA FRIENDS FOR INCARCERATED SETTINGS

Jessica Bibbo, and Sarah Nicolay, *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*

This presentation will present the findings from the pilot sessions. 266 people completed both pre- and post-session surveys (Mage=46.10, SDage=11.47; Female=62.03%; Full time=97.36%). Sixty-five percent knew a person living with dementia (PWD) and 28.57% said they worked with PWD. Four out of the five attitude items (e.g., I am confident interacting with PWD; I am able to recognize behaviors that may be due to dementia) significantly improved ($ps<0.001$). There was no change in knowledge items ($ps \geq 0.18$); Ninety-five percent agreed they would use the information in their work and 95.82% would recommend the session to the people they worked with. Topics participants wanted to learn more about focused on communication with and activities for PWD in an incarcerated setting, learning more about dementia, adjusting the physical environment for PWD, and ensuring proper diet. Further, participants felt the session should be required for all ODRC staff.

IMMEDIATE AND FUTURE IMPLICATIONS

Martha Williman, *Ohio Council for Cognitive Health, Findlay, Ohio, United States*

ODRC leadership was engaged in developing and promoting this first-of-its-kind initiative. Success was enhanced by making the training mandatory and providing CEs for employees in ODRC's medical, behavioral health, mental health, dental and dietary departments. Our goals are to expand to all the ODRC's over 12,000 employees and to increase dementia education in correctional settings across the U.S. In addition, we propose further developing the program to include people living in incarcerated settings and those being released into the community. With 95% of staff agreeing they would be able to use what they learned in their workplace, and over 63% of attendees stating they know someone who lives/lived with dementia, this training has implications for not only professional development, but personal support as well and provides a starting point for future education sessions to serve both staff and those living in incarcerated settings within and beyond Ohio.

SESSION 3540 (PAPER)

A MOBILE APPLICATION FOR MUSIC EXPOSURE MEASUREMENT IN DEMENTIA RESEARCH: A PROOF-OF-CONCEPT STUDY

INNOVATIONS IN TECHNOLOGY FOR SOCIAL ENGAGEMENT AMONG OLDER ADULTS AND TO IMPROVE CAREGIVER COMMUNICATION AND TRAINING

Hongdao Meng[1], Sean Barbeau[1], Mingyang Li[1], Cassidy Doyle[1], Kelly Wiechart[2], Robert Hammond[1], and William Kearns[1], *1. University of South Florida, Tampa, Florida, United States, 2. KellyW Consulting, Tampa, Florida, United States*

Music-based interventions (MBIs) have been shown to benefit persons with dementia. To develop new MBIs and build the evidence base for motor, cognitive, emotional, and behavioral outcomes, accurate measures of music exposure (e.g., content, dose, and duration) are critically important. However, most commercial music services require internet access and/or subscription fees without providing convenient ways for researchers to access music exposure data. Our research team developed the open-source MUsic to Support Engagement and Resilience (MUSER) Android application with an associated data processing engine. Caregivers can use MUSER to deliver individualized music selections via smartphones/tablets, with music exposure data being generated for research use. We used the Kotlin programming language for application development and Java/Python/Microsoft BI for data processing and analytics instrumentation. The MUSER application was tested for music exposure measurement feasibility with 16 users (ten research team members and six family caregivers of persons with dementia) for two weeks between July and November of 2021. Semi-structured interviews were conducted pre-post application testing to gather qualitative and quantitative data to enrich the understanding of user experiences. Family caregivers had a mean age of 57.8 (SD=26.2; range 20-77). The average number of listening days was 6 (SD=2.5), and the average music listening duration was 203 minutes (SD=123.2). Caregivers played an average of 52 (SD=36.9) songs from 10 (SD=4.2) albums involving 34 (SD=36.3) artists. Given the ease of deployment and integrated data collection and reporting capabilities, this application supports collaborative software development among researchers to advance MBI research.

INTEGRATING HEALTH AND HOME CARE THROUGH TECHNOLOGY: ACTIONABLE SOLUTIONS FOR PROGRESS

Lauren Dunning, Caroline Servat, and Nora Super, *Milken Institute Center for the Future of Aging, Santa Monica, California, United States*

Shifts toward virtual care driven by the pandemic have continued to blur the previously sharp lines between health care and home care. A new care ecosystem is emerging, bringing with it the opportunity to integrate health and home care through technology. Over the course of the pandemic, Medicare telehealth visits increased 63-fold between 2019 and 2020, innovative programs enabled acute hospital care at home using digital tools, and people in need of care could reach their providers through a broad range of devices and modalities. But many of the policy changes underlying these advancements and others were temporary, and permanent actions are needed to sustain momentum. To characterize the emerging landscape, the Milken Institute conducted informational interviews with over 40 experts representing health, technology, government and policy, research and academia, philanthropy, advocacy, and community-based organizations. From these interviews, themes emerged on barriers, innovations, and opportunities. Findings were further refined through a roundtable workshop and survey to develop guiding principles and consensus-built recommendations. Three sets of recommendations were then developed on: 1) pandemic-related and larger-scale policy and program design to support tech-enabled care, 2) practices and policies to develop a systems approach that integrates health and home care and bolsters equity, and 3) collaboration and coordination to accelerate efforts. This paper focuses on the interview themes and progress made to advance solutions in partnership with stakeholders.

PREDICTORS OF PARTICIPATION IN A TELEPHONE-BASED SOCIAL CONNECTEDNESS INTERVENTION FOR OLDER ADULTS

Omolola Adepoju[1], Ben King[1], Jiangtao Luo[2], LeChauncy Woodard[1], Jessica Dobbins[3], Jason Pierett[3], and William Glasheen[3], *1. University of Houston College of Medicine, Houston, Texas, United States, 2. University of Houston, Houston, Texas, United States, 3. Humana, Louisville, Kentucky, United States*

Background: Social isolation is a well-documented contributor to poor mental and physical health, and interventions promoting social connectedness have been shown to be protective. This study examined predictors of participating in a telephone-based social connectedness intervention for socially isolated older adults.

Methods: Data was obtained from a social connectedness intervention that paired students with older adults. Eligible participants included Houston area older adults, 65 years or older, enrolled in Medicare Advantage plans. Eligible participants were contacted telephonically and asked to complete the 3-item UCLA Loneliness Scale. Those who screened positive for loneliness were invited to participate in the social connectedness intervention. Logistic regression models, that accounted for sociodemographic, clinical and functional indices, were used to identify predictors of participation.

Results: Females (OR: 1.23, 95% CI: 1.04-1.45), and racial/ethnic minorities (African American OR: 1.39, 95%CI: 1.16-1.68; Hispanic OR: 1.43, 95%CI: 1.04-1.99) were more likely to participate in a telephone-based social connectedness intervention. Older adults with a disability (OR: 2.37, 95%CI: 1.96-2.87), higher CMS Hierarchical Condition Category risk scores (OR: 1.15, 95%CI: 1.06-1.25) and those who reported having 1+ social needs (OR: 1.38, 95%CI: 1.14-1.66) were more likely to participate. Of all Charlson Comorbidity Index flags examined, diabetes was the single strongest predictor of participation (OR=2.49, p=0.02). Older adults who reported functional comorbidities for anxiety and depression were also more likely to participate.

Conclusion: Telephone-based social connectedness interventions can reach vulnerable older adults with clinical and social needs, and can be useful in addressing racial/ethnic health equity gaps in socially isolated older adults.

PUTTING THE 4MS INTO PRACTICE: IMPLICATIONS FOR TRAINING AND TECHNOLOGY

Jennifer Crittenden[1], Rachel Coleman[2], Jennifer Jain[2], David Wihry[3], Lenard Kaye[2], Susan Wehry[4], and Judith Metcalf[4], *1. UMaine Center on Aging, Bangor, Maine, United States, 2. University of Maine, Bangor, Maine, United States, 3. University of Maine, Orono, Maine, United States, 4. University of New England, Biddeford, Maine, United States*

The AgingME Geriatrics Workforce Enhancement Program (AgingME GWEP), a statewide collaboration led by the University of New England and the University of Maine, is guided by an annual statewide survey of community and professional stakeholders. The aim of this research is to identify training and resource gaps related to age-friendly healthcare and topics of interest. Of the 245 survey respondents, 15% indicated existing knowledge of the 4Ms framework. The top sources of 4M's framework exposure included trainings or webinars (30%) and web-based resources (19%). Of those with knowledge of the 4M's, 33% of providers and 29% of older adults/community members reported employing the 4Ms in their professional practices and personal lives, respectively. Respondents also noted the need for more training on how to use technology to locate healthcare information (33%), using technology to reduce isolation and loneliness among older adults (29%), and keeping providers connected with older patients (26%).

Additional write-in responses (11%) suggest a need for general technology training and improving access to technology overall. Respondents' (N = 157) top five categories for needed aging-related training topics were community resources for older adults (15%), aging-in-place (14%), exercise and nutrition (11%), improving provider/patient communication (9%), and 4M's of age-friendly healthcare overview (8%). Responses also identified themes related to improving patient/provider communications, availability of resources, and ageism that could be addressed through upcoming GWEP activities. Results indicate a need to facilitate the translation of 4Ms knowledge into practice and increasing technology training and access.

SUPPORTING RESIDENT ENGAGEMENT VIA WEB-BASED ASSESSMENT: EXPERIENCE OF ACTIVITY PROFESSIONALS IN LONG-TERM CARE

xiaoli li[1], and Cheng Yin[2], *1. University of North Texas, Frisco, Texas, United States, 2. University of North Texas, Corinth, Texas, United States*

Background: Resident engagement and activities have positive relationships with emotional wellbeing and physical health. However, regularly offered activities may not be suitable for all individuals and may be unsustainable when there are changes in residents' health. Loneliness, depression, and social isolation are observed among residents in long-term care facilities. A web-based assessment system, "Elder Engagement Performance Improvement (EEPI)," has the potential to support resident engagement. Activity professionals are crucial in utilizing EEPI and engaging residents in meaningful activities, especially regarding their role in helping enhance resident engagement and wellbeing. This study aims explores activity professionals' experiences in implementing the EEPI assessment. Method: Semi-structured interviews with 23 long-term care activity professionals (e.g., certified activities professionals, therapeutic recreation specialists, and activity assistants) were conducted and analyzed using qualitative content analysis.

Results: Activity professionals` experiences showed the EEPI was a means in improving residents' engagement quality and making engagement a more targeted outcome. Four main themes emerged: (a) Lack of assessment tools, (b) Acceptance of a web-based assessment system, (c) Barriers to using the EEPI (time arrangements, staffing issues, and being on the same page), and (d) Areas for job improvement (person-center care and measurable practices). Conclusions: The EEPI may serve as a valuable tool in long-term care facilities. The web-based assessment system facilitated activity professionals' daily work and involved the residents' input in their care, which may enhance resident engagement and reduce the risk of social isolation in long-term care facilities.

SESSION 3550 (SYMPOSIUM)

INTEGRATING DIVERSE CANCER PERSPECTIVES: FROM DEVELOPMENT TO IMPLEMENTATION

Chair: Sean Halpin

Cancer among older adults is pervasive, putting excessive strain at the individual, caregivers, and wider society levels. In our symposium, we bring together researchers from varied disciplines—with a focus on easing the strain of cancer on older adults by identifying important gaps in care and developing and implementing innovative methods for improving health services. First, Carrion will discuss the multifactorial experience of fears and beliefs about cancer and cancer prevention in 57 older Latino men. Krok-Schoen will discuss the longitudinal association between religiosity and cognitive functioning among older adults with hematological cancers. Next, Seaman will discuss engaging hard-to-reach patients and those who underutilize the health system. Blackberry will then describe an implementation and impact framework of a five-year research program to improve care in older people with cancer. Lastly, Halpin will discuss the 36-month implementation of a video-based patient education program for patients with multiple myeloma who are preparing for autologous stem cell transplant. Understanding the development and implementation of programs aimed at improving health services among older adults with cancer will help improve understanding potential methods for identifying and addressing health services challenges in these populations.

IMPLEMENTATION OF AN EDUCATION INTERVENTION FOR MULTIPLE MYELOMA PATIENTS RECEIVING STEM CELL TRANSPLANT

Sean Halpin[1], and Michael Konomos[2], *1. Evidera, Decatur, Georgia, United States, 2. Emory University, Atlanta, Georgia, United States*

Older adults have an increased risk for multiple myeloma (MM), yet they are often unable to collect sufficient healthy stem cells for autologous stem cell transplant (ASCT). We sought to assess the implementation of educational intervention videos, termed Ready for Transplant (R4T), for MM patients both during the 18-month study and at 12 and 18-months post-study. Guided by the Reach, Effectiveness, Adoption, Implementation and Maintenance (RE-AIM) framework, we observed 152 clinical encounters for 70 patients who received the intervention. Patients who reported viewing the R4T videos (56%) tended to be older and male and were more likely to admit for transplant than those who did not report viewing the videos (risk ratio, 2.3; 95% CI, 0.61, 3.88). At 12- and 18-months-post, nurses reported still using the R4T videos and found them particularly useful during times when patients were unable to attend the hospital for in-person visits due to the pandemic.

IMPLEMENTING AND MEASURING IMPACT OF A FIVE-YEAR TRANSLATIONAL GERIATRIC ONCOLOGY RESEARCH PROGRAM

Irene Blackberry[1], Christopher Steer[2], Tshepo Rasekaba[1], Stacey Rich[3], Nicole Webb[2], and Kim Young[1], *1. La Trobe University, Wodonga, Victoria, Australia, 2. Border Medical Oncology and Haematology, Albury, New South Wales, Australia, 3. La Trobe University, John Richards Centre, Wodonga, Victoria, Australia*

The Geriatric Oncology Regional Victorian Trials Alliance, Linkages, Special populations, Equity program (GO ReViTALISE) is part of a five-year state-wide grant to increase access to cancer clinical trials in regional Victoria, Australia. The initiative covers engagement with key stakeholders and trial sites, co-design of research programs with consumers, implementation of multiple interventional and non-interventional research, and capacity building.

Employing a framework prospectively is critical to guide and scaffold implementation of complex interventions and capture the process of how several activities interact. Likewise, there is a need to show research impact beyond successful implementation and clinical outcomes. Using the GO ReViTALISE as a case study, we will demonstrate how an implementation framework and the Framework to Assess the Impact from Translational health research can deliver a cohesive, impactful and measurable program of research to increase older adults' participation in cancer clinical trials, trials availability and build capacity in regional cancer sites.

NOT HAVING THE FAMILY, INSURANCE, AND MONEY AND EXPERIENCING LOTS OF PAIN: FEARS ABOUT CANCER AMONG OLDER LATINO MEN

Iraida Carrion[1], and Malinee Neelamegam[2], *1. University of South Florida, Tampa, Florida, United States, 2. University of North Texas Health Science Center, Fort Worth, Texas, United States*

Cancer is the second leading cause of death among Latino men. A total of 44.1% of Latino males 60-years or older have a lifetime probability of developing invasive cancer with lower survival rates, even when accounting for age and stage distribution. Given the population growth is essential to examine older Latinos' understanding of a cancer diagnosis. The study consisted of 200 surveys that included a qualitative component consisting of open-ended questions in Spanish. We separately analyzed the responses of the 57 immigrant Latino men to understand their perspective regarding cancer, prevention, diagnosis, and treatment. The median age is 68 years and the length of stay in the US is 27 years. Utilizing a grounded theory approach and thematic analysis, codes were developed based on five priori interview themes: leaving people behind, worry and stress about payment, emotions of sadness and fear of uncertainty, struggle with acceptance, and faith as comfort.

THE ROOM WHERE IT HAPPENS: ENGAGING EQUITABLY TO OPTIMIZE CANCER SURVIVORSHIP CARE

AARON SEAMAN, and Nitin Pagedar, *University of Iowa, Iowa City, Iowa, United States*

Cancer survivorship care programs, services, and research would benefit from including people living with a cancer history who have ceased their survivorship care in their engagement efforts. Our prior research with head and neck cancer survivors has shown that a considerable number of patients discontinue their post-treatment survivorship care despite still having care needs. Those patients who continue their care are also the ones most often engaged in research and community partnership; as the ones who are "in the room where it happens," they consequently have the most influential voices in shaping survivorship care. In this paper, we underscore the necessity of including those who discontinue survivorship care in research and community engagement efforts. We use our work with head and neck cancer survivors as a model for strategizing ways to inclusively and respectfully do so.

THE ASSOCIATION BETWEEN RELIGIOSITY AND COGNITIVE FUNCTIONING AMONG OLDER ADULTS WITH HEMATOLOGICAL CANCERS

Jessica Krok-Schoen[1], Ashley Rosko[2], Ying Huang[3], Allesia Funderburg[2], Katy Dvorak[2], and Erin Stevens[2], *1. The Ohio State University, Columbus, Ohio, United States, 2. The Ohio State University Comprehensive Cancer Center, Columbus, Ohio, United States, 3. The Ohio State University, Division of Hematology, Columbus, Ohio, United States*

Religiosity is positively associated physical health outcomes, yet longitudinal research on this association among older adults with cancer is limited. Participants were enrolled in a longitudinal study assessing chemotherapy's impact on the health of older adults with hematological cancers. Religiosity was assessed by the Duke University Religion Index (DUREL), with higher scores indicating higher religiosity. Cognitive functioning was assessed by the Blessed Dementia Scale, with higher scores indicating more impairment. Participants (n=97) had a median age of 70 years (range:60-88) and were 58% male and 97% white. DUREL scores were unchanged with a mean score of 22 (range:5-27). Cognitive functioning significantly improved with a median score of 4 (range:0-22) at baseline to 0 (range:0-20) at end-of-treatment. Religiosity was not significantly correlated with cognitive functioning over time. Future research should explore the trajectory of cognitive functioning and other sources of coping (social support, palliative/supportive care) among older adults with hematological cancers.

SESSION 3555 (SYMPOSIUM)

DYING WELL WITH DEMENTIA: SUPPORT NEEDS AND DIVERSITY ACROSS CULTURES AND SETTINGS

Chair: Jenny van der Steen

Dementia is increasingly recognized as a terminal illness but the end of life may comprise an extended period with death difficult to predict. Progressive cognitive impairment negatively affects autonomy. Family caregivers of people with dementia often fulfil important roles as spokespersons, informants, partners in care and proxy decision-makers. However, across cultures and individuals, values around autonomy, being in control, and family involvement are diverse. Therefore, perspectives on end of life with dementia and what is good care during the last phase of life may vary as well. Understanding and measuring good end-of-life care in dementia can help improve person and family centered caregiving at the end of life. This symposium will give insights into what is good end-of-life care in dementia and will show cultural and contextual differences drawing on studies in various countries. The contributions are based on diverse innovative and classical qualitative and quantitative methods including those engaging patient and public. Further work addresses how to support good end-of-life care during the COVID-19 pandemic, given the limitations of family restrictions and the need to provide care virtually. We present research on decision aids, care planning tools and care programs with a focus on ensuring that the perspectives of the person with dementia and family are at the forefront, and address individual differences in perceptions of a good end of life with dementia.

A GOOD END OF LIFE WITH DEMENTIA ACROSS CULTURES

Jenny van der Steen, *Leiden University Medical Center, Leiden, Zuid-Holland, Netherlands*

Conceptualizations of a good end of life with dementia vary across cultures and understanding differences and similarities can help develop care planning tools and help understand validity of measuring it in the context of cross-cultural comparisons. We have analysed (2019-2020) 14 cross-cultural studies covering qualitative data of 121 people with dementia and 292 family caregivers. Nine cross-culturally common themes emerged, ranging from basic care needs addressed to satisfaction with life and spiritual well-being. Good relationships were essential in all themes, but an emphasis on “care for caregivers” differed the most across cultures. Based on this work, we expanded an existing dementia care goals model by refining palliative care goals beyond comfort and functioning, and in an ongoing Delphi study (2021-2022) it was evaluated by experts of over 30 countries. This session will report on these studies, focusing on relevant cross-cultural differences, and connecting it to available measures of comfort and end-of-life care.

SUPPORTING RESIDENTS WITH DEMENTIA LIVING AND DYING IN LONG-TERM CARE AND THEIR FAMILIES DURING COVID-19

Sharon Kaasalainen[1], Abigail Wickson-Griffiths[2], and Rose McCloskey[3], *1. McMaster University, Hamilton, Ontario, Canada, 2. University Of Regina, Regina, Saskatchewan, Canada, 3. University of New Brunswick, Fredericton, New Brunswick, Canada*

TThis presentation will share research findings about experiences during COVID-19 about implementing a virtual palliative toolkit in long-term care in Canada. The toolkit includes tools and practices to: (a) engage residents and families with dementia within a palliative approach to care, (b) develop workforce capacity through online education modules, (c) reduce stress and improve psychological health of residents, families, and staff, and (d) develop organizational structures and processes to promote a palliative approach to care. Individual interviews were conducted with residents, family members, and staff before implementing a palliative toolkit and after using it. Findings highlighted the negative impacts of COVID-19 on resident health due to isolation within home, preventing family from being at the bedside and cancelling stimulatory activities especially at end of life that were exacerbated by the lack of resources and government supports. Families appreciated the virtual supports and stated that they helped prepare them for their loved ones’ death while feeling more empowered, engaged, and supported in their journey. Although feedback from families was mostly positive, stating the virtual toolkit improved accessibility to information and supports, it was clear that some misunderstood terms, particularly what a palliative approach to care means; and others had challenges navigating the virtual platform to use the toolkit. Future work is needed to make the virtual tools more user-friendly so that they can be scaled up more widely.

DEATH AND DYING IN GREEN CARE FARMS

Judith Meijers[1], Kirsten Smit[2], Bram de Boer[1], Hilde Verbeek[1], and Sascha Bolt[3], *1. Maastricht University, Maastricht, Limburg, Netherlands, 2. University Utrecht, Utrecht, Utrecht, Netherlands, 3. Tilburg University, Tilburg, Noord-Brabant, Netherlands*

Green care farms form an alternative to traditional nursing homes for people with dementia and combine agriculture production with health-related, social and educational services. Twenty-four-hour care green care farms offer end-of-life care. The aim of the study was to explore the experiences of healthcare workers and family caregivers with end-of-life care for people with dementia who died on a green care farm in the Netherlands. Semi-structured, in-depth interviews were conducted to explore their experiences with end-of-life care, including topics such as advance care planning, bereavement support and the influence of COVID-19. The study showed that most experiences were characterized by personal attention for the resident and family caregivers, and tailored holistic care. The duration of the dying phase was typically short, and most residents remained active until their final days. Despite the COVID-19 measures, healthcare workers and family caregivers still experienced adequate end-of-life care.

SUPPORTING DECISIONS ABOUT END-OF-LIFE CARE IN DEMENTIA: FEASIBILITY OF A DECISION AID

Nathan Davies, Narin Aker, Victoria Vickerstaff, Elizabeth Sampson, and Greta Rait, *UCL, London, England, United Kingdom*

Decisions about end-of-life care are often left to family caregivers to make with professionals. Caregivers find these decisions difficult. A decision aid is one option to support family caregivers. We aimed to test the acceptability and feasibility of a co-produced decision aid for family carers of people with severe dementia or those towards the end of life in the UK. We aimed to recruit 30 family caregivers for a 6 month pre-post test feasibility study. Primary outcome was the feasibility of the study. We included quantitative measures at baseline, 3 month and 6 months, including: Decisional Conflict scale (DCS) and Kessler Psychological Distress Scale (K10). We recruited 28 carers (93% target), 26 completed baseline and 20 completed 6 month follow up. All outcomes changed indicating improvement at 6 months. Qualitative interviews reported the decision aid was acceptable. We met our success criteria, the study is feasible and the decision aid acceptable to caregivers.

SESSION 3560 (SYMPOSIUM)

INTERSECTIONALITY OF SENSORY LOSS AND RACE: IMPLICATIONS FOR BRAIN AND MENTAL HEALTH IN OLDER ADULTS

Chair: Jennifer Deal Co-Chair: Willa Brenowitz Discussant: Roland J. Thorpe, Jr.

Despite recent evidence that sensory loss may increase risk of dementia, mood disorders, and poor physical health in older adults, nearly all research to-date has been conducted in populations that are predominantly White and from high-income countries. This session will investigate the intersectionality of race with sensory loss with a focus on health equity and inclusion of traditionally underrepresented populations. It will evaluate sensory loss across multiple senses, how patterns vary by race, and whether socioeconomic status can explain these differences. In the US, prevalence of impairment in vision, touch, and smell is lower in Whites compared to Black or Hispanics. Interestingly, hearing loss prevalence is lower in Blacks than Whites, but dementia incidence is higher. This session will describe incident dementia risk associated with hearing loss in Black compared to White Americans. It will also address the relationship between dual (hearing and vision) loss and depressive symptoms in India to explore the generalizability of findings to lower middle-income countries. Sensory impairments may intersect with racial discrimination to exacerbate social and health disparities. This session will also describe racial disparities in food insecurity among Americans with vision loss. Finally, we will present results of a randomized controlled trial of an innovative, community-delivered approach to affordable, accessible hearing care. The study represents the largest U.S.-based trial cohort to date of low-income older adults and older African American adults with hearing loss.

PREVALENCE OF SENSORY IMPAIRMENTS VARY BY RACE IN OLDER US ADULTS

Faaizah Arshad[1], Jayant Pinto[2], Kristine Yaffe[1], and Willa Brenowitz[1], *1. University of California, San Francisco, Los Angeles, California, United States, 2. University of Chicago, Chicago, Illinois, United States*

Few studies have examined racial/ethnic disparities in sensory function. We studied 3,005 US adults (aged 57-85, mean 69.3 years); 10% Hispanic, 17% Black, 71% White; National Social Life, Health, and Aging Project). Impairment was defined by established criteria for objectively measured vision, smell, taste, touch and interviewer-rated hearing. Vision (22%), hearing (19%), smell (23%), taste (15%), and touch (19%) loss were common. Hispanic and Blacks showed the highest prevalence of vision, smell, and touch dysfunction. Findings persisted after adjustment for age, sex, education, and cardiometabolic conditions. Blacks had higher odds of impaired vision (adjusted Odds Ratio [aOR]:1.61; 95%CI:1.12, 2.32), smell (aOR:2.64; 95%CI:1.81, 3.84)) and touch (aOR:1.81; 95%CI:1.23, 2.64)) compared to Whites. Hispanics had higher odds of impaired smell than Whites (aOR:2.33; 95%CI:1.47, 3.67). Racial/ethnic minorities face marked disparities in function of the classical senses. Understanding how these differences arise, including potential systemic/social mechanisms, may catalyze interventions that promote health equity.

HEARING LOSS AND INCIDENT DEMENTIA OVER 7 YEARS IN BLACK AND WHITE OLDER ADULTS IN ARIC-NCS

John Shin[1], Kening Jiang[2], Nicholas Reed[1], David Knopman[3], Thomas Mosley[4], Richey Sharrett[5], Frank Lin[2], and Jennifer Deal[6], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 3. Department of Neurology, Mayo Clinic, Rochester, Minnesota, United States, 4. UMMC-The MIND Center, Jackson, Mississippi, United States, 5. Department of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 6. Johns Hopkins University, Baltimore, Maryland, United States*

Hearing loss is a risk factor for dementia; whether this association differs by race is unknown. Although hearing loss is less prevalent in Blacks than Whites, we hypothesized the hearing loss-dementia relationship is stronger in Blacks. All-cause dementia and mild cognitive impairment (MCI) were adjudicated using longitudinal cognitive data. Hearing was measured using pure tone better-ear thresholds (0.5-4 kHz). Cox proportional hazards models adjusted for demographic and clinical covariates and included an interaction term between hearing and race. In 3,605 participants from a population-based cohort (68-89 years, 23% Black, 59% female), estimates for 7-year dementia risk per 10 decibels increase in hearing loss were stronger in Blacks (hazard ratio [HR]:1.24, 95% Confidence Interval (CI):1.07,1.43) than Whites (HR:1.07; 95%CI:0.96,1.19). Hearing loss is a risk factor for dementia in Black Americans. These findings emphasize the need to address existing racial disparities in hearing healthcare.

DUAL SENSORY LOSS AND DEPRESSIVE SYMPTOMS: FINDINGS FROM THE LONGITUDINAL AGING STUDY IN INDIA (LASI)

Ethan Wang[1], Emmanuel Garcia Morales[1], Frank Lin[2], Nicholas Reed[3], and Jennifer Deal[4], *1. Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 4. Johns Hopkins University, Baltimore, Maryland, United States*

Prior work suggests that vision and hearing loss may be risk factors for depressive symptoms in older adults. However, few studies have focused on the relationship of both vision and hearing loss (dual sensory loss, DSL) and depressive symptoms. Using the first nationally representative population study from LASI in India conducted from 2017-2019, Poisson models tested the association of DSL with depressive symptoms. Self-reported vision and hearing loss were associated with increased depressive symptoms (PR 1.29; 95%CI, 1.25-1.33 and 1.15; 95%CI, 1.09-1.22) after adjusting for age, sex, education, economic status, marital status, urbanicity, region, diabetes, heart disease, hypertension, stroke, and smoking. DSL had a 46% higher risk (95% CI, 1.37-1.56) of depressive symptoms. Poor vision and/or hearing loss may be a risk factor for depressive symptoms in adults in India aged ≥45 years. The risk of depressive symptoms in those with sensory loss should be investigated in further studies.

RACIAL DISPARITIES IN THE ASSOCIATION BETWEEN VISION IMPAIRMENT AND FOOD INSECURITY IN THE US

Varshini Varadaraj[1], Priyanka Kumar[2], Jessica Brinson[3], Jiangxia Wang[4], Laura Samuel[1], Adrienne Scott[5], and

Bonnielin Swenor[1], *1. Johns Hopkins University, Baltimore, Maryland, United States, 2. Johns Hopkins University School of Medicine, Baltimore, Maryland, United States, 3. Howard University College of Medicine, Washington, District of Columbia, United States, 4. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 5. The Johns Hopkins Wilmer Eye Institute, Baltimore, Maryland, United States*

We examined racial disparities in household food insecurity among low-income Americans with and without vision impairment in the National Health Interview Survey, years 2011-2018. Among 257,620 U.S. adults below a threshold of 150% poverty, 15% of White, 16% of Black, and 8% of Asian Americans, and 18% of American Indians and Inuits reported vision impairment. In analyses adjusted for sociodemographic variables, vision impairment was associated with >100% greater odds (95% CI=2.01-2.31) of 30-day food insecurity, as compared to no vision impairment. Further, odds of household food insecurity were higher among Black Americans (OR=1.37, 95% CI=1.29-1.47), and American Indians and Inuits (OR=1.38, 95% CI=1.15-1.66) than White Americans, while Asians had lower odds (OR=0.45, 95 %CI=0.36-0.57). These findings highlight that low-income adults with vision impairment and racial minorities experience food disparities and dietary inadequacy, an area of disadvantage that can influence overall health, in a nationally representative sample in the U.S.

ADVANCING HEARING HEALTH EQUITY FOR OLDER ADULTS: FINDINGS FROM THE HEARS RCT

Carrie Nieman[1], Joshua Betz[2], Emmanuel Garcia Morales[3], Jonathan Suen[4], Nicole Marrone[5], Hae-Ra Han[4], Sarah Szanton[6], and Frank Lin[7], *1. Johns Hopkins University School of Medicine, Baltimore, Maryland, United States, 2. Cochlear Center for Hearing & Public Health, Baltimore, Maryland, United States, 3. Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 4. Johns Hopkins University, Baltimore, Maryland, United States, 5. University of Arizona Department of Speech, Language, and Hearing Sciences, Tucson, Arizona, United States, 6. Johns Hopkins University School of Nursing, Baltimore, Maryland, United States, 7. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States*

Hearing loss is highly prevalent but disparities exist in hearing care. Delivering care in partnership with community health workers (CHWs) is an established approach to addressing disparities but has not been robustly studied in hearing care. We recruited older adults with hearing loss from community sites in Baltimore, MD. The 2-hour intervention consists of fitting a low-cost amplification device and counseling.151 participants were randomized. The primary outcome was change in communication function (Hearing Handicap Inventory for the Elderly-Screening [HHIE-S]; range 0-40; higher scores indicate poorer function). Communication function significantly improved in the intervention group, with an intention to treat estimated average treatment effect of a -12.98 point change (95% CI: -15.52, -10.42). In the first randomized control trial of a CHW-delivered hearing care intervention for older adults using low-cost amplification devices, participants receiving the intervention demonstrated a treatment effect comparable to prior studies of conventional hearing aids fit by audiologists.

SESSION 3570 (SYMPOSIUM)

IT'S ABOUT WHO YOU KNOW: RELATIONSHIPS BETWEEN SOCIAL NETWORKS, COGNITIVE FUNCTION, AND BRAIN HEALTH IN LATER LIFE

Chair: Lucas Hamilton Discussant: Sara Moorman

Evidence has been steadily increasing about the benefit of social connectedness for healthy aging. Yet, thanks to the complexity of human social interactions, it remains difficult to pinpoint specific benefits and mechanisms by which such benefits emerge. We offer this symposium to address this issue by presenting new findings from ongoing work at Indiana University in collaboration with the Indiana Alzheimer's Disease Research Center. First, an overview of recent literature will be presented alongside a brief introduction to egocentric network analysis and its utility in probing social determinants of health. Next, we turn our attention to characteristics of social networks and their importance for cognitive health in later life. Different types of social enrichment will be evaluated in terms of their respective influence on cognitive reserve (i.e., neuropsychological evaluations, brain health). Additional attention will be paid to the comparison of emotionally supportive (i.e., social bonding) and more informationally supportive (i.e., social bridging) ties as promoters of brain health. Then, the final talks will describe potential avenues for increasing social connectedness in older adulthood. Individual differences in social cognitive function, namely Theory of Mind (i.e., reading another person's thoughts, feelings, and intentions), has been implicated as mechanism by which older adults can maintain larger networks with more weak ties, in turn, promoting cognitive function. Separately, the presence of ambivalent ties (i.e., connections that beget positivity and negativity) may serve as a window of opportunity whereby older adults can leverage strengths in emotion regulation to maintain these ties without negative health consequences.

AGING AND THE SOCIAL BRAIN: THE ROLE OF SOCIAL NETWORKS IN ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

Brea Perry, *Indiana University, Bloomington, Indiana, United States*

Research suggests social connectedness reduces dementia risk and helps older adults with neuropathology maintain cognitive functionality and quality of life. However, little is known about the specific underlying social and biological mechanisms. This presentation provides an overview of three promising pathways through social bridging (i.e., cognitive enrichment through expansive social networks), social bonding (i.e., neuroendocrine benefits of integration in cohesive social networks), and social stress (i.e., HPA axis dysregulation resulting from social losses, role exits, and dysfunction or strain in relationships). It discusses how personal social network methodology combined with tests of general and social cognitive function and/or biomarkers can identify specific etiological mechanisms. These insights can be leveraged to develop policies and programs that support brain health and cognitive function in older adults. This presentation sets the stage for the remainder of the symposium, which presents empirical findings examining these mechanisms from a social network perspective.

NEUROLOGICAL CORRELATES OF SOCIAL BONDING AND BRIDGING

Mohit Manchella[1], Paige Logan[2], Brea Perry[3], Siyun Peng[3], Lucas Hamilton[3], Shannon Risacher[2], Andrew Saykin[2], and Liana Apostolova[2], *1. University of Southern Indiana, Carmel, Indiana, United States, 2. Indiana University School of Medicine, Indianapolis, Indiana, United States, 3. Indiana University, Bloomington, Indiana, United States*

Social connectedness has been linked to decreased rates of cognitive decline in later life. However, recent work suggests that particular social network characteristics (i.e., bonding and bridging) may buffer against age-related degeneration. The present study analyzes social network and structural MRI data of 176 older adults from the Social Networks and Alzheimer's Disease (SNAD) study. Results indicate that increased social bridging is associated with greater grey matter (GM) volume in several limbic structures. Increased social bonding is associated with greater GM volumes in several cerebral cortex structures as well as greater volumes in some components of the limbic system. Most notably, the effects of bridging are primarily lateralized in the left hemisphere while the effects of bonding are observed mostly in the right hemisphere. These results suggest that the neurocognitive benefits of social connectedness depend on the preponderance of bridging and/or bonding ties in older adults' social networks.

LINKS BETWEEN SOCIAL CONNECTEDNESS AND COGNITIVE HEALTH OPERATE THROUGH SOCIAL STIMULATION AND COGNITIVE RESERVE

Siyun Peng[1], Anmoldeep Singh[2], Mohit Manchella[3], and Brea Perry[1], *1. Indiana University, Bloomington, Indiana, United States, 2. Indiana University, Newburgh, Indiana, United States, 3. University of Southern Indiana, Carmel, Indiana, United States*

The link between social connectedness and dementia risk and resilience has been examined using a diverse set of measures. Though different measures of connectedness reflect distinct social processes and underlying mechanisms (e.g., stress buffering, cognitive stimulation), few studies have compared them. Using data from two social network studies of older adults (N=283), we compare associations between 29 measures of social connectedness and general cognitive function (MoCA), and non-verbal (Rey) and episodic memory (Craft). Measures of social participation (e.g., volunteering, working, attending church) and social support were unassociated with cognitive outcomes, net of controls. Quality of friendships ($p<.05$), family relationships ($p<.01$), and marriage ($p<.05$) were sporadically associated. Measures indicating large, diverse, and expansive networks were strongly and consistently related to all cognitive outcomes (e.g., number of phone contacts [$p<.001$], network size [$p<.001$], density [$p<.001$], racial homophily [$p<.05$], age heterogeneity [$p<0.01$], and diversity [$p<.001$]). We discuss implications for theories of cognitive reserve.

SOCIAL COGNITIVE DEFICITS RELATE TO KEY ASPECTS OF OLDER ADULTS' SOCIAL NETWORKS

Anne Krendl, and Brea Perry, *Indiana University, Bloomington, Indiana, United States*

Social connectedness confers benefits to older adults' cognition, including slowing the progression of Alzheimer's disease (AD). Social connectedness is facilitated by social cognitive function – how people understand, store, and apply information about others – which declines over the lifespan. We examined whether two core social cognitive skills – face memory and theory of mind (the ability to infer others' mental states) – predicted older adults' social network structure and composition. Cognitively normal older adults (OA; N=119) and OA with mild cognitive impairment (MCI) or AD (N=96) completed a social network interview, a face memory task, and a theory of mind measure. Social cognitive deficits were highest among OA with MCI and AD. Face memory predicted network size, whereas theory of mind predicted network composition. Neuroimaging results describing OA's social cognitive deficits are also discussed. Social cognitive function may be an important intervention target for preserving older adults' social connectedness.

TO LOVE AND LOATHE: EXAMINING THE COSTS AND BENEFITS OF AMBIVALENT TIES IN OLDER ADULTHOOD

Lucas Hamilton, Siyun Peng, Anne Krendl, and Brea Perry, *Indiana University, Bloomington, Indiana, United States*

Ambivalent ties are relationships that offer support but beget stress, which generally has a detrimental impact on health. Existing theory suggests that older adults gradually remove such ties over time; however, it is not uncommon for ambivalence to exist in older adults' close relationships (i.e., partners, children). Social network data was used from 286 older adults with about half having mild cognitive impairment. Roughly two-thirds of the sample reported at least one ambivalent tie, most commonly partners, children, and friends. Logistic regressions revealed distinct characteristics of these ties. Participants who reported at least one ambivalent tie (most notably, partners and friends) had social networks with structures known to confer cognitive benefits. Importantly, these effects dissipate with diminished cognitive status. Altogether, ambivalent ties may confer benefits when resources are available to manage such relationships. When resources are taxed, however, ambivalent ties may contribute to cascading health declines.

SESSION 3580 (SYMPOSIUM)

KUAKINI HHP CENTER FOR TRANSLATIONAL RESEARCH ON AGING: LATEST FINDINGS FROM MICE TO HUMANS

Chair: BRADLEY WILLCOX Co-Chair: Richard Allsopp
Discussant: Peter Martin

Kuakini Medical Center (Kuakini) was funded by NIH in late 2019 to create an interdisciplinary Hawai'i-based, Center of Biomedical Research Excellence (COBRE), for translational research on aging. This Center is building upon Kuakini's five-decades of prior NIH-funded research. These resources include clinical data from the 57-year ongoing Kuakini Honolulu Heart Program (HHP), Honolulu-Asia Aging Study, HHP Offspring Study and a large biorepository. The Center's overarching aim is to increase infrastructure for collaborative aging research in Hawaii. The first step is to grow the Center's faculty by hiring and mentoring research project leaders (RPLs) from diverse disciplines to become independent, R01-funded, investigators on aging. Our first RPL has graduated after obtaining R01-funded status. His project utilizes novel CRISPR methods to i) improve the safety and efficacy of delivering potentially therapeutic genes (such as FOXO3) to the mouse genome, and ii) test whether temporal enhancement of FOXO3 expression improves healthy aging in this mouse model - both key steps for potential translation to human clinical therapies. This work will be highlighted in the Program Overview session followed by current RPL findings. The first of these current RPL talks presents data on a potential relation between the FOXO3 gene and vascular dementia in elderly Japanese-American males. The second talk reports on how strong social networks mitigate risk for dementia in elderly Japanese-American males. The third talk will report a relation between FOXO3-associated resilience to hypertension and lower intracerebral hemorrhagic stroke risk in elderly Japanese-American males. Supported by NIGMS 5P20GM125526 and NIA R01AG027060.

FOXO3-MEDIATED PROTECTION AGAINST VASCULAR DEMENTIA RISK IN A CASE-CONTROL STUDY OF ASIAN AMERICAN MEN

Philip Davy[1], Kalpana Kallianpur[2], Randi Chen[1], Timothy Donlon[1], Brian Morris[1], Richard Allsopp[3], Bradley Willcox[1], and Kamal Masaki[1], *1. Kuakini Medical Center, Honolulu, Hawaii, United States, 2. Kuakini Medical Center, Honolulu, Hawaii, Honolulu, Hawaii, United States, 3. University of Hawaii, Honolulu, Hawaii, United States*

The longevity-associated allele of FOXO3 is associated with a significant reduction in cardiovascular disease (CVD) risk in older adults. We hypothesized that dementia, which shares several risk factors with CVD, might also be related to FOXO3 genotype, particularly vascular dementia (VaD). Therefore, we utilized the Kuakini Honolulu Heart Program/ Honolulu Asia Aging Study dataset to assess the relation of FOXO3 genotype to dementia risk. Preliminary analyses suggested that VaD had the strongest relation to FOXO3 genotype. Therefore, we performed larger, more detailed study of FOXO3 genotype and VaD risk in a 9-year nest case-control study. Chi-Square test was used to assess the association of dementia with FOXO3 genotype in a sample of 1504 Japanese-American male study participants, aged 71-93 years, at the baseline exam. General Linear Model was utilized to compare VaD risk factors between VaD cases and controls. Multivariate Logistic Regression was used to assess the association of VaD with FOXO3 genotype adjusting for birth year, education, APOE4 and other vascular risk factors. We found a significant protective association for carriers of the principal FOXO3 longevity-associated allele (SNP rs2802292 G allele-carriers) against VaD risk (OR = 0.66, 95% CI = 0.44-0.98, p = 0.0388). The protective association retained significance when controlling for common risk factors for VaD in a multivariate model. These data indicate a potential neuroprotective role for the FOXO3 longevity-associated genotype against vascular dementia. This finding merits validation studies in other cohort studies.

LATE-LIFE SOCIAL NETWORKS AND INCIDENT ALZHEIMER'S DISEASE: THE KUAKINI HONOLULU-ASIA AGING STUDY

Kalpana Kallianpur[1], Kamal Masaki[2], Randi Chen[2], Bradley Willcox[2], Richard Allsopp[3], Philip Davy[2], and Hiroko Dodge[4], *1. Kuakini Medical Center, Honolulu, Hawaii, Honolulu, Hawaii, United States, 2. Kuakini Medical Center, Honolulu, Hawaii, United States, 3. University of Hawaii, Honolulu, Hawaii, United States, 4. Oregon Health & Science University, Portland, Oregon, United States*

We assessed longitudinal associations between social networks and incidence of all-cause dementia, Alzheimer's disease (AD) and vascular dementia in Kuakini Honolulu-Asia Aging Study participants over a 10-year follow-up period. Median split of Lubben Social Network Scale (LSNS) scores defined weak/strong social networks among 2636 men who were dementia-free at baseline (median age 77 years) and during the first 3 years. Kaplan-Meier curves showed that those with strong networks at baseline were less likely to develop all-cause dementia ($p<0.0001$) and AD ($p=0.0006$); probability of dementia-free survival at 10 years for strong and weak social network groups was 93.8% and 89.0%, respectively. Cox regression models adjusting for age and other baseline factors revealed associations of weak networks with increased risk of all-cause dementia (HR=1.52, 95%CI=1.11-2.08, p=0.009) and AD (HR=1.67, 95%CI=1.11-2.51, p=0.014). As strong social networks may protect against incident dementia and AD, and are associated with other health benefits, prevention of social isolation of older adults should be considered a priority.

FOXO3 LONGEVITY GENOTYPE MITIGATES THE IMPACT OF HYPERTENSION ON RISK OF INTRACEREBRAL HEMORRHAGE

Kazuma Nakagawa[1], Randi Chen[1], Steven Greenberg[2], Webster Ross[3], BRADLEY WILLCOX[1], Timothy Donlon[1], Brian Morris[1], and Kamal Masaki[1], *1. Kuakini Medical Center, Honolulu, Hawaii, United States, 2. Massachusetts General Hospital, Boston, Massachusetts, United States, 3. Pacific Health Research and Education Institute, Honolulu, Hawaii, United States*

The longevity-associated FOXO3 G allele of SNP rs2802292 is associated with protection against mortality, however the impact of FOXO3 genotype on the association between hypertension and risk of intracerebral hemorrhage (ICH) has not been assessed. Therefore, we utilized the Kuakini Honolulu Heart Program (KHHP), a prospective population-based cohort of Japanese American men living in Hawaii that began in 1965 to study this relation. After excluding baseline prevalent stroke and those missing FOXO3 data, 6,469 men were included in the analysis. Age-adjusted prevalence of ICH by hypertension was assessed for the whole cohort after stratifying by FOXO3 genotype. Cox regression models, adjusted for age, cardiovascular risk factors, FOXO3 and APOE genotypes, were utilized to assess relative risk of hypertension on ICH. All models were created for the whole cohort and stratified by FOXO3 genotype, namely G allele carriers versus TT genotype. Overall, 183 subjects developed ICH over the 34-year follow-up period. Age-adjusted ICH prevalence was 0.90 versus 1.32 per 1,000 person-years follow-up in those without and with hypertension, respectively (p=0.002). After stratifying by FOXO3 genotype, this association was no longer significant in G allele carriers. In the whole cohort, hypertension was an independent predictor of ICH (RR=1.70, 95%CI 1.25, 2.32; p=0.0007). In stratified analyses, hypertension remained an independent predictor of ICH among the FOXO3 TT allele group (RR=2.02, 95% CI 1.33, 3.07; p=0.001), but not in FOXO3 G allele carriers (RR=1.39, 95% CI 0.88, 2.19; p=0.15). Thus, the longevity/resilience-associated FOXO3 G allele may mitigate the impact of hypertension on ICH risk in this population. Further study is needed in other populations.

SESSION 3585 (SYMPOSIUM)

NARRATIVE AS A BOUNDARY CONCEPT IN GERONTOLOGY: THE STORY BEHIND THE STORIES

Chair: Kate de Medeiros Co-Chair: Desmond O'Neill

Ever since the “narrative turn” was taken up by the humanities and social sciences in the 1980s and early 1990s, there has been an increased interest in narrative as a medium for gaining knowledge in gerontology. Narrative gerontology in particular assumes that the "life lived is inseparable from the life told" (Bruner 1987). Central to this notion is the metaphor of life as story or, as Kenyon and Randall put it, "[W]e not only have stories, we are stories" (1999). As a boundary concept, “narrative” inhabits several disciplinary worlds. Its analysis can focus on individual identification strategies, on the storytelling process and its context, or on aesthetic dimensions, for instance when analyzing cultural representations including film and fiction. Often loosely defined yet broadly applied, narrative work can range from personal life stories to master narratives that convey cultural and/or political values. The purpose of the Humanities and Arts symposium is to take a critical look at "narrative" within gerontology to include mapping the uses of narrative as actions, objects, ways of knowing and acts of resistance. The first paper presents a conceptual structure of narrative based on findings from a guided review of narrative definitions and approaches in gerontology. The second argues for the normative importance in studying cultural narratives of dementia. The third paper examines narrative in the context of the medical humanities and narrative medicine, pointing to ways in which narrative competence translates into medical practice. The final paper considers the narrative of aging through music.

HOW HAS NARRATIVE BEEN USED IN GERONTOLOGY?: FINDINGS FROM A QUALITATIVE EVIDENCE SYNTHESIS

Kate de Medeiros, *Miami University, Oxford, Ohio, United States*

Narrative gerontology emerged as a concept in the 1990s to describe the ways that people age biographical as well as biologically. Since then, narratives and narrative approaches have gained popularity as methods and ways of knowing. This paper presents findings from a qualitative evidence synthesis (QES) of narrative within the gerontological literature.). QES describes methods to systematically review qualitative evidence (e.g., extracted text). The purpose is to gain a deeper understanding of a concept rather than evaluate study designs or findings. An initial search returned 1,480 papers. Upon further analysis, the following three large categories with regards to narrative were identified: definitions, accounts, processes, and possibilities. Overall, findings provide an comprehensive overview of uses of narrative within gerontology.

EXPLORING THE NARRATIVE OF AGING THROUGH MUSIC

Desmond O'Neill, *Trinity College Dublin, Dublin, Dublin, Ireland*

With increasing interest in exploring narratives of aging through literary/oral sources, a less prominent area of inquiry has been possibilities afforded by narratives inherent in music across the life-span and into later-life. Two possible areas of interest are the arc of development and change over the life-course, and inherent content of the music. The latter element is less prominent in narrative analysis, providing a potentially rich field of discovery. While popular song parallels these possibilities, further opportunities arise from instrumental, orchestral and operatic music, allied to strengths in musicological analysis. Later compositions whose elements provide insights into life course review (Shostakovich Viola Sonata and Metamorphosen, Richard Strauss) as well as romantic love in later life across generations (The Cunning Little Vixen, Leos Janáček). The analysis will seek to delineate to possible avenues of interpretation of musicological analysis in understanding the phenomenology and opportunities arising from aging.

UNDERSTANDING CULTURAL NARRATIVES OF DEMENTIA: TASKS AND TOOLS FOR HUMANITIES SCHOLARSHIP

Nancy Berlinger, *The Hastings Center, Garrison, New York, United States*

Humanities scholarship on dementia has long focused on the depiction of dementia in literature, film, and other genres. Recent research on neurodiversity includes humanistic scholarship on creativity within dementia. It is time for interdisciplinary humanities scholarship to focus on narratives of dementia that circulate within aging societies, are embedded in policy, and shape experiences of typical people living with dementia or providing dementia care. This paper argues for the normative importance of studying values-laden cultural narratives, recognizing competing or evolving narratives within a society, and demonstrating how to reframe flawed narratives beyond necessary attention to ageist and ableist language. It presents examples of approaches to social narrative analysis; describes tools and training that could be integrated into humanities scholarship on dementia and aging, and considers the potential role of social narrative analysis in articulating and launching policy ideas for aging societies.

NARRATIVE MEDICINE AS INTERDISCIPLINARY PRACTICE

Ulla Kriebernegg, *University of Graz, Graz, Steiermark, Austria*

When dealing with patients who talk about their illnesses, medical doctors need to interpret the stories they hear. Also, they need to make sense of their own experiences regarding their medical encounters. Narrative and its analysis plays a central role in such processes that require empathy and self-reflection. The interdisciplinary practice of teaching medical students concepts and theories from literary studies as well as discussing literary texts with them can expand their scientific medical understanding. This paper explores the concept of narrative in the context of geriatric medical humanities and narrative medicine, looking at how narrative competence translates into medical practice. Presenting findings from a seminar on Narrative medicine at the Medical University of Graz, Austria, it also addresses some methodological and didactic challenges of this interdisciplinary approach.

SESSION 3590 (SYMPOSIUM)

NEAR: NEW OPPORTUNITIES FOR AGING RESEARCH

Chair: Debora Rizzuto Co-Chair: Scott Hofer

The global increase in life expectancy is one of the greatest achievements of the last half century. However, the demographic developments towards an older population also challenge many parts of the society, especially the health care. Promoting healthy ageing is therefore one of the most important commitments of the 21st century and to succeed, scientifically based knowledge of older individuals' health- and care requirements are needed. To better understand the individual and population aging process, the National E-infrastructure for Aging Research (NEAR) was founded in 2018 to build and run a national infrastructure by integrating existing databases from the 15 major longitudinal studies on aging and health in Sweden. To show the added value of NEAR, this symposium will present results from four ongoing NEAR projects: 1) Developing a metric of global brain integrity in multiple Swedish studies with different scanners; 2) Functional aging trajectories and drug interactions; 3) Long-term prediction of dementia using machine learning algorithms; 4) The new aging – how different aspect of ageing has changed over half a century. The creation of national infrastructures is needed to achieve broad, multidisciplinary research perspectives that cannot be achieved by individual databases. Moreover, to address the increased health demands of an older population and enhance new opportunities for aging research, a critical mass of data is needed to increase sample sizes, variations, representativeness, and generalizability. Ultimately, this can lead to the identification of sustainable intervention strategies for better health and care for older persons during the coming decades.

FUNCTIONAL AGING TRAJECTORIES AND DRUG INTERACTIONS

Thais Lopes Deliveira[1], and Sara Hägg[2], *1. Karolinska Institutet, Stockholm, Sodermanlands Lan, Sweden, 2. Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*

Markers of functional aging can be used to track biological aging longitudinally and how it changes in response to the environment, e.g., drugs. We aimed to investigate how different drug classes may alter functional aging trajectories using data from the National E-infrastructure of Aging Research (NEAR) in Sweden. Data were harmonized across several longitudinal cohorts of aging for general cognitive performance, grip strength, walking speed, sensory ability (visual and hearing), lung function and assessment of frailty using the accumulation deficit model known as the frailty index. Selected drug classes were lipid lowering, glucose lowering and blood pressure lowering medications that are commonly used in old adults. Preliminary analysis using data from one longitudinal cohort shows that using glucose lowering drugs was associated with lower frailty. Additional analyses are ongoing to increase sample sizes. We anticipate that several drug classes may be important for changing functional aging trajectories in late life.

THE NEW AGING: HOW DIFFERENT ASPECTS OF AGING HAVE CHANGED OVER HALF A CENTURY. THE H70 STUDIES WITHIN NEAR

Ingmar Skoog[1], and Therese Rydberg Sterner[2], *1. University of Gothenburg, Mölndal, Vastra Gotaland, Sweden, 2. Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*

The number and proportions of older people are increasing world-wide. The Gothenburg H70 Birth Cohort Studies started in 1971 and are still on-going. The studies include representative birth cohorts born 1901-02, 1906-07, 1911-12, 1922, 1923-24, 1930, and 1944 followed longitudinally from age 70 until death. The studies include psychiatric, somatic, audiological, opthalmological, psychological, social, genetic, dietary, functional, and psychometric examinations, personality, collection of blood, plasma, serum, and cerebrospinal fluid, and examinations with MRI. During the study period, cognitive and physical functions, and hearing, has improved considerably, the prevalence and incidence of dementia has decreased, the prevalence of depression and psychotic disorders has decreased, and sexual activity and alcohol consumption has increased considerably. Even personality has changed. Present older people are less neurotic and more extrovert. Our study shows that aging is a changing concept, and that previous knowledge needs to be continuously updated, as new generations reach old age.

LONG-TERM PREDICTION OF DEMENTIA USING MACHINE LEARNING ALGORITHMS

Johan Sanmartin Berglund[1], and Ashir Javeed[2], *1. Blekinge Institute of Technology, Karlskrona, Blekinge Lan, Sweden, 2. Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*

The core interest of this project is the development of predictive estimates and the identification of modifiable risk factors for the development of neurocognitive disorders based on multifactorial data from multiple health databases. We are conducting epidemiological research on predicting neurocognitive diseases of older adults included in the National E-Infrastructure on Aging Research (NEAR) using deep learning and other AI methods. Exploring the impact of lifestyle and environment on dementia development in the subjects together with biomarkers and images and predicting dementia using machine learning techniques would give insights into the long-term development. In addition, the possibility of screening a large number of persons and consequent early prediction of dementia based on optimized machine learning techniques could be of great importance for early treatment.

SESSION 3600 (SYMPOSIUM)

NOVEL INTERVENTIONS AND TARGETS FOR THE PREVENTION OF DEMENTIA AND FRAILTY: 2021 EDITOR'S CHOICE ARTICLES FROM JGMS

Chair: Lewis Lipsitz Discussant: Beverly Gwen Windham

This symposium will present four 2021 "Editor's Choice" articles from the Journal of Gerontology Medical Sciences that focus on novel interventions and targets for the prevention of dementia and frailty. Jeffrey Scherrer and colleagues, in their article "Lower Risk for Dementia Following Adult Tetanus, Diphtheria, and Pertussis (Tdap) Vaccination," examine the links between adult vaccinations and decreased dementia risk. Katharine Brewster, Justin Golub (presenter), and colleagues, in "Age-Related Hearing Loss, Late-Life Depression, and Risk for Incident Dementia in Older Adults," investigate hearing loss and depression as independent risk factors for eventual conversion to dementia. By understanding these potentially reversible mechanisms for dementia, targets for early interventions could be identified. "Association Between Long-Term Aspirin Use and Frailty in Men: The Physicians' Health Study," written by Ariela Orkaby and colleagues, examines the association between long-term aspirin use and frailty, furthering our understanding of the benefits of anti-inflammatory medications even in older adults. Kristen George and coauthors, in their article, "Impact of Cardiovascular Risk Factors in Adolescence, Young Adulthood, and Midlife on Late-Life Cognition: Study of Healthy Aging in African Americans," examine how cardiovascular risk factors early in life may affect late life cognition in Black Americans. Beverly Gwen Windham, the discussant, will highlight commonalities and lessons learned from these studies.

ADULT TETANUS, DIPHTHERIA, AND PERTUSSIS VACCINATION AND INCIDENT DEMENTIA

Jeffrey Scherrer[1], Joanne Salas[2], Timothy Wiemken[2], Christine Jacobs[2], John Morley[2], and Daniel Hoft[2], *1. Saint Louis University School of Medicine, St. Louis, Missouri, United States,*
2. Saint Louis University, St. Louis, Missouri, United States

Adult vaccinations may reduce risk for dementia. We determined whether tetanus, diphtheria, pertussis (Tdap) vaccination is associated with lower risk for dementia. Analysis conducted with Veterans Health Affairs (VHA) administrative medical record data and replicated in private sector medical claims data. Patients were ≥65 years of age and free of dementia for 2 years prior to index date. Tdap vaccination in 2011 or 2012. Follow-up through 2018. Controls had no Tdap vaccination for the duration of follow-up. After controlling for confounding, patients with, compared to without Tdap vaccination, had a significantly lower risk for dementia in both cohorts (VHA: HR=0.58; 95%CI:0.54 - 0.63 and MarketScan: HR=0.58; 95%CI:0.48 - 0.70). Results were replicated in two cohorts with different clinical and sociodemographic characteristics. Several vaccine types are linked to decreased dementia risk, suggesting that these associations are due to nonspecific effects on inflammation rather than vaccine-induced pathogen-specific protective effects.

IMPACT OF CARDIOVASCULAR RISK FACTORS IN ADOLESCENCE, YOUNG ADULTHOOD, AND MID-LIFE ON LATE-LIFE COGNITION

Kristen George[1], Paola Gilsanz[2], Rachel Peterson[3], Lisa Barnes[4], Charles DeCarli[3], Elizabeth Mayeda[5], Dan Mungas[6], and Rachel Whitmer[7], *1. University of California Davis School of Medicine, Daivs, California, United States, 2. Kaiser Permanente Division of Research, Oakland, California, United States, 3. University of California Davis School of Medicine, Sacramento, California, United States, 4. Rush Alzheimer's Disease Center, Rush University Medical Center, Chicago, Illinois, United States, 5. University of California, Los Angeles Fielding School of Public Health, Los Angeles, California, United States, 6. University of California, Davis, Sacramento, California, United States, 7. University of California Davis School of Medicine, Davis, California, United States*

Using the Study of Healthy Aging in African Americans (STAR), we assessed cardiovascular risk factors (CVRFs) in adolescence, young adulthood, and midlife with late-life cognition. Among 755 participants, body mass index, blood pressure, glucose, and total cholesterol were collected during Multiphasic Health Checkups (1964-1985). At STAR baseline (2018-2019; mean age=69(SD=9)), executive function (EF), verbal episodic memory (VEM), and semantic memory (SM) were measured using the Spanish and English Neuropsychological Assessment Scales. Linear regression models associated CVRFs with cognition. Hypertension was associated with worse late-life EF (β[95% CI]:-0.14[-0.28, -0.00]) and VEM (β[95% CI]:-0.22[-0.37, -0.07]). Diabetes was associated with worse EF (β[95% CI]: -0.43[-0.83, -0.03]). In age-stratified analyses, adolescent hypertension was associated with lower late-life EF (β[95% CI]:-0.39[-0.67, -0.11]). Young adulthood hypertension (β[95% CI]:-0.29[-0.49, -0.09]) and midlife hyperlipidemia (β[95% CI]:-0.386[-0.70, -0.02]) were associated with lower VEM. These results emphasize the importance of lifecourse cardiovascular health on the aging brain among Black Americans.

ASSOCIATION BETWEEN LONG-TERM ASPIRIN USE AND FRAILTY IN MEN: THE PHYSICIANS' HEALTH STUDY

Ariela Orkaby[1], Laiji Yang[2], Alyssa Dufour[3], Thomas Travison[4], Howard Sesso[5], Jane Driver[6], Luc DJousse[5], and J Gaziano[1], *1. VA Boston, Boston, Massachusetts, United States, 2. Hebrew Senior Life, Boston, Massachusetts, United States, 3. Hebrew SeniorLife, Boston, Massachusetts, United States, 4. Harvard Medical School, Boston, Massachusetts, United States, 5. Brigham & Women's Hospital, Boston, Massachusetts, United States, 6. VA Boston Healthcare System, Brockton, Massachusetts, United States*

The role of anti-inflammatory medications such as aspirin to prevent frailty is unknown. We studied 12,101 men ≥60 years who participated in the Physicians' Health Study I, a completed aspirin trial. Annual questionnaires collected data on aspirin use, lifestyle, and clinical variables. Average aspirin use was dichotomized: ≤60 vs >60 days/year. Frailty was assessed using a 33-item index. Propensity score methods addressed confounding by indication. Logistic regression models estimated odds of frailty as a function of categories of average aspirin use. Mean age was 71 years. Following an average of 11 years of follow-up, 15% reported aspirin use ≤60 days/year; 20% were frail. The OR (95%CI) for frailty was 0.85 (0.76-0.96) for average aspirin use >60 days/year vs ≤60 days/year. Results were similar using an alternate definition of frailty. Long-term regular aspirin use is inversely associated with frailty among older men, even after consideration of multi-morbidity and health behaviors.

AGE-RELATED HEARING LOSS, LATE-LIFE DEPRESSION, AND RISK FOR INCIDENT DEMENTIA IN OLDER ADULTS

Justin Golub[1], Katharine Brewster[2], Mei-Chen Hu[3], Sigal Zilcha-Mano[3], Patrick Brown[4], Melanie Wall[3], Steven Roose[5], and Bret Rutherford[5], *1. Columbia University, New York, New York, United States, 2. New York State Psychiatric Institute, New York, New York, United States, 3. New York State Psychiatric Institute, Columbia University College of Physicians and Surgeons, New York, New York, United States, 4. New York State Psychiatric Institute, Columbia University College of Physicians and Surgeons, New York., New York, New York, United States, 5. New York State Psychiatric Institute, Columbia University College of Physicians and Surgeons,, New York, New York, United States*

The interrelationships between hearing loss (HL), depression, and dementia remain poorly understood. 8529 participants ≥60 years without cognitive impairment were analyzed from the National Alzheimer's Coordinating Center uniform dataset. Participants had no HL, untreated HL, or treated HL. Outcomes included depression (15-item GDS≥5) and dementia conversion. A longitudinal logistic model examined the association between HL and changes in depressive symptoms. Cox proportional hazards models examined HL and incident dementia. Treated HL (vs no HL) had increased risk for depression (OR=1.26, 95%CI=1.04-1.54) and dementia conversion (HR=1.29; 1.03-1.62). Baseline depression was a strong independent predictor for dementia conversion (HR=2.32, 1.77-3.05). Development/persistence of depression was also associated with dementia (HR=1.89, 1.47-2.42), but only accounted for 6% of the direct hearing-dementia relationship suggesting no significant mediation of depression. In conclusion, both HL and depression are independent risk factors for dementia conversion. Understanding the mechanisms linking these later-life disorders may identify targets for early interventions.

SESSION 3610 (SYMPOSIUM)

OPPORTUNITIES AND CHALLENGES OF INNOVATIVE QUALITATIVE RESEARCH METHODS

Chair: Melinda Heinz Discussant: Keith Kleszynski

Using new qualitative methods can be exciting and add value to the field. However, Institutional Review Boards (IRB) approval can be a challenge if the methods are relatively new. This symposium provides an overview of 1) how several new methodologies have been used 2) IRB approval challenges and resolutions and 3) how varied disciplines can work together to understand phenomena. The first presentation explains how older adults used photographs to document meaning/purpose in their lives. IRB expressed concerns over identifying information in photographs. Discussion of how interdisciplinary collaborations create opportunities for diverse data dissemination will be included. The second presentation focuses on intersectionality and the benefits/challenges to understanding socially constructed identities. Discussion explains how to implement this methodology, including how category complexity creates additional possibilities for data analysis but also difficulties with narrowing down approaches. In the third presentation, examples of how to conduct co-research, such as photovoice with older adults will be reviewed, including best practices. Smartphones offer extensive possibilities for co-research; but developing IRB protocols to address concerns are needed. The fourth presentation outlines digital storytelling between older adults and university students. An explanation of how digital storytelling is connected to the narrative method and critical gerontology framework will be addressed. Advantages and pitfalls of digital storytelling with also be discussed. The last presentation focuses on using reminiscence with older migrant workers who have dementia, using a decolonial framework. The project seeks to improve participatory action research, with increased focus on "hearing" participants.

PHOTO DOCUMENTATION: USING NEW METHODS IN COLLABORATION WITH ART

Melinda Heinz, Laura Gleissner, and Nathan Benton, *Upper Iowa University, Fayette, Iowa, United States*

Narrative analysis has been used extensively in qualitative research, but photo analysis is relatively new. In the present study, older adults took photographs and wrote narratives for 15 days about something that brought meaning and purpose to their lives. This presentation explains how both methods were paired together and the challenges of seeking Institutional Review Board (IRB) when new and "unproven" approaches are used. In our case, IRB reviewers were particularly concerned with identifying information in photographs and recommended that personal information (e.g., medication bottle) should be blurred when sharing photographs. Discussion of how using diverse qualitative methods can create opportunities for new dissemination methods and partnerships with other disciplines will also be noted. In our study, several pop-up art exhibits of participant photos and narratives were hung in public community spaces to promote greater discussion and reflection on purpose and meaning in later life.

INTERSECTIONALITY AND QUALITATIVE HEALTH RESEARCH: POTENTIALS TO IMPACT QUALITATIVE RESEARCH

Martina Roes[1], Franziska Laporte-Uribe[1], Jem Bhatt[2], Carolien Smits[3], Aud Johanessen[4], Viktoria Peters-Nehrenheim[5], and Huerrem Tezcan-Guentekin[6], *1. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany, 2. UCL, Unit for Stigma Research, London, England, United Kingdom, 3. Pharos, Utrecht, Utrecht, Netherlands, 4. University of South-Eastern Norway, Kongsberg, Vestfold, Norway, 5. DZNE, Göttingen, Nordrhein-Westfalen, Germany, 6. ASH, Berlin, Berlin, Germany*

With a growing interest in intersectionality, critical qualitative researchers acknowledge the benefit from incorporating an intersectional lens. Incorporated intersectionality can be beneficial since it allows researchers from different disciplines to consider and account for the participant identities as multidimensional, fluid and, interdependent at each stage of the research process. In this presentation we will offer insights how qualitative research can be enhanced by incorporating an intersectional lens when analyzing the interconnectedness of numerous socially constructed identities (such as sex/gender/ethnicity/transnational families). Furthermore, we will address challenges how to conduct intersectional qualitative research (e.g. intersectional oriented interviews) and analysis (e.g. anticategorial, intracategorial and intercategorial complexity). This approach challenges on many levels, but since qualitative and interdisciplinary research is about utilizing meaning of phenomena, incorporating an intersectional lens will not only expand the methodological horizon of researchers but also stimulate ethical and critical inquiry throughout the research process.

PLACE AND MEANING OF HOME: RESEARCH IN A VIRTUAL, PHOTOVOICE LENS

Joyce Weil, *University of Northern Colorado, Greeley, Colorado, United States*

Photovoice is built upon the principle of empowerment. With the increased use of Smartphones, photovoice provides a more readily available qualitative option for co-research with older adults. This presentation provides examples from the current study illustrating the process of creating a project that uses photovoice to see how older adults construct the meaning of home and place. While the benefits of this design are many, some issues do arise during implementation, such as: creating study protocols to address Institutional Review Board (IRB) concerns; working with organizations to ensure that the design is truly co-created; and navigating and conducting photovoice in a completely virtual arena. Examples will also be drawn from technical training received as part of LeadingAge LTSS Center @UMass Boston and Collective Insight's Aging Centered Outcomes Research Learning Collaborative, as well as the Healthier Black Elders Center, which is affiliated with the University of Michigan and Wayne State University.

DIGITAL STORYTELLING AND INTERGENERATIONAL COLLABORATIONS: OLDER ADULTS AND COLLEGE STUDENTS

Angela Lavery, *West Chester University, West Chester, Pennsylvania, United States*

The use of digital storytelling can be a helpful tool within community work, health and social work research and policy. Digital storytelling refers to life-story telling that can be done in a variety of ways and used to encourage social change and transformation. This presentation will include experience on how this method was used in a study and an intergenerational project between older adults and university graduate and undergraduate students. This group of older adults specifically shared their experiences with equine interactions and activities, while the university students worked with the older adults to create a digital story. For this study and project, recruitment included students enrolled in different disciplines. Discussion on digital storytelling's connection to the narrative method and critical gerontology framework will be noted. Challenges and barriers, including Institutional Review Board and ethical considerations while preparing for this method will also be discussed.

HEARING THE VOICE OF OLDER MIGRANTS WITH DEMENTIA: A DECOLONIAL APPROACH OF PARTICIPATIVE ACTION RESEARCH

Saloua Berdai Chaouni, *University College Karel de Grote Antwerp, Antwerp, Antwerpen, Belgium*

Gerontological research has been proven not always to succeed in engaging older migrants and their families. Various attempts are made to give voice to this under-researched population. Qualitative methods like participative action research (PAR) have been put forward as a way to engage this population. However, this approach does not always succeed to achieve this goal. Drawing on insights from decolonial frameworks, we present a learning process in engaging older migrants with and without dementia and their family members in developing a migration-sensitive reminiscence approach as a psycho-social intervention for older migrants with dementia. The emphasis of decolonial perspectives on seeing this population as the "Knower", deep reflection on own coloniality of mind as a researcher while critically looking at exclusive aspects of epistemology offers a supporting gaze to reshape PAR as an approach where this population is not only given voice but also heard.

SESSION 3620 (PAPER)

PHYSICAL EXERCISE AND FRAILTY

A LIVE ONLINE EXERCISE PROGRAM FOR OLDER ADULTS' IMPROVED DEPRESSIVE SYMPTOMS: A PILOT RCT

Giulia Coletta, Angelica McQuarrie, Julia Delvecchio, Paula Bochnak, Meridith Griffin, Ada Tang, and Stuart Phillips, *McMaster University, Hamilton, Ontario, Canada*

Exercise improves mental health and effectively alleviates cognitive and physical declines. Unfortunately, engagement in physical activity decreases as individuals age and this was likely exacerbated by the COVID-19 pandemic. New technologies to deliver live online home-based group exercise classes may help mitigate mental and physical health declines in older adults while maintaining social connectivity. We evaluated the feasibility of an age-appropriate and ability-modified at-home exercise program via live video stream. The impact on loneliness, anxiety, and depression in older adults were exploratory outcomes. In this two-arm pilot RCT, we randomly assigned sedentary community-dwelling adults (65-80 years) to a waitlist control (CON) or an active group (ACTIVE) of thrice-weekly, 8-wk online live exercise program delivered via Zoom by trained exercise professionals. Attendance was recorded, and participant satisfaction to ACTIVE was assessed. Pre- and post-intervention loneliness, anxiety, and depression were collected using the revised

UCLA Loneliness Scale (R-UCLA), the Geriatric Anxiety Inventory (GAI), and the Geriatric Depression Scale (GDS). 32 participants were randomized (ACTIVE: n=16, mean age 70 ± 4, 69% women, 30 ± 5 kg/m2; CON: n=16, mean age 71 ± 5; 88% women; 29 ± 5 kg/m2). Attendance to online classes was >80% and all ACTIVE participants reported being satisfied with the exercise sessions. There was no intervention effect compared to CON on loneliness and anxiety. An effect of the intervention was observed for depression (ACTIVE: -1.94; CON: -0.07; p=0.015). We demonstrated good feasibility, satisfaction, and preliminary efficacy of a live online exercise program on older adults' mental health.

ACCEPTABILITY OF A VIDEOCONFERENCE-BASED MULTICOMPONENT EXERCISE PROGRAM (VIVIFRAIL) FOR THE OLDEST-OLD

Ana Tiecker[1], and Angelo Jose Bos[2], *1. PUCRS, Porto Alegre, Rio Grande do Sul, Brazil,*
2. Pontifical Catholic University of Rio Grande do Sul, PORTO ALEGRE, Rio Grande do Sul, Brazil

Introduction: Previous studies have shown the effectiveness of supervised multicomponent exercise programs on counteract age-related changes in functional capacity and quality of life in the oldest-old. During the quarantine imposed by COVID-19 pandemic, social isolation has been a barrier to implement face-to face exercise programs. Objective: To study the acceptance and adequacy of an exercise protocol in oldest-old. Methodology: Quasi-experimental study with initial, intermediate and post-intervention evaluation. The functional capacity assessment was carried out by the Vivifrail test (Short Physical Performance Battery and 4 falls risk assessment tests), by videoconference at the three moments of the project. For twelve weeks, the older adults performed multicomponent ViviFrail exercises with monitoring and acceptance assessment (with a maximum score of 24 points) by weekly contact by videoconference.

Results: This study concluded 14 oldest-old (89.07 ± 6.30 years). In the 12 weeks, the participants showed an average increase of 4.2 points in acceptance, with a significant correlation (p < 0.001). It was possible to observe an improvement in the functional capacity of the oldest old, although not significant, with a decrease in the time to perform the Time Up and Go tests, sit and stand, and in walking time, which is the most evident change.

Conclusions: This study demonstrated that a home training program with weekly monitoring by videoconference was well accepted and suitable for oldest-old people in a period of social isolation imposed by COVID-19. In addition, it proved to be an effective intervention for maintaining and improving the functional capacity of oldest-old people.

IMPACT OF FRAILTY ON THE DIGNITY OF COMMUNITY-DWELLING OLDER PEOPLE

Ali Darvishpoor Kakhki, Fereshteh Moradoghli, and Roghayeh Esmaeili, *Shahid Beheshti University of Medical Sciences, Tehran, Tehran, Iran*

The population of people aged 60 and older is rapidly increasing in developing countries such as Iran due to declining birth rates and increased life expectancy. Old age is associated with increased risk for frailty and reduced dignity. This study investigated the impact of frailty on the dignity of older people in Tehran, Iran. This cross-sectional study was conducted on 200 individuals aged 60 years and older. Data collection relied on the Demographic Questionnaire, Frailty Index for Elders (FIFE) and the Patient Dignity Inventory (PDI). Data were analyzed with SPSS 25. The mean age of the participants was 68 (±5.05) years; 62% of the participants were at risk for frailty, and 69% had few dignity-related problems. The multiple regression results showed that frailty was significantly associated with dignity (ß = -0.571, p < 0.001). The association was significant across all the dimensions of dignity measured by the PDI. The highest predictors of frailty included dependency (ß = -0.584, p < 0.001), followed by existential distress (ß = -0.560, p < 0.001), symptom distress (ß = -0.400, p = 0.400), social support (ß = -0.391, p < 0.001), and peace of mind (ß = -0.338, p < 0.001) in dignity. The results show that higher levels of frailty in older people are associated with decreases in their dignity, and frailty was the leading predictor of dignity. Providers should develop programs to prevent and reduce frailty in those at risk and to enhance the dignity of the already frail.

PHYSICAL ACTIVITY TRENDS IN A NATIONWIDE MHEALTH PROGRAM: A POPULATION-BASED COHORT STUDY

Gregory Ang[1], Sarah Edney[1], Chuen Seng Tan[1],
Nicole Lim[2], Jeremy Tan[2], Falk Riemenschneider[1], and
Cynthia Chen[3], *1. National University of Singapore, Singapore, Singapore, 2. Health Promotion Board, Singapore, Singapore, 3. National University of Singapore, Singapore, Singapore*

Physical inactivity is a global public health challenge, leading to an increase in chronic diseases. Effective large-scale physical activity interventions are needed. We examined the effectiveness of a nationwide mHealth intervention in Singapore, National Steps Challenge Season 3 (NSC3). NSC3 included gain-framed financial incentives for reaching pre-defined daily step targets, nudging via reminders and real-time feedback on physical activity levels. Our study includes 411,528 participants, with 53,371 (13.0%) participants aged 59 and above. Regression discontinuity design examined changes to daily step counts prior to and during NSC3. NSC3 was associated with an overall mean increase of 1437 steps per day (95% CI: 1408 to 1467). Participants in older age groups were associated with larger mean step increases. Females aged between 59 to 68 and 69 and above were associated with average increases of 1640 steps per day (95% CI: 1510 to 1770) and 2300 steps per day (95% CI: 2050 to 2550), respectively. Males in the same age groups were associated with average increases of 1360 steps per day (95% CI: 1200 to 1520) and 1640 steps per day (95% CI: 1370 to 1900), respectively. We provide real-world evidence that suggests NSC3 improved participants' step counts, with a larger increase among older adults. As older adults have a higher risk of chronic diseases, lower physical inactivity has potential health benefits such as reducing the incidence of hypertension and improving cardiovascular health biomarkers. While results are promising, further investigations are necessary to ensure sustained engagement among older adults.

SESSION 3630 (PAPER)

PHYSICAL, SOCIAL, AND PLEASANT ACTIVITIES AND HEALTH

COMPARING EXERCISE DETERMINANTS BETWEEN BLACK AND WHITE OLDER ADULTS WITH HEART FAILURE

Navin Kaushal[1], Donya Nemati[1], Dylan Mann-Krzisnik[2], and Adrian Noriega de la Colina[3], *1. Indiana University, Indianapolis, Indiana, United States, 2. McGill University, Montreal, Quebec, Canada, 3. McGill University, Westmount, Quebec, Canada*

Heart Failure (HF) is a leading cause of mortality among older-adults (OA); however, engaging in moderate-to-vigorous intensity of physical activity (MVPA) improves survival rates. Limited research has applied behavior theory to understand determinants of MVPA among OA with HF and compared the effects between races. This study aimed to use the Health Belief Model (HBM) to compare MVPA determinants between Black and White OA diagnosed with HF.

Methods: The HF-ACTION Trial is a multi-site trial that helped facilitate physical activity among individuals with HF. The present study used structural equation modeling to test the change in HBM determinants and MVPA across 12 months among OA.

Results: Participants were OA 72.28 (SD= 5.41) years old, (Black: n= 230; White, n= 441). The model found MVPA to be facilitated by perceived benefits (Black: β=.27, p=.001; White: β=.28; p<.001), self-efficacy (Black: β=.20, p=.003; White: β=.24; p<.001) and deterred by perceived barriers (Black: β=-.25, p=.001; White β=-.24; p<.001). Perceived threats deterred Black OA (β=-.23; p=.002) but not White OA (β=-.07; p=.278) from MVPA. Experimental arm predicted the development of self-efficacy (Black: β=.21. p=.001; White: β=.23; p=.001), and perceived benefits (Black: β=.21. p=.001; White: β=.23; p=.001) but not barriers (p>.05) for both races.

Conclusions: Perceived barriers was a strong determinant to MVPA, and it was not resolved in the experimental arm for either race. The experimental arm did not resolve perceived threat, which was a deterrent for Black OA. Individual characteristics need to be considered when designing programs for HF patients to reduce health disparity.

SOCIAL PARTICIPATION AND DEPRESSIVE SYMPTOMS AMONG SPOUSAL AND ADULT CHILD CAREGIVERS

Elliane Irani, and Fei Wang, *Case Western Reserve University, Cleveland, Ohio, United States*

Participating in social activities through formal (e.g., social or religious organizations) and informal (e.g., gatherings with family members or friends) avenues is known to positively contribute to mental wellbeing. Family caregivers are at risk for limited social participation and increased depressive symptoms. However, little is known about which social activities are associated with depressive symptoms among spousal and adult child caregivers. The purpose of this study was to examine the effects of participating in various social activities on depressive symptoms among spousal (n=422) and adult child (n=1,112) caregivers using data from the 2017 wave of the National Study of Caregiving. Caregivers reported on participating in six social activities in the past month (e.g., visiting family and friends, attending religious services, doing volunteer work, working for pay) and completed the 2-item Patient Health Questionnaire to assess depressive symptoms. Data were analyzed using multiple linear regression, with separated models for spousal and adult child caregivers. Sociodemographic characteristics, self-rated health, and dementia caregiving status were included as covariates. For spousal caregivers, visiting friends or family and attending religious services were associated with lower depressive symptoms (b=-.55, p=.010 and b=-.33, p=.036, respectively). For adult child caregivers, going out for enjoyment was associated with lower depressive symptoms (b=-.80, p<.001). Findings suggest that spousal and adult child caregivers may benefit from participating in different types of social activities. Interventions targeting social participation to reduce depressive symptoms need to be tailored to the needs and preferences of spousal and adult child caregivers to be most effective.

THE MULTIDIMENSIONAL SUCCESSFUL AGING SCALE: DEVELOPMENT AND VALIDATION

Edwin K. H. Chung, and Dannii Yeung, *City University of Hong Kong, Kowloon, Hong Kong*

Subjective successful aging involves a self-appraisal of individual aging process over multiple dimensions of later life (Feng et al., 2015). However, studies often ignore its multidimensional nature and simply utilize a single item as the measurement (e.g., Stewart et al., 2019). Two studies were hence conducted to develop and validate the Multidimensional Successful Aging Scale (MSAS). In Study 1, MSAS was administered among 414 community-dwelling older Chinese adults (Mage=64.50 years, SD=4.01; range = 60 – 82; 55.3% females). Repeated exploratory factor analysis revealed a nine-factor solution of 25 items, accounting for 64% of the variance. The nine factors include harmonious family, active engagement, supportive friendship, adaptive coping, social contribution, living independently, civic awareness, positive attitudes, and perceived constraints. The nine factors exhibit similar strength of associations with most of the well-being measures, but certain factors show stronger correlation with depressive symptoms, suggesting the uniqueness of each factor. In Study 2, the nine-factor model of MSAS was replicated in a sample of 558 older adults (Mage=69.11 years, SD=6.68; range = 60 – 97; 59.2% females) and the results of CFA indicated a good model fit ($\chi2$ = 527.86, df = 239; CFI =.97; TLI =.96; RMSEA =.05; SRMR = .04). The strict and metric forms of measurement invariance were shown across age groups and gender, respectively. Overall, the MSAS demonstrates satisfactory psychometric properties. These findings disclose that the older adults' perceptions of successful aging cover broader dimensions than those identified in the Rowe and Kahn's (1997) model.

SESSION 3640 (SYMPOSIUM)

POLICY ATTENTION NEEDED TO IMPROVE DIRECT CARE WORKER WAGES AND OTHER CHALLENGES

Chair: Denise Tyler Discussant: Robyn Stone

Direct care workers (DCWs), including nursing assistants, home health aides, and personal care assistants, play an essential role in the health and well-being of over 20 million

Americans who receive long-term services and supports (LTSS) at home, in nursing facilities, and other settings. In 2020, nearly 4 million DCWs supported older adults and people with disabilities in completing self-care and other daily tasks. Their efforts require considerable technical and interpersonal skills, but these essential workers receive low pay and rarely receive benefits. The COVID-19 pandemic has increased the attention paid to DCWs in the media and among policymakers. This symposium presents the results of three studies conducted by RTI International and the Office of the Assistant Secretary for Planning and Evaluation (ASPE) focused on DCWs. First, we present the results of a study examining how the wages of DCWs compare to the wages of other entry-level workers across all 50 states and report the effect of state policies aimed at improving DCW wages. Second, we report findings from a study exploring the experiences of home care aides during the pandemic as well as the federal and state policies implemented to assist these DCWs during the pandemic. Finally, we present the results of a study that assessed the effect of the COVID-19 pandemic on DCW staffing in nursing facilities. Together these studies suggest that more policy attention is needed to improve direct care work and attract the millions of additional DCWs that are expected to be needed in coming years.

EFFECT OF STATE WAGE POLICIES ON DIRECT CARE WORKER WAGES

Denise Tyler[1], Olga Khavjou[2], Melissa Hunter[3], Marie Squillace[4], Judith Dey[5], and Iara Oliveira[5], *1. RTI International, Waltham, Massachusetts, United States, 2. RTI International, Research Triangle Park, North Carolina, United States, 3. RTI International, Durham, North Carolina, United States, 4. ASPE, Washington, District of Columbia, United States, 5. Office of the Assistant Secretary for Planning and Evaluation, Washington, District of Columbia, United States*

Direct care workers (DCWs) have low wages and some states have tried to improve their wages through policies such as Medicaid wage pass-throughs and wage floors specific to DCWs. The purpose of this study was to examine the wages of DCWs in comparison to those of other entry level workers and assess the effect of state wage policies on changes in DCW wages. We analyzed state-level hourly wages using Bureau of Labor Statistics (BLS) data for two categories of DCWs separately—(1) home health and personal care aides and (2) nursing assistants and compared these to wages for other entry-level workers. Results show that many states that implemented policies to improve the wages of DCWs reduced the gap between these workers' wages and the wages of other entry-level workers, but the gap was still substantial in many states. Additional efforts will be needed to increase DCW wages.

COVID-19 INTENSIFIED HOME CARE WORKFORCE CHALLENGES

Melissa Hunter[1], Denise Tyler[2], Kristie Porter[1], Judith Dey[3], Marie Squillace[4], William Haltermann[4], and Iara Oliveira[3], *1. RTI International, Durham, North Carolina, United States, 2. RTI International, Waltham, Massachusetts, United States, 3. Office of the Assistant Secretary for Planning and Evaluation, Washington, District of Columbia, United States, 4. ASPE, Washington, District of Columbia, United States*

The COVID-19 pandemic affected home care workers in several important ways. The purpose of this study was to detail the challenges faced and the state and federal policy responses implemented to address those challenges. We conducted scans of federal and state policies enacted during the pandemic, home care agency practices described in media reports and the literature, and interviews with 25 stakeholders. Some challenges encountered were entirely new and resulted directly from the pandemic, such as limited access to personal protective equipment due to workers not being recognized as "essential." In other cases, the pandemic worsened long-standing challenges, such as recruitment and retention. State policy responses included Medicaid rate increases, hazard pay, and changes to staff training requirements. Federal policy responses included disaster relief funding as well as allowing non-physician practitioners to order services. Stakeholders suggested additional policy changes will be needed to address ongoing challenges experienced by this workforce.

COVID-19 PANDEMIC INCREASED NURSING FACILITIES' RELIANCE ON CONTRACT STAFF TO ADDRESS STAFFING SHORTAGES

Kristie Porter[1], Micah Segelman[2], Angela Gasdaska[3], Marie Squillace[4], Judy Dey[5], Iara Oliveira[5], and Denise Tyler[6], *1. RTI International, Durham, North Carolina, United States, 2. Research Triangle Institute, Washington, District of Columbia, United States, 3. RTI International, Research Triangle Park, North Carolina, United States, 4. ASPE, Washington, District of Columbia, United States, 5. Office of the Assistant Secretary for Planning and Evaluation, Washington, District of Columbia, United States, 6. RTI International, Waltham, Massachusetts, United States*

Nursing facilities (NFs) used a variety of strategies to mitigate worsening nursing staff shortages during the COVID-19 pandemic. We conducted analysis of payroll based journal PBJ data and interviewed 9 experts to understand COVID's impact on NF staffing, especially changes in contract staffing. In 2020, NFs increased their use of contract staff hours per resident day (HPRD) by 24%. Use of contract staff during the first year of the pandemic (comparing 2020 to 2019) varied by some facility characteristics (e.g., profit status). NF providers, and industry and academic experts confirmed facilities used multiple strategies beyond using contract staffing, such as temporary nurse aides, hazard pay and flexible schedules to maintain staffing throughout the pandemic. Competition for nursing staff from other healthcare settings and non-healthcare industries has grown throughout the pandemic, continuing to threaten the stability of the NF workforce.

SESSION 3650 (SYMPOSIUM)

POLYPHARMACY IN ASSISTED LIVING: WHERE ARE WE NOW AND EFFECTIVE APPROACHES TO IMPROVE MEDICATION MANAGEMENT

Chair: Barbara Resnick

There are many definitions for polypharmacy used within clinical practice and research and many factors contributing to this problem. Definitions vary from being based on the number of medications the older adult is taking to a more qualitative evaluation of the appropriateness of medication based on the benefit of the drug for a specific problem. For research purposes the definition is more commonly conceptualized as being equivalent to taking five or more medicines. Polypharmacy is noted to be presented in about 40% of older adults living in the community. Limited research has focused specifically on polypharmacy in assisted living settings. In addition to concerns about polypharmacy in assisted living there has also been a focus on the use of psychotropic medication and opioids in these settings as prevalence ranges from 53% to 68%. Although there are not regulations related to decreasing polypharmacy via deprescribing or to decrease use of psychotropics or opioids in assisted living, there are currently major initiatives in geriatrics to focus on these areas. This symposium will provide current data on medication use and polypharmacy among a large sample of 781 assisted living residents from 85 communities across three states and address the impact of a Function Focused Care approach on decreasing polypharmacy and use of psychotropics and opioids. Lastly data will be provided on the value of Deprescribing Networks to help decrease polypharmacy within these settings. The findings from this symposium will provide recommendations for future research as well as guidance for clinical practice.

THE IMPACT OF FFC-AC-EIT ON DECREASING USE OF PSYCHOTROPIC MEDICATIONS AND OPIOIDS IN ASSISTED LIVING

Barbara Resnick, *University of Maryland, Baltimore, Maryland, United States*

The secondary aim of the study testing the impact of Function Focused Care for Assisted Living Using the Evidence Integration Triangle (FFC-AL-EIT) was to decrease psychotropic medications and opioids among assisted living residents. Function Focused Care is a philosophy of care in which direct care workers are taught how to evaluate older adults' underlying function and physical activity and optimize their participation in all activities. This randomized controlled trial included 85 communities and 781 residents across three states. A total of 501 out of 794 participants (63%) received at least one psychotropic medication or opioid. Except for opioid use at four months, there was no significant difference in the intervention groups with regard to medication use at any time point. The findings suggest that encouraging participation in physical activity during all care interactions does not result in an increase in the need for and prescribing of psychotropic medications or opioids.

POLYPHARMACY IN ASSISTED LIVING

Elizabeth Galik, *University of Maryland, Baltimore, Baltimore, Maryland, United States*

The purpose of this study was to describe polypharmacy in assisted living settings, evaluate the factors that influence polypharmacy and the impact of polypharmacy on clinical outcomes. Baseline data from the study entitled, Dissemination and Implementation of Function Focused Care for Assisted Living Using the Evidence Integration Triangle (FFC-AL-EIT) was used. Total number of drugs taken daily among the 781 participants was 5.16 (SD=2.40) and over half (N=484, 62%) were exposed to polypharmacy. None of the predicted variables (age, gender, race, setting, diagnoses, and cognition) were associated with polypharmacy (Wald = .207, p=.65). Similarly, controlling for age, gender, race, setting, diagnoses, cognition, function, and physical activity, polypharmacy was not associated with falls, emergency room visits or hospitalizations. Factors not included in the data contributing to the high rate of polypharmacy in assisted living settings will be discussed and recommendations for further research and practice implications reviewed.

DEPRESCRIBING IN ASSISTED LIVING

Barbara Zarowitz[1], and Nicole Brandt[2], *1. University of Maryland School of Pharmacy, Las Vegas, Nevada, United States, 2. University of Maryland, Baltimore, Baltimore, Maryland, United States*

Deprescribing is defined as the thoughtful process of “tapering, stopping, discontinuing, or withdrawing drugs, with the goal of managing polypharmacy and improving outcomes.” There are multiple clinical issues that deprescribing can address such as: antibiotic resistance caused by inappropriate and excessive use, the ongoing opioid epidemic, as well as over treatment particularly at the end of life. Networks have been established to address deprescribing across settings including assisted living nationally and internationally. Fourteen key informants from these networks were interviewed including different disciplines. From the interviews, six major themes across two domains were identified. The two domains included regional resources and knowledge gaps and the six themes included: (a) network structure, (b) public perception, (c) policy implications, (d) implementation, (e) challenges, and (f) recommendations. Overall, the importance of collaboration among interprofessional team members will be critical to the success of deprescribing as this clinical issue moves ahead.

SESSION 3660 (PAPER)

RESEARCH TO ADDRESS THE NEEDS OF OLDER ADULTS USING LONG-TERM SERVICES AND SUPPORTS

CONTENDING WITH UNCERTAINTY: IMPLEMENTING THE CMS ACUTE HOSPITAL CARE AT HOME WAIVER PROGRAM IN THE UNITED STATES

Ksenia Gorbenko[1], Emily Franzosa[1], Abigail Baim-Lance[1], Gabrielle Schiller[2], Heather Wurtz[1], Sybil Masse[1], David Levine[3], and Albert Siu[1], *1. Icahn School of Medicine at Mount Sinai, New York, New York, United States, 2. CUNY School of Public Health, Astoria, New York, United States, 3. Mass General Brigham, Boston, Massachusetts, United States*

As Congress considers renewing the Acute Hospital Care At Home (AHCaH) waiver, which provides a full hospital payment for Hospital at Home (HaH) care, evaluating uncertainty around the future of HaH payment is critical. Our qualitative study explored HaH leaders’ experiences with implementing HaH (N=18, clinical/medical directors, operational and program managers) from 14 new and pre-existing programs across the U.S. We conducted semi-structured interviews with HaH programs diverse by size, urbanicity, and geography. We analyzed transcripts using a thematic approach. Participants across settings and regions wanted greater clarity about the waiver’s future. Lack of clarity affected staffing (nurses reluctant to take temporary jobs) and investment in establishing programs (building EMR components, changing workflows, creating inpatient processes in an outpatient setting). Programs adapted to uncertainty in multiple ways: 1) operating parallel waiver and non-waiver programs; 2) seeking to determine/ calculate the HaH value for their institution; 3) determining which patients would benefit most from HaH; and 4) seeking additional health system financing options beyond the CMS reimbursement (new programs) or relying on existing contracts with payers (existing programs). Implementing HaH is a complex and resource intensive process. Greater clarity from CMS regarding the waiver's future state will encourage programs to invest the resources that they need to establish their programs long-term. Waiver extension/ permanence would also enable programs to develop and test measures of value, making rigorous evaluations possible to optimize different HaH components.

EXPLORING QUALITY AND COVID MEASURES OF NEW YORK STATE LONG-TERM CARE FACILITIES INVOLVED IN THE SAFE STAFFING LAWSUIT

Jason Semprini[1], and Brian Kaskie[2], *1. University of Iowa College of Public Health, Iowa City, Iowa, United States, 2. University of Iowa, Iowa City, Iowa, United States*

In April 2021, New York's "Safe Staffing" law capped Long-Term Care Facility (LTCF) profits. LTCFs with "excess profits" are now challenging the law in court. This study examined how LTCFs involved in the lawsuit differed from other NY state LTCFs before and during the COVID-19 pandemic. LTCF “Safe Staffing” lawsuit data were obtained from Long Term Care Community Coalition, then linked with Centers for Medicare and Medicaid Services COVID-19 and Small Business Association Paycheck Protection Program (PPP) data. First, we tested for differences across quality measures. We found that, compared to LTCFs not involved in the lawsuit, LTCFs in the lawsuit were more likely to be located outside of a hospital, report more certified beds and higher occupancy rates, and have higher overall quality scores. LTCFs in the lawsuit also reported lower staff ratings and staffing hours, which have previously been identified as a determinant of higher mortality in LTCFs. To create valid comparisons given these systematic differences, we specified “Doubly Robust” Augmented Inverse Probability Weighted regression models and tested if lawsuit involvement was associated with COVID-19 outcomes. Despite finding higher rates of admitting patients infected with COVID-19 in “excess profit” LTCFs, we did not find that COVID-19 deaths differed by lawsuit involvement. Finally, lawsuit involvement was associated with a higher probability of receiving a PPP loan. Before and during the pandemic, LTCFs with "excess profits" appeared fundamentally different than other NY LTCFs. How these differences impact the health of older adults receiving long-term care beyond the pandemic remains unknown.

FACTORS ASSOCIATED WITH THE AVAILABILITY OF SPECIALIZED RESOURCES TO TACKLE OBESITY IN HIGH MEDICAID NURSING HOMES

Gregory Orewa[1], Ganisher Davlyatov[2], Rohit Pradhan[3], Justin Lord[4], and Robert Weech-Maldonado[1], *1. University of Alabama at Birmingham, Birmingham, Alabama, United States, 2. University of Oklahoma, Oklahoma City, Oklahoma, United States, 3. West Liberty University, West Liberty, West Virginia, United States, 4. Louisiana State University at Shreveport, Bossier City, Louisiana, United States*

The purpose of this research is to explore the factors associated with the availability of specialized resources required to care for obese residents in high Medicaid nursing homes (NHs) (85% or higher). Due to the vagaries of payment models---Medicaid payments lag other modes of NH reimbursements—high Medicaid NHs typically report poorer quality and financial performance. Operating in a financial perilous environment, and with obesity among the elderly on the rise, high Medicaid NH may particularly struggle to obtain the appropriate resources essential to cater to obese residents' needs. Utilizing the resource-dependent theory, we hypothesized that occupancy rate, acuity index, and payer mix may be positively associated with the availability of obesity related specialized equipment in high Medicaid NHs. The study was conducted by merging survey and secondary data sources for the year 2017-2018. Obesity related data was collected via mail surveys sent to Directors of Nursing in high Medicaid NHs, The survey data was merged with the following secondary data sources: Brown University's LTC Focus, Area Health Resource File, and the Medicare cost reports. The dependent variable was the summative obesity score that ranged from 0-19 with the larger number indicating greater availability of obesity-related equipment/services. An ordinary least square regression with propensity score weights (to adjust for potential non-response bias), and appropriate organizational/market level control variables were used for our analysis. Results suggest that payer mix (>Medicare residents) and acuity index were positively associated with the summative obesity score ($p < 0.05$). Policy and managerial implications are discussed.

INFORMATION SHARING TO SUPPORT CARE TRANSITIONS FOR PATIENTS WITH COMPLEX MENTAL AND BEHAVIORAL HEALTH NEEDS

Taylor Bucy, and Dori Cross, *University of Minnesota School of Public Health, Minneapolis, Minnesota, United States*

Information sharing practices between hospitals and skilled nursing facilities (SNFs) are insufficient to effectively support patient handoffs. Information needs are even greater for SNFs that admit patients with complex behavioral needs. It is unclear whether these needs have prompted hospital investment in enhanced information sharing with these SNFs, and what strategies these facilities are using to meet informational needs. We use data from a 2019 nationally representative SNF survey (N=265, response rate 53%) designed to gather information on information sharing practices with hospital partners. 122 SNFs (57% of respondents) report accepting at least two of the following complex conditions: serious mental illness, substance use disorder, or medication assisted treatment. Using logistic regression models that adjust for facility ownership and rurality, SNFs that accept complex patients are significantly more likely to receive information on behavioral, mental, and functional status compared to facilities who accept none or only one type of complex patient (odds ratio=2.42; p=0.023). Unadjusted models indicate that facilities that accept complex patients lag in IT-facilitated access to hospital information, and report more difficulty securing timely access to information. The significance of these findings do not persist after adjustment, suggesting structural differences in the types of SNFs that hospitals are partnering with to improve information sharing. We conclude that while SNFs that accept complex patients are mostly keeping pace or even doing slightly better in terms of access to hospital information that supports transitional care, further investment is needed to improve hospital information sharing behaviors.

REBALANCING LONG-TERM CARE: THE ROLE OF MEDICAID-MANAGED LONG-TERM SERVICES AND SUPPORTS

Howard Degenholtz, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

From 2018 to 2020, Pennsylvania conducted a phased implementation of a mandatory Medicaid managed long-term services and supports program called Community HealthChoices (CHC). The new program covers people receiving Medicaid financed long-term services and supports (LTSS) in nursing homes and home and community-based settings. The three participating MCOs are incentivized to serve people in the community. This study took advantage of the phased implementation to generate causal estimates of the effect of the new program on both the extensive margin (the proportion of people receiving HCBS vs. nursing homes), and the intensive margin (the type and amount of HCBS services). Medicaid claims data for the years 2013 to 2020 were analyzed to examine pre-program trends and program effects. There was a long-term pre-program trend away from nursing homes. The implementation of managed care did not appear to accelerate this trend, however, analysis of data from 2020 is complicated by the COVID-19 pandemic. However, MLTSS did appear to control to growth in hours of personal care per person both in the aggregate and longitudinally within the same individuals over time. There were decreases in the use of adult day services and home delivered meals. However, the decline in home delivered meals was more than offset by an increase in uptake of the supplementary nutritional assistance program (SNAP). This is the first causal analysis of the effects of managed care on use of long-term services and supports. The findings have implications for other states that are considering implementing similar policies.

SESSION 3670 (SYMPOSIUM)

TECHNOLOGY DESIGN AND IMPLEMENTATION TO PROMOTE EQUITY, INCLUSION, AND DIVERSITY

Chair: Walter Boot

The design of technology and technology-based solutions for the challenges many older adults face must consider principles of equity, inclusion, and diversity, or there is a risk of exacerbating digital divides in our society. This session focuses on the design, evaluation, and implementation of technologies to support older adults considering the diversity of the older adult population with respect to factors such as race and ethnicity, income level, health conditions, and cognitive status. M. Harris will discuss the facilitators and barriers identified by Black older adults related to the use of wearable devices for health monitoring. J. Chung will present on the development of a smart speaker application to support wellness among low-income senior housing residents. C. Berridge and E. Sanders will discuss designing technology solutions related to diversity with respect to cognitive status, with Berridge discussing preferences of older adults with mild Alzheimer's disease for a technology-delivered planning tool, and Sanders presenting technology-based solutions to support the prospective memory of older adults with diverse cognitive impairments. Finally, Schiaffino will present a study examining the acceptability of community-based telehealth programs among vulnerable older adults as a function off health, language, and ethnicity. General themes of inclusive design to ensure that all older adults can benefit from existing and emerging technology-based solutions will be highlighted.

EXPLORING THE POTENTIAL OF WEARABLE DEVICES FOR HEALTH MONITORING: A FOCUS ON BLACK OLDER ADULTS

Maurita Harris[1], Shaunik Kapoor[2], and Wendy Rogers[3], *1. University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 2. skapoo21@illinois.edu, Champaign, Illinois, United States, 3. University of Illinois Urbana Champaign, Champaign, Illinois, United States*

Chronic diseases are some of the top conditions leading to death in the United States. Management of these chronic diseases could benefit from monitoring risk factors, such as physical activity. Wearable devices (e.g., Fitbit) have the capability to track and give information to allow the individual to take control of their health. However, wearables are typically advertised to young, physically active, and individuals who belong to racial groups with the highest population. As such, the purpose of this study was to understand Black adults' opinions and attitudes towards wearable design to support usage, focusing on both users and non-users. Participants were interviewed to explore their wants and needs towards wearables to support usage (e.g., aesthetics) and to overcome barriers (e.g., usability concerns). The findings from the thematic analysis will be presented to illustrate these facilitators and barriers identified by Black adults. These insights can guide future inclusive design.

ENGAGING LOW-INCOME SENIORS IN PARTICIPATORY DESIGN OF SMART SPEAKER APPLICATIONS FOR WELLNESS

Jane Chung[1], Jodi Winship[1], Tracey Gendron[2], Rachel Wood[3], Natalie Mansion[2], and George Demiris[4], *1. Virginia Commonwealth University, Richmond, Virginia, United States, 2. Virginia Commonwealth University College of Health Professions, Richmond, Virginia, United States, 3. Bon Secours Mercy Health System, Cincinnati, Ohio, United States, 4. University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Low-income senior housing (LISH) residents are at a high risk of unmanaged health conditions, loneliness, and limited healthcare access. Smart speakers have the potential to improve wellness in LISH settings. We conducted a user-centered process with primarily African American, LISH residents (N=25) to develop prototypes of smart speaker applications for wellness and social connections. Five focus groups were conducted to elicit feedback about challenges with maintaining wellness and attitudes towards smart speakers. Participants expressed their desires for using the technology for safety and health. Through design workshops, they identified several smart speaker functionalities perceived as necessary for improving wellness and social connectedness. Then, seven low-fidelity prototypes and scenarios were developed in the following categories: wellness check-ins, befriending the virtual agent, community involvement, and mood detection. We demonstrate how smart speakers can provide a tool for their wellness and increase access to applications that provide a virtual space for social engagement.

PILOT STUDY OF A SELF-ADMINISTERED ADVANCE PLANNING TOOL FOR TECHNOLOGY USE WITH DEMENTIA CARE DYADS

Clara Berridge, Natalie Turner, and Liu Liu, *University of Washington, Seattle, Washington, United States*

We present feasibility and preliminary efficacy findings from a novel web-app intervention to educate and facilitate dyadic communication about four categories of technologies used in dementia care and to document preferences of people living with mild AD regarding these technologies. A pre/post-test design was conducted. Eighty-eight percent of the 66 enrolled participants completed the study for a total of 29 dyads. Participants gave favorable ratings of satisfaction, helpfulness, clarity, and other usability measures. While improvements on multiple measures were of greater magnitude for care partners than for people living with dementia (PLWD), paired t-tests showed statistically significant improvement with medium and large effect sizes in PLWD (p<.001) and care partners' (p<.001) self-reported understanding of the technologies, as well as care partners' perceptions of the PLWD's understanding (p<.01). After completing the web-app together, care partners felt significantly more prepared to make decisions about these technologies (p<.01).

UNDERSTANDING THE UNIQUE NEEDS OF VULNERABLE OLDER ADULTS IN A COMMUNITY-BASED TELEHEALTH PROGRAM

Melody Schiaffino[1], Zhan Zhang[2], Pratik Chaudhari[2], and Jina Huh-Yoo[3], *1. San Diego State University, San Diego, California, United States, 2. CSIS, New York, New York, United States, 3. College of Computing and Informatiics, Philadelphia, Pennsylvania, United States*

Vulnerable older adults benefit from community-based telehealth programs (CTP) that facilitate remote health monitoring with support from trained personnel. This study assessed acceptability with such technology as a self-reported measure of comfort among participants in an on-going CTP, the Telehealth Intervention Program for Seniors (TIPS). We analyzed data from participants across 20 sites (N=2279), 38% responded to their comfort with technology (n=866). We modeled self-reported factors to explore the association with technology acceptability. There was more comfort with technology than not (53.5% vs 46.5%). Participants under age 65, those reporting better vs poorer health (p<0.0001) and a happier mood state (p<0.0001) were more likely to be comfortable. Older adults and much older adults reported greater odds of comfort compared with those under 65. Better health status was associated with 84.5% greater odds of acceptability compared to those with poor (AOR 1.85; 95CI 1.28-2.65). Happier participants reported 56% greater odds of comfort compared with those reporting unhappiness. Though only marginally significant, non-English speaking participants reported greater odds of comfort compared to English proficient. While ethnicity was not associated, our marginal significance for language suggests a need to continue exploring. Our work demonstrates the need to address the unique needs of older adults.

ACCOUNTING FOR DIVERSITY IN COGNITIVE STATUS IN THE DESIGN AND EVALUATION OF INCLUSIVE PROSPECTIVE MEMORY SOLUTIONS

Edie Sanders[1], Walter Boot[2], and Robin Stuart[2], *1. Florida State University, TALLAHASSEE, Florida, United States, 2. Florida State University, Tallahassee, Florida, United States*

Technology holds tremendous promise for supporting older adults' performance of important everyday activities. However, truly inclusive design of technology-based solutions must account for diversity with respect to cognitive status. This talk will focus on empirical studies conducted under the umbrella of the Enhancing Neurocognitive Health, Abilities, Networks, & Community Engagement (ENHANCE) Center with an emphasis on designing inclusive prospective memory solutions for older adults with cognitive impairments. Initial usability studies will be discussed examining the usability and efficacy of novel technology solutions, including the use of smartwatches and digital assistants, to support prospective memory, the ability to remember and carry out an intention in the future, which is crucial for maintaining health, independence, and social connections.

SESSION 3680 (SYMPOSIUM)

THE GEROPSYCHIATRIC NURSING COLLABORATIVE: ADDRESSING BEHAVIORAL NEEDS OF PERSONS WITH DEMENTIA

Chair: Lauren Massimo Co-Chair: Lauren Hunt Discussant: Kathleen Buckwalter

Over the last decade, the Geropsychiatric Nursing Collaborative (GPNC) has sought to improve care of older adults with mental health needs such as those with dementia. Geropsychiatric nurses are well-poised to deliver person-centered care to address the psychosocial needs of persons with dementia, which may include behavioral expressions. In this interdisciplinary symposium, we will highlight approaches members of the GPNC are taking to address mood and behavior in persons with dementia. The first session will describe how persons with mild-cognitive impairment draw upon their inner strength after they receive a diagnosis. The second session will discuss how common behavioral expressions such as anxiety, depression and apathy contribute to difficulty with everyday functional activities in persons with Alzheimer's disease. The third session will describe an interprofessional communication tool to improve communication of behavioral expression in the nursing home setting. The last session will share findings from a nurse practitioner-led team care management model to address cognitive vulnerability in older adults with dementia, depression, and/or delirium. Together, these presentations describe how geropsychiatric nurses are investigating mood and behavioral symptoms in persons with dementia and addressing their mental health needs with innovative person-centered interventions.

EXPERIENCES OF INNER STRENGTH AT THE TIME OF MILD COGNITIVE IMPAIRMENT DIAGNOSIS

Brianna Morgan[1], Lauren Massimo[1], Sharon Ravitch[1], Jason Karlawish[2], and Nancy Hodgson[1], *1. University of*

Pennsylvania, Philadelphia, Pennsylvania, United States, 2. University of Pennsylvania Perelman School of Medicine, Philadelphia, Pennsylvania, United States

Inner strength is a person's internal process of moving through challenging circumstances, such as receiving a diagnosis of Mild Cognitive Impairment (MCI). This study describes experiences of inner strength using qualitative methodologies to identify themes within semi-structured dyadic and individual interviews with persons diagnosed with MCI within 12 months at a Memory Center and their care partners. We analyzed data in NVivo using reflexive thematic analysis methods. Trustworthiness was maintained through vetted interview guides, verbatim transcription, field notes, peer group analysis, and audit trails. One overarching theme and three subthemes explained inner strength. An overarching theme, Finding Ways to Live with It, described how participants live within the circumstances of MCI. Three subthemes were Defining Strength by Recalling the Past, Seeking Relief and Dwelling in It, and Finding Purpose & Meaning. Implications include supporting inner strength at the time of MCI diagnosis through reminiscence therapy and meaning making interventions.

APATHY AND ANXIETY ARE RELATED TO POOR FUNCTION IN PERSONS WITH EARLY-ONSET ALZHEIMER'S DISEASE

Adele Crouch, and Lauren Massimo, *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Neuropsychiatric symptoms are prevalent in persons with early-onset Alzheimer's disease (EOAD) and may contribute to the inability to perform instrumental activities of daily living. We examined associations between frequently observed symptoms in persons with EOAD: apathy, anxiety, depression, and patient function. Caregivers of 94 persons with EOAD completed questionnaires including the Neuropsychiatric Inventory and the Functional Activities Questionnaire. Regression analyses were performed for each neuropsychiatric symptom as a predictor with covariates (age, sex disease duration) and our outcome was patient function. We then performed multivariate analysis with the significant predictors. We observed that apathy explained 20.51% [F(4,68)=5.65, adjusted R2=0.2051; p<0.001], anxiety explained 6.63% [F(4,70)=2.31, adjusted R2=0.0663 p<0.05], and depression was not a significant predictor of patient function. In a multivariate model, apathy and anxiety explained 21.03% [F(5,67)=4.83, adjusted R2=0.2103; p<0.001] of the variance in patient function. These results suggest apathy and anxiety contribute to diminished ability to complete functional activities.

DEMENTIA CARE IN NURSE PRACTITIONER-LED CARE MANAGEMENT FOR COGNITIVELY VULNERABLE OLDER ADULTS

Richard Fortinsky[1], and Shawn Ladda[2], *1. University of Connecticut Center on Aging, Farmington, Connecticut, United States, 2. UConn Center on Aging, University of Connecticut School of Medicine, Farmington, Connecticut, United States*

Care management approaches are being widely tested in the Medicare-eligible population to manage chronic conditions, but few have focused on cognitive vulnerability as the pathway to optimizing independence in the community-dwelling older population. Cognitive vulnerability refers to living with dementia, depression, and/or a history of delirium. This presentation features a nurse practitioner-led team care management model (3D Team) to address cognitive vulnerability, tested in an ongoing clinical trial with older adults in a Medicare Advantage population. For older adults with dementia and their families served by the 3D Team, the nurse practitioner works closely with occupational therapists (OTs) delivering a nonpharmacological dementia care intervention. Preliminary results presented will include: characteristics of dyads that have received the dementia care intervention (N=70 dyads to date), how the nurse practitioner and OTs communicate, how the nurse practitioner reinforces dementia care skill-building strategies introduced by OTs, and process evaluation results to date.

SESSION 3690 (SYMPOSIUM)

WHAT MAKES A BEAUTIFUL DAY IN THE NEIGHBORHOOD? PLACE AS A CONTRIBUTOR TO FUNCTION IN LATER LIFE

Chair: Andrea Rosso

Neighborhood environments are increasingly recognized as an important determinant of health and function in older adults. Environmental supports such as density of intersections and available community resources can promote activity and participation which in turn promotes physiological health. In contrast, barriers such as disorder and high traffic can limit activity and participation, particularly for those at high risk for mobility limitations and falls. Here, we present five papers exploring these relations. First, Kate Duchowny presents work assessing relations of the built and social environment with muscle strength in the Health and Retirement Study. Two papers utilizing walkability assessments using Google Street View in a physical activity intervention trial are presented; Kyle Moored demonstrates relations of neighborhood walkability with Global Positioning System (GPS)-derived time out of home and Anisha Suri assesses how the relation between actigraphy-derived gait quality and daily step counts differs by walkability. Next, Philippa Clarke presents data on the association of neighborhood environment with diabetes risk in those with low visual function in an administrative claims database. Finally, Pam Dunlap describes results of a systematic review of outdoor environmental risk factors for falls and fear of falling. Together, these papers will demonstrate the breadth of ways in which neighborhood environments and function relate to determine health outcomes for older adults.

WHICH NEIGHBORHOOD FEATURES MATTER MOST FOR MUSCLE STRENGTH? FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

Kate Duchowny[1], L. Grisell Diaz-Ramirez[1], W. John Boscardin[1], Peggy Cawthon[2], Maria Glymour[1], and Scarlett Lin Gomez[1], *1. University of California, San Francisco, San Francisco, California, United States, 2. California Pacific Medical Center Research Institute, San Francisco, California, United States*

Linking data from the National Neighborhood Data Archive (NaNDA) to the 2006-2018 Health and Retirement

Study (N=22,245), we fit linear mixed models to assess which of 22 built and social neighborhood environment variables predicted grip strength, a measure of total-body muscle strength. Among 22,245 respondents (mean age=63 years, SD=9.2) with up to 4 grip strength measures, neighborhood physical disorder (B= -0.25 kg, 95% CI= -0.37,-0.13), number of parks (B= 0.05 kg, 95% CI= 0.01, 0.10), number of gyms/fitness centers (B=-0.44 kg, 95% CI= -0.82, -0.07), proportion of highly developed land (B=-2.06 kg, 95% CI=-4.06, -0.07), and % urban (B=-0.66 kg, 95% CI=-1.27, -0.05) were associated with grip strength level after adjustment. No social neighborhood variables were associated with grip strength. Although preliminary, findings suggest that highly developed urbanized land may be a barrier to maintaining muscle strength in later life, but resources such as parks are associated with better outcomes.

NEIGHBORHOOD WALKABILITY IS ASSOCIATED WITH GPS-DERIVED LIFE-SPACE MOBILITY OF OLDER ADULTS

Kyle Moored[1], Breanna Crane[1], Pamela Dunlap[2], Michelle Carlson[1], and Andrea Rosso[2], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

For community-dwelling older adults, living in a more walkable neighborhood may encourage greater travel outdoors (i.e., life-space mobility). We assessed associations between neighborhood walkability and objective, GPS-derived life-space mobility. Participants were 149 adults (Age: M=77.1±6.5, 67% women) from a randomized trial to improve walking in older individuals. Participants carried a GPS at baseline that passively collected real-time location data for 5-7 days. Life-space mobility was quantified using median percentage time spent outside of home (pTOH). Neighborhood walkability was assessed using a modified Active Neighborhood Checklist and Google Street View, and a composite factor score was derived (M=-0.13±0.90, greater score=less slopes, more mixed residential/commercial land use). Each 1-point higher walkability score was associated with 2.5% greater pTOH (95%CI: 0.21-4.69, β=.23, p=.032), after adjusting for age, sex, race, device, season, and clustering on Census tract. Future work will examine how neighborhood walkability and functional status may interact to influence life-space mobility.

NEIGHBORHOOD WALKABILITY INFLUENCES ASSOCIATIONS BETWEEN PHYSICAL ACTIVITY AND GAIT MEASURES IN OLDER ADULTS

Anisha Suri[1], Xiaonan Zhu[2], Geeta Acharya[2], Alyson Harding[3], Jessie VanSwearingen[4], Mark Redfern[1], Ervin Sejdic[5], and Andrea Rosso[2], *1. Swanson School of Engineering, University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 3. University of Minnesota, Minneapolis, Minnesota, United States, 4. School of Health and Rehabilitation Sciences, Pittsburgh, Pennsylvania, United States, 5. University of Toronto, Toronto, Ontario, Canada*

Neighborhood walkability can influence physical activity and of older adults. Residential neighborhoods of participants (N=186, 77±6 years, 70% females) were audited for walkability using Google Street View. Factor analysis categorized neighborhood walkability as high, medium, and low. Gait quality was derived from a 4-m instrumented walkway (pace, variability, walk-ratio) and accelerometry signals at the lower back during a 6-minute walk test (adaptability, similarity, and smoothness). Activity was step-count from seven-day actigraphy. We studied associations between gait variables and step-count across high, medium, and low walkability neighborhoods using linear regression (age and sex as covariates). Pace(m/s) [High(β=0.46, p<.05), Medium(β=0.43, p<.05), Low(β=0.25, p>.05)], adaptability(m/s2) [High(β=0.47, p<.05), Medium(β=0.24, p<.05), Low(β=0.37, p<.05)], and similarity [High(β=0.39, p<.05), Medium(β=0.28, p<.05), and Low(β=0.18, p>.05)] were associated with step-count, stronger associations for high walkability neighborhoods (p for interactions <0.01). No associations with variability, walk-ratio, and smoothness were found. Associations between gait and activity differed by neighborhood walkability.

RISK OF DIABETES AMONG ADULTS AGING WITH VISION IMPAIRMENT: THE ROLE OF THE NEIGHBORHOOD ENVIRONMENT

Philippa Clarke[1], Anam Khan[1], Kenzie Mintus[2], and Joshua Ehrlich[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Indiana University Purdue University Indianapolis, Indianapolis, Indiana, United States*

Experiencing vision loss as a result of the aging process may be different from aging with vision impairment (VI) acquired earlier in life. Adults aging with VI may be at risk for Type-2 Diabetes (T2DM) due to community barriers in accessing health care, healthy food, and recreational resources. We examined the relationship between neighborhood characteristics and incident diabetes in 22,719 adults aging with VI (without prevalent T2DM) in a private medical claims database (2008-2019). The primary outcome was time to incident T2DM diagnosis over 3+ years of enrollment. Cox models estimated hazard ratios (HRs) for incident diabetes (adjusted for age, sex, and comorbidities). Residence in neighborhoods with greater intersection density (HR=1.26) and traffic (HR=1.22) increased risk of T2DM, while broadband internet access (HR=0.67), optical stores (HR=0.62), supermarkets (HR=0.78), and gyms/fitness centers (HR=0.63) were associated with reduced risk. Results emphasize the importance of neighborhood context for aging well with VI.

OUTDOOR ENVIRONMENTAL RISK FACTORS FOR FALLS AND FEAR OF FALLING: A SYSTEMATIC REVIEW

Pamela Dunlap[1], Zachary Hubbard[2], Erica Fan[1], Elsa Strotmeyer[3], and Andrea Rosso[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. University of pittsburgh Geriatric Psychiatry Neuroimaging Program, Pittsburgh, Pennsylvania, United States, 3. School of Public Health, University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

The purpose of this systematic review was to identify outdoor environmental risk factors associated with falls and/or fear of falling among older adults. PubMed, EMBASE, and CINAHL were searched through February 19, 2021. Studies were included if they measured outdoor environment, falls or fear of falling as an outcome, and included adults aged ≥ 45 years. Excluded studies were not published in English and/or did not include original results. Two study-team members completed abstract screening. For full text reviews, a third reviewer resolved conflicts. A total of 5,727 abstracts were screened and 462 full texts were reviewed. After full-text review, approximately 25 studies will be assessed for risk of bias and data extracted by two independent reviewers. Based on the initial review, uneven outdoor surfaces, busy traffic areas, and neighborhood disorder were associated with falls/fear of falling among older adults. Modifiable outdoor environmental factors may be targets for fall prevention.

SESSION 3700 (SYMPOSIUM)

WHAT PANDEMIC RECOVERY WILL LOOK LIKE FOR OLDER, MULTICULTURAL WORKERS

Chair: Cassandra Burton Co-Chair: Katherine Bridges
Discussant: Aisha Cozad

It is no surprise to many that the impact of Covid-19 on older adults, particularly LGBTQ and people of color has been detrimental, not just physically, but mentally, socially, and economically. Many African American/Black adults have suffered disproportionately during the pandemic. In terms of Social Security more than nine in 10 (93%) older Black Americans report that having adequate Social Security benefits is important, but for the many who were forced to retire early due to the pandemic, they will be at a disadvantage. LGBTQ older adults experience persistent discrimination due to sexual orientation or gender identity. When the LGBTQ individual was African American/Black, experiences of discrimination were higher and often occurred in the workplace. These forms of discrimination are directly impacts ones earning potential both during active work years and in retirement savings. AARP has a long history of being an advocate for marginalized and vulnerable adults. AARP staff will discuss policy needs and what the post pandemic workplaces needs to ensure that older LGBTQ people can thrive in the workplace with dignity and respect. The 2021 AARP's Vital Voices research will be used to showcase the economic impact the pandemic has had on older adults, African American communities, Hispanic/Latino communities, Asian Pacific Islander communities and LGBTQ communities. AARP staff will discuss strategies and tactics needed to ensure that opportunities for economic recovery for older adults. The survey gathers information to gauge opinions on a range of topics as well as breaking and current issues.

WHAT PANDEMIC RECOVERY WILL LOOK LIKE FOR OLDER, MULTICULTURAL WORKERS

Cassandra Burton[1], Aisha Cozad[2], and Katherine Bridges[3], *1. AARP, Atlanta, Georgia, United States, 2. AARP, Washington, District of Columbia, United States, 3. AARP, Deer Isle, Maine, United States*

AARP has a long history of being an advocate for marginalized and vulnerable adults. AARP staff will discuss policy needs and what the post pandemic workplaces needs to ensure that older LGBTQ people can thrive in the workplace with dignity and respect. The 2021 AARP's Vital Voices research will be used to showcase the economic impact the pandemic has had on older adults, African American communities, Hispanic/Latino communities, Asian Pacific Islander communities and LGBTQ communities. AARP staff will discuss strategies and tactics needed to ensure that opportunities for economic recovery for older adults. The survey gathers information to gauge opinions on a range of topics as well as breaking and current issues. Among other issues, it explores concerns about racism and experience with age discrimination and employment experience among older adults.

SESSION 3710 (AWARD LECTURE)

DISTINGUISHED FACULTY AWARD AND RISING STAR EARLY CAREER FACULTY AWARD PRESENTATIONS AND LECTURES

Chair: Kara Dassel

The Distinguished Faculty Award Lecture will feature an address by the 2022 recipient Christine A. Fruhauf, PhD, FGSA, FAGHE, of Colorado State University. The Distinguished Faculty Award recognizes persons whose teaching stands out as exemplary, innovative, of impact, or any combination thereof. The Rising Star Early-Career Faculty Award Lecture will feature an address by 2022 recipient M. Aaron Guest, PhD, MPH, MSW, of Arizona State University. The Rising Star Early-Career Faculty Award acknowledges new faculty whose teaching and leadership stand out as influential and innovative.

STARS AND WISHES: INSIGHTS AND SUGGESTIONS FOR ACADEMICS IN GERONTOLOGY AND GERIATRICS EDUCATION

Christine Fruhauf, *Colorado State University, Fort Collins, Colorado, United States*

In 2002, I presented a student paper at the annual meeting and educational leadership conference of the Association for Gerontology in Higher Education (AGHE) about co-teaching with my mentor an undergraduate adult development and aging course. Little did I know then, presenting about collaborative teaching methods and proven student assessment of learning such as, 'Stars and Wishes', that the AGHE presentation would lead me on a rewarding career path resulting in receiving the 2022 AGHE Distinguished Faculty Award. The purpose of this presentation is to discuss seven 'Stars' that I believe were pivotal points in my career whereby gerontological education and students studying gerontology benefited, and my 'Wishes' for gerontology and geriatrics education to inspire future academics as they navigate the next 20 years.

DIRECTIONS UNCLEAR: DEMYSTIFYING AGING AND FINDING OUR FUTURE GERONTOLOGISTS

Aaron Guest, *Arizona State University, Phoenix, Arizona, United States*

When did you first learn about gerontology? Becoming a gerontologist is rarely at the top of any student's potential career list. How many of us only found the prospect of a gerontological career in graduate school – or after entering the workforce. We often hear that too few students show interest in jobs working with older persons. In turn, dedicated homes for gerontological degrees are threatened with closure and consolidation. Rather than students being uninterested, I believe the perceived ambiguity of careers and lack of exposure to aging content prevent many from seeking out these careers. In this lecture, I will share my own experience in navigating the ambiguity of a career in aging and how I now use it as a strength to recruit students. I aim to emphasize the unique role of gerontological education and the transdisciplinary approaches and interprofessional strengths that it provides for our aging society.

SESSION 3720 (PAPER)

COMPLEX CHRONIC AND END-OF-LIFE CARE ISSUES

ASSOCIATION OF SOCIAL SUPPORT AND LONELINESS WITH FRAILTY AND FUNCTIONAL STATUS

Kay Thwe Kyaw[1], Thomas Flagiello[2], Alec Levine[2], and Joel Salinas[2], *1. NYU Grossman School of Medicine, Hartsdale, New York, United States, 2. NYU Grossman School of Medicine, New York, New York, United States*

Observational studies suggest psychosocial factors such as social support and loneliness are associated with vulnerability for frailty in older adults, but less is known about the generalizability of these putative psychosocial mechanisms in underrepresented groups. Thus, we evaluated whether better telecommunication social support and lower levels of loneliness were associated with decreased frailty and increased functional ability using a unique longitudinal cohort of rural South African older adults. We conducted generalized estimating equation and robust regression analyses using cross-sectional data from 347 participants in the HAALSI (Health and Aging in Africa: A Longitudinal Study of an INDEPTH Community in South Africa) Dementia Cohort. Social support via telecommunication and self-reported loneliness were measured using standard assessments and modeled as exposure variables. Outcomes were frailty (measured using Fried's frailty phenotype) and functional status (measured by instrumental activities of daily living, IADLs). Lower level of telecommunication social support was associated with higher impairment in ability to perform IADLs. This association persisted after additional adjustments for depression (beta -0.007, 95 % CI -0.016, 0.001) and vascular risk factors (beta -0.012, 95 % CI -0.020, 0.003). No associations were observed in relating telecommunication social support and loneliness with frailty. Among rural South African Black older adults, lower telecommunication-based social support was associated with greater risk of impairment in functional ability. Although further validation is required for possible reverse causality, our findings suggest that future intervention studies focused on promoting telecommunication-based social support to preserve independent functioning may be merited.

CHRONIC CONDITIONS DURING THE COVID PANDEMIC: MORTALITY PATTERNS IN THE UNITED STATES

Julia Kravchenko[1], Masudul Hoque[2], and Igor Akushevich[2], *1. Duke University School of Medicine, Durham, North Carolina, United States, 2. Duke University, Durham, North Carolina, United States*

Patients with chronic diseases, especially the older adults, are at increased risk of death during the COVID pandemic. We analyzed monthly patterns of mortality rates for patients with diabetes, arterial hypertension, cerebrovascular disease, heart failure, and kidney disease using the provisional Multiple Cause of Death data (2018-2022), for age-, gender, and race/ethnicity-specific population groups. Since population is available at annual basis, we used interpolation of population at risk to have the estimates of population at monthly basis. For all studied diseases, there were substantial increases in mortality among patients that peaked in late-Spring 2020 and Winter 2020/2021. Increases of COVID-related deaths were greater in older (aged 65+) than in younger (55-64) patients. For majority of diseases, Black patients predominantly had their maximum/peaks of COVID-related mortality in late-Spring 2020, while White, American Indian, and Hispanic patients had their max in Winter 2020/2021, and Asian patients had both peaks. Additionally to increased COVID-related deaths, higher mortality rates were also observed among patients with above diseases who did not have COVID in their death records. These increases were more pronounced in younger (55-64) than in older (65+) age groups, and they varied by the studied disease. Increased mortality not directly related to COVID could be due to the relocations of medical resources, lower access to medical care (e.g., limited use of telemedicine), non-COVID related complications caused by the earlier COVID infection, undiagnosed and/or unregistered COVID cases in patients with chronic disease, or other causes. Disease-specific differences in mortality patterns were analyzed and discussed.

DELIRIUM SUPERIMPOSED ON DEMENTIA IN POST-ACUTE CARE: NURSE DOCUMENTATION OF SYMPTOMS AND INTERVENTIONS

Andrea Sillner[1], Diane Berish[2], Tanya Mailhot[3], Logan Sweeder[4], Donna Fick[5], and Ann Kolanowski[6], *1. Pennsylvania State University Ross and Carol Nese College of Nursing, University Park, Pennsylvania, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States, 3. Université de Montréal, Montreal, Quebec, Canada, 4. The Pennsylvania State University, State College, Pennsylvania, United States, 5. Penn State University, University Park, Pennsylvania, United States, 6. Penn State University, Penn State University, Pennsylvania, United States*

Delirium is common in older adults and across settings of care, including post-acute care (PAC). Nurses have an important role in identifying, preventing and managing delirium. Even though best practice guidelines highlight the need to accurately document delirium and to deliver non-pharmacological, nurse-driven interventions, it is unclear how this is done in PAC. The aim of this research was two-fold: 1) to describe how nurses document DSD symptoms in PAC nursing notes and 2) to determine if appropriate non-pharmacological nursing interventions are included in their documentation when DSD is present. The sample (N=281) was drawn from a large, single-blinded randomized controlled trial (Recreational Stimulation For Elders As A Vehicle To Resolve DSD (Reserve-DSD) across 8 facilities. Participants tended to be white, female, and had a high-school education. A total of 115 participants (40.6%) had full delirium per the CAM upon admission to PAC, while the remainder 168 (59.4%) had subsyndromal delirium. All had a baseline of dementia. Symptoms of 'Confusion or Acute Confusion' were reported for more than 50% of patients. Approximately 90% of had the symptom 'Confusion or Acute Confusion' documented and this was also the most commonly documented symptom for which a nursing-driven intervention was provided. Overall delirium symptoms and interventions were poorly documented by nurses. Implications for future research and practice include understanding how the pandemic and subsequent resource deprivations impacted delirium documentation and intervention in this setting. Also there is a need for expanded nurse and other healthcare provider education.

END-OF-LIFE HEALTH LITERACY: VALIDATION STUDY OF A NEW INSTRUMENT, THE END-OF-LIFE HEALTH LITERACY SCALE (EOL-HLS)

Clément Meier[1], Sarah Vilpert[1], Gian Domenico Borasio2, Ralf J. Jox[3], and Jürgen Maurer[1], *1. University of Lausanne, Lausanne, Vaud, Switzerland, 2, Lausanne University Hospital and University of Lausanne, Lausanne, Vaud, Switzerland, 3. Lausanne University Hospital and University of Lausanne, Lausanne, Vaud, Switzerland*

Measuring health literacy allows to assess individuals' competencies to deal with health issues; it influences how individuals perceive their health problems, communicate with healthcare providers, or make medical decisions. The end of life is commonly characterized by one or several diseases, healthcare services' uses and requires individuals to make complex medical decisions. Although the end-of-life concerns everyone, the level of competencies of individuals to get through this stage of life has been little explored. This study aims to fill this gap by validating a new instrument, the End-of-life Health Literacy Scale (EOL-HLS), in a representative sample of older adults aged 58+ living in Switzerland. We use the Swiss wave 8 (2019/2020) of SHARE. Based on the seminal work of Nutbeam (2000), end-of-life health literacy skills are measured using questions on the difficulty in understanding medical interventions, finding information, communicating, deciding in advance, and choosing end-of-life care options. In addition, we compare the findings to the European Health Literacy Survey questionnaire (HLS-EU-Q16). The results confirmed the suitability for performing factor analysis (KMO = 0.924, Bartlett's test of sphericity statistically significant), a three-factor model was established and showed good fit properties (CFI = 0.964, TLI = 0.958, RMSEA = 0.047, SRMR = 0.067) and good reliability ($\alpha = 0.93$). The associations found between individuals' sociodemographic characteristics and the HLS-EU-Q16 were also present in our instrument, but higher EOL-HLS scores were associated with more positive end-of-life outcomes. The EOL-HLS is a reliable and valid instrument to target individuals with low end-of-life health literacy.

SESSION 3730 (SYMPOSIUM)

DAILY CONTEXTS AND HEALTH OUTCOMES ACROSS ADULTHOOD

Chair: Joanna Hong Co-Chair: Meng Huo Discussant: David Almeida

Different daily contexts (i.e., social, behavioral, emotional) influence psychological and physical health. In particular, daily contexts change across adulthood and identifying salutary daily contexts is vital for improving the health of middle-aged and older adults. This symposium adds to a burgeoning literature and presents studies that examine how different daily contexts (social - friend interactions, behavioral - electronic usage, emotional - affective response) impact health outcomes across adulthood. Ng et al. found that friend interactions were associated with poorer heart rate variability throughout the day among Black, but not White adults. Kim et al. showed that evening computer use, a health-impairing behavior, is associated with greater sleep disturbances on the following nights among older adults. Rush et al. found that low and high levels of negative affect reactivity to stressors (increased negative affect in response to stress) were associated with poorer health. Yet, moderate levels of stress reactivity predicted better health. Similarly, Hong et al. found that less positive affect reactivity to stressors (decreased positive affect in response to stress) was protective against elevated systolic blood pressure across stressful days. Lastly, Huo et al. identified an association between older adults' empathy and daily rumination (i.e., repetitive thoughts) over distress, but observed that the link was attenuated on days when older adults maintained more stable levels of negative affect. Together, findings may inform future interventions aimed at increasing health across adulthood. Dr. Almeida will serve as the Discussant and summarize these studies with regard to their theoretical and methodological contributions.

WHAT SAVES A STRESSFUL DAY: PROTECTIVE ROLE OF POSITIVE AFFECTS AGAINST DAILY STRESS

Joanna Hong[1], Jody Greaney[2], Jacqueline Mogle[3], and David Almeida[3], *1. The Pennsylvania State University, State College, Pennsylvania, United States, 2. The University of Texas of Arlington, Arlington, Texas, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States*

Experiencing a greater number of stressful days is associated with a heightened risk of cardiovascular disease. This study examined whether positive affect reactivity, the trait-like change in positive affect in response to daily stressors, moderates the association between the number of stressful days and blood pressure. Participants were 664 adults from the National Study of Daily Experiences II (Midlife in the United States sub-study). Participants reported stressors and positive affect across 8 days and provided resting blood pressure measures during a separate clinic visit. A greater number of stressful days was associated with increased systolic blood pressure, but only among individuals with higher positive affect reactivity (B = 15.11, SE = 6.36, p = 0.02). Results suggests that individuals who maintain positive affect when experiencing stressors may have lower risk of heightened systolic blood pressure, contributing to the growing evidence that positive affective reactivity may be protective against daily stress.

DO MORE EMPATHIC OLDER ADULTS RUMINATE MORE? EMOTION REGULATION MATTERS

Meng Huo[1], Kate Leger[2], Kira Birditt[3], and Karen Fingerman[4], *1. University of California, Davis, DAVIS, California, United States, 2. The University of Kentucky, Lexington, Kentucky, United States, 3. University of Michigan, Ann Arbor, Michigan, United States, 4. The University of Texas at Austin, Austin, Texas, United States*

Older adults differ in their responses to distress, and those who tend to ruminate report poor health. We sought to examine whether trait empathy, the tendency to share and understand others' distress, underlies rumination, and whether this association varies by emotion regulation. Participants included 289 adults aged 65+ in the Daily Experiences and Well-being Study. They reported demographics, empathy, general preferences for emotion regulation strategies, and affect throughout the day as well as daily rumination. Empathy was associated with greater rumination, which was particularly evident in older adults who preferred avoidant strategies. We also found that the link between empathy and rumination was attenuated on days when older adults had lower negative affect variability. This study identifies empathy as a key factor that underlies individual differences in rumination, a key precursor of psychopathologies, and also suggests emotion regulation as a promising target of interventions that can promote older adults' health.

DAILY EVENING ELECTRONIC MEDIA USE, SEDENTARY BEHAVIORS, AND SLEEP IN LATER LIFE

Yijung Kim[1], Nicole Richards[2], and Karen Fingerman[1], *1. The University of Texas at Austin, Austin, Texas, United States, 2. The University of Texas, Austin, Austin, Texas, United States*

Sleep complaints and disorders are two of the most common disturbances to health and well-being in later life. This study examined how evening electronic media use and daytime sedentary behaviors affect subsequent sleep hours and perceived sleep quality, and whether consistent sleep hours (i.e., sleep regularity) moderate these associations. Data were drawn from 241 older adults (Mage = 74.02) from the Daily Experiences and Well-being Study who completed ecological momentary assessments and wore an accelerometer for four days on average. A series of conditional fixed-effects models indicated that older adults reported more sleep disturbances on nights following the evening computer use. Sedentary behaviors and evening television viewing were not associated with sleep quantity and quality. Older adults with more consistent hours of bedtime reported better sleep quality regardless of their evening electronic media use and daytime sedentary behaviors, thereby highlighting the importance of sleep regularity in later life.

DO FRIENDS GET UNDER THE SKIN? DAILY INTERACTIONS AND CARDIOVASCULAR FUNCTIONING AMONG BLACK AND WHITE AMERICANS

Yee To Ng[1], Sae Hwang Han[2], Karen Fingerman[3], and Kira Birditt[4], *1. UT Austin, Ann Arbor, Michigan, United States, 2. University of Texas at Austin, Austin, Texas, United States, 3. The University of Texas at Austin, Austin, Texas, United States, 4. University of Michigan, Ann Arbor, Michigan, United States*

Scarce research has examined racial differences in cardiovascular health in the context of social interactions. This study investigated whether (a) friend interactions were associated with better cardiovascular functioning, and (b) such associations vary among Black and White adults. This study employed dual assessment techniques—ecological momentary assessments (EMA) and ambulatory physiological assessments—to examine the co-occurrence of social interactions and cardiovascular functioning. Multilevel models revealed no racial differences in ambulatory HRV and frequency of friend interactions throughout the day. Findings revealed a between-person link of friend interactions and better HRV in the overall sample. Race-stratified models found a within-person link between friendship interaction and worse HRV and a between-person link between friendship interaction and better HRV for Blacks but not for Whites. Findings suggest friend interactions are more salient for Blacks' cardiovascular health and may serve as a modifiable factor for preventing cardiovascular diseases.

NONLINEAR ASSOCIATIONS OF DAILY STRESS REACTIVITY WITH HEALTH AND WELL-BEING

Jonathan Rush[1], Anthony Ong[2], Jennifer Piazza[3], Susan Charles[4], and David Almeida[5], *1. University of Victoria, Victoria, British Columbia, Canada, 2. Cornell University, Ithaca, New York, United States, 3. California State University, Fullerton, Fullerton, California, United States, 4. University of California, Irvine, Irvine, California, United States, 5. The Pennsylvania State University, University Park, Pennsylvania, United States*

Research has repeatedly demonstrated that greater affective reactivity to daily stressors is associated with detrimental health outcomes (e.g. inflammation, mortality). However, most research has only considered linear effects, which precludes an examination of whether moderate levels of stress reactivity may be beneficial. Using daily diary data from the National Study of Daily Experiences (N=2,018) we fit multilevel SEMs to simultaneously model daily within-person associations between stress and negative affect (i.e., stress reactivity), and individual differences in the linear and quadratic associations between stress reactivity and life satisfaction, psychological distress, and chronic conditions. Significant quadratic effects were found for each

of the three outcomes (estimates=-20.23; 11.49; 20.81, ps<.001, respectively), indicating a U-shaped pattern where both low and high levels of stress reactivity were associated with poorer health, whereas moderate levels of daily stress reactivity predicted better health outcomes. The results suggest that some affective response to daily stressors can be beneficial.

SESSION 3740 (SYMPOSIUM)

EMBRACING THE DIVERSITY OF GRANDFAMILIES: UNDERSTANDING THE INFLUENCE OF CULTURE AND RACISM

Chair: Nancy Mendoza Discussant: Loriena Yancura

In line with this year's conference theme, we examine diversity in different forms, such as racial, cultural, and familial diversity. We discuss the importance of diversity's influence on the experiences of grandfamilies and the impact it has on their members. Findings from a study with Latinx grandparent caregivers suggest that those raising grandchildren often do not view themselves as "raising," but instead "helping." Such findings highlight the importance of understanding cultural norms to appropriately tailor services and resources. In an exploration of the experiences of Korean custodial grandparents, findings demonstrated the influence of patrilineality and stigma surrounding divorce for Korean grandparent-headed families, indicating the importance of considering a grandparents' position in the family when providing services. In a study with custodial grandparents during the COVID-19 pandemic, researchers examined the role of racial discrimination on grandparents' depressive symptoms and access to health services. Results indicated a higher level of perceived racial discrimination was associated with more depressive symptoms. These results imply the need to address racial/ethnic disparities experienced by these caregivers. Similarly, in a study of emerging adults raised by grandparents, race moderated the influence of attachment on symptoms of racial discrimination. Findings support the use of interventions addressing attachment and ethnic identity to decrease symptoms of racial trauma in grandfamilies. Together these four studies reiterate the diversity of grandfamilies, enrich our understanding of these families, and encourage us to reimagine how to best serve them.

LATINX GRANDPARENTS RAISING GRANDCHILDREN: THE INFLUENCE OF CULTURAL NORMS

Nancy Mendoza, and Cherrie Park, *The Ohio State University, Columbus, Ohio, United States*

Few studies have focused on the experiences of Latinx grandparents. Using a grounded theory approach, nine Latinx grandparent caregivers were interviewed in an effort to understand how the Latinx culture influences their experiences. Major themes that emerged during data analysis were related to reasons for caring. These included cultural norms of caring and reasons for the non-usage of services. Findings suggest Latinx grandparents tend to care for their grandchildren because they view it as part of their role as a grandparent. Thus, the biggest "barrier" to acquiring services could be that they do not view themselves as primary caregivers. These findings emphasize the need to understand the experiences of these grandparents and the importance of tailoring education and resources to this subgroup. This study provides professionals with a new way of looking at services for Latinx grandparents and opens the door to a new set of implications for practice.

CUSTODIAL GRANDPARENTS' DEPRESSION AND ACCESS TO HEALTH CARE DURING COVID-19: THE ROLE OF RACIAL DISCRIMINATION

Yanfeng Xu[1], and Theresa Harrison[2], *1. University of South Carolina, Columbia, South Carolina, United States, 2. University of South carolina, Columbia, South Carolina, United States*

The COVID-19 pandemic has exacerbated racism against racial minorities and widened racial/ethnic disparities in health outcomes and access to health care services. This study analyzed cross-sectional data (N=219) collected from custodial grandparents via Qualtrics Panels in February 2022 to understand the role of race and perceived racial discrimination in contributing to custodial grandparents' depressive symptoms and access to health care services. Results indicated that a higher level of perceived racial discrimination was positively associated with grandparents' more depressive symptoms, but it was also associated with lower odds of custodial grandparents' access to health care services. Furthermore, racial/ethnic disparities in depressive symptoms and access to telemental health services among custodial grandparents were identified. Results imply the importance of addressing racial/ethnic disparities in depressive symptoms and access to health care services among custodial grandparents.

EXPERIENCES OF KOREAN GRANDFAMILIES: DIFFERENCES BETWEEN MATERNAL AND PATERNAL GRANDPARENTS

Youjung Lee, *Binghamton University, Binghamton, New York, United States*

Grandparent-headed families in South Korea have been growing prominent in the country's cultural landscape. Approximately 153,000 Korean grandparent-headed households existed in 2015; this number is expected to double by 2035. This qualitative study explored Korean custodial grandparents' experiences of raising grandchildren and the cultural significance of multigenerational caregiving in Korea. Using a phenomenological approach, semistructured interviews with 22 custodial grandparents were conducted. Significant functions of patrilineality and stigma surrounding divorce for Korean grandparent-headed families were found. Considering the complicated cultural factors, social/family service programs must pay attention to the unique needs of grandparent-headed families and consider the circumstances related to grandparents' positions in the family (i.e., paternal vs. maternal grandparent caregivers). Korean government programs and policies could better help marginalized grandparent-headed families with an empowerment approach to help marginalized grandparent-headed families gain positive attitudes toward their caregiving situation.

RACIAL TRAUMA IN EMERGING ADULTS RAISED BY GRANDPARENTS: PROTECTING AGAINST DISCRIMINATION

Acacia Lopez[1], Rachel Scott[1], Marin Olson[2], and Danielle Nadorff[2], *1. Mississippi State University, Starkville, Mississippi, United States, 2. Mississippi State University, Mississippi State, Mississippi, United States*

Experiences of racial trauma are linked with psychopathology, but a strong ethnic identity may serve as a protective factor. Grandparents primarily influence the development of ethnic identity, and BIPOC children are increasingly being raised by grandparents. Secure attachments influence stronger ethnic identities, yet custodial grandchildren are at higher risk of disrupted attachments. The current study investigated whether ethnic identity would mediate the relation between attachment and racial trauma symptoms in emerging adults previously raised by their grandparents and their peers (N = 370; 33% raised by grandparents; 25.6% non-white), with race as a moderator. Across all races, there were group differences in symptoms of racial trauma, with those not raised by grandparents experiencing a direct effect of race on ethnic identity. Attachment was a significant predictor of trauma symptoms of discrimination, moderated by race. Implications may provide support for clinical interventions addressing attachment and ethnic identity to decrease trauma symptoms.

SESSION 3750 (SYMPOSIUM)

ESPO AND HEALTH SCIENCES SECTION SYMPOSIUM: INCLUDING DIVERSE STAKEHOLDERS IN HEALTH INTERVENTION DESIGN: LESSONS LEARNED FOR ADVANCING HEALTH EQUITY

Chair: An Nguyen Co-Chair: Kyle Moored Discussant: Kyle Moored

The COVID-19 pandemic exposed persistent disparities in the effectiveness of healthcare services and long-term care among the older adult population. For example, significant gaps disproportionately affected older adults living in rural areas, racial and ethnic minorities, individuals with cognitive impairments, and those from low socioeconomic backgrounds. To improve health equity, research is needed to design, implement, and disseminate health interventions that address the heterogeneity of older adults and caregivers. Reflecting on lessons learned from including underrepresented key stakeholder groups in intervention research may reveal strategies to design health interventions that are more accessible and effective for diverse populations of older adults and their caregivers. This symposium highlights five studies that included diverse populations of older adults and/or caregivers in the design of health interventions. Dr. Schiaffino will share how disparities in co-morbid cancer and dementia across racial, ethnic, and age groups will inform improvements to care delivery processes for this population. Ms. Crane will discuss barriers to designing exergame interventions that are accessible to older adults with multiple chronic conditions and functional limitations. Dr. Díaz-Santos will describe results of piloting and refining a social connection intervention to reduce loneliness among Latinx older adults at risk for dementia. Dr. del Pino will highlight strategies to improve implementation of a screening intervention for at-risk drinking among African American older adults living with HIV. Mr. Cotton will present results of tailoring a crisis intervention to improve cultural fit for African American caregivers of people with dementia.

ENGAGING A COMMUNITY ADVISORY BOARD TO VALIDATE A CULTURALLY TAILORED INTERVENTION MODEL

Quinton Cotton[1], Gina Green-Harris[1], Juliet Chang[2], Laura Block[3], and Andrea Gilmore-Bykovskyi[2], *1. University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin, United States, 2. University of Wisconsin-Madison, Madison, Wisconsin, United States, 3. University of Wisconsin-Madison School of Nursing, Madison, Wisconsin, United States*

National dementia research priorities call for interventional studies addressing the needs of vulnerable populations experiencing disparities and for greater inclusion of dementia care recipients and their family caregivers in research. While studies document disparities, high needs and experiences of African American dementia caregivers, there is limited translation of this knowledge into the development, implementation, and dissemination of dementia-specific culturally tailored interventions. Research methods that facilitate engagement capable of strengthening data collection and culturally congruent interpretation of caregiving perspectives are needed to inform intervention development. Drawing on a qualitative study utilizing Grounded Dimensional Analysis, we employed a longitudinal engagement method with a Community Advisory Board (CAB) to validate a culturally tailored crisis intervention model for African American dementia caregivers. We identified lessons learned through a review of transcripts, memos and research team discussions. CAB members identified language, family structure, cultural history, knowledge, and respect as important features for cultural tailoring.

INCLUDING FEEDBACK FROM OLDER ADULTS WITH VARYING HEALTH CONDITIONS TO INFORM EXERGAME DESIGNS

Breanna Crane[1], Brittany Drazich[2], Janiece Taylor[3], Kyle Moored[1], Omar Ahmad[3], John Krakauer[3], and Michelle Carlson[1], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. University of Maryland, Baltimore, Maryland, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States*

Exergames are emerging technologies that combine “exercise” and “video games” to promote enjoyable cognitive and physical activities. Exergame studies often exclude individuals at greatest risk for adverse health outcomes (e.g., oldest-old, living with chronic conditions, comorbidities, or functional limitations). Thus, it is important to 1) understand motivators and barriers for joining and adhering to exergame studies and 2) capture perspectives from individuals commonly excluded from these studies. We conducted three focus groups among 14 older adults (mean age=79±9 years) with varying health conditions who participated in a novel three-dimensional exergame feasibility study. Data were analyzed using the “Sort and Sift, Think and Shift” approach. Motivators for joining were generativity, peer referrals, self-improvement, and curiosity. Motivators for retention were accomplishment, enjoyability, and exercise. Barriers to participation included frustration and pain/fatigue. We also discuss how participants' feedback influenced future exergame design. Findings will aid in promoting scalable, enjoyable, and accessible exergame interventions for all.

TALKING ABOUT AT-RISK DRINKING WITH OLDER ADULTS AGING WITH HIV

Homero del Pino, *Charles R. Drew University of Medicine and Science, Los Angeles, California, United States*

Older adults living with HIV (OALWH) may have health conditions that amplify the negative health effects of alcohol use. Traditional alcohol screening tools do not consider comorbidities or age. We adapted the Comorbidity Alcohol Risk Evaluation Tool screening tool for at-risk drinking to reflect HIV-related conditions and medications. We tested a brief intervention with Black OALWH and collected usability data. Participants, n=27, 53.2 average age in years, 21 average years living with HIV. Three themes: (1) Expectations of doctors ("Doctors better ask me questions about my alcohol use..."); (2) It's how you say it ("[Doctors] talk down to me like I don't know my freaking disease …"); and (3) Effects of surviving HIV ("I am fully aware of the effects of alcohol…. I'm probably better informed than most people…"). We identified strategies to address at-risk drinking with OALWH.

A SOCIAL CONNECTION HEALTH INTERVENTION FOR ISOLATED LATINX OLDER ADULTS AT RISK OF DEMENTIA

Mirella Díaz-Santos[1], Sandy Alcantar[2], Maribel Magana[3], Sujey Martinez[3], and Taya Varteresian[3], *1. University of California, Los Angeles, Los Angeles, California, United States, 2. Los Angeles County Department of Mental Health, Long Beach, California, United States, 3. Los Angeles County Department of Mental Health, Los Angeles, California, United States*

COVID-19 exacerbated the "epidemic of loneliness." Although loneliness and social isolation are social determinants of health and Alzheimer's dementia (AD), culturally and linguistically responsive social connection interventions tailored to Spanish-Speaking community-dwelling immigrant older adults at higher risk of AD are lacking. UCLA's Hispanic Neuropsychiatric Center of Excellence (HNCE) collaborated with Los Angeles County Department of Mental Health (LACDMH) to develop and implement a community-partnered social connection group intervention via Telehealth. All clients are homebound due to physical, psychiatric, and/or medical conditions. The main objective was to reduce feelings of loneliness by combining brain health education with skill-based exercises promoting self-efficacy, trust, belonging, and resilience by effectively communicating their needs in a psychologically safe group space. The effectiveness of the pilot intervention, however, required multiple refinements accounting for structural-social barriers, culture, language, and histories of trauma in country of origin and post-immigration to the United States.

RACIAL, ETHNIC, AND AGE-RELATED DISPARITIES IN COMORBID CANCER AND DEMENTIA

Melody Schiaffino[1], James Murphy[2], Vinit Nalawade[3], Jessica Schumacher[4], William Dale[5], and Alison Moore[3], *1. San Diego State University, San Diego, California, United States, 2. UC San Diego, La Jolla, California, United States, 3. University of California, San Diego, La Jolla, California, United States, 4. University of Wisconsin, Madison, Wisconsin, United States, 5. City of Hope Comprehensive Cancer Center, Duarte, California, United States*

Older adults make up over 60% of new cancer cases and will be 73% of survivors by 2040. Dementia, which is cognitive impairments that includes Alzheimer's, affects 10.3% of this age group with a greater burden on Black and Latino/a older adults. It is essential to accurately characterize the prevalence of comorbid dementia and cancer (ADRD+Ca) to ensure guideline concordant care. The goal of our study was to characterize pre-existing ADRD+Ca across cancer sites (cervical, breast, prostate, colorectal, head and neck, and lung). Using a validated CMS algorithm, we found 5.6% ADRD+Ca in our sample. Female patients were more likely to report ADRD+CA vs men (62.5% vs 37.5%, $p<0.0001$); similarly, age differences were observed with the biggest difference among 85+ ages 33.8% vs 11.7% respectively. The proportion of Black patients with ADRD+Ca was nearly double compared to Ca only groups. Patients with additional multiple comorbidities, unstaged site, and single/other marital status were also more likely to report ADRD+Cancer ($p<0.0001$). Among cancer sites, we observed the highest prevalence in colorectal and cervical cancer both over 8%, the lowest was in prostate cancer (2.64%). Our findings show inequities in social factors and cancer subtypes among fee-for-service Medicare beneficiaries that warrants investigation.

SESSION 3760 (SYMPOSIUM)

FACTORS THAT IMPACT SUCCESSFUL AGING AMONG OLDER ADULTS LIVING WITH HIV/AIDS

Chair: Erin Robinson Co-Chair: Molly Perkins Discussant: Alexis Bender

The past two decades have brought significant medical advances in antiretroviral therapies (ART) for people living with HIV/AIDS (PLWHA). This has enabled PLWHA to live longer and healthier lives than ever before. In fact, nearly half of all PLWHA in the United States are age 50+ and HIV is treated as a chronic disease, instead of a terminal illness. Despite these advancements older adults living with HIV/AIDS (OALWHA) are still a highly stigmatized population who faces challenges with their health and overall well-being. This symposium will highlight recent research on factors that play a role in successful aging among OALWHA. Our first presentation leverages a quantitative dataset of OALWHA and examines the relationship between childhood sexual abuse and ART adherence, with a particular focus on substance abuse as a potential mediator. Our second presentation features a qualitative study with OALWHA that explores their conceptions of successful aging. Our third presentation includes a sample of medical case managers who serve OALWHA and examines the feasibility of using a cognitive screening tool with this population. Cognitive screening with OALWHA can help provide early indicators of cognitive decline and initiate early intervention. Finally, our fourth presentation includes a sample of older women living with HIV/AIDS and examines their support needs and resources, particularly to help understand their complex caregiving needs.

Findings from these four studies advance our understanding of OALWHA and their needs to ensure continued successful aging. This symposium informs further research and direct practice with this population.

CHILDHOOD SEXUAL TRAUMA, SUBSTANCE USE, AND ART ADHERENCE AMONG OLDER ADULTS LIVING WITH HIV

Monique Brown, *University of South Carolina, Columbia, South Carolina, United States*

Childhood sexual abuse (CSA) is associated with lower ART adherence among people living with HIV and is linked to substance use (SU) in adulthood. However, studies examining the mediating role of SU in the association between CSA and ART adherence are lacking. Therefore, the aim of this study was to examine SU as a mediator in the association between CSA and ART adherence among older adults living with HIV (OALH). Data were obtained from 91 OALH. Adjusted path models were used to determine the mediating role of SU. After controlling for sociodemographic characteristics and depression, CSA had a direct association with ART adherence (β=-3.20; p<0.001) and with SU (β=-2.46; p=0.023). The association between SU and ART adherence was not statistically significant (β=0.071; p=0.444). Therefore, the indirect effect between CSA, SU, and ART adherence was not statistically significant (β=0.175; p=0.468). Future research should examine alternative pathways between CSA and ART adherence.

CONCEPTIONS OF SUCCESSFUL AGING AMONG OLDER MEN AND WOMEN LIVING WITH HIV

Anna Rubtsova[1], Tonya Taylor[2], Marcia Holstad[3], Gina Wingood[4], Ighovwerha Ofotokun[5], Deborah Gustafson[6], Dilip Jeste[7], and David Moore[8], *1. Emory University, Atlanta, Georgia, United States, 2. SUNY Downstate Medical Center, Brooklyn, New York, United States, 3. Emory University Nell Hodgson Woodruff School of Nursing, Atlanta, Georgia, United States, 4. Columbia University Mailman School of Public Health, New York, New York, United States, 5. Emory University School of Medicine, Atlanta, Georgia, United States, 6. SUNY Downstate, Brooklyn, New York, United States, 7. University of California San Diego, La Jolla, California, United States, 8. University of California, San Diego, La Jolla, California, United States*

The aim of this qualitative study was to compare conceptions of successful aging (SA) among older men and women living with HIV. Participants were recruited through 1) Women's Interagency HIV Study (Atlanta and Brooklyn sites); and 2) HIV Neurobehavioral Research Program at the University of California, San Diego. Our sample included 31 participants: 17 women living with HIV (WLH) and 14 men living with HIV (MLH), age range 51 to 73, 58% Black. We conducted semi-structured interviews in 2018-2021, using the same interview guide for MLH and WLH. The interviews lasted ~90 minutes and were fully transcribed. The thematic and comparative analysis was conducted within the social constructivist paradigm, using MAXQDA software. Although there was some overlap in SA conceptions between MLH and WLH, we found important differences. Whereas maintaining function and general health was more emphasized by MLH, WLH stressed accepting and celebrating aging within the life course perspective.

DETERMINING FEASIBILITY FOR USE OF GERIATRIC COGNITIVE SCREENINGS BY MEDICAL CASE MANAGERS SERVING OLDER (50+) PLWH

Monica Maly[1], and Erin Burk-Leaver[2], *1. Colorado School of Public Health, Aurora, Colorado, United States, 2. International Association of Gerontology and Geriatrics, Denver, Colorado, United States*

Cognitive impairment (CI) is a significant age-related risk exacerbated by HIV. However, AIDS Service Organizations (ASO) have not implemented effective screening tools for detection of CI in older adults living w/HIV (OALH). This study examined feasibility for use of those tools by medical case managers (MCM) serving OALH. MCMs from nine Colorado ASOs self-administered a questionnaire measuring baseline knowledge of warning signs and risk factors (WS/RF) of CI in OALH, evaluating familiarity with screening of/response to WS/RF of CI within this population. Data from 24 MCMs showed OALH comprised 47% of all clients, and 68% of respondents reported no related training. Similarly, 67% reported not feeling confident identifying WS/RF. 100% of respondents reported not screening for CI, and many endorsed limited awareness/availability of screening tools (87%), referral resources (87%), and training (83%). This identified a need and desire for use/implementation of cognitive screening tools to improve ASO care for OALH.

SUPPORT NEEDS AND RESOURCES OF OLDER WOMAN LIVING WITH HIV

Jasmine Manalel[1], Jennifer Kaufman[2], and Mark Brennan-Ing[1], *1. Hunter College, New York, New York, United States, 2. Brookdale Center for Healthy Aging Hunter College, CUNY, New York, New York, United States*

People living with HIV are at increased risk for social isolation and sparse support networks, making it difficult to navigate complex caregiving needs as they age. This study aimed to identify the support needs and resources of older women living with HIV, an understudied population in this field, and their association with well-being. Participants included 217 heterosexual women aged 50 to 77 (Mage=59) from the ROAH 2.0 Study. Almost half of the sample (47.7%) had never required assistance because of HIV or other illness or disability, whereas the remainder required current or past assistance. Preliminary findings controlling for sociodemographics indicated that availability of emotional support, but not practical support (i.e., having someone to count on for activities of daily living), was associated with lower depressive symptomology. Identifying sources and types of support will help older women leverage existing social ties or form new ones to promote successful aging with HIV.

SESSION 3770 (PAPER)

FINANCIAL SECURITY, ECONOMICS, HEALTH, AND HOUSING

"WE WANT TO PAY AND WE WANT TO STAY": OLDER ADULTS MANAGING PROPERTY TAX BURDEN IN A GROWING URBAN COUNTY

Anthony Traver[1], Katie White[1], Marisa Sheldon[2], Holly Dabelko-Schoeny[2], and Bethany Sanders[3], *1. The Ohio State University, Columbus, Ohio, United States, 2.*

Ohio State University, Columbus, Ohio, United States, 3. Franklin County Auditor's Office, Columbus, Ohio, United States

Aging in place is a goal for many older adults. As many older adults own their homes, strategies designed to promote aging in place must account for threats to the financial sustainability of ownership and occupancy later in life. One such threat is property taxes, which have risen substantially in many metropolitan areas over the last decade as home values soar. Property tax relief programs offered by state and local governments are designed to ease the housing cost burden of older adults. Yet, recent research indicates that such programs do little to ensure affordability for low-income homeowners. This study reviewed local property tax relief programs and interviewed local older adult homeowners and housing professionals to understand the circumstances of older adult homeowners in one growing U.S. County. Four major themes emerged from the interviews: housing market dynamics, personal finances, local housing resources, and wellbeing. Results indicate that unaffordability is a growing concern among older adult homeowners and services providers alike. Current property tax relief programs are thought to do little to reduce the cost burden posed by property taxes. Implications for social policy include expanding eligibility criteria and indexing the benefit to a local economic metric so that the relief remains relevant in areas with dynamic markets. Implications for practitioners include understanding the property tax relief programs in one's area and referring clients when appropriate.

DISABILITY STATUS, FINANCIAL STRAIN, AND SUBJECTIVE HEALTH AND WELL-BEING FOR PEOPLE WITH LTSS NEEDS IN CALIFORNIA

Lei Chen[1], Kathryn Kietzman[2], and
Fernando Torres-Gil[2], *1. University of California, Los Angeles, Los Angeles, California, United States, 2. University of California, Los Angeles (UCLA), Los Angeles, California, United States*

Many people with needs for Long-Term Services and Supports (LTSS) are vulnerable to financial strain, a chronic economic stressor that may negatively affect a person's well-being. This study examines the extent to which financial strain mediates the relationship between people's disability status and subjective health and well-being, controlling for select demographic characteristics. Disability status refers to the intensity of disabilities that people report, including cognitive impairments, and/or difficulties performing activities of daily living and/or instrumental activities of daily living. Financial strain measures the number of challenges that participants incurred during the last year in acquiring food, housing, health care, and other basic needs. We use the first cycle of data (2019-2020) from the California Long-Term Services and Supports (LTSS) survey, merged with select data from the California Health Interview Survey (CHIS) (N = 2,030). Drawing from Pearlin's Stress Process Model, we use Conditional Process Analysis (CPA) to examine the hypothesized mediation relationships. Findings show that the intensity of disability status has a direct association with self-rated health (c' = -.2054, p < .0001) and psychological distress (c' = .7247, p < .0001). Furthermore, financial strain experienced by people with LTSS needs mediates the relationship between their disability status and 1) self-rated health (ab = -.0178, BootCI= -.0285 to -.0082) and 2) psychological distress (ab = 0.19, BootCI= .1323 to .2648). These results have policy and practice implications for national and state programs, such as Medicaid, the Universal Basic Income (UBI) program, and the Master Plan for Aging in California.

FOOD INSECURITY AMONG OLDER ADULTS WITH A HISTORY OF INCARCERATION: A MIXED METHODS STUDY

Rodlescia Sneed[1], and Tamara Jordan[2], *1. Wayne State University, Detroit, Michigan, United States, 2. Michigan State University College of Human Medicine, Flint, Michigan, United States*

The purpose of this study was to use a mixed methods approach to describe the association between history of incarceration (HOI) and food insecurity (FI) among older adults. Quantitative data were obtained from the Health and Retirement Study, a population-based study of community-dwelling adults (n=12,702) aged >50. Qualitative data were obtained via key informant interviews with formerly incarcerated older adults and the human service providers serving them (n=15). Multiple logistic regression was used to estimate the association between HOI and FI, adjusting for demographic variables. HOI was associated with increased odds of FI (OR 1.83; 95% CI 1.52-2.21). Race/ethnicity moderated the association between history of incarceration and food insecurity, with effects observed among Non-Hispanic Blacks (OR 1.78; 95% CI 1.29-2.46) and Whites (OR 2.27; 95% CI 1.74-2.97), but not Hispanics (OR 1.11; 95% CI 0.69-1.77) or those of other racial/ethnic groups (OR 1.79; 95% CI 0.71-4.52). Explanations for the association between HOI and FI obtained from qualitative interviews included ineligibility for food assistance programs due to felony conviction, lack of safe places to store healthy food, and difficulty using technologies needed to enroll in food assistance programs. The most common barrier associated with inaccessibility to healthful foods for this population, according to interviewees, is ineligibility for food assistance programs. FI is an important issue among older adults with a HOI. Re-examination of policies and procedures for accessing food assistance programs may be needed to reduce FI in this population.

RECESSION EVENTS AND SLEEP PROBLEMS IN MIDLIFE AND AGING ADULTS

Aarti Bhat[1], Jose Diaz[2], and David Almeida[2], *1. The Pennsylvania State University, State College, Pennsylvania, United States, 2. The Pennsylvania State University, University Park, Pennsylvania, United States*

Adverse economic events can negatively impact aspects of health, including sleep quality. Poor sleep can increase risk of developing or exacerbating health conditions such as cardiovascular and metabolic disease, cancer, and suicidal ideation. It is critical to examine how economic hardships may amplify health disparities in midlife and aging, a rapidly growing demographic in the U.S. This study examines the effect of recession hardships on sleep issues in midlife and aging adults using waves 2 and 3 of the Midlife in the United States study (MIDUS; N = 2602; M age = 63.47;

56.99% women; 15.76% Black). Participants reported chronic sleep problems experienced in the past year, alongside frequency of experiencing sleep disruptions (trouble with onset, maintenance, feeling unrested). Participants also reported economic impacts (financial, housing, and job-related) experienced in the aftermath of the recession; with 75.56% reporting at least one adverse recession event. Regression indicated that recession events were significantly associated with higher odds of chronic sleep problems and high frequency sleep disruptions in wave 3, even when controlling for sleep problems in wave 2. When examining race and age as moderators, Black participants who experienced adverse events were more vulnerable to chronic sleep problems than white participants, whereas age showed no significant interactions. Results indicate that adverse economic events can impact sleep quality for midlife and aging adults, and that policy mitigating economic effects on sleep may especially benefit Black adults. Subsequent analyses will examine the effect of recession events on daily sleep patterns.

THE EFFECTS OF HOUSING AND LIVING STANDARDS ON LONELINESS AND SOCIAL EXCLUSION AMONG OLDER PEOPLE

Charles Waldegrave[1], Chris Cunningham[2], Catherine Love[3], and Giang Nguyen[3], *1. Family Centre Social Policy Research Unit, Lower Hutt, Wellington, New Zealand, 2. Research Centre for Maori Health and Development, Wellington, Wellington, New Zealand, 3. Family Centre Social Policy Research Unit, Wellington, Wellington, New Zealand*

Introduction: Housing security is a likely indicator of loneliness (Gierveld et. al. 2015, Gonyea et. al. 2018) but there are few studies that focus specifically on the relationship between the two. This paper presents findings from a New Zealand Ageing Well National Science Challenge research programme that presents findings on the impacts of housing and living standards on loneliness and social exclusion. Method: This presentation will provide results from a study of 200+ Māori (indigenous New Zealanders) aged 50 years and over. Key questions around loneliness and social isolation were co-created with the participants and responses compared with standard international scales to help identify both universal aspects of loneliness and culturally specific aspects. Questions relating to housing security, affordability, living standards and neighbourhood safety were also asked. Regression analysis was used to test the statistical significance of the various relationships between differing aspects of housing and loneliness.

Results: The results demonstrate statistically significant relationships between housing quality, affordability, living standards and neighbourhood suitability with both the universal and culturally specific scales of loneliness. Overall greater housing security and quality was shown to be negatively associated with loneliness, which suggests it contributes to the reduction of loneliness.

Conclusion: Addressing the quality of social connections has often been seen as the key way to address loneliness. The results of this study suggest housing security and living standards play an important role in people's perception of loneliness and their experience of it, as well.

SESSION 3780 (SYMPOSIUM)

IMPLEMENTATION RESEARCH: INTERGENERATIONAL PROGRAMS ACROSS UNIVERSITY SETTINGS

Chair: Jill Juris Co-Chair: Skye Leedahl Discussant: Natalie Douglas

Implementing intergenerational programs within university settings has been associated with benefits for all generations involved, which often includes young children, university students, and older adults. However, from conceptualization to pilot testing to evaluation, challenges and opportunities present themselves. This symposium will highlight implementation realities for intergenerational programs within higher education settings. This symposium will specifically address dimensions of: geography (rural versus urban), modality (such as in-person, virtual, or a mix), community/university partnerships, and scholarship for faculty balancing instruction and research demands. Addressing stages of implementation, the papers reflect a continuum from pre-planning to pilot to more advanced stages of implementation. First, Lisa Borrero will highlight challenges and opportunities of conceptualizing fully online intergenerational programming, including the pre-implementation planning, execution, and evaluation stages. The second paper from Ladan Ghazi Saidi will describe pre-implementation tasks completed to establish interest in intergenerational programming in a rural setting, as well as challenges stemming from the pandemic. Third, Jill Juris and colleagues will highlight an online intergenerational technology program offered from a rural Western North Carolina university that began implementation during the pandemic.Fourth, Rachel Scrivano and colleagues will describe a community-based participatory research method that bridged the gap between expectations and reality of implementing a 5-year intergenerational program focused on healthy food access. The fifth paper from Skye Leedahl and colleagues will discuss the implementation experiences of an intergenerational, reverse mentoring, technology program that has evolved for seven years at a Rhode Island public university and utilizes community partners from across the state.

OPTIMIZING ONLINE DELIVERY OF INTERGENERATIONAL STUDENT EXPERIENCES: LEVERAGING OPPORTUNITIES

Lisa Borrero, *University of Indianapolis, Indianapolis, Indiana, United States*

Conceptualizing intergenerational opportunities for students in fully online courses can initially appear daunting or impractical, given the absence of a common physical classroom and community environment. However, it could be argued that online learning serves as a facilitator, rather than a barrier to intergenerational programming. This session will focus on the connections between intergenerational programming and the principles of quality online teaching – emphasizing the ability of online modalities to increase connections with a global community, remove the limitations of geographic-based access to experiences, and elevate the level of student engagement typically expected within online courses. Leveraging opportunities to overcome real and perceived challenges to the planning, delivery, and evaluation of intergenerational student experiences in online courses will be discussed, as well as opportunities for future growth in the current era.

INTEGRATING RESEARCH, TEACHING, AND SERVICE: AN INTERGENERATIONAL BONDING PROGRAM AT THE UNIVERSITY OF NEBRASKA

Ladan Ghazi Saidi, *Universoty of Nebraska at Kearney, Kearney, Nebraska, United States*

To establish an Intergenerational Bonding (IGB) program that pairs undergraduate students at the University of Nebraska at Kearney with older adults of this rural community, we first tested acceptability and feasibility of such a program. We surveyed both groups to identify their interest level in IGB and identify their common interests in activities. Older adults residing in independent dwellings, assisted living homes, and nursing homes and members of community groups were invited to participate in the survey. However, the response rate was low. Given the restrictions of the pandemic, accessing community older adults was challenging. Internet access was low, which made virtual and digital participation modalities impossible; recruitment from assisted living facilities was not successful; and, establishing collaboration with nursing homes was not easy despite initial interest. Building trust and working with community activity group facilitators was ultimately beneficial in recruiting older adults. Collaboration with community-based organizations facilitated the study.

EVALUATING IMPLEMENTATION OF AN ONLINE INTERGENERATIONAL TECHNOLOGY PROGRAM

Jill Juris[1], Rachel Scrivano[2], Erin Bouldin[3], and Katherine Uva[4], *1. Appalachian State University, Boone, North Carolina, United States, 2. The Ohio State University, Columbus, Ohio, United States, 3. University of Utah, Salt Lake City, Utah, United States, 4. Appalachian State university, Boone, North Carolina, United States*

Social isolation and loneliness contributed to poor health outcomes among rural older adults prior to COVID-19. Physical distancing protocols during COVID-19 exacerbated social disconnect of rural older adults and paused in-person intergenerational programs. Pilot data from a Cyber-Seniors program that was adapted for virtual delivery and participation during the pandemic (2020-2021) indicates positive health outcomes for older adults (improved social isolation and loneliness). This presentation will address a gap between outcomes and the implementation process of the intergenerational technology program. Multi-method data on student experiences as technology mentors working at a distance suggest a need for an evaluation of program implementation. The type 1 effectiveness-implementation hybrid design includes quantitative measures of student outcomes (ageism, social isolation, and loneliness) and qualitative analysis of students' program implementation experiences. Students identified challenges accessing and working with the online platforms, scheduling meetings with older adults, and providing support with online systems by phone.

THE IMPLEMENTATION PROCESS OF AN INTERGENERATIONAL COMMUNITY RESEARCH PROJECT: A NARRATIVE REVIEW

Rachel Scrivano[1], Jill Juris[2], and Shannon Jarrott[1], *1. The Ohio State University, Columbus, Ohio, United States, 2. Appalachian State University, Boone, North Carolina, United States*

Food for a Long Life (FFLL) was a five-year USDA Children, Youth and Families at Risk intergenerational community research project that sought to increase healthy food consumption, knowledge, and access among preschoolers and older adults living in food insecure communities of Ohio and Virginia. Using the community-based participatory action research approach, community stakeholders jointly participated in all stages of the project to co-create context-specific programming to address needs within their communities with the goal of promoting program sustainability beyond the grant funding period. This presentation will provide a narrative review to explore the implementation process of FFLL by comparing initial project expectations to reality using the community-based participatory research conceptual model (Wallerstein et al., 2008; Wallerstein et al., 2018). By exploring project barriers such as COVID-19, facilitators such as flexible partner relationships, and strategies including promoting early buy-in, we provide an in-depth discussion of project successes and lessons learned.

SEVEN YEARS OF IMPLEMENTING AN INTERGENERATIONAL PROGRAM WITH UNIVERSITY/COMMUNITY PARTNERSHIPS

Skye Leedahl, Erica Estus, Kristin Fratoni Souza, and Alexandria Capolino, *University of Rhode Island, Kingston, Rhode Island, United States*

The University of Rhode Island Engaging Generations Cyber-Seniors Program was first implemented in the fall semester of 2015. URI students from 15+ majors have supported the digital competency of older adults in Rhode Island each semester and summer session since its inception. Gradually over time, we modified and expanded this in-person program to meet student, older adult, community partner, and faculty needs. The pandemic led to our program expanding exponentially due to new grant funding opportunities, new partnerships, and student interest. This presentation will address strengths and challenges of implementing this program state-wide in a small, mostly urban state with community partners, mostly involving senior centers. We will describe moving from in-person to phone/virtual and now to a hybrid model. Last, we will explain the program's efforts to conduct formative and summative evaluation research to assess program output and examine outcomes for students and older adults in the program.

SESSION 3790 (SYMPOSIUM)

INDIGENOUS UNDERSTANDINGS AND APPROACHES TO SUCCESSFUL AGING

Chair: Jordan Lewis Co-Chair: Steffi Kim

Indigenous peoples worldwide face unique challenges growing old. Many of these challenges are founded in historical colonization practices, present oppressive systems, racism, and underrepresentation in research, service provision, health education, and successful aging theories. The focus of this symposium is to discuss specific barriers and challenges related to Indigenous aging in rural and urban communities, as well as community strategies supporting aging well. The first presentation by Zayla Asquith-Heinz and colleagues will share the results of what successful aging or "Eldership" means in the Norton Sound southern subregion of Alaska. Results indicate that family plays a central role within the Norton Sound model of successful aging. The second presenter, Steffi Kim and Jordan Lewis, are discussing the role of cultural influences and Elder identity on successful aging in the context of Alaska Native Elders migrating from rural traditional communities to a western urban community. The third and fourth presentations by Sarah Russell and Rachel Quigley will share the results on what aging well means within Torres Strait Islander people. The results suggest that the availability and accessibility to traditional practices, language and foods can facilitate aging well within these communities. They will also describe the development and implementation of a toolbox of culturally appropriate screening tools and interventions. Lastly, Jordan Lewis will explore the Indigenous concept of "doing" successful aging rather than having good health. He will outline differences and similarities with BIPOC studies on successful aging.

ALASKA NATIVE SUCCESSFUL AGING IN NORTHWEST ALASKA: AGING IN A GOOD WAY STARTS WITH YOUR FAMILY

Zayla Asquith-Heinz[1], Jordan Lewis[2], and Steffi Kim[3], *1. University of Minnesota Medical School, Minneapolis, Minnesota, United States, 2. University of Minnesota Medical School, Duluth, Minnesota, United States, 3. University of Minnesota, Minneapolis, Minnesota, United States*

Alaska Natives (AN) view aging from a holistic perspective. One of the challenges of researching with cultural groups is the lack of data, or research, on culture and aging. This research explored successful aging from an AN perspective. A community-based participatory research (CBPR) model was used to engage participants at every stage of the research process. Semi-structured interviews were conducted with 16 AN men and 25 women. Kleinman's Explanatory Model of Illness was adapted to gain a sense of the beliefs about aging and to guide the data analysis to establish an AN understanding of successful aging or attaining "Eldership" in Northwest Alaska. The foundation of the Norton Sound southern sub-region Model of Successful Aging is family, which contributed to Elders' feelings of emotional well-being, ability to engage in their Native Way of life, maintain their physical health, and continue spiritual practices.

AN EXPLORATION OF CULTURAL INFLUENCES ON SUBJECTIVE SUCCESSFUL AGING

Steffi Kim, *University of Minnesota, Minneapolis, Minnesota, United States*

Indigenous peoples worldwide face unique challenges growing old. Many of these challenges are remnants of previous colonization practices and current oppressive systems often leading to out-migration from rural to urban environments. Despite Anchorage having the highest population of Alaska Native Elders little is known about the experience of relocation. This study investigated the impact of culture on the experience of successful aging within the Alaska Native context. Twenty-five semi-structured qualitative interviews with rural (N=13) and urban Elders (N=12; ages 48-84) were conducted. The use of Gee's discourse analysis tools provided the framework for analyzing the discourse of Elders based on location and traditional or western influences on subjective successful aging. We explored the use of language within two identified discursive patterns: cultural discourse and Elder identity discourse. Social and contextual determinants of successful aging involve aspects of minority and majority culture and self-appraisal of successful aging based on cultural assumptions.

ON THE "ACTION" OF DOING HEALTHY AGING AS OPPOSED TO "HAVING" GOOD HEALTH

Jordan Lewis, *University of Minnesota Medical School, Duluth, Minnesota, United States*

The field of successful aging continues to grow and expand as authors investigate this topic in BIPOC populations, broadening the scope of successful aging, including Indigenous communities in the Arctic. Successful aging in Alaska Native communities is still a young, but growing, field of research, and this field of study places Indigenous voices at the forefront. This presentation will present data from 11 years of interviews with 108 Alaska Native Elders from rural and urban communities across the State of Alaska and highlight how successful aging is more of an "action" of doing healthy aging as opposed to the Western notion of "having" good health. The findings of this presentation will discuss how Alaska Native Elders' understanding, or doing, successful aging can be applied to everyday life, similarities and differences with BIPOC studies on successful aging, and serve as an act of resistance against western notions of successful aging.

SESSION 3800 (SYMPOSIUM)

INTEGRATING AGE INCLUSIVITY WITH DEI EFFORTS ON AGE-FRIENDLY UNIVERSITY (AFU) CAMPUSES

Chair: Joann Montepare Co-Chair: Kimberly Farah
Discussant: Peter Lichtenberg

The pioneering Age-Friendly University (AFU) initiative, endorsed by GSA's Academy for Gerontology in Higher Education (AGHE), calls for institutions of higher education to respond to shifting demographics and the needs of age-diverse, older populations through more age-friendly programs, practices, and partnerships. Over 85 institutions in the United States, Canada, European countries, and beyond have joined the global network and endorsed the 10 AFU principles, with even more showing interest in becoming partners in the movement. One key foundational area identified by AFU research efforts and partners is integrating age inclusivity with ongoing diversity, equity, and inclusion (DEI) efforts on campuses. This symposium explores the need for this integration featuring AFU partners who will offer their observations and recommendations. Bowen and colleagues will open the session with data from their national study of age-friendliness in U.S. institutions to describe their insights regarding the state of age diversity on campuses and the experiences of students, faculty, and staff that call for greater age inclusivity. Morrow-Howell and colleagues will present data from interviews with DEI officers that identify institutional considerations for inclusion efforts. Andreoletti and colleagues will offer specific curricular and related strategies for connecting age-inclusivity efforts with DEI campus efforts. Gugliucci will discuss considerations regarding age-inclusive images and messages in health professions education including the inclusion of identifiable DEI objectives in syllabi. As discussant, GSA president Lichtenberg will comment on age-inclusivity efforts in higher education within GSA's broader commitment to diversity, equity, and inclusion.

MAKING THE CASE FOR AGE INCLUSIVITY IN HIGHER EDUCATION

Lauren Bowen[1], Joann Montepare[2], Nina Silverstein[1], Susan Whitbourne[3], and Celeste Beaulieu[1], *1. University of Massachusetts Boston, Boston, Massachusetts, United States, 2. Lasell University, Newton, Massachusetts, United States, 3. University of Massachusetts Amherst, Amherst, Massachusetts, United States*

Often viewed as institutions primarily servings 18-to-24-year-old student populations, U.S. colleges and universities are age-diverse. In our recent national study of AFU institutions, 21 campuses maintaining age data reported that 12,718 faculty (39.24% of faculty) and 20,361 staff (42.31% of staff) were ages 50+. Additionally, 22 campuses reported 7,080 students (1.58%) ages 50+. Despite higher education's attention to diversity, equity, and inclusion (DEI), age is often overlooked; therefore, universities may need strategies for improving age inclusivity. Across 2,447 open-ended survey responses from our study, faculty, staff, and students describe experiences with age inclusivity (e.g., feeling valued) and exclusion (e.g., feeling unwelcome), and many call for greater sensitivity to aging in existing DEI efforts, such as more age-inclusive language in classrooms and attention to age bias in hiring and promotions. In addition, this presentation will examine responses that raise important considerations for integrating age inclusivity with other higher education DEI efforts.

AGE AS A DIVERSITY FACTOR IN HIGHER EDUCATION: INSIGHTS FROM DEI OFFICERS

Nancy Morrow-Howell, Natalie Galucia, and Michele Dinman, *Washington University in St. Louis, St. Louis, Missouri, United States*

This study described how DEI officers across universities/colleges currently think about AGE as a diversity factor; and identified strategies used to increase age-inclusivity. Data were generated through review of university websites, focus groups and one-to-one interviews with DEI staff. Findings suggest that age is acknowledged as a diversity factor but there is less action toward strategies to increase age-inclusion. Examples of initiatives include: training human resource staff to be age-neutral in hiring; eliminating birthdates and other years from applications; workshops on multigenerational workplaces and classrooms; presentations on ageism; and specific programs to support non-traditionally aged students. Some of the motivation to address ageism stems from legal mandates rather than being mission-driven. There is the concern that focusing more on age may require moving attention and resources away from other diversity factors. It appears that there is interest in elevating age as an important factor in DEI efforts.

STRATEGIES FOR CONNECTING AGE INCLUSIVITY TO DEI EFFORTS: A CAMPUS CASE STUDY

Carrie Andreoletti, and Andrea June, *Central Connecticut State University, New Britain, Connecticut, United States*

We've employed a multi-pronged approach to connecting our AFU initiatives, which promote age inclusivity, to our university's DEI efforts. First, we asked our DEI office if they would collaborate. They agreed to link our AFU webpage to the DEI webpage and supported Ageism First Aid training for faculty and staff. Second, we participated in equity, justice, and inclusion (EJI) efforts on campus by ensuring that gerontology courses qualified for the EJI designation. This helps expand aging education across the curriculum as all students must take one EJI designated course. We also volunteered to speak about ageism to the first cohort of John Lewis Institute Scholars. Third, we partnered with our Center for Teaching and Innovation to offer programming on age inclusivity and generational diversity in the classroom. Taken together, these efforts have helped us to expand our reach and ensure that age is part of DEI conversations on our campus.

AGE-FRIENDLY MESSAGES AND IMAGES: A VIEW FROM HEALTH PROFESSIONS EDUCATION

Marilyn Gugliucci, *University of New England College of Osteopathic Medicine, Biddeford, Maine, United States*

The World Health Organization (WHO) report published March 2021 emphasizes that older adults are often subjected to a variety of negative stereotypes including helplessness, frailty, and child-like qualities. Ageism has both real mental and physical health consequences, including a decreased will to live, less desire to live a healthy lifestyle, an impaired recovery from illness, increased stress, and a shortened life span. Health professions education has a responsibility to prepare future providers in more than mindful physical care of older adults, it must address ageism that has proliferated negative personal biases that have triggered reduced overall health and quality of life. Preparation of lectures and learning materials in health professions education requires mindfulness of diversity as well as the implicit bias faculty may portray regarding age. This presentation will bring these nuances to light for consideration and as a reference to instill change.

SESSION 3810 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

GENE REGULATION IN AGING

Chair: Alexander Mendenhall

The regulation of genes can both influence aging, and be influenced by the aging process itself. That is, the rate of aging can be altered by changing the gene expression program. And, the aging process itself causes changes in gene expression, including the ways in which genes are regulated. Understanding the consequences of differences in gene expression on aging rate, and the consequences of aging on gene regulation will continue to have profound impacts on our ability to manipulate the aging process. This symposium on gene regulation in aging will focus on how genes are regulated by the aging process and can be regulated differently to affect the aging process. We have an expert on the regulation of gene expression in the immortal germline and soma of the hydra, Dr. Celina Juliano. Dr. Roger Brent is an expert on the mechanisms of cell to cell variation in gene expression. Dr. Monica Driscoll is an expert on both the genetics of aging and gene expression changes with age. Finally, Dr. Alex Mendenhall's studies are focused on understanding intrinsic (epigenetic) variation in the regulation of gene expression as a cause and consequence of aging. Together these experts will present their research as it relates to gene regulation and the aging process.

HOW THE SAME GENETIC PROGRAM RUNS DIFFERENTLY IN INDIVIDUAL ANIMALS TO AFFECT AGING AND DISEASE

Alexander Mendenhall, Bryan Sands, and Soo Yun, *University of Washington, Seattle, Washington, United States*

Monozygotic human twins will age at different rates. The same is true for isogenic laboratory animals. Some of these differences in the rates of aging are caused by differences in the expression of genes. And, some of the differences in gene expression between isogenic individuals are caused by seemingly non-heritable, stochastic epigenetic differences. Here we discuss how differences in chaperone expression can influence aging and a model of Ras-driven neoplasia risk and survival in the model nematode Caenorhabditis elegans. We review evidence suggesting differences in epigenetic silencing machinery contribute to differences in chaperone gene expression. We suggest models for germline and somatic epigenetic regulation of chaperones. We discuss potential means of targeted epigenome modification, and potential implications for human health during aging.

MECHANISMS OF DEVELOPMENT AND REGENERATION IN HYDRA

Celina Juliano, Jack Cazet, and Abby Primack, *University of California, Davis, Davis, California, United States*

Hydra vulgaris is a small and simple aquatic animal capable of whole-body regeneration and has negligible senescence. The entire animal, including the nervous system, is composed of about 25 cell types, and can regenerate from a fragment of tissue as small as ~300 cells. In addition, all cell types are continually renewed in the uninjured adult as part of normal homeostasis; every differentiated cell type is replaced approximately every 20 days, which likely contributes to its lack of aging. The remarkable features of Hydra are enabled by three distinct populations of stem cells that support the three lineages that make up the adult Hydra – the ectodermal epithelial lineage, the endodermal epithelial lineage, and the interstitial lineage (includes the neurons). A major goal of our laboratory is to understand the gene regulatory networks that control the specification of all Hydra cell types in the uninjured (homeostatic) state and then understand how injury triggers these differentiation pathways at unexpected locations during regeneration. Using high throughput genomics approaches such as scRNA-seq, ATAC-seq, and Cut&Tag, we have transcriptionally defined every cell type in Hydra and identified putative transcriptional regulators for each cell type. This includes the 11 neuronal subtypes that comprise the nerve net that spans the entire length of the Hydra body. We are currently leveraging these data to conduct functional testing of key putative regulators and to identify injury inputs into cell specification events during regeneration.

MISEXPRESSION OF GENES LACKING CPG ISLANDS IS A SHARED TRAIT OF MAMMALIAN AGING

Samuel Beck, *Boston University School of Medicine, Boston, Massachusetts, United States*

Changes in the 3-D architecture of chromatin are observed in various diseases and are also a hallmark of aging. Disruption of the nuclear lamina and associated heterochromatin are commonly observed in various aging contexts, including premature aging diseases, cellular senescence, and normative aging. Although these conserved structural changes have been reported for over two decades, their impacts on transcription and contribution to age-related degenerative changes remain unknown. By performing a large-scale computational analysis and experimental validation, here we show that genes lacking CpG islands (CGI- genes), which form heterochromatin when transcriptionally silent, are globally misexpressed in aged nuclei with disrupted chromatin architectures. We demonstrate that CGI- gene misexpression is a common feature of mammalian aging and explains the molecular basis of various age-associated defects, ranging from loss of cellular identity and increased transcriptional noise to age-associated chronic inflammation. Our findings reveal that CGI- gene misexpression is directly associated with age-related physiological deterioration, thus providing a novel biomarker of aging.

A SIMPLE ANIMAL MODEL OF EXERCISE REVEALS A MOLECULAR DETERMINANT OF LONG TERM HEALTH MAINTENANCE

Monica Driscoll, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

At all stages of life, both dynamic gene expression changes and events that “lock in” particular programs that promote health and maintenance are critical factors in aging trajectories. We have a long-term interest in the fundamental biology of healthy maintenance, a topic that has led us to consider multiple facets of healthspan. A powerful whole-organism intervention with maintenance-promoting, anti-disease, anti-aging impact is exercise. The molecular and cellular mechanisms that mediate long-term system-wide exercise benefits, however, remain poorly understood, especially as applies to “off target” tissues that do not participate directly in training activity. We are investigating the basic biology of exercise benefits using the simple 959-celled model C. elegans. We found that multiple daily swim sessions are essential for exercise adaptation, leading to enhanced expression of muscle structural genes and improved locomotory performance. Importantly, swim exercise training enhances whole-animal health parameters such as mitochondrial respiration and mid-life survival, increases functional healthspan of pharynx and intestine, and enhances nervous system health by increasing learning ability of adults and protecting against neurodegeneration in models of tauopathy, Alzheimer's disease, and Huntington's disease. Remarkably, swim training only during early adulthood induces long-lasting systemic benefits that in several cases are still detectable well into mid-life. Our investigation of the molecular requirements for long-term maintenance ("legacy effects") revealed that deletion of the sole C. elegans extracellular superoxide dismutase gene SOD-4 changes this pattern. sod-4 mutants are able to swim train to gain measurable benefits, but do not maintain the healthspan improvements that wild type animals do, defining extracellular SOD-4 as a powerful mid-life maintenance factor associated with exercise experience. Our talk will discuss transcriptomic analysis of exercise and SOD-4, as well as our current understanding of the molecular mechanisms operative. Notably, mammalian extracellular SOD ecSOD has been shown to promote exercise associated health and protection against oxidative stress insults (PMID: 32220789 Yan, Spaulding 2020), implicating ecSOD in a conserved role for health maintenance and underscoring potential for therapeutic translation.

SESSION 3820 (PAPER)

LABOR FORCE PARTICIPATION: A GLOBAL PERSPECTIVE

CHANGES IN SUBJECTIVE WELL-BEING DURING RETIREMENT TRANSITION: A 10-YEAR COHORT STUDY OF AGING ADULTS IN CHINA

Shuai Zhou, *The Hong Kong Polytechnic University, Hung Hom, Kowloon, Hong Kong*

The literature on retirement adjustment remains inconclusive whether retirement transition is a stressor or a relief. This study examined the effects of retirement on subjective well-being of Chinese ageing adults in various phases of retirement. Drawing on a representative sample of "baby boomers" born in 1945-1965 (N = 3,328) from the China Family Panel Studies (2010-2018), the author examined the within-individual changes in subjective well-being, measured by life satisfaction and confidence in the future, using time-distributed fixed-effects regression technique. After adjusting for a wealth of potential confounders such as financial standing and health, the data reveal that the two outcomes of interest started increasing at two years before retiring. In addition, the improvements persisted in four or more postretirement years. Urban adults experienced greater well-being boost than rural residents during the immediate pre- and post-retirement period, but not in two or more postretirement years. Furthermore, the subjective well-being of urban females and rural males increased upon retirement and fluctuated significantly, whereas rural females and urban males experienced a stable increase in subjective well-being since the first preretirement year. Results suggest that the transition into retirement generally represents a relief for urban ageing adults in China, but the well-being improvements are stratified by residency and gender. Therefore, retirement policies should ensure subjective well-being of disadvantaged pre-retirees and attend to the needs of retired urban women and rural men.

DETERMINANTS OF RETIREMENT-AGE WOMEN'S LABOR FORCE PARTICIPATION: A RUSSIA AND THE US COMPARISON

Oksana Dikhtyar, *Miami University, Oxford, Ohio, United States*

Factors such as one's health, education, marital status, and family caregiving were found to be associated with people's retirement timing. Few studies looked at those factors separately for men and women and few cross-cultural studies were conducted on the topic. Women tend to accumulate less income and retirement savings throughout their working careers compared to men due to having more intermittent careers and lower paying jobs. Women, in general, live longer than men and are more likely to be divorced or widowed at older ages. Thus, they must spend fewer financial resources over a longer time in retirement. One possible solution is to continue employment after reaching pensionable age. Therefore, it is important to know factors that affect women's labor force participation at or after pensionable age.This quantitative study examines the relationship between women's personal and family factors and their labor force participation after reaching pensionable age in Russia and the U.S. Using data from the Background Questionnaire of the Program for the International Assessment of Adult Competencies (PIAAC) survey, we analyzed a sample of Russian women ages 55 and older and American women ages 66 and older.For retirement-age Russian women, having highest level of education, living in a larger household, and having spouse or partner in the labor force were positively associated with women's labor force participation. Likewise, American women of pensionable age with more education and a working spouse were more likely to be in the labor force. Implications for policy and future research are discussed.

RE-EMPLOYMENT MANDATE IN SINGAPORE: EMPLOYMENT AND HEALTH OUTCOMES

Ngee Choon Chia[1], Cynthia Chen[2], Jemima Koh[1], Kia Yee Lim[1], and Yuet Yan Tsoi[1], *1. National University of Singapore, Singapore, Singapore, 2. National University of Singapore, Singapore, Singapore*

Older workers can be a crucial resource to meet manpower needs for aging society. This is especially so for countries where older adults are expected to live longer and healthier. In 2012, Singapore implemented the Retirement and Re-employment Act (RRA) which obliged employers to offer re-employment to eligible workers. With RRA, mature workers have the flexibility to work beyond retirement age. Using the Retirement and Health Study (RHS) data and regression discontinuity design, we find that, after adjusting for education, marital status, housing asset and expenditure, the re-employment mandate helps delay retirement in the sample by 8.7%, with a larger impact of 9.1% among the males, as compared to the females of 7.3%. More non-retirees reported that they have very good or excellent health compared to retirees. Retirement leads to increase in healthcare utilization. Does the work environment affect how one responds to retirement option? We observe a correlation between post-retirement wellbeing and stress at work. Our study also suggests that mandatory re-employment offers are less effective in encouraging those in physically demanding jobs to continue working. Re-employment mandate helped raise the employment rate for workers in high-routine, high-manual jobs by 6.1 per cent. These would include craft workers and trade workers. It raised the employment rate for workers in highly routine and low-manual occupations by 26.9 per cent. These include workers in the hospitality, retail and services sectors. In sum, the mandate together with other inclusive work policies have been useful to mitigate impacts of societal ageing in Singapore.

SESSION 3830 (PAPER)

MEALTIMES AND NUTRITION

BREADTH OF ADVERSE OUTCOMES ASSOCIATED WITH ANOREXIA/APPETITE LOSS IN OLDER POPULATIONS

Roger Fielding[1], Francesco Landi[2], Karen Smoyer[3], Thomas McRae[4], Lisa Tarasenko[4], and John Groarke[4], *1. Jean Mayer USDA Human Nutrition Research Center on Aging, Tufts University, Boston, Massachusetts, United States, 2. Fondazione Policlinico Universitario Agostino Gemelli IRCSS, Rome, Lazio, Italy, 3. Envision Pharma Group, Philadelphia, Pennsylvania, United States, 4. Pfizer Inc, New York, New York, United States*

The scope of the clinical problem of anorexia or appetite loss (AL) in older populations is potentially underappreciated. A systematic literature review (SLR) was conducted following PRISMA guidelines to summarize associations of anorexia/AL in older adults with a range of clinical outcomes. Searches were run January/1/2011–July/31/2021 in PubMed, Embase®, and Cochrane databases to identify English-language studies of adults (aged ≥65 years) with anorexia/AL. Two independent reviewers screened titles/abstracts and full text against pre-defined inclusion/exclusion criteria. In all, 146 studies underwent full-text review; 58 met eligibility criteria. Most were from Europe (34/58 [58.6%]) or Asia (16/58 [27.6%]); only 3 (5.2%) were from the United States (US). Although mortality (n=18) and malnutrition (n=15) were the most reported outcomes, no US study reported on these outcomes. Other commonly reported outcomes included sarcopenia (n=7), functional status (n=6), need for increased care (n=6), and hospitalization (n=4). Significant associations of anorexia/AL were most consistently observed with mortality (17/18 studies), malnutrition (15/15 studies), and functional status (5/6 studies). Although the overall number of studies is small, associations have emerged with falls (2/3 studies), health related quality of life (2/3 studies), depression (2/2 studies), and cognition (2/2 studies). However, associations with hospitalization (1/4 studies), sarcopenia as assessed by muscle strength (2/4 studies) or by muscle mass (1/3 studies), and need for increased care (3/6 studies) were less consistent. Together, these studies highlight the breadth of adverse outcomes associated with anorexia/AL in older populations and a need for more US-based research into this common clinical problem.

DYSPHAGIA FOLLOWING HOSPITALIZATION IN NURSING HOME RESIDENTS WITH ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

Nicole Rogus-Pulia[1], Raele Robison[1], Sweta Patel[2], Jennifer Bunker[3], James Rudolph[2], and Joan Teno[2], *1. University of Wisconsin-Madison, Madison, Wisconsin, United States, 2. Brown University, Providence, Rhode Island, United States, 3. Oregon Health and Science University, Portland, Oregon, United States*

Dysphagia frequently occurs in nursing home (NH) residents with Alzheimer's Disease and Related Dementias (ADRD), often leading to serious health outcomes (e.g., pneumonia, malnutrition, reduced quality of life). While it is known that hospitalized NH residents with ADRD experience high rates of iatrogenic complications, dysphagia following discharge has not been examined. A retrospective cohort of all NH residents in the US (older adults aged ≥66) with advanced ADRD (Cognitive Function Scale ≥2), hospitalized between 2013-2017, and without a feeding tube or reported dysphagia on a Minimum Data Set (MDS) 3.0 assessment within 120 days prior to hospitalization was constructed. Treatment with intermittent mandatory ventilation (IMV) or non-invasive ventilation (NIV) during hospitalization and dysphagia status on the first post-hospitalization MDS was recorded. Data were analyzed using descriptive statistics and random effects multivariate logistic models that adjusted for age, gender, race/ethnicity, CFS score, ADL score, and comorbidities. Among the 805,199 residents with ADRD who survived the hospitalization and returned to the NH, new onset dysphagia occurred in 53,807 (6.7%; 95% CI 6.6-6.7) of residents. After adjustment, invasive mechanical ventilation (IMV) use was associated with increased risk of new onset of dysphagia (AOR 1.5; 95% CI 1.4-1.6) and non-invasive mechanical ventilation (NIMV) only slightly increased the risk (AOR 1.3; 95% 1.2-1.3). NH residents with ADRD are at risk for dysphagia following hospitalization. These findings emphasize the importance of swallowing evaluation and dysphagia treatment during hospitalization for ADRD patients, especially those treated with IMV or NIV, to prevent further negative health outcomes.

FACTORS ASSOCIATED WITH EATING PERFORMANCE IN NURSING HOME RESIDENTS WITH DEMENTIA AND MULTIPLE COMORBIDITIES

Wen Liu[1], Elizabeth Galik[2], and Barbara Resnick[3], *1. University of Iowa, Iowa City, Iowa, United States, 2. University of Maryland, Baltimore, Baltimore, Maryland, United States, 3. University of Maryland, Baltimore, Maryland, United States*

Eating performance is the functional ability to get food and drink into the mouth. Nursing home residents with dementia commonly experience compromised eating performance and subsequent nutritional consequences. Resident characteristics including cognition, physical capacity, and functional ability are associated with eating performance. This study aimed to test the association between functional ability, behavioral symptoms, psychotropic medication use, and comorbidities and eating performance. This was a secondary analysis using baseline data from two randomized controlled trials testing the impact of Function Focused Care on function and behavioral symptoms between 2014-2020. A total of 889 residents with moderate-to-severe dementia (mean age 86.58 years, 72% female, 70% white, 69.5% severe dementia) from 67 nursing homes in two states were recruited. Eating performance (dependent variable) was measured using the single self-feeding item on the

Barthel Index. Independent variables included functional ability (Barthel Index total score excluding self-feeding item score), behavioral symptoms (agitation, depression, resistiveness to care), and psychotropic medication use (anti-depression, sedative, anti-psychotics, anti-seizure, anti-anxiety), and comorbidities. Residents had on average 5 documented comorbidities (SD=3.06, range=0-12) and were on approximately 1 psychotropic medication (range=0-5, SD=1.24). Thirty-eight percent of residents were dependent in eating performance. Functional ability (OR=1.052, 95% CI=1.043,1.061, p<.001), depression(OR=.931, 95% CI=.887,.978, p=.004), and anti-anxiety medication use(OR=.632, 95% CI=.409, .978, p=.039) were associated with eating performance. Findings supported better functional ability, lower depression, and less anti-anxiety medication use were associated with better eating performance. Targeted efforts including maintaining functional ability, minimizing anti-anxiety medication use, and managing depression are encouraged to support eating performance.

FACTORS ASSOCIATED WITH MEALTIME LANGUAGE CHARACTERISTICS IN NURSING HOME STAFF AND RESIDENTS WITH DEMENTIA

Wen Liu[1], Ying-Ling Jao[2], and Si On Yoon[3], *1. University of Iowa, Iowa City, Iowa, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States, 3. The University of Iowa, Iowa City, Iowa, United States*

Interactive staff-resident communication is crucial for nursing home residents with dementia requiring mealtime assistance. Effective communication may facilitate food intake and promote function and nutrition. However, understanding of staff and resident language characteristics in mealtime interactions is limited. This study examined language characteristics and associated factors in mealtime interactions. This was a secondary analysis using data from videotaped mealtime observations (N=160) involving 36 staff and 27 residents with moderate-to-severe dementia (53 staff-resident dyads) in 9 nursing homes. The dependent measures were 1) the number of words produced in each utterance (expression length), and 2) whether staff named the resident in each utterance (naming the resident). Mixed-effects models examined the effect of utterance quality (positive vs. negative utterances), intervention (pre- vs. post-communication training), and subject speaking (staff vs. resident), adjusting resident comorbidities and dementia stage. Staff (mean=4.30, SD=2.98) produced significantly longer utterances than residents (mean=2.64, SD=2.27). Expression length was modulated by utterance quality and intervention. Staff's negative utterances were shorter than their positive utterances, while residents' negative utterances were longer than their positive utterances. Staff's negative utterances became longer after the intervention while the length of positive utterances remained similar pre- and post-intervention. Staff named the resident in 16.72% of their utterances and was more likely to name residents with severe dementia. Findings emphasize the potential benefit of communication training on mealtime interactions. Findings also highlight the need to further examine the impact of language characteristics on food intake, which may guide intervention development to promote nutrition for residents with dementia.

FIFTEEN-YEAR TRENDS IN THE PATTERNS OF MEAL TIMING AND EATING FREQUENCY AMONG US ADULTS

Samaneh Farsijani, Ziling Mao, and Anne Newman, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Understanding patterns of eating behavior may provide insights into contributors to obesity and metabolic diseases. To characterize trends in meal timing and frequency in US population age >19 years, we performed a serial cross-sectional analysis of 8 National Health and Nutrition Examination Survey (NHANES) cycles (2003-2018) on 34,470 adults (52.5% women and 21% black). Time of food and beverage intake was extracted from two 24-hour food recalls. The following meal timing measures were defined: 1) The time of the last and first calorie intake either from food or drink, 2) Eating window: The time elapsed between the first and last food intake, 3) Calorie midpoint time: The time when half of the calories for the day were consumed, 4) Late night eating: Consumption of ≥33% of total daily energy between 5:00pm and midnight, and 5) Eating frequency: Frequency of food or beverage consumption >0 kcal which were >15 minutes apart. From 2003 to 2018, survey-weighted mean (±SE) of eating window decreased from 12.21±0.06 to 12.02±0.05 hours/d (Ptrend=0.002). Time of the last calorie intake significantly decreased from 20.31±0.04 to 20.09±0.03 hours/d, while the time of first calorie intake and eating frequency remained unchanged. More than two-third of participants consumed ≥33% of total daily energy after 5:00pm. Over the 15-year span, composition of diet has also changed, including a decline in total calorie intake and percentage of energy from carbohydrate intake, while percentage of energy from dietary fats increased, Ptrend< 0.05. Patterns of eating behavior have changed in American adults over time.

SESSION 3840 (SYMPOSIUM)

MITIGATING LONG-TERM CONSEQUENCES OF COVID-19 ON OLDER ADULTS IN HONG KONG, SINGAPORE, THAILAND, AND THE US

Chair: Ladda Thiamwong Discussant: Vivian Wei Qun Lou

The impact of COVID-19 on older adults goes beyond a higher risk for serious infection to long-term consequences such as decreased well-being and disability. In 2020, we formed an international and interdisciplinary research group and adopted a biopsychosocial model as a conceptual framework to guide our collaboration. Our ultimate goal is to mitigate the long-term health consequences of the pandemic and utilize affordable technology-based interventions to enhance the quality of life for older adults in Hong Kong, Singapore, Thailand, and the US. Five empirical studies will be presented with topics ranging from quality of life, fear of falling, attitudes toward technology, and the utilization of technology-based interventions. A path analysis from the first study indicated that physical frailty was the strongest direct power on quality of life followed by depressive symptoms, and life-space mobility. The second study found that fear of falling was predicted by falls risk, resistance, COVID fear, and health conditions. The third study revealed a strong connection between the COVID severity and positive attitudes toward technology, and social support facilitates the adoption of technology. The fourth study reported the benefits of using a technology-based body-mind intervention to alter a mismatch between fear of falling and actual fall risk and to increase the accessibility of the fall intervention. The final study indicated that utilizing an alternative online exercise program during the pandemic increased exercise regularity and enhanced motivation. Together, all five studies contribute to strategic implications on global mitigating long-term health consequences and essential issues for further research.

A TECHNOLOGY-BASED BODY-MIND INTERVENTION FOR LOW-INCOME AMERICAN OLDER ADULTS.

Ladda Thiamwong[1], Rui Xie[1], Joon-Hyuk Park[1], Nichole Lighthall[1], Victoria Loerzel[2], and Jeffrey Stout[1], *1. University of Central Florida, Orlando, Florida, United States, 2. College of Nursing, University of Central Florida, Orlando, Florida, United States*

Research is limited on the use of technology to help individuals who have a mismatch between physiological fall risk (Body) and perceived fall risk (Mind) and are unable to access traditional fall interventions. We examined the feasibility and acceptability of a technology-based body-mind intervention in low-income older adults during the COVID-19 pandemic and explored barriers to access and adopting the technology. Data were collected using a survey, balance test, accelerometer-based physical activity (PA), and semi-structured interviews with twenty participants who engaged in an 8-week intervention at a low-income setting in Florida. We found that: 1) the technology-based intervention is feasible, 2) participants tend to accept technology to alter their perceptions of fall risk and balance capacity, 3) tailored activities to each component are not a one-size-fits-all approach. There were no statistically significant changes in sedentary time, light PA, and moderate to vigorous PA between pre and post-intervention.

A MULTISITE INVESTIGATION OF FACTORS INFLUENCING QUALITY OF LIFE IN THAI OLD ADULTS DURING THE COVID-19 PANDEMIC

Inthira Roopsawang[1], suparb Aree-Ue[1], Teepatad Chintapanyakun[2], Yuwadee Saraboon[3], and Sirirat Intharakasem[3], *1. Mahidol University, Bangkok, Krung Thep, Thailand, 2. Department of Nursing, Bangkok, Krung Thep, Thailand, 3. Mahidol University Amnatcharoen Campus, Amnatcharoen, Amnat Charoen, Thailand*

Coronavirus-19 outbreak situation is a significant problem affecting the older population globally. The aim of this study was to investigate the association among physical activity, physical frailty, social frailty, life-space mobility, and depressive symptoms on quality of life in Thai older persons with non-communicable diseases prior to the COVID-19 pandemic. A path analysis was used for data analysis with the Mplus program. A total of 2,000 participants aged rang 60 – 89 years with a mean age of 65.13 years (SD = 4.62 years) participated in the study. Path analysis indicated that physical frailty was the strongest direct power on quality of life followed by depressive symptoms, and life-space mobility, respectively at the time of COVID-19's first outbreak. Monitoring and managing changes in physical frailty, depressive symptoms, and life-space mobility are suggested to promote active aging and maintain a good quality of life in this population, specifically age-friendly living areas.

COVID-19 AND THE FEAR OF FALLING AMONG OLDER ADULTS IN SINGAPORE: AN ELECTRONIC SURVEY

Wayne Chong[1], Tharshini Lokanathan[2], and W. Quin Yow[2], *1. Nanyang Technological University, Singapore, Singapore, Singapore, 2. Singapore University of Technology & Design, Singapore, Singapore*

We investigated the predictors of fear of falling in Singapore during the COVID-19 pandemic. Older adults aged 60 to 85 (N=144) participated in an electronic survey that assessed their attitudes toward technology, perceived severity and fear of COVID, frailty, social engagement and falls risk. Hierarchical linear regressions revealed that the fear of falling was first predicted by falls risk, beta = .26, p = .001, F(1, 142) = 10.50, then by resistance, beta = .18, p = .03, F(2, 141) = 7.96. When COVID-19 fear, beta = .14, p < .001, and health conditions, beta = -.22, p = .005, were added together, falls risk became non-significant, beta = .14, p = .083, F(4, 139) = 10.50. The interaction between COVID-19 fear and health conditions was found to add significant variance in the final model, beta = -.31, p < .001, R square = .37, R square change = .09.

HOW HAS COVID-19 SHAPED SINGAPORE OLDER ADULTS' ATTITUDES TOWARD TECHNOLOGY?

W. Quin Yow[1], Tharshini Lokanathan[1], and Wayne Chong[2], *1. Singapore University of Technology & Design, Singapore, Singapore, 2. Nanyang Technological University, Singapore, Singapore, Singapore*

This study investigated Singapore older adults' attitudes toward technology during the COVID-19 pandemic when in-person socializations have been negatively impacted. One hundred and forty-four older adults (range = 60-85 years old) participated in a large-scale survey that included questions such as their attitudes toward technology, severity and fear of COVID, as well as frequency of social support and contact with relatives and friends. Results revealed that the more severe the COVID situation in their area was, the more they believe that technology is useful and could enhance their effectiveness, and the more they like the idea of using technology in their daily activities, Fs>6.60, Bs>1.71, ps<.01. Furthermore, social support could facilitate the adoption of technology in older adults, F=6.31, B=.89, p=.013. Paradoxically, the fear of COVID could collaterally increase the hesitation of using technology in older adults for fear of making mistakes they cannot correct, F=8.50, B=1.30, p=.004.

ONLINE EXERCISE CLASS EXPERIENCE AMONG OLDER ADULTS' MEMBERS OF COMMUNITY CENTERS IN HONG KONG DURING COVID-19

Janet Lok Chun Lee[1], Vivian Wei Qun Lou[2], and Rick Kwan[3], *1. The Hong Kong Polytechnic University, Hong Kong, Hong Kong,*
2. The University of Hong Kong, Hong Kong, Hong Kong, Hong Kong, 3. Tung Wah College, Hong Kong, Hong Kong

Due to the social distancing measures, community-centres in Hong Kong has been converting exercise classes to online delivery mode through video-conferencing software since the outbreak of COVID-19. The phenomenon is new, and no research has been done to investigate older adults' experience on it. This study adopted a descriptive qualitative methodologically orientation to understand the phenomenon. Twenty-three older adults (aged 55-89 years), with experience of participating online exercise class since COVID-19 participated in the study. Six major themes regarding their experiences emerged. Regarding positive experiences, older adults experienced convenience, increased exercise regularity, technical transformation and motivation in this new form of home-based exercise. At the same time, they experienced specific technical barriers and compensated supervision quality from the instructor. The findings of the study gave important future research direction and implications to the development of smart aging in community centres in Hong Kong.

SESSION 3850 (SYMPOSIUM)

MULTIDISCIPLINARY PERSPECTIVES ON LATER-LIFE DEPRESSION: THE ROLE OF BRAIN HEALTH

Chair: Ann Steffen Discussant: Jennifer Moye

Bi-directional associations between depression and cognitive functioning are magnified among aging individuals, challenging behavioral health providers who treat older adults experiencing clinical and subsyndromal depression. This symposium contributes to the science and practice of assessing and treating later-life depression while also attending to issues in professional training. The first paper presents pre-treatment data from the multi-site Optimum Study of older adults experiencing treatment-resistant depression (n = 529). The relevance of positive psychological constructs is supported with analyses showing important relationships among cognitive functioning, social participation, and psychological well-being. The second paper describes the development of an updated measure to assess behavioral health providers' knowledge of later life depression, including brain health concerns. Psychometric data for the measure were generated from a random pool of licensed social workers (N=900) who were mailed the survey packet. The third presentation features an experimental study demonstrating that foundational information about aging, including debunking misconceptions about cognitive aging, influenced continuing education preferences of generalist Licensed Professional Counselors (LPCs). Among the randomly generated pool of LPCs (N = 120), participants who received aging-specific information were more likely to later choose an aging-specific continuing education option. The fourth paper highlights recommendations for mental health practitioners working in primary care and general medical settings with older adults who have co-existing depressive symptoms and cognitive concerns. The fifth and final presentation describes cognitive behavioral clinical tools to address brain health concerns in the context of later-life depression, using the new Brain Health module of a published client workbook.

PSYCHOLOGICAL WELL-BEING IN OLDER ADULTS WITH TREATMENT-RESISTANT DEPRESSION

Selmi Kallmi[1], Ann Steffen[1], and Eric Lenze[2], *1. University of Missouri-St. Louis, St. Louis, Missouri, United States, 2. Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States*

Geriatric psychiatry research has documented the importance of psychological well-being to older adults diagnosed with depression (Lenze et al., 2016). This presentation utilizes pre-treatment data from the Optimum Study of treatment-resistant depression in older adults recruited from five USA and Canadian metropolitan areas (N = 529). Social participation was measured with the PROMIS scale: Ability to Participate in Social Roles and Activities (Hahn et al., 2014). Positive affect and life satisfaction were assessed using scales from the Psychological Well-Being subdomain (Salsman et al., 2013) of the NIH Toolbox for Assessment of Neurological and Behavioral Function - Emotion Battery (NIHTB-EB). Along with associations between social participation and positive affect (r = .38, p < .01) and between social participation and life satisfaction (r = .26, p < .01), path analyses explored social participation as a mediator of the relationship between cognitive functioning (NIHTB-CB; Weintraub et al., 2013) and psychological well-being.

MEASURING PROFESSIONAL KNOWLEDGE OF LATER LIFE DEPRESSION

Abby Laine, and Ann Steffen, *University of Missouri-St. Louis, St. Louis, Missouri, United States*

Research linking behavioral health providers' knowledge of later life depression to their clinical practices and patient outcomes is restricted by outdated measures. A multi-stage study was conducted to ameliorate this gap. Qualitative interviews with geropsychology content experts (N = 5) generated 49 true/false items capturing relevant concepts in later life depression, including brain health concerns. Additional content experts (N = 10) completed the questionnaire and a card sort task placing items into categories (Psychopathology, Assessment/Diagnosis, Treatment, Other) to understand measurement structure. This resulted in retention of 42 items. A random pool of licensed social workers (N=900) were mailed the survey packet with option to complete via return mail or online. This presentation will review scale psychometrics, reliability, and construct validity among MSWs from diverse clinical backgrounds. Associations between participant characteristics and knowledge of cognitive and other depressive symptoms will also be highlighted.

SHAPING PREFERENCES FOR AGING-SPECIFIC CONTINUING EDUCATION BY LICENSED PROFESSIONAL COUNSELORS

Nicholas Schmidt[1], and Ann Steffen[2], *1. Boston VA Healthcare System, Boston, Massachusetts, United States, 2. University of Missouri-St. Louis, St. Louis, Missouri, United States*

Although the prevalence of depression, like many other mental health disorders, declines with age, older adults who seek behavioral health services often present with depressive symptoms mixed with cognitive complaints. This creates challenges for generalist practitioners, who are responsible for the majority of mental health care of aging individuals. Ageism and misconceptions about older adults are theorized barriers to clinicians seeking aging-specific specialty training. This completed experimental study showed that assignment to receiving foundational information about aging, including debunking common misconceptions about cognitive aging, influenced choice of continuing education (CE) preferences of generalist Licensed Professional Counselors (LPCs). Among the randomly generated pool of LPCs (N=120), participants who received aging-specific information were more likely to choose an aging-specific CE option, F(4, 107) = 5.35, p<.001. Demographic variables, perceived competence for working with older adults, knowledge of aging, and ageist beliefs were also collected; analyses including these variables will also be presented.

MANAGEMENT OF DEPRESSION IN OLDER ADULTS RECEIVING CARE IN MEDICAL SETTINGS

Cecilia Poon, *Nebraska Medicine, Omaha, Nebraska, United States*

Although rates of major depressive disorder are lower among older adults, depressive symptoms are a common presentation for aging individuals in medical settings. Unique challenges arise when treating depressive symptoms co-occurring with brain health concerns in older adults with a complex medical history. This presentation reviews how cognitive behavioral interventions for later-life depression are relevant for mental health practitioners who work in primary care and general medical settings. Specific clinical and multicultural considerations will be highlighted to support clinicians and interdisciplinary teams to work effectively with older adults who have co-existing depressive symptoms and cognitive concerns.

CLINICAL TOOLS TO ADDRESS BRAIN HEALTH CONCERNS IN THE CONTEXT OF LATER-LIFE DEPRESSION

Kelly Bergstrom, *University of Missouri-St. Louis, St. Louis, Missouri, United States*

GSA's revised KAER Toolkit for Primary Care Teams (Fall, 2021) is an important resource, yet the complexities of depressive and cognitive symptoms in aging individuals create particular challenges for generalist behavioral health providers. Mental health practitioners and their patients can benefit from evidence-based clinical intervention materials that address the intersection of depression and brain health concerns. This presentation highlights treatment strategies and clinical tools from the new Brain Health module of the revised 2021 client workbook Treating Later-Life Depression: A Cognitive Behavioral Therapy Approach from Oxford University Press. Examples will be presented of large print within-session "Learn pages" that inform both providers and patients about normative cognitive aging and ways in which cognitive functioning can be affected by depression. Between-session "Practice forms" will also be demonstrated that address lifestyle factors to promote brain health, consideration of whether to complete a cognitive evaluation, and strategies to manage brain health changes.

SESSION 3860 (SYMPOSIUM)

NEIGHBORHOOD CHARACTERISTICS INFLUENCE OLDER ADULTS' HEALTH AND MENTAL HEALTH OUTCOMES

Chair: Weidi Qin Discussant: Weidi Qin

Both social and physical aspects of neighborhood characteristics are related to a wide range of health and mental health outcomes. There has been increasing evidence pointing to the link between neighborhood-level factors and health among older adults. Specifically, older adults living in disadvantaged neighborhoods with under-resourced infrastructure may experience more daily activity limitations, mental health symptoms, and increased morbidity and mortality. Positive aspects of the neighborhood, such as social cohesion, may serve as a social capital resource and protect against adverse health outcomes. On the contrary, negative aspects of the neighborhood, such as physical disorder, can be a substantial stressor leading to poor health. The neighborhood environment also disproportionally affects racial and ethnic minorities in the US. This symposium session will present four studies exploring important topics related to neighborhood factors of health among older adults. Collectively, the findings will inform neighborhood-level interventions to promote health and well-being among community-dwelling older adults. This session will start with a talk by Dr. Chan on the link between neighborhood and disability across six ethnic groups of older Asian Americans residing in New York City. Dr. Perry will present a qualitative study to explore the environmental and infrastructure challenges in the neighborhood from the perspective of older adults in Detroit. This will be followed by Dr. Jiang's talk on the relationship between neighborhood cohesion and mortality among a sample of older Chinese in Chicago. Finally, the session will conclude with Dr. Qin's presentation on how neighborhood characteristics affect older adults' mental health trajectories.

ETHNIC AND NEIGHBORHOOD DIFFERENCES IN POVERTY AND DISABILITY AMONG OLDER ASIAN AMERICANS IN NEW YORK CITY

Keith Chan[1], and Christina Marsack-Topolewski[2], *1. Hunter College, City University of New York, New York, New York, United States, 2. Eastern Michigan University, Ypsilanti, Michigan, United States*

Asian Americans are the fastest growing and aging U.S. population, and occupy both extremes of socioeconomic and health indices. Using the 2016 NYC.gov dataset, multilevel logistic regression analyses were conducted to examine the relationship of poverty, acculturation and neighborhood-level variables with disability for different ethnic groups of Asian older adults (Chinese, South Asian, Filipino, Japanese, Korean and Vietnamese) in New York City. Findings indicated that South Asian older adults had higher odds for disability compared to other ethnic groups. Living in a neighborhood with higher percentages of persons of the same ethnicity was protective for Chinese older adults only. There is an important opportunity for interprofessional collaborations through education, awareness, screening and intervening to enhance systems of care for Asian older adults. Social workers can play a pivotal role in providing key linkages to form interprofessional solutions and shared efforts to address the needs of this understudied and under-resourced population.

UNDEREXPLORED SOLUTIONS IN DETROIT'S NEIGHBORHOODS: THE IMPORTANCE OF LEGACY TO ADDRESS ENVIRONMENTAL CONCERNS

Tam Perry[1], Evan Villeneuve[2], Brenda Butler[3], Fatima Hazimeh[4], and Ventra Asana[5], *1. Wayne State University, Detroit, Michigan, United States, 2. ClearCORPS Detroit, Detroit, Michigan, United States, 3. Detroit's Eastside Community Network/Marlowe Stoudamire Wellness Hub, Detroit, Michigan, United States, 4. Wayne State University, Dearborn, Michigan, United States, 5. Independent Scholar, Detroit, Michigan, United States*

Neighborhood infrastructure challenges and changes are possibly understood and experienced in unique ways across the lifespan. This study presents findings on neighborhood conditions and underexplored solutions from the perspective of older adults in Detroit, Michigan. This project obtained multiple perspectives on these issues from older Detroiters through interviews (n-19) and professionals working on climate concerns in the region (n=5). The research was designed using community-based research approaches including having older adults as members of the research team from instrument design to dissemination. One emergent theme, the importance of legacy as motivation in addressing environmental concerns, will be highlighted. This presentation will conclude with a discussion of next steps for this work.

NEIGHBORHOOD COHESION, LIVING ALONE, AND ALL-CAUSE MORTALITY IN COMMUNITY-DWELLING OLDER CHINESE AMERICANS

Yanping Jiang, Mengting Li, and Tammy Chung, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

This study aimed to examine whether neighborhood cohesion would mitigate the adverse effect of living alone on all-cause mortality in community-dwelling older Chinese Americans. Data were drawn from the Population Study of Chinese Elderly (PINE, N = 3,157, 59-105 years, 58% female), a longitudinal study started in 2011. Mortality was tracked through December 2021 (N = 642 deceased). Cox regression indicated that neighborhood cohesion moderated the association between living alone and all-cause mortality (HR = 0.74, 95%CI [0.57, 0.97]), showing that among participants living alone (N = 678), those with high neighborhood cohesion had a 41% lower mortality risk than their counterparts with low neighorhood cohesion. In contrast, among participants living with others, those with high and low neighborhood cohesion had a similar mortality risk. These findings highlight that strong neighborhood cohesion may protect against the increased risk of premature mortality associated with living alone in older Chinese Americans.

NEIGHBORHOOD CHARACTERISTICS AND TRAJECTORIES OF DEPRESSIVE SYMPTOMS AND ANXIETY

Weidi Qin, *University of Michigan, Ann Arbor, Michigan, United States*

This study aims to identify the trajectories of mental health among older adults and to examine the association between neighborhood characteristics (i.e. social cohesion and physical disorder) and the identified trajectories. Data came from nine waves of the National Health and Aging Trend Study (N=6,951). Group-based trajectory modeling was used to identify the trajectories of depressive symptoms and anxiety respectively. Multinomial logistic regressions were used to examine the relationship between neighborhood and trajectories. Four trajectories were identified, namely “constantly low” “increasing” “decreasing” and “constantly high”. Results show that higher levels of social cohesion and the absence of physical disorder in the neighborhood demonstrated beneficial and protective effects on older adults’ mental health trajectories. The findings suggest that social cohesion may be an important social capital to cope with negative mental health experiences. On the contrary, negative physical features may be a stressor that adversely affect older adults’ mental health trajectories.

SESSION 3870 (SYMPOSIUM)

ORAL HEALTH AND DENTAL CARE AMONG OLDER ADULTS IN DIVERSE POPULATIONS: ANALYSES OF LARGE COHORT DATA

Chair: Bei Wu Co-Chair: Stephen Shuman Discussant: Michele Saunders

Using large cohort surveys, this symposium includes five studies examining the linkages between oral health and systemic conditions, and social and behaviors factors affecting oral health and dental care utilization in older adults. The first study used the English Longitudinal Study of Ageing (ELSA) and analyzed the effect of changes in self-rated dental conditions on memory among adults age 51+. This study also examined the mediation effect of stroke on this relationship. Using the same data (ELSA), the second study examined the longitudinal relationships between cognitive function and changes in diabetes and oral health status. Results showed that participants with co-occurrence of diabetes and poor oral health had an accelerated decline in cognitive function over the study period. The third study was conducted among 8,744 adults age 51+ using data from the Health and Retirement Study over a 10-year period. The authors found that social isolation had a significant effect on dementia onset and that both dental visits and tooth status had a mediating effect on the association. The fourth study analyzed the Medical Expenditure Panel Survey from 2009-2016 and found that individuals with cognitive impairment had a significantly lower probability of annual dental visits. Using data from the Population Study of Chinese Elderly in Chicago collected between 2017-2019, the fifth study found that spousal support was significantly associated with a lower likelihood of having any dental visit. Findings illustrate the importance of understanding how different aspects of social relationships might play a role in dental care use.

THE IMPACTS OF CHANGES IN DIABETES AND ORAL HEALTH CONDITIONS ON COGNITIVE TRAJECTORIES

Bei Wu[1], Chenxin Tan[1], Huabin Luo[2], and Xiang Qi[3], *1. New York University, New York, New York, United States, 2. East Carolina University, Greenville, North Carolina, United States, 3. New York University, New York City, New York, United States*

Despite the emerging research studying the relationship between diabetes mellitus (DM), oral health problems, and cognitive function, little is known about how changes in DM and oral health status affected the trajectories of cognitive decline. Using data of 12,802 participants aged 51+ from the 2006-2018 English Longitudinal Study of Ageing, this study examined the longitudinal relationships of cognitive functions with time-varying DM and oral health status – measured by edentulism, self-rated dental condition, and oral impact on daily performance (OIDP) scale at five time-points from 2006 to 2018. Results showed that participants had DM and edentulism throughout the study period had an accelerated decline in verbal fluency (mean=20.9; b=-0.17, 95% CI=-0.28, -0.07); and those had both DM and OIDP-problem had an accelerated decline in memory function (mean=10.4; b=-0.09, 95% CI=-0.15, -0.03). Prevention and treatment of multiple chronic conditions are essential for cognitive health in later life.

SELF-REPORTED DENTAL CONDITIONS AND MEMORY DECLINE: THE MEDIATION ROLE OF STROKE

Chenxin Tan[1], Huabin Luo[2], Xiang Qi[3], and Bei Wu[1], *1. New York University, New York, New York, United States, 2. East Carolina University, Greenville, North Carolina, United States, 3. New York University, New York City, New York, United States*

The relationship between oral health and cognitive function has been studied extensively; however, little research has examined the underlying pathways. Using a cohort of 6,403 adults aged 51+ from the 2006-2010 English Longitudinal Study of Ageing, we analyzed the effect of changes in self-rated dental conditions on memory function (ranges 0-20) and the mediation effect of stroke using a causal mediation analysis framework. Controlling for socio-demographics, lifestyle, and health status, we found that compared with participants whose dental conditions remained the same, those who reported deterioration of dental conditions in 2006-2010 (N=1,755) experienced a steeper decline in memory function, with an average total effect of -0.22 (95% CI=-0.36, -0.07). The stroke incident had an average mediation effect of -0.007 (95% CI=-0.014, -0.001), representing 3% of the average total effect. The findings accentuate the importance of dental care access for older adults with exacerbated oral health problems.

SOCIAL ISOLATION AND DEMENTIA ONSET: THE ROLE OF DENTAL VISITS AND TOOTH STATUS

Xiang Qi[1], and Bei Wu[2], *1. New York University, New York City, New York, United States, 2. New York University, New York, New York, United States*

Using data from the Health and Retirement Study, this study investigated the mediating effects of dental visits and tooth status (measured by edentulism) on the association between social isolation and dementia onset. Social isolation (exposure) and covariates in 2008, mediators (dental visits and edentulism) in 2012, and the onset of dementia between 2012 and 2018 were obtained. Dementia was identified through self- or proxy-reported physician diagnosis. We included 8,744 participants, and 576 (6.6%) had dementia during follow-up. There was a significant effect of social isolation on the onset of dementia (Hazard Ratio [HR], 1.14; 95% CI, 1.01-1.28). Controlling for mediators, the effect of social isolation was reduced to 1.10 (95% CI, 0.98-1.25), leaving an indirect effect of 1.03 (95% CI, 1.02-1.04). The proportions mediated by dental visits and edentulism were 4.4% and 7.5%, respectively. Our findings highlight the importance of improving oral health and dental care for older adults.

DISPARITIES IN ACCESS TO DENTAL CARE IN COMMUNITY-DWELLING OLDER ADULTS WITH COGNITIVE DISABILITY

Preeti Zanwar[1], Elizabeth Wood[2], and Gilbert Gimm[3], *1. Jefferson College of Population Health, Philadelphia, Pennsylvania, United States, 2. Washington State University, Spokane, Washington, United States, 3. George Mason University, Vienna, Virginia, United States*

Older adults with cognitive disability are worse off with being up-to-date with preventive care and routine dental care is not considered a clinical preventive visit covered by insurance for this population. I examine disparities in access to dental and clinical preventive services (e.g. dental visit, blood pressure visit, flu shot) in the past year in 28,068 older adults with cognitive disability using the nationally representative Medical Expenditure Panel Survey from 2009-2016. I conduct multivariate logistic regressions and find older adults with cognitive disability vs. no disability have higher odds of receiving annual blood pressure check (AOR, 1.97, 95% CI 1.34-2.88) but lower odds for having an annual dentist visit (AOR, 0.61, 95% CI 0.53-0.71) with only one-tenth of those with cognitive disability report having dental insurance. These findings have implications for integrated community-and-clinical care partnerships for closing the gap for routine dental care services among older adults with cognitive disability.

SOCIAL SUPPORT, SOCIAL STRAIN, AND DENTAL CARE UTILIZATION AMONG OLDER CHINESE AMERICANS

Weiyu Mao[1], Bei Wu[2], Iris Chi[3], Wei Yang[4], and XinQi Dong[5], *1. University of Nevada, Reno, Reno, Nevada, United States, 2. New York University, New York, New York, United States, 3. University of Southern California, Los Angeles, California, United States, 4. University of Nevada Reno, Reno, Nevada, United States, 5. Rutgers, New Brunswick, New Jersey, United States*

Regular dental care utilization is instrumental to good oral health. This study aimed to examine how positive and negative aspects of social relationships jointly exert influences towards dental care use among foreign-born older Chinese Americans. Data came from the Population Study of Chinese Elderly in Chicago collected between 2017 and 2019 (n = 3,000). Dental care utilization was dichotomized into "no dental visit" versus "any dental visit" in the past two years (including dental visit overseas). Social support and strain were measured by the Health and Retirement Study's scale from spouse, other family members, and friends (1= having any support/no strain). In stepwise logistic regression, accounting for chronic conditions, oral health problems, and sociodemographics, spousal support remained to be significantly associated with a lower likelihood of having any dental visit. Findings illustrate the importance of understanding how different aspects of social relationships might play a role in dental care use.

SESSION 3880 (SYMPOSIUM)

OUTDOOR FALLS PREVENTION: PROMOTING SAFETY IN URBAN NEIGHBORHOODS

Chair: Tracy Chippendale

Outdoor falls present a significant challenge to the well-being of community dwelling older adults. There are a number of existing evidence-based programs that address fall risk, including multifactorial and exercise-based programs. However, despite the difference in risk factors for indoor and outdoor falls, no existing program specifically targets outdoor falls. To fill this gap, the Stroll Safe program was developed and refined based on a prior feasibility study. The 7-week group-based manualized program is focused on promoting safe behavioral strategies to reduce the risk of outdoor falls. In addition to presentations and community mobility coaching by the group leader, an occupational therapist, the program includes group discussion and problem solving, capitalizing on the life experiences of participants. Action planning facilitates implementation of the strategies discussed. Given that the neighborhood environment impacts both risk and fear of falling, a walkability audit (i.e. the SWAN) focused on environmental hazards is included and is used to promote awareness of hazards and as a tool for self-advocacy. Data science and machine learning facilitate the creation of resources for route planning. Vision Zero resources help to identify hotspots for pedestrian injuries, and a map of shadow is used to create a user friendly map of potential hotspots for black ice. In this symposium, we will present 1) Findings from the efficacy trial for Stroll Safe, and 2) Describe data science research that can be used to inform outdoor falls prevention programs.

EFFICACY OF THE STROLL SAFE OUTDOOR FALLS PREVENTION PROGRAM

Tracy Chippendale[1], and Steven Albert[2], *1. New York University, New York, New York, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Informed by the Ecological and Health Belief models, the manualized Stroll Safe program addresses the unmet need of a targeted outdoors falls prevention program. We examined the efficacy of the program in partnership with eight Naturally Occurring Retirement Community program sites in one U.S city (N=86). Participants age 60 and older with a history of falls or a fear of falling were recruited. Community sites were randomly assigned to the treatment or wait list control group. Results of independent samples t-tests reveal a statistically significant improvement in knowledge of outdoor fall risks and safe community mobility strategy use for the treatment group as compared to the wait list control group on the Outdoor Falls Questionnaire (OFQ) and Falls Behavioral Scale for the Older Person (FaB) (ps<.001, Cohen's d=1.9 & 1.2). Improvements were retained at 6-week follow up. Implementation strategies are being developed to facilitate program adoption by other occupational therapists.

MAPPING SIDEWALK FALL RISKS USING BIG DATA AND MACHINE LEARNING

Fabio Miranda[1], and Maryam Hosseini[2], *1. University of Illinois at Chicago, Chicago, Illinois, United States, 2. New York University, Brooklyn, New York, United States*

Outdoor falls are a leading cause of fatal and non-fatal injuries in the US. These falls are more likely to occur due to environmental hazards, inclement weather, unsafe construction zones, or poor sidewalk condition. Fall prevention programs targeted at older adults must therefore be informed by the interplay between weather condition, urban development, and built environment. Current practices, however, are limited by the lack of comprehensive data describing the condition of pedestrian facilities at fine, human scale, limiting the effectiveness of these programs. To address these shortcomings, we propose a multi-pronged approach leveraging urban data and machine learning techniques to create city-scale inventories describing sidewalk features that can inform safe strategies and programs for community mobility. We will cover the creation of multiple data sets, including computing shadow / shade from building geometries, detection of sidewalk surface material from street-level images, and creation of sidewalk networks from satellite images.

SESSION 3890 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: THE INTERSECTION OF AGE AND RACE: IMPACT ON REIMAGINING AGING

Chair: Shannon Jarrott Co-Chair: Karen Lincoln
Discussant: Becca Levy

In this BSS Presidential Symposium, we address the conference theme of "Embracing our diversity; enriching our discipline; reimagining aging" by attending to the intersection of age and race. In our panel, speakers will address the intersection of age and race as it relates to experience of ageism and its effects on individuals' opportunities to live meaningful lives. Researchers who apply an intersectional lens to their study of aging, ageism, and productive aging among diverse populations will share relevant theoretical concepts, methodological approaches, and associated findings. Links between racism, ageism, and health hold practice implications across health care, work, leisure, and other community settings. Researchers link life course influences, including discrimination, and cognitive health (Muñoz) and productive aging (Gonzales); Robinson-Lane presents a health care model of Culturally and Linguistically Appropriate Services Standards designed to reduce racism and improve care; and, Muramatsu offers practice and policy recommendations to reduce structural racism experienced by older persons and those paid to care for them. Presenters will address the following as we discuss how to reimagine aging from an anti-ageist, anti-racist perspective: 1. Evidence of the intersection of age and race in the experience of ageism. 2. Research models that attend to the intersection of age and race.3. Efforts to reduce ageism as it intersects with race in order to reimagine aging through practice and policy.

PLACE, TIME, AND STRUCTURAL RACISM: GLOBAL PERSPECTIVES FOR REIMAGINING AGING

Naoko Muramatsu, *University of Illinois Chicago, Chicago, Illinois, United States*

Racism is embedded throughout society, producing enduring health inequities. Structural racism is pervasive across racial or ethnic groups and at the intersection of racism, ageism, and sexism. However, only the tip of the iceberg is visible in the literature or media. This presentation highlights aging and long-term care experiences of racial and ethnic groups that are often invisible in structural racism discussions (e.g., Asians). It also features direct care workers, many of whom are minorities or immigrants. I present a conceptual model of how structural racism (institutionalized, personally mediated, internalized) impacts well-being (mental, physical, cognitive, social). The model integrates the concepts of "place" (where we live, work, play, learn), "time" (effects of history, cohort, age), and invisibility. Global perspectives of structural racism will help engage gerontologists, policy makers, practitioners, and the public to maximize everyone's opportunities to live meaningful lives.

ENDING AGEISM ISN'T ENOUGH: INFUSING AN INTERSECTIONAL LENS TO ADVANCE PRODUCTIVE AGING RESEARCH AND HEALTH

Ernest Gonzales, *New York University, New York, New York, United States*

This presentation integrates anti-racism, anti-ageism, and health equity lenses into the productive aging scholarship. Ageism and racism undermine population health and compromises choices to work and volunteer. These isms, among others, intersect and disproportionately impact populations of color and older adults; nonetheless, these oppressive systems create a culture of intergenerational conflict within the workplace and in general society. I will review key theoretical concepts and values in productive aging scholarship and how intersectionality as a framework has informed the development of new and important research questions for the field. This presentation will also analyze a variety of methodological approaches to examine productive aging and health inequities by race, ethnicity, gender, and age. A discussion on the implications for research, policy, and practice will conclude the presentation.

PAIN, PLACE, AND POSITIONALITY: SYSTEMIC APPROACHES TO IMPROVING EQUITABLE HEALTH OUTCOMES FOR OLDER ADULTS

Sheria Robinson-Lane, *University of Michigan School of Nursing, Ann Arbor, Michigan, United States*

Racism and other "isms" are systemic problems that operate across multiple domains and affect access to care and services, available treatments, and long-term health outcomes for older adults. As such, changing these systems requires diverse methodological approaches that can identify and examine the contextual factors that influence these outcomes, along with continued strong advocacy that will result in related policy change. This presentation will highlight challenges in care delivery and outcomes for Black older adults in pain management, COVID care, and long term care placement and examine how mixed methodological approaches and implementation of the Culturally and Linguistically Appropriate Services (CLAS) Standards as outlined by the U.S. Department of Health and Human Services can make a difference.

NO SILVER BULLET: ADDRESSING COGNITIVE HEALTH IN RACIALLY AND ETHNICALLY DIVERSE OLDER ADULTS

Elizabeth Muñoz, *The University of Texas at Austin, Austin, Texas, United States*

The growing racial and ethnic diversity of the older adult population, along with continued inequities in brain health outcomes highlight the need to examine risk-factors for reduced cognitive health in racial-ethnic minoritized adults. Stress is an important risk factor for reduced cognitive health, but the conditions under which stress operates among minoritized older adults is poorly understood. This presentation will discuss how studying sources of stress across multiple levels of analyses, including neighborhoods and interpersonal interactions, and the timing and duration of these experiences is needed. Further, addressing within group heterogeneity and shifting from between group comparison will enrich our understanding of risk-factors. Theoretical and empirical support for these propositions will be discussed, particularly as they relate to how neighborhood contexts and experiences with discrimination are associated with reduced cognitive health across multiple timescales.

SESSION 3900 (PAPER)

ADVANCING THE IMPLEMENTATION SCIENCE OF HOME MODIFICATION FOR OLDER ADULTS: AN UMBRELLA REVIEW

PROGRAMS, POLICIES, AND SERVICES TO FACILITATE AGING IN PLACE

Mengzhao Yan, Emily Nabors, and Jon Pynoos, *University of Southern California, Los Angeles, California, United States*

Rooted in the person-environment-fit theory, home modification has been tested as an intervention to support older adults to age safely at home by improving functioning and reducing fall risks. Home modification is often a complex process, involving multiple steps and various stakeholders. As such, proper implementation is important to its effectiveness. However, limited research has focused on how to implement home modification from a comprehensive perspective. To advance the implementation science of home modification for older adults and achieve a better understanding of promising practices, we conducted a scoping analysis of review articles, referred to as umbrella review, to identify strategies that have been found effective in implementing home modification. Guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analysis Protocols (PRISMA-P), after performing a thorough literature search from six electronic databases, including MEDLINE, PubMed, Embase, CINAHL, Web of Science, and Cochrane Review, we identified 16 highly relevant review articles from 1,310 articles retrieved. From these, we derived a set of practical strategies for service delivery professionals and developed an implementation matrix with the strategies clustered under two dimensions: (1) types of home modification based on demands of effort and level of evidence, including evidence-based practices, best practices, emerging practices; and (2) the critical stages of home modification, including preparation, home assessment, installation, follow-up visit. Our findings highlight the importance of maintaining cohesion between different stages of home modification and sustaining consensus among service delivery professionals and residents when implementing home modification for older adults.

CORRELATES OF SOCIAL COHESION AMONG COMMUNITY-DWELLING OLDER PERSONS IN SOUTH-WESTERN NIGERIA

Eniola Cadmus[1], Lawrence Adebusoye[2], and Eme Owoaje[3], *1. College of Medicine/ University of Ibadan, Ibadan, Oyo, Nigeria, 2. Chief Tony Anenih Geriatric Centre, University*

College Hospital, Ibadan, Oyo, Nigeria, 3. University of Ibadan, Ibadan, Oyo, Nigeria

Existing research shows that older persons prefer to 'Age in Place' in their homes or community for as long as possible and are attached to both the physical space as well as the social environment. Despite growing attention to the relationship between social cohesion and health outcomes, few studies have focused on its correlates, especially in low- and middle-income countries, including Nigeria. This study identified the factors related to neighbourhood social cohesion among older adults aged >60years dwelling in a selected rural and urban community in Oyo State, southwestern Nigeria. Data were collected using a semi-structured, interviewer-administered questionnaire and analysed using Stata version 15. Overall, 1180 (588 rural and 592 urban) respondents were interviewed (mean age 74.2 ± 9.5 years). Over half (55.3%) of the respondents had an adequate level of social cohesion. In the rural environment, positive predictors of social cohesion were male gender [OR: 1.73 (95%CI: 1.10-2.73)], formal education [OR:2.70 (95%CI: 1.52-4.81)] being employed [OR:3.68 (95%CI: 2.50-5.42)], homeownership [OR: 1.82 (95%CI: 1.22-2.71)] and good self-rated health (SRH) [OR:2.73 (95%CI: 1.78-4.20)]. Among the urban respondents, factors predictive of good social cohesion were male sex [OR:1.68 (95%CI: 1.06-2.68)], being employed [OR:2.38 (95%CI: 1.67-3.41) and reporting good SRH [OR:2.13 (95%CI: 1.45-3.11)]. Older respondents were less likely to have good social cohesion compared with the younger respondents in the rural [OR:0.54 (95%CI: 0.35-0.84)] and urban setting [OR:0.68 (95%CI: 0.47-1.00)]. The study findings underscore the importance of socio-economic status and homeownership on older adults' social cohesion and areas for targeted policy and intervention

HOUSEHOLD COMPOSITION AND THE RESILIENCE OF OLDER ADULTS AGING IN COMMUNITY DURING COVID-19

Samara Scheckler, Jennifer Molinsky, and Christopher Herbert, *Harvard University, Cambridge, Massachusetts, United States*

Household composition impacts older adults' financial needs, earnings capacity, and benefits eligibility. It is also related to formal and informal LTSS access and may be associated with disparities between racial and ethnic groups since Black and Hispanic older adults are more likely than white older adults to live in multigenerational homes. The relationship between household composition and community-based aging is highly salient as multigenerational households and older people living alone are expected to increase in both number and share in coming years. This research framed the pandemic period as a stress-test to detect differences in resilience, defined as financial and LTSS stability and number of hardships, associated with older adults living alone, with partner, or with family or unrelated coresidents. Using the state-identified Health and Retirement Study (HRS), researchers developed a pre-pandemic profile of financial resources and public benefit utilization, informal and professional LTSS, and a vector of wellbeing measures by household composition type. Researchers then conducted two analyses to identify different pandemic experiences by composition type. First, wave over wave variation was regressed by household composition, noting any increased rates of instability in the 2020 wave. Researchers then used the HRS COVID-19 supplemental survey to describe pandemic hardships by household composition. About a third of HRS respondents lived in each household type. Findings, which offer a profile of resources by housing composition type and two analyses of resilience associated with composition, suggest complex relationships between household composition and resilience, but overall, residents living alone appear more vulnerable to instability.

UNDERSTANDING THE USE OF FLEXIBLE WORK ARRANGEMENTS AMONG OLDER INFORMAL CAREGIVERS

Shanika Koreshi, and Fiona Alpass, *Massey University, Palmerston North, Manawatu-Wanganui, New Zealand*

The increasing provision of informal caregiving and the extension of working lives will result in many older workers combining paid work and informal caregiving responsibilities. Specific flexible work arrangement policies have been enacted in many countries to support working caregivers. Flexibility in the workplace has been suggested to promote prolonged employment among older workers. This study primarily focuses on the question of whether use of flexible work arrangements differs between caregivers and non-caregivers and how potential differences can be explained. Participants were 296 carers and 1611 non-carers (aged 55–70 years) who completed wave 8 of the New Zealand Health, Work and Retirement survey. The use of flexible work arrangements was analyzed based on five categories; Flexibility in number of work hours, flexible schedule, flexible place, options for time off, and other options. Hierarchical regressions were used to investigate caregiving as an independent predictor of use of flexible work arrangements after controlling for demographic and work characteristics. Results indicate that the studied informal caregivers on average used more workplace flexible arrangements than non-caregivers, both in flexible work hours, flexible schedules, and time off. The caregiver status difference in use of the three significant categories of flexible work arrangements can be explained by differences in socio-demographic and work characteristics. This difference in use of FWAs among older caregivers and non-caregivers warrants attention in discussions about prolonged employment and reconciliation of care and paid work.

SESSION 3910 (SYMPOSIUM)

REIMAGINING THE FUTURE OF ASSISTED LIVING TO PROMOTE QUALITY

Chair: Sheryl Zimmerman

Assisted living (AL) has existed in the U.S. for decades, evolving in response to older adults' need for supportive care and distaste for nursing homes and older models of congregate care. Today, AL is the largest provider of residential long-term care in the country, with more than 996,000 AL beds in almost 29,000 AL communities. Unfortunately, that growth has spawned notable concern, with a recent report concluding that the initial key constructs of AL have become mired under key tensions such that "the current model of AL has been taken as far as it can go." This symposium includes five presentations that respond to some of those tensions. The first two presentations respond to the increased acuity of AL residents: one addresses challenges and recommendations for residents' palliative care needs based on numerous studies, and the other provides expert consensus panel recommendations for pragmatic medical and mental health care provision in AL. The next two presentations respond to concerns related to quality in AL, one focusing on frameworks, measures, and implementation of quality metrics, the other envisioning use of administrative data to study and promote quality. The final presentation speaks to the complexity of regulation, and how related research can be improved to better examine consequential differences between models of AL care. The discussant, a nationally recognized and highly regarded leader from the American Health Care Association/National Center for AL, will discuss how the presentations can be used to reimagine the future of AL to promote quality.

EXPERT CONSENSUS PANEL RECOMMENDATIONS FOR MEDICAL AND MENTAL HEALTH CARE IN ASSISTED LIVING

Sheryl Zimmerman[1], Philip Sloane[2], Christopher Wretman[3], Kevin Cao[4], Johanna Silbersack[1], Paula Carder[5], Kali Thomas[6], and Suzanne Meeks[7], *1. University of North Carolina, Chapel Hill, North Carolina, United States, 2. University of North Carolina-Chapel Hill, Chapel Hill, North Carolina, United States, 3. University of North Carolina at Chapel Hill School, Chapel Hill, North Carolina, United States, 4. University of Illinois, Chicago, Illinois, United States, 5. Portland State University, Portland, Oregon, United States, 6. Brown University, Providence, Rhode Island, United States, 7. University of Louisville, Louisville, Kentucky, United States*

Assisted living (AL) is now the largest residential provider of long-term care in the U.S., and the acuity of AL residents has been rising. However, AL is not a health care setting, and concern has grown about the medical and mental health care needs of AL residents. Because there is no guidance to inform this care, a Delphi consensus panel of 19 experts was convened, and their recommendations were compared to actual practice. Panelists rated 200 discrete items, 43 of which met standard recommendation cut points (rated as important by at least 75% of panelists) and reflected four critical components of AL: the tenets of AL, the role AL plays in providing long-term care for persons with dementia, the need for pragmatism in response to the diversity of AL, and workforce needs. Next steps regarding implementation of the recommendations will be discussed.

CHALLENGES AND RECOMMENDATIONS TO MEETING THE PALLIATIVE CARE NEEDS OF RESIDENTS IN ASSISTED LIVING

Debra Dobbs[1], Hongdao Meng[1], William Haley[1], Carlyn Vogel[1], and Harleah Buck[2], *1. University of South Florida, Tampa, Florida, United States, 2. Csomay Center for Gerontological Excellence, Iowa City, Iowa, United States*

Of the more than 800,000 assisted living (AL) residents in the U.S. approximately 25% remain until the end of life and can benefit from palliative care (PC) and hospice care. Although the AL population is the fasting-growing segment of hospice care, increasing by 40% in the past five years, ALs still have special challenges in providing quality end-of-life care. ALs have a lack of nurse staffing and adequate training about how to care for those with serious illnesses. We present findings from studies over the last decade in Florida ALs (N=100) related to PC and hospice care practices. Some of the findings reveal gaps in care related to PC staff education, documentation of pain and advance directives and recognizing the need for more family involvement in decisions, especially for those with dementia. Recommendations on how to improve processes of care for residents who can benefit from PC will be discussed.

QUALITY METRICS IN ALFS: FRAMEWORK, MEASURES, AND IMPLEMENTATION

Tetyana Shippee[1], Taylor Bucy[2], Odichinma Akosionu[1], and Tricia Skarphol[1], *1. University of Minnesota, Minneapolis, Minnesota, United States, 2. University of Minnesota School of Public Health, Minneapolis, Minnesota, United States*

Concerns have surfaced regarding the quality of assisted living (AL) with calls for quality metrics reporting as essential for consumer choice and organizational accountability. This study presents a framework for quality metrics in ALs using a) results from literature review and environmental scan of existing domains and indicators used to assess quality in AL and 2) a survey of results from MN stakeholders (n=822) on their priorities regarding these quality measures. Our findings showed that consumer-reported measures (resident quality of life and family satisfaction) were rated as top priority, followed by staff-based measures (e.g., job satisfaction, turnover). Other domains included residents' safety, resident health outcomes, care services and integration, and the environment of the ALs. These results have implications for states looking to develop and implement quality measures in ALs, especially in the context of rising AL resident acuity and the continued trend away from institutional models of long-term care.

A VISION FOR THE FUTURE OF ASSISTED LIVING RESEARCH: LEVERAGING ADMINISTRATIVE DATA TO STUDY QUALITY

Kali Thomas[1], Paula Carder[2], Lindsey Smith[1], and Sheryl Zimmerman[3], *1. Brown University, Providence, Rhode Island, United States, 2. Portland State University, Portland, Oregon, United States, 3. University of North Carolina, Chapel Hill, North Carolina, United States*

Because the assisted living industry is neither federally regulated nor federally licensed, methodologies to study the quality of long-term care used in other settings (e.g., annual inspection reports, resident assessment data) do not exist for the large and growing number of assisted living communities and their residents. The objective of this presentation is to present a vision for the future of assisted living research to inform quality using large, national datasets. To do this, the presenter will discuss existing approaches to identify and characterize assisted living communities and their residents using administrative data. A specific focus will be to highlight the opportunities and challenges associated with each approach. The presenter will offer suggestions for possible enhancements in existing approaches and next steps in the study of assisted living aimed at understanding and improving the quality of care delivered in these settings.

REIMAGINING POLICY-INFORMED RESEARCH FOR THE FUTURE OF ASSISTED LIVING

Paula Carder[1], Kali Thomas[2], Lindsey Smith[2], and Sheryl Zimmerman[3], *1. Portland State University, Portland, Oregon, United States, 2. Brown University, Providence, Rhode Island, United States, 3. University of North Carolina, Chapel Hill, North Carolina, United States*

Researchers have long known that states are responsible for licensing assisted living (AL). Recent analyses indicate that the regulatory landscape is more complex, as states have numerous license classifications that can be combined in multiple ways through various subtypes and designations applied to settings under the AL umbrella. Other sources of complexity include within-state policy variation in terms of affordability and access, person-directed care, emergency preparedness, workforce, and diversity and inclusion. This presentation describes a vision and framework for future research informed by this complex policy landscape. We describe how researchers can better conceptualize types of ALs, and provide guidance for how and why AL researchers might shift from the current practice of analyzing AL settings by the "state" versus by license type, among other categorizations.

SESSION 3920 (SYMPOSIUM)

THE FACES OF ELDER ABUSE: A CROSS-CULTURAL PERSPECTIVE

Chair: Pamela B. Teaster Teaster Discussant: Georgia Anetzberger

This presentation gives a real world and compelling picture of the abuse of older adults, with authors representing three different World Health Regions (i.e., Regional Office for Africa, Regional Office for Southeast Asia, and the Regional Office for the Western Pacific) each locating the problem within an area's historic and present societal treatment of older persons. An actual and emblematic case study of the abuse of an older adult will frame each presentation. Presenters will synthesize empirical data and research on the problem, explaining its usefulness and limitations as well as guiding frameworks utilized to address the problem, highlighting efforts of leading figures in each area or region who are addressing the problem and explaining existing policies and future initiatives to address the abuse of older adults. Dr. Eniola Cadmus will present perspectives on elder abuse in Nigeria. Drs. Noriko Tskudada and Asako Katsumata and will present perspectives from Japan. Drs. Farida Ejaz and Mala Shankardass will present perspectives from India. Dr. Georgia Anezberger will tie together the differences and commonalities within each region drawing upon a holistic and person-centered picture of the issue and problem of elder abuse.

THE FACE OF ELDER ABUSE IN AFRICA: THE NIGERIAN PERSPECTIVE

Eniola Cadmus, *College of Medicine/ University of Ibadan, Ibadan, Oyo, Nigeria*

Elder abuse is increasingly recognized as a serious problem in many African societies, including Nigeria. Contributing factors include a high level of poverty, unemployment, diminished availability, willingness, and ability of primary caregivers to provide for their older persons. Traditionally, elder abuse is considered taboo, and high secrecy surrounding its occurrence further contributes to challenges reporting and addressing the problem. Additionally, the patriarchal nature of the Nigerian society accounts for the gender-based differences in forms of abuse experienced with increased vulnerability among older women. This paper presents case studies that typify the experience of abuse among male and female older persons. The prevalence rates of abuse are drawn from community surveys across the six geopolitical zones. Although the methodologies vary, the total prevalence of any form of abuse experienced ranged from 30-81.1%. However, most studies relied on self-reports with no attempts at verification or data and records for triangulation of information.

WHAT CAN WE LEARN FROM THE THREE MURDER CASE IN A FEE-BASED NURSING HOME IN JAPAN?

Noriko Tsukada[1], and Asako Katsumata[2], *1. Nihon University, Tokyo, Tokyo, Japan, 2. Rehabilitation Institution, Chiba, Chiba, Japan*

Japan enacted "The Act on the Prevention of Elder Abuse, Support for Caregivers of Elderly Persons and Other Related Matters" on 2006 April 1. Although the Act enabled the implementation of new programs and procedures to address abuse, elder abuse remains a cause of concern, particularly in institutional settings. This paper presents an elder abuse case that occurred in 2014 in a fee-based nursing home where a staff member murdered three residents. Although extreme, we chose to present this case because there is minimal research focused on fee-based nursing homes. Moreover, this case provides an opportunity to look broadly at factors that need to be addressed to reduce the likelihood of elder abuse in institutional settings. This paper first introduces facts about this case and discusses what can be learned to help increase an understanding about preventing future elder abuse cases in institutional settings.

ELDER MALTREATMENT IN INDIA: EXAMINING THE SENIOR CITIZENS ACT OF 2007 AND ITS IMPLEMENTATION

Farida Ejaz, *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*

Although cultural traditions place a high regard for older adults, elder maltreatment is on the rise in India. Prevalence rates vary widely. A recent national survey demonstrated a prevalence rate as low as 5% (LASI, 2020) while another report (HelpAge, 2015) found that 50% of older adults felt emotionally abused by family members. This presentation focuses on an important legislation, 'The Maintenance and Welfare of Parents and Senior Citizens Act' of 2007, amended in 2013 and 2018. It makes it obligatory for adult children and heirs to care for their parents/stepparents, address their needs, provide a monthly allowance and protect their property. As part of the implementation of this Act, tribunals have been set up to prosecute perpetrators. Police stations also have a helpline for Senior Citizens to address complaints amicably. Through two case studies, we will discuss how the Act is implemented in India, bringing critical nuances to light.

SESSION 3930 (SYMPOSIUM)

THE MANY VOICES OF CARE PARTNERS ACROSS THE CONTINUUM OF CARE

Chair: Aimee Fox Co-Chair: Abigail Latimer Discussant: Deborah Waldrop

Caregiving and care-sharing is a dynamic, stressful, and physically demanding responsibility, often leading to adverse psychological and physical outcomes. Caregiving for chronic illness and disease involves increasing complexity and scope of responsibilities and expectations. Utilizing strengths-based approaches and a variety of qualitative methods, this symposium highlights the many voices of care partners across the continuum of care; pre-, during and post-caregiving. First, Latimer and colleagues will present a case study of an older adult with multiple chronic illnesses, offering insight into anticipating care needs and coping with daily stressors of multi-morbidity in late life. Second, Morgan and colleagues will present findings from interviews with care partners on supporting the inner strength of those recently diagnosed with mild cognitive impairment. Third, Fox and colleagues share results from a dyadic, multi-modal intervention for pain management. Care partners who both experience persistent pain discuss changes in their relationship as a result of participating in the intervention together. Fourth, Wladkowski discusses caregiver's perspectives on live discharge and re-enrollment into hospice care. Her findings demonstrate how the anticipated "end" isn't always the end for ADRD caregivers. Fifth, Buck and colleagues will share caregivers' responses to a psychotherapy intervention for the treatment of complicated grief post-death of the care partner. Discussant Deborah Waldrop will contextualize these findings and offer suggestions for future research and interventions to enhance care partners' well-being across the continuum of chronic illness and care.

MULTIMORBIDITY IN LATE LIFE: APPRAISAL, COPING, AND ANTICIPATING CARE NEEDS

Abigail Latimer, Jia-Rong Wu, and Patricia McGuire, *University of Kentucky, Lexington, Kentucky, United States*

Older adults diagnosed with multiple chronic and serious illnesses are confronted with complex, at times unpredictable, and burdensome medical realities. We present a case study of a 76-year-old woman with heart failure, kidney disease, and arthritis early in her illness course. We use the Theory of Stress and Coping to guide our discussion of her coping appraisals and strategies that promote her psychological and emotional well-being. Although she dismissed her heart failure symptoms as "old age," she identified pain and disability associated with her arthritis as more of an immediate and serious threat to her autonomy, control, and personal goals. As she is functioning independently and still working, we share her perspective on anticipated caregiving needs and expectations for the last decades of her life. Insights from this case study can inform future research directions and have implications for education and practice.

THE ROLE OF CARE PARTNERS IN SUPPORTING INNER STRENGTH OF PERSONS NEWLY DIAGNOSED WITH MILD COGNITIVE IMPAIRMENT

Brianna Morgan[1], Lauren Massimo[1], Sharon Ravitch[1], Jason Karlawish[2], and Nancy Hodgson[1], *1. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 2. University of Pennsylvania Perelman School of Medicine, Philadelphia, Pennsylvania, United States*

Inner strength is one's internal process of facing challenging circumstances, like receiving a mild cognitive impairment (MCI) diagnosis. However, the role of care partners in this process is unknown. This study explores the role of care partners in supporting inner strength at the time of diagnosis using qualitative methodologies. We interviewed persons diagnosed with MCI (N=5) at a Memory Center within 12 months and their care partners (N=5). We analyzed data in NVivo using reflexive thematic analysis methods. Trustworthiness was maintained through vetted semi-structured interview guides, verbatim transcription, field notes, peer analysis, and audit trails. Care partners supplant cognitive losses (e.g., redistribution of self, organizing and coordinating) to allow the person with MCI to thrive, which is built on a foundation of the care partner's personal resources and the nature of their relationship with the person with MCI. Implications include incorporating care partners into diagnostic processes and tailoring caregiving supports.

EXPERIENCING PAIN TOGETHER: CARE PARTNERS REFLECT ON A DYADIC INTERVENTION FOR PAIN SELF-MANAGEMENT

Aimee Fox[1], Arlene Schmid[2], Jennifer Dickman Portz[3], Marieke Van Puymbroeck[4], Heather Leach[2], Julia Sharp[2], and Christine Fruhauf[2], *1. Kansas State University, Manhattan, Kansas, United States, 2. Colorado State University, Fort Collins, Colorado, United States, 3. University of Colorado Anschutz, Aurora, Colorado, United States, 4. Clemson University, Clemson, South Carolina, United States*

When caregivers and care receivers (caregiving dyad) both experience persistent pain, there is increased risk for shared adverse health outcomes, including social isolation and decreased relationship satisfaction. Yet, there are few non-pharmacological pain interventions for the caregiving dyad. The purpose of this study was to understand changes in the caregiving dyad after participating in a dyadic, multimodal intervention for pain self-management. Fifteen caregiving dyads with pain (N=30) participated in the Merging Yoga and self-management to develop Skills (MY-Skills) intervention. Open-ended questions were included in the post-intervention evaluation tool to discuss changes in the dyadic relationship. Qualitative methods were used to analyze data, develop a coding scheme, and identify themes. Findings suggest the intervention strengthened relationships by improving communication, enhancing emotional connection, and increasing physical activity. This study demonstrates the importance of dyadic approaches to interventions for care partners with pain.

UNDERSTANDING CAREGIVER PERSPECTIVES ON LIVE DISCHARGE AND RE-ENROLLMENT ONTO HOSPICE CARE

Stephanie P. Wladkowski, *Bowling Green State University, Bowling Green, Ohio, United States*

Hospice care improves end-of-life outcomes for adults with Alzheimer's Disease and related dementias (ADRD), yet with eligibility limited to a six-month prognosis, the patient-caregiver dyad can experience a live discharge from hospice. In 2019, nearly 350,000 patients with an ADRD diagnosis received hospice services in the US, and 6.5% of hospice patients were discharged due to being 'no longer terminally ill.' Caregivers of adults with ADRD who experienced a live discharge (n=24) were interviewed and thematic analysis was conducted. More than half (58%) noted specific support in their caregiving roles while 46% cited feeling relief. Eleven participants were enrolled for one hospice episode, and six re-enrolled at least one time. While participants would consider re-enrolling, they are waiting for a health crisis (n=7) for eligibility, while others question the meaning of hospice for ADRD patients (n=10). Implications for policy, practice, and research to support the patient-caregiver dyad are discussed.

CAREGIVERS' EXPECTATIONS OF A MIND-BODY THERAPY FOR COMPLICATED GRIEF

Harleah Buck, *Csomay Center for Gerontological Excellence, Iowa City, Iowa, United States*

Accelerated Resolution Therapy (ART) is a psychotherapy for the treatment of complicated grief, defined as unusually prolonged, functionally impairing grief. The purpose of this study was to qualitatively examine caregiver's expectations of ART. The sample included 29 primarily female, older (67.4 + 7.1 years) former informal caregivers; a little over half (n=18) had been married to their care recipient. Thematic analysis resulted in three themes and six sub-themes arising: The role of knowledge in expectations (sub-themes uncertainty, prior knowledge); The role of personality in expectations (sub-themes openness, positive affect); and Expecting a process (sub-themes cognitive processes, affective processes) which described the interaction of person and process in shaping expectations of our intervention. An across theme analysis of the specificity of the participants' expectations uncovered that knowledge and personality inform expectations of ART and that individuals who verbalize a process for recovery tend to be very specific in their expectations.

SESSION 3940 (SYMPOSIUM)

THE RAISE FAMILY CAREGIVER ADVISORY COUNCIL: STRATEGIES TO BOLSTER CAREGIVERS' FINANCIAL SECURITY

Chair: Pamela Nadash

The RAISE Family Caregiving Advisory Council, created under the Recognize, Assist, Include, Support, and Engage (RAISE) Family Caregivers Act (2018) has been tasked to support the Secretary of Health and Human Services in developing a national family caregiving strategy. The Council began by (in 2021) identifying five key Goals critical to supporting family caregivers, which were reported to Congress in the Council's Initial Report; the next step (in 2022) was to identify how these Goals are to be operationalized via specific actions, as well as the stakeholders that needed to be involved. This symposium discusses Goal 4, which states that "Family caregivers' lifetime financial and employment security is protected and enhanced," a goal incorporating diverse components, including federal legislation (expanding FMLA, for example), enhancing workplace security for working caregivers, and ways to pay family caregivers for providing supportive services. The first paper, by Salom Teshale, PhD, will provide an overview of the Council's work and the strategies that have been chosen to support the overall national strategy. The second paper, by Eileen J. Tell, MPH, will describe strategies to improve the ability of caregivers to remain and thrive in the workplace. Pamela Nadash, PhD, will report on the research that identified the expansion of self-directed programs to incorporate payment for family caregivers as key, and the fourth paper by Rani Snyder will conclude by identifying the research needed to move these efforts forward. Greg Link of the Administration for Community Living will act as discussant.

STRATEGIES TO CREATE CAREGIVER-FRIENDLY WORKPLACES

Eileen Tell[1], Pamela Nadash[2], and Siena Ruggeri[3], *1. ET Consulting, LLC, Belmont, Massachusetts, United States, 2. University of Massachusetts Boston, Boston, Massachusetts, United States, 3. Community Catalyst, Boston, Massachusetts, United States*

An estimated one in six employees is juggling work and being a family caregiver. Research suggests working caregivers neglect their own health and experience higher levels of stress and poor mental health. Their employers also experience negative outcomes, most typically in terms of increased absenteeism, lost productivity, difficulty recruiting and retaining workers, and higher health care claim costs. A wide range of strategies have emerged for employers to better support working caregivers and, hopefully, thereby reducing the financial impact both for the company and the caregiver. In this session, we discuss recommendations that emerged from research with both public and private sector stakeholders to identify best practice models and action steps for a national strategy supporting working family caregivers. Recommendations range from employer education, voluntary recognition programs, tax credits for employer-paid caregiver support programs, expanded PFMLA, and even federal LTSS financing reform.

A RESEARCH AGENDA TO ADVANCE FAMILY CAREGIVERS' FINANCIAL SECURITY

Rani Snyder[1], and Eileen Tell[2], *1. The John A. Hartford Foundation, New York, New York, United States, 2. ET Consulting, LLC, Belmont, Massachusetts, United States*

The research supporting the RAISE Family Caregiver Advisory Council engaged a broad range of stakeholders who were committed to supporting actions that make a difference to family caregivers' financial security, with many focusing on actions that sustain continued employment; 103 different organizations participated, including employer representatives. Participants strongly agreed on the need for more data. On a broad level, there was agreement on federal-level coordination regarding data collection on elements specific to family caregivers across federal agencies. In addition, they called for better information on the return on investment of varying strategies for workplace supports for employers, the added value of caregiver employees, and evidence regarding best practices in supporting family caregivers, with a goal of making a business case for family caregiver workplace supports.

THE RAISE COUNCIL'S WORK IN DEVELOPING A NATIONAL FAMILY CAREGIVING STRATEGY

Salom Teshale, *National Academy for State Health Policy, Washington, District of Columbia, United States*

Since 2019, the RAISE Family Caregiver Advisory Council (FCAC) has met regularly to carry out its work of developing a national family caregiving strategy. This strategy incorporates five goals to support family caregivers, and key actions that a range of stakeholders can carry out centered around these goals. This overview will describe the RAISE FCAC's work in developing the national family caregiving strategy, and highlight the development of recommendations and key actions to support the fourth goal, "Family caregivers' lifetime financial and employment security is protected and enhanced." This goal's recommendations include supporting caregivers through flexible workplace policies; supporting affordable long-term services and supports; supporting financial education and planning; and reducing overall negative financial impacts of caregiving short and long-term.

WHAT DO FAMILY CAREGIVERS WANT? PAYMENT FOR PROVIDING CARE

Pamela Nadash, *University of Massachusetts Boston, Boston, Massachusetts, United States*

Although the primary goal of self-directed programs providing long term services and supports (LTSS) is to maximize choice and control for service recipients, such programs may also benefit family caregivers by compensating them for providing supportive services. This study draws on qualitative data from research supporting the RAISE Family Caregiver Advisory Council, finding that family caregivers themselves see the expansion of self-directed programs as a policy priority due to their need for financial security. The request for compensation was the strongest finding, with respondents highlighting the incompatibility of work with caregiving and their inability to rely on the existing paid workforce due to supply and quality issues; the consequences of this loss of earned income were reported as severe. Ultimately, respondents saw payment for providing care as an issue of fairness. This evidence supports the policy case for expanding access to self-directed programs that permit the employment of family caregivers.

SESSION 3950 (PAPER)

WORKFORCE ISSUES ACROSS THE LONG-TERM CARE CONTINUUM

DIRECTORS OF SOCIAL SERVICES: OVERLOOKED LEADERSHIP NEEDS AT SKILLED NURSING FACILITIES (SNFS)

John Paul Abenojar, *Vinson Hall Retirement Community, Arlington, Virginia, United States*

Skilled Nursing Facilities (SNFs) provide ongoing care to the elderly and chronically ill. To maximize the quality of this care, SNF staff must be trained to respond to patient care crises and communicate across departments. Although researchers have studied the leadership styles, strategies, and interactions of facility administrators and nursing directors, little was known about the leadership styles and strategies employed by the directors of social services (DSSs). The aim of this phenomenological study was to explore how DSSs influenced leadership policies, prepared subordinates for crisis intervention and management, perceived that social workers influenced patient care decisions, and believed that communication amongst SNF staff about patient care could be improved. The conceptual framework was based on the multilevel leadership model construct, the situational leadership model construct, and the complex adaptive leadership model construct. Participants included a purposive sample of 10 DSSs working in a large, corporate SNFs in Virginia. Data were collected via in-person, semi structured interviews consisting of open-ended questions. Data were analyzed via Hycner's phenomenological approach. Findings from this investigation helped clarify roles and responsibilities of DSSs, thereby improving the leadership they provide to subordinate social workers. Findings may be used to improve communication across professionals within SNFs and their roles in patient care decisions.

DOES HIGHER WORKER RETENTION BUFFER AGAINST CONSUMER COMPLAINTS? EVIDENCE FROM OHIO NURSING HOMES

Katherine Kennedy[1], and John Bowblis[2], *1. Providence VA Medical Center, Providence, Rhode Island, United States, 2. Miami University, Oxford, Ohio, United States*

This study examined the relationship between nursing home (NH) quality using consumer complaints and certified nursing assistant (CNA) annual retention rates among Ohio freestanding NHs with complete data (n = 691). Core variables came from the 2017 Ohio Biennial Survey of Long-term Care Facilities and CMS Automated Survey Processing Environment Complaints/Incidents Tracking System. Four quartiles were created to compare NHs on their CNA retention rates: low (0-48%), medium (49-60%), high (61-72%), and very high retention (73-100%). Negative binomial regressions were estimated on total, substantiated, and unsubstantiated counts of allegations and complaints. All regressions controlled for facility and county-level factors and clustered facilities by county. Controlling for other factors, NHs in the top 50% (high and very high) of retention received 1.92 fewer allegations than those in the bottom 50%, representing a 19% difference; this trend was significant and negative across all outcomes. Using quartiles revealed a non-linear pattern: high retention NHs received the fewest number of allegations and complaints. The difference between high and low retention on total allegations, substantiated allegations, and unsubstantied allegations were 33% (3.73 fewer), 34% (0.51 fewer), and 32% (3.12 fewer) respectively. Unexpectedly, very high retention NHs received more unsubstantiated allegations than high retention NHs controlling for other variables. Research, policy, and practice efforts are critical to increase CNA retention for better consumer experiences by substantively improving CNA job quality through career advancement, high wages, and benefits. Given some turnover is desirable, effective strategies for recruitment are also needed.

EFFECT OF ACA MEDICAID EXPANSION ON THE LABOR SUPPLY OF DIRECT CARE WORKERS

Lili Xu, and Hari Sharma, *University of Iowa, Iowa City, Iowa, United States*

Direct care workers (DCWs) such as personal care aides, home health aides, and nursing assistants provide critical care to patients and residents in different settings including at home, nursing homes, and hospitals but DCWs earn low wages with limited benefits. The Affordable Care Act Medicaid expansion increased health insurance access among low-income individuals but there are concerns that public insurance may disincentivize labor supply. In this study, we examine whether Medicaid expansion affected the labor supply of low-educated DCWs at both extensive and intensive margin overall, and by different healthcare settings. Using annual American Community Survey data from 2010 to 2019 retrieved via Integrated Public Use Microdata Series, we identify 100,676 adult DCWs (age: 19-64) with a high school or less degree from 50 states and DC. We examine the potentially causal effect of Medicaid expansion on labor supply of DCWs using difference-in-differences and event-study regressions We find that Medicaid expansion is associated with a 2.9 percentage-point ($p< 0.01$) increase in full-time employment (>=35 hours) and a 1.9 percentage point ($p< 0.05$) decrease in part-time employment (20-34 hours). We also find that unemployment decreased by 0.8 percentage points ($p< 0.1$) among DCWs mainly driven by those working in the long-term care industry. Our study suggests that Medicaid expansion does not have a negative impact on labor supply among low-educated DCWs. States that have not expanded Medicaid can consider policies to increase insurance coverage for DCWs as a strategy to strengthen this workforce.

HOME HEALTHCARE WORKFORCE AND NEIGHBORHOOD CHARACTERISTICS

Chenjuan Ma, *New York University, New York, New York, United States*

Despite the rapid increase in the needs for home- and community-based services (HCBS), including home health care which is the most commonly used HCBS, workforce shortage has become a critical challenge to home health agencies in providing quality care to meet the needs of millions of homebound Americans. This study aimed to examine the availability of home health care workforce and its variations by neighborhood characteristics. We linked several national datasets from 2019 and included information from 11,005 HHC agencies in 1,849 counties. The unit for analysis is county. We found that on average county had fulltime equivalent (FTE) 83 (SD=351) home health care nurses, 120 (SD=411) FTE skilled home health providers (e.g., nurses, physical/occupational therapists) and 37 (SD=411) FTE aides. For every 1,000 persons, on average counties had 0.7 (SD=4.6) FTE nurses, 0.9 (SD=4.7) FTE skilled providers, and 0.2 (SD=0.8)) FTE aides. For every 1,000 older adults (>=65), on average counties had 3.6 (SD=23.9)) FTE nurses, 4.8 (SD=24.6) FTE skilled providers and 1.2 (SD=4.4) FTE aides. We also found that counties with moderate (2nd tertile) proportion of Black and Hispanic Americans; counties with highest (3rd title) proportion of Black and Hispanic Americans had the lowest number of FTE home health care aides per every 1,000 persons. Our findings highlight the staff shortage facing home health care and suggest the existence of disparities in availability of home health care workforce.

THE RELATIONSHIP BETWEEN ADULT DAY HEALTH CENTER OWNERSHIP, STAFFING, AND PARTICIPANT OUTCOMES

Joanne Spetz[1], and Jason Flatt[2], *1. University of California, San Francisco, San Francisco, California, United States, 2. University of Nevada, Las Vegas, School of Public Health, Las Vegas, Nevada, United States*

Growing demands for specialized care for older adults living with disabilities, including those with Alzheimer's Disease and related dementia (ADRD), and for caregiver respite have resulted in rising use of adult day health centers (ADHCs). ADHCs vary in size, ownership, participant demographics, and services offered, with a many operated by multi-site chain organizations and with for-profit ownership. This study examines whether ADHC ownership is associated with their scope of services, staffing models, and outcomes. We used facility-level data from the restricted-use 2014 National Post-Acute and Long-Term Care Study (NPALs) Adult Day Services Center module, which collects primary data on ADHCs through a nationally representative survey. Key outcome variables were measures of ADHC staffing, and rates of participants' emergency department visits, hospitalizations, and falls. The first part of the analysis was descriptive, focused on participant and staffing patterns. We then estimated ordinary least squares multivariate regressions to learn whether staffing differences exist holding other ADHC characteristics constant, such as size, region, and other services offered. We also estimated Poisson regression models to learn whether there are differences in rates of emergency room visits, hospitalizations, and falls. We found little difference in staffing or participant outcomes between for-profit vs. not-for-profit ADHCs. We found that chain-affiliated ADHCs had different participant populations and sources of revenue. They also had lower levels of staffing in general and for licensed nurses, activity staff, and social workers. Rates of falls and emergency department visits were higher in chain-affiliated versus independent ADHCs when controlling for other characteristics.

SESSION 3960 (SYMPOSIUM)

PANDEMIC POLICIES MOVING FORWARD: WHAT HAVE WE LEARNED

Chair: Brian Lindberg

Leading aging and health policy advocates will present their findings and viewpoints regarding pandemic and post-pandemic policy and programmatic changes and innovations. Issues will include elder justice, home and community-based services, Medicaid, nursing home care, and social isolation. The group will discuss what has changed and how will programs and services be different in the future.

SESSION 4001 (BIOLOGICAL SCIENCES INVITED SYMPOSIUM)

MITOCHONDRIAL COMMUNICATION AND AGING

Chair: Changhan Lee

Mitochondria evidently originate from endosymbiotic bacteria that presumably provided several advantages for eukaryotic life. For the past 1–2 billion years, mitochondria co-evolved with the ancestral cell to coordinate various cellular functions. Coordination requires communication and mitochondrial signaling has been shown to be vital to cellular fitness and aging. In this symposium, the speakers will discuss the role of mitochondria as a signaling organelle and their impact on key cellular functions in the context of aging. Consistent with emerging evidence of the complexity and sophistication of mitochondrial communication mechanisms, some of the mitochondrial-to-nuclear communication modes, including nuclear transcriptional programs and cellular signaling networks, that regulate molecular and cellular processes to promote fitness will be discussed. Dr. Chen will discuss how a mitochondrial metabolic checkpoint can regulate stem cell quiescence and maintenance that is important to stem cell aging. Dr. Picard will discuss the impact of mitochondrial stress on increased energetic cost of living (i.e. hypermetabolism) and cellular lifespan. Finally, Dr. Lee will discuss how signaling peptides that are encoded withing the mitochondrial genome regulate cellular homeostasis, increase physiological resilience, and promote healthy aging.

MITOCHONDRIA: POWERHOUSE, SLAUGHTERHOUSE, AND SPEAKER OF THE HOUSE

Changhan Lee, *University of Southern California, Los Angeles, California, United States*

The nuclear and mitochondrial genomes have co-evolved since the union forged 1-2 billion years ago between our ancestral cell and free-living bacteria. The bi-genomic system is coordinated by close communication between the two genome-possessing organelles. More recently, peptides that are encoded in the mitochondrial genome have been identified and shown to communicate mitochondrial messages. In this symposium, I will discuss MOTS-c as a mitochondrial-encoded communication factor in the context of aging. MOTS-c can translocate to the nucleus under metabolic stress to directly regulate adaptive nuclear gene expression. In humans, MOTS-c levels increase in skeletal muscle and in circulation upon exercise. In mice, MOTS-c treatment significantly reversed physical decline in aged mice (22 mo.), including doubling in treadmill running time. Studies from our lab and others point to a novel class of mitochondrial-encoded longevity genes that coordinate cellular homeostasis.

MITOCHONDRIAL METABOLIC CHECKPOINT, STEM CELL AGING AND REJUVENATION

Danica Chen, *University of California - Berkeley, Berkeley, California, United States*

Cell cycle checkpoints are surveillance mechanisms in eukaryotic cells that monitor the condition of the cell, repair cellular damages, and allow the cell to progress through the various phases of the cell cycle when conditions become favorable. Recent advances in stem cell biology highlight a mitochondrial metabolic checkpoint that is essential for stem cells to return to the quiescent state. As quiescent stem cells enter the cell cycle, mitochondrial biogenesis is induced and mitochondrial stress is increased. Mitochondrial unfolded protein response and mitochondrial oxidative stress response are activated to alleviate stresses and allow stem cells to exit the cell cycle and return to quiescence. These processes are critically regulated by several sirtuin family members, which are NAD+-dependent deacetylases. Because loss of stem cell quiescence results in the depletion of the stem cell pool and compromised tissue regeneration, deciphering the molecular mechanisms that regulate the mitochondrial metabolic checkpoint in stem cells will increase our understanding of tissue homeostasis and how it becomes dysregulated under pathological conditions and during aging. More broadly, this knowledge is instrumental for understanding the maintenance of cells that convert between quiescence and proliferation to support their physiological functions.

CROSSTALK BETWEEN UBIQUITINATION AND ADP-RIBOSYLATION IN THE MAINTENANCE OF MITOCHONDRIAL HOMEOSTASIS

Valentina Perissi, *Boston University School of Medicine, Boston, Massachusetts, United States*

Oxidative stress and increased ROS production, as observed in aging and obesity, commonly lead to the accumulation of mitochondrial dysfunctions. This is met by the activation of a robust mitochondria-to-nucleus stress response promoting the rewiring of nuclear gene expression to limit cellular and tissue damage and promote organelle adaptation. Here we will review previous work uncovering the transcriptional cofactor G-Protein Pathway Suppressor 2 (GPS2) as a mediator of mitochondria retrograde signaling and a key nuclear regulator of nuclear-encoded mitochondrial genes, including mitochondrial chaperones/proteases, mitokines, and other protective enzymes such as the ADP-ribosyltransferase NEURL4. We will also discuss unpublished work showing that shuttling of GPS2 between organelles plays a role in coordinating the transcriptional and translational regulation of antioxidant factors and pro-apoptotic genes by promoting the ubiquitination of mitochondria-associated translation factors.

DOES THE ENERGETIC COST OF STRESS ACCELERATE BIOLOGICAL AGING AND SHORTEN LIFESPAN?

Martin Picard, *Columbia University, New York, New York, United States*

In humans, chronic activation of cellular stress responses predict functional decline, accelerate aging, and increase mortality, but the cellular basis for the stress-aging cascade remains unclear. Here we induced chronic stress in primary human fibroblasts from multiple donors with constant i) ATP-synthase inhibition (Oligomycin-1nM) or i) glucocorticoid stimulation (Dexamethasone-100nM) cultured for up to 10 months. Stressors triggered mtDNA instability and activated integrated stress responses resulting in both transcriptional activation and secretion of cytokines and metabokines. In parallel, chronic stress increased cellular energy expenditure or the “cost of living” by 62–108% ($Ps<0.001$). Thus, chronically stressed cells considerably expend more energy to undergo each cell division. This severe state of hypermetabolism led to faster rates of telomere shortening and of genome-wide DNA methylation-based epigenetic aging monitored across the cellular lifespan, reflecting mito-nuclear signaling. This accelerated aging phenotype culminated in 20–40% fewer maximal cell divisions (i.e., Hayflick limit). Based on findings that hypermetabolism and increased energy flux through mitochondria may shorten lifespan, we pharmacologically inhibited carbon entry (glutamine, pyruvate, long-chain fatty acids) into the Krebs cycle across the entire cellular lifespan. While this manipulation successfully decreased OxPhos activity, it increased glycolysis-derived ATP synthesis and total energy expenditure, exacerbating the accelerated aging phenotype. Combined, our longitudinal bioenergetic and multi-omic profiling of primary human cells show that chronic heterotypic stressors converge on an acceleration of metabolism (i.e., hypermetabolism), and commensurately accelerate the progression of multiple aging hallmarks. These findings also implicate long-term mitonuclear signaling in the stress-aging cascade in a human model.

SESSION 4010 (PAPER)

COVID-19 CAREGIVING

ALL HANDS ON DECK: CONCEPTUALIZING AND OPERATIONALIZING COLLABORATION WITHIN CARE NETWORKS

Athena Koumoutzis[1], Katrina Ellis[2], Jordan Lewis[3], Zhiyong Lin[4], Yuanjin Zhou[5], William Chopik[6], and Richard Gonzalez[2], *1. Miami University, Oxford, Ohio, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. University of Minnesota Medical School, Duluth, Minnesota, United States, 4. University of Texas at San Antonio, San Antonio, Texas, United States, 5. University of Texas at Austin, Austin, Texas, United States, 6. Michigan State University, East Lansing, Michigan, United States*

Care recipients often report multiple caregivers that provide assistance. Yet, consideration of conceptual and methodological issues of caregiving networks has yet to be fully explored. This paper proposes a care collaboration index for each care network that predicts variation in collaboration among multiple networks. The association between network size, race/ethnicity, and dementia status with collaboration was also examined. Data came from the 2015 waves of NHATS and NSOC. Operationalization of collaboration was derived from 1,298 caregivers within 552 care networks. Care recipients were older adults (Mage = 83.69, SD = 7.73), most were women (71.6%), 47.9% had possible/probable dementia, and 38.9% identified as persons of color. The collaboration index considered shared care tasks and scope of assistance while controlling for the size of the immediate and broader care networks. This measure also considered task overlap among care networks as a collaboration process. A series of regression models were run to analyze whether care collaboration differed for older adults by key predictors and if the association between care collaboration and predictors varied across care tasks. Care networks with more caregivers garnered greater collaboration overall, both in general and across most types of tasks. Greater collaboration was observed among Black, Hispanic, and Other (non-White) care recipients and those with possible/probable dementia. This index provides a way to examine care network behaviors and highlights the importance of collaboration-informed approaches. Implications regarding the relationship between care collaboration and outcomes for caregivers and recipients will be discussed.

CHALLENGES AND SUPPORTS FOR VETERAN CAREGIVERS DURING THE COVID-19 PANDEMIC: A MIXED-METHODS STUDY

Lauren Penney[1], Polly Noel[1], Karla Hernandez-Swift[2], Luci Leykum[1], Ranak Trivedi[3], Stuti Dang[4], Andrea Kalvesmaki[5], and Jorie Butler[6], *1. South Texas Veterans Health Care System, San Antonio, Texas, United States, 2. Texas State University, San Antonio, Texas, United States, 3. Stanford University, Palo Alto, California, United States, 4. Miami Veterans Affairs Healthcare System, Miami, Florida, United States, 5. Informatics, Decision-Enhancement and Analytic Sciences Center, Salt Lake City, Utah, United States, 6. Salt Lake City Veterans Health Care System, Salt Lake City, Utah, United States*

Informal caregivers face challenges in supporting older or medically-complex Veterans, which could be exacerbated by the COVID-19 pandemic. Our mixed methods observational study explored Veteran caregivers' supports, challenges, and self-identified impacts during the pandemic. Caregivers whose veterans needed help with at least one activity of daily living for the last year and received care at one of five Veterans Health Administration (VA) study sites were eligible. Survey participants (n=46) were 96% female, 32-83 years old (median 59); most (83%) cared for a spouse. A majority (67%, n=31) reported increased stress since the start of the pandemic. Top sources of increased stress included worry about COVID-19 infection, increased caregiving responsibility, delayed access to care, concerns about vaccine safety, and employment or financial concerns. Caregiver interviews (n=26) qualitatively analyzed using a rapid, templated approach identified the following themes: (1) the benefits and challenges of VA COVID precautions to Veteran care access (e.g. telehealth, getting care for new problems), (2) supports afforded by and limits of the expansion of the VA Caregiver Support Program, (3) declines in Veteran physical and cognitive functioning, (4) increased caregiver role in Veterans' support and care, (5) changes in work and living situations to address increased caregiving needs and/or reduce risk of exposure, and (6) loss of and then return to more usual routines and social outlets amid ongoing COVID-related uncertainties. Recommendations include targeted, personalized outreach to engage caregivers in existing supports, removing barriers and streamlining processes for obtaining services, and creating durable caregiver-to-caregiver, peer support opportunities.

EVALUATION OF A CAREGIVER FINANCIAL PREPAREDNESS PROGRAM: SIGNIFICANT SHORT- AND LONG-TERM IMPACTS

Katherine Judge[1], Claire Grant[2], Monica Moreno[3], Kerry Lanigan[3], Lauren Stratton[3], and Sam Fazio[3], *1. Cleveland State University, Cleveland, Ohio, United States, 2. Cleveland State University, Cleveland Heights, Ohio, United States, 3. Alzheimer's Association, Chicago, Illinois, United States*

Over 50 million informal caregivers provide care to an older adult age 50 or older. Negative financial impacts include significant out-of-pocket expenses, decreased income and future earnings. The program, Managing Money: A Caregiver's Guide to Finances, was developed to address the lack of evidence-based programs and evaluated using a randomized control trial across 5 time points: Time 1 (baseline); Time 2 (after condition completion); Time 3 (30 days after Time 2); Time 4 (60 days after Time 2); and Time 5 (90 days after Time 2). The mean age of participants was

55.45 (SD=14.85); 80% female; 72% White and 69% married. Forty-six percent provided care to their parent/in-law, 36% to a spouse/partner, and 40% were employed full-time. Participants were randomly assigned to the program (N=76) or waitlist condition (N=98). No significant differences on demographic or care context variables were found between conditions. A 2 x 5 repeated measures analyses examined significant change across time based on condition. For significant outcomes, post-hoc analyses examined whether change was short-term (T2,T3); long-term (T4,T5); or both. Results found: 1) significant short- and long-term improvements for Unmet Needs (F(1,4)=8.34,p=.01); Self-efficacy (F(1,4)=4.27,p=.01); and Behavioral Intentions (F(1,4)=3.63,p=.01) and 2) significant long-term improvements for Unmet Needs Distress (F(1,4)=5.82,p=.01) and Behavioral Actions (F(1,4)=4.55,p=.01). Results indicated the program was efficacious in positively impacting key financial preparedness measures. Discussion highlights key study elements including program accessibility and scalability; generalizability of findings and limitations; and contextualizing results within the larger literature.

IT WAS TERRIBLE, I DIDN'T SLEEP FOR TWO YEARS: A MIXED-METHODS EXPLORATION OF SLEEP AMONG HOSPICE FAMILY CAREGIVERS

Lauren Starr[1], Karla Washington[2], Miranda McPhillips[1], George Demiris[1], and Debra Parker Oliver[2], *1. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 2. Washington University in St. Louis, St. Louis, Missouri, United States*

Due to overnight caregiving demands and inadequate social support, over 1.2 million hospice family caregivers in the U.S. and millions more worldwide are at risk of poor sleep and resulting negative effects on health. Sleep problems are a modifiable source of global health inequities. The purpose of this study was to describe hospice family caregiver sleep experiences, efforts to improve sleep, and effects of sleep. Developed using the Symptom Management Model, this mixed methods study featured a concurrent nested design prioritizing qualitative reflexive thematic analysis. In 2021, 47 family caregivers of hospice care-recipients from two randomized clinical trials in the United States (NCT03712410, NCT02929108) were interviewed. Sleep-related questions from PHQ-9 and GAD-7, and self-rated health and energy were administered at baseline. Three themes emerged: quality of sleep, factors influencing sleep, and effects of sleep. Hospice family caregivers commonly experienced "interrupted" sleep with frequent night-waking due to "on-call" "vigilance" and anxiety overnight and, sometimes, in bereavement. Negative effects included exhaustion, mental and physical health decline, and reduced performance. 72.5% described sleep quality as "fair" or "poor." At baseline, 35.5% of caregivers were bothered by trouble falling asleep, staying asleep, or sleeping too much at least "more than half the days" in a week. Caregivers were reluctant to take sleep medications. Over half quit jobs or reduced work hours to provide care; few reported adequate support. Hospice family caregivers commonly experience disordered sleep with negative effects. Clinicians must assess sleep, offer tailored sleep interventions, and provide more supports to hospice family caregivers.

SESSION 4030 (PAPER)

FAMILIES AND CAREGIVING

ALTRUISTIC AGING: ON THE MORALITY OF "AGING WELL"

Anne Barrett[1], and Katia Vecchione[2], *1. Florida State University, Tallahassee, Florida, United States, 2. University of Trento, Trento, Trentino-Alto Adige, Italy*

A dominant aging narrative emphasizes what individuals should do to age well, namely remain active and productive. Underlying these promotional messages, however, are others about what should be avoided. At their core is a proscription against becoming dependent, thus "burdensome." To critically examine this aging narrative, we develop the concept of "altruistic aging," which captures a cultural expectation that older adults adopt a selfless concern for the well-being of others. We use data from interviews with 28 Italians aged 65 and older to illustrate how the goal of altruistic aging shapes older adults' behaviors in the present and their framing of care options in the future. It motivates physical and social activity, as well as healthy eating – all aimed, in part, at extending the duration of one's self-sufficient years. Altruistic aging also involves expunging the idea of ever living with one's children and emphasizing the benefits of nursing homes. This observation suggests that altruistic aging may be constructed as a familial duty, particularly in nations like Italy with family-centered models of care. Our analyses reveal that taken-for-granted, and culturally celebrated, orientations toward aging may mask an internalization of ageism that devalues the self to the point of selflessness.

DETERMINING EVIDENCE FOR EFFECTIVE FAMILY CAREGIVER COMMUNICATION: STRATEGIES LEADING TO BREAKDOWN AND REPAIR

Carissa Coleman[1], Jinxiang Hu[2], and Kristine Williams[3], *1. University of Kansas, Kansas City, Kansas, United States, 2. University of Kansas Medical Center, Kansas City, Kansas, United States, 3. University of Kansas Medical Center, Lawrence, Kansas, United States*

Communication is fundamental for dementia care and identifying evidence for strategies that facilitate or impede communication is needed. We analyzed 221 videos from a randomized controlled trial of a family caregiver telehealth intervention (FamTechCare) using Noldus second-by-second behavioral coding of communication behaviors and breakdowns in interactions between 53 caregiver-person with dementia dyads. Coded data from 3,642 30-second observations were first analyzed using penalized regression for feature selection (least absolute shrinkage and selection operator; LASSO) to identify strategies most important for predicting prevention and successful repair of communication breakdown. Bayesian mixed modeling was then used to identify communication strategies associated with successful versus unsuccessful prevention and repair of communication breakdown taking into account of the dyadic structure of our data. Results showed that given our data, communication breakdown was associated with caregivers changing topic (Mdn=11.23, 95% CrI [4.39, 24.43]), ignoring (Mdn=11.47, 95% CrI [4.75, 24.17]), making commands (Mdn=10.55, 95% CrI [3.41, 23.22]) and taking over the task (Mdn=4.04, 95% CrI [1.69, 7.23]). Successful repair of breakdown was associated with caregivers verbalizing understanding (Mdn=-0.47, 95% CrI [-0.88, -0.09]), tag questions, (Mdn=-2.44, 95% CrI [-5.35, -0.33), and silence (Mdn=-0.78, 95% Crl [-1.18, -0.40) while ignoring and changing topic were associated with unsuccessful repair (Mdn=3.63, 95% Crl [-2.56, 4.78; and 2.51 [1.39, 3.74]). These results provide evidence for development and testing of evidence-based communication strategy training for family caregivers of persons with dementia. Future analyses will identify effects of dementia stage, diagnosis, and dyad characteristics on associations.

EMPLOYING DESIGN THINKING METHODS TO CREATE BEHAVIORAL INTERVENTIONS THAT SUPPORT AFRICAN AMERICAN CAREGIVERS

Leila Aflatoony[1], Kenneth Hepburn[2], Molly Perkins[3], Drenna Waldrop[4], and Karah Alexander[2], *1. Georgia Institute of Technology, Atlanta, Georgia, United States, 2. Emory University, Atlanta, Georgia, United States, 3. Emory University School of Medicine, Atlanta, Georgia, United States, 4. Emory, Atlanta, Georgia, United States*

Design Thinking provides an empathy-based creative problem-solving approach to intervention and/or patient-centered care design that seeks to articulate the right problem space and propose appropriate solutions to challenges encountered by individuals in specific contexts, such as healthcare. This abstract illustrates the application of the Design Thinking approach in the context of dementia caregiving. Emory's Roybal Center for Caregiving Mastery conducted a three-part design studio workshop with African American dementia family caregivers to understand and identify prioritized solutions to their caregiving challenges. The workshops followed the Double-Diamond design process model that is divided into four phases (Discover, Define, Develop, and Deliver) and that emphasizes divergent and convergent modes of thinking. The process first encourages divergent thinking to explore a problem space and then employs convergent thinking to identify the salient problem and develop the right solution. The workshop's Discover stage provided a broad and deep contextual understanding of the range of unmet needs African American caregivers experience in their interactions with healthcare personnel and systems. The Define phase enabled the convergent review and prioritization of the list of needs to be addressed. The Develop phase generated 17 intervention ideas. Finally, the Deliver phase focused on converging and validating the proposed interventions. The workshops concluded that having access to caregiver-focused resources supporting mental/physical self-care, such as support groups and peer programs, can be beneficial interventions to potentially improve knowledge, awareness, and caregiving mastery among African Americans American caregivers.

HOW DO OLDER AFRICAN AMERICAN COUPLES TAKE CARE OF EACH OTHER? A DYADIC, QUALITATIVE ANALYSIS

Amy Rauer[1], Wendy McClean Cooke[2], and Lyndsey Hornbuckle[2], *1. University of Tennessee Knoxville, Knoxville, Tennessee, United States, 2. University of Tennessee, Knoxville, Tennessee, United States*

Guided by Lyons and Lee's (2018) Dyadic Theory of Illness Management, the current study explored covariation in dyadic health management behaviors within a sample of seventeen older African American married couples (Mage=61.68 years; Mmaritalduration=32.29 years). We also examined if spouses agreed on how they took care of each other's health and whether these patterns changed after couples participated in a health-focused intervention together. Prior to beginning a 12-week walking plus resistance training exercise intervention, spouses completed questionnaires asking them to list the common things they did to help take care of their partner's health as well as what their partner did for them. Thirteen couples completed these questionnaires post-intervention. Data from both waves were analyzed using thematic analysis (Braun & Clarke, 2006). Five health management behaviors domains were identified (diet, exercise, self-care, medical compliance, relationship maintenance). Although both partners reported encouraging healthier diets and exercise, wives also reported promoting other health management behaviors. Couples had greater congruence in their appraisals of wives' health management behaviors compared to husbands', as wives recognized many things husbands did to take care of them that husbands did not report themselves. Patterns appeared stable over time. Findings suggest the incongruence in couples' health management behaviors represented complementary efforts to support each other and revealed that husbands may be underestimating how much care they are providing to their wives. A promising method for addressing health disparities in this population may involve capitalizing on this clear investment that older African American couples have in each other's health.

SESSION 4040 (PAPER)

FRAILTY, RESILIENCE, AND FUNCTION

A SIMPLIFIED APPROACH FOR CLASSIFYING PHYSICAL RESILIENCE AMONG OLDER ADULTS: THE HEALTH ABC STUDY

Chenkai Wu, and Tianze Lin, *Duke Kunshan University, Kunshan, Jiangsu, China (People's Republic)*

Physical resilience is an emerging concept within the context of aging and geriatric medicine, and we previously developed and validated one such measure based on the mismatch between persons' frailty level and comorbidity burden. We sought to develop a simplified version for classifying physical resilience. We also examined the agreement between the simplified version and the original approach and evaluated its predictive validity. We included 2,457 older adults from the Health, Aging, and Body Composition Study. We constructed a simplified version for quantifying physical resilience based on the comorbidity burden and level of frailty (score: 0-10). Participants were grouped by the number of diseases and classified into three groups—adapters, expected agers, and premature frailers—based on the mean and SD of frailty score (less than, within, or above one standard deviation of the mean). The Cohen's kappa between the novel resilience classification and the original approach was 0.70, and the percentage of absolute agreement was 85.4%. We observed a steep increase in years of healthy and able life from premature frailers to adapters in the simplified resilience classifications. We developed a simplified version for quantifying physical resilience in a cohort of initially well-functioning older Black and White adults. The agreement between the simplified version and the original approach is high. Adapters had a longer healthy lifespan than expected agers and premature frailers. This user-friendly measure could help assess patients' physical resilience in clinical settings.

CHANGES IN FUNCTIONAL STATUS AMONG US ADULTS IN LATE MID-LIFE FROM THE HEALTH AND RETIREMENT STUDY 2004–2016

Adit Doza[1], Elham Mahmoudi[1], and Wassim Tarraf[2], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Wayne State University, Detroit, Michigan, United States*

Reducing racial/ethnic disparities in health and functioning among older adults are salient key goals in the U.S. health policy. This study examined whether and how the functioning have progressed between White and minority populations in late midlife in recent years. We analyzed the Health and Retirement Study (HRS) among adults ages 45-64 years across two time periods (2004-2010 and 2010-2016). Using generalized linear regression, we modeled changes in activities of daily living (ADL) and changes in instrumental activities of daily living (IADL) as a function of race/ethnicity and sequentially adjusted for period specific risk factors including sociodemographic factors, health insurance, health behaviors and social networks. Oaxaca-Blinder Regression Decomposition (OBRD) techniques are used to assess the contributions of these factors to the observed trends in ADL/IADL. We find changes in ADL is significantly higher for Blacks (Odds Ratios of 1.23, CI 1.01-1.48) and US-born Hispanics (Odd Ratios of 1.54, CI 1.12-2.12) after adjusting for all the risk factors in the second period. About two-thirds of the disparity in functional status of adults is explained in our OBRD model and more than 70% of these explained differences among minorities is related to socio-demographic factors. This probably occurred due to the differences in income and net wealth which began to widen during the time of 2008 financial crisis. Although recently there is a decline in disability trends for older adults in U.S., our findings point to an increase in racial/ethnic disparities in functional status for adults in late midlife.

PROXIES OF FRAILTY AND INFLAMMATION PREDICT ALTERED WHITE MATTER MICROSTRUCTURE IN OLDER ADULTS

Andrew Bender[1], Sandra Duezel[2], Ulman Lindenberger[3], Ilja Demuth[4], Elisabeth Steinhagen-Thiessen[5], Thad Polk[6], and Simone Kühn[3], *1. Michigan State University, East Lansing, Michigan, United States, 2. Max-Planck-Insitute for human developement, Berlin, Berlin, Germany, 3. Max Planck Institute for Human Development, Berlin, Berlin, Germany, 4. Charité Universitätsmedizin Berlin, Berlin, Berlin, Germany, 5. Charité - Universitätsmedizin Berlin, Berlin, Berlin, Germany, 6. University of Michigan, Ann Arbor, Michigan, United States*

Age-related elevations in inflammation are associated with both neurodegeneration and increased frailty in older adults. Here we used state-of-the-art diffusion-MRI (dMRI) methods to examine how specific markers of white matter (WM), including fiber density [FD], fiber cross-section [FC], and extracellular cerebral spinal fluid [CSF] are linked to inflammation and frailty in a population-based aging cohort. We hypothesized that increased inflammation and frailty would be associated with reduced FD and FC and increased CSF. Participants included 255 older adults (Mage=70.46; SD=3.79 years; 42% women) recruited from the Berlin Aging Study-II (BASE-II) for MRI scanning. Measures of blood serum ferritin and grip strength (corrected for sex and body mass) served as proxies of inflammation and frailty, respectively. Processing of dMRI data (b=1000 s/mm2; 60-directions) followed the MRtrix3 fixel-based analysis (FBA) pipeline, extended for voxelwise estimation of FD, FC, and CSF, with data transformed to a sample-specific template. The voxelwise estimates of FD, FC, and CSF were then regressed on the measures of blood serum ferritin and grip strength, correcting for multiple comparisons. Greater inflammation (ferritin) and frailty (grip strength) predicted lower FD in the internal capsule and anterior commissure. Higher ferritin also predicted lower FC in dorsal cingulum and forceps minor. Finally, frailty, but not inflammation, predicted increased CSF in multiple regions. These findings demonstrate common and specific associations of inflammation and frailty with WM in older adults and highlight the utility of newer methods for characterizing WM alterations.

THE PHYSIOLOGIC COMPLEXITY OF BEAT-TO-BEAT BLOOD PRESSURE FLUCTUATION IS ASSOCIATED WITH FRAILTY IN OLDER ADULTS

Junhong Zhou[1], Yurun Cai[2], Yi Guo[3], and Xin Jiang[3], *1. Harvard Medical School/Hebrew SeniorLife, Roslindale, Massachusetts, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 3. Shenzhen People's Hospital, Shenzhen, Guangdong, China (People's Republic)*

Background: Beat-to-beat blood pressure (BP) is an important cardiovascular output and regulated by neurophysiologic elements over multiple temporal scales. The multiscale dynamics of beat-to-beat BP fluctuation has thus been characterized using "BP complexity" and has been linked to age-related adverse health outcomes. We here aimed to examine the relationship of BP complexity to frailty, and if BP complexity mediates the association between arterial stiffness and frailty. Method: A total of 350 older adults completed assessments for frailty (i.e., Fried frailty phenotype criteria), arterial stiffness (i.e., average brachial-ankle pulse wave velocity), and beat-to-beat finger BP. The complexity of beat-to-beat systolic (SBP) and diastolic (DBP) BP series were measured using multiscale entropy. The relationships between frailty, BP complexity and arterial stiffness were examined using ANOVA and linear regression models. The effects of BP complexity on the association between arterial stiffness and frailty were examined using mediation analyses.

Results: Compared to non-frail, pre-frail and frail groups had significantly elevated lower SBP and DBP complexity ($F>11$, $p< 0.001$), and greater arterial stiffness ($F=16$, $p< 0.001$). Greater arterial stiffness was associated with lower BP complexity ($\beta<-0.42$, $p< 0.001$). SBP and DBP complexity mediated the association between arterial stiffness and frailty (indirect effects>0.28), account for at least 47% of its total effects on frailty (Mediated proportion: SBP: 50%, DBP: 47%).

Conclusion: This study demonstrates that BP complexity is associated with frailty in older adults, and mediates the association between arterial stiffness and frailty, suggesting that this metric would serve as a marker to characterize important functions in older adults.

SESSION 4050 (SYMPOSIUM)

HEARING, COGNITION, AND PHYSICAL FUNCTION: LEVERAGING LARGE-SCALE EPIDEMIOLOGIC STUDIES TOWARD INTERVENTION

Chair: Carrie Nieman Co-Chair: Jennifer Deal Discussant: Margaret Wallhagen

Hearing loss and aging represent the intersection of two major public health challenges. Over 1.5 billion individuals or almost 20% of the global population have hearing loss, where the largest burden is among older adults secondary to age-related hearing loss. By 2030, the end of the UN Decade of Healthy Aging, almost 2 billion individuals are expected to be living with hearing loss. Evidence continues to grow related to the negative consequences of hearing loss in the context of aging, both on cognitive and physical function. This symposium will share the latest findings on hearing loss and its relationship to a range of negative consequences from diverse large-scale cohorts. Specifically, the session will cover hearing loss and its relationship to cognitive health, including subjective cognitive decline and neuropsychiatric symptoms among persons living with dementia, as well as physical health, including frailty and physical function. Each presentation draws upon datasets from a large-scale epidemiologic study with varying types of data on hearing status and measures of cognitive and physical health. The covered datasets include nationally representative cohorts, such as the National Health and Aging Trends Study (NHATS), to longitudinal cohorts, such as the Atherosclerosis Risk in Communities Study (ARIC). The session will serve as a primer on available datasets that include data on hearing status and hearing care, including strengths, limitations, and analysis considerations. This symposium will provide tangible ways to leverage existing data in order to move toward intervention and build capacity around hearing health within gerontology.

HEARING LOSS, HEARING AID USE, AND NEUROPSYCHIATRIC SYMPTOMS IN DEMENTIA: FINDINGS FROM NACC

Carrie Nieman[1], Emmanuel Garcia Morales[2], Jeannie-Marie Leoutsakos[1], Constantine Lyketsos[3], and Esther Oh[4], *1. Johns Hopkins University School of Medicine, Baltimore, Maryland, United States, 2. Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 3. Johns Hopkins Bayview, School of Medicine, Baltimore, Maryland, United States, 4. Division of Geriatric Medicine, Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Hearing loss is highly prevalent among persons living with dementia (PWD) and associated with an increased risk of neuropsychiatric symptoms (NPS), while hearing aid use may be protective. We analyzed data from the National Alzheimer's Coordinating Center's (NACC) uniform data set. We estimated the association between hearing loss and number or severity of NPS in a negative binomial regression adjusting for demographic and clinical characteristics. In the subsample with hearing loss, we estimated the association between hearing aid use and number or severity of NPS.10,054 participants were included with a mean age of 75 years. 2,416 (24%) self-reported hearing loss with 71% reporting 2+ NPS. In PWD and hearing loss, 1,325 (54.8%) reported hearing aid use. After a well-balanced matching, in adjusted models, hearing aid use was associated with fewer (IRR=0.82; 95%CI=0.77,0.87) and less severe NPS (IRR=0.74; 95%CI=0.69,0.80). Hearing aid use may represent an underutilized, non-pharmacological intervention to address NPS.

HEARING LOSS AND SUBJECTIVE COGNITIVE DECLINE IN THE ARIC-NEUROCOGNITIVE STUDY

Jennifer Deal[1], Natalie Lenzen[2], marjan majid[3], Kening Jiang[4], and Nicholas Reed[5], *1. Johns Hopkins University, Baltimore, Maryland, United States, 2. Boys Town National Research Hospital, Omaha, Nebraska, United States, 3. Rice University, Houston, Texas, United States, 4. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 5. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Subjective cognitive decline (SCD) impacts quality-of-life, healthcare utilization and predicts dementia. If hearing loss is associated with SCD is unknown. We estimated the cross-sectional association between hearing loss and SCD in 2,536 participants (79.3±4.4 years, 60% female, 20% Black) in the Atherosclerosis Risk in Communities Neurocognitive Study. SCD was defined as self-reported persistent decline in memory (yes/no) among adults with normal cognition. Hearing was measured using pure tone better-ear thresholds (0.5-4 kHz), speech-in-noise, and self-report. Using Poisson models with robust standard errors, after adjustment for demographic and clinical covariates, self-reported moderate or greater trouble hearing (vs. excellent/good) was associated with a 30% increase in the prevalence of SCD (95%CI:1.12,1.51). Audiometric hearing and speech-in-noise performance were not associated. Use of self-report to approximate audiometric hearing warrants caution, particularly when the outcome is also self-reported; our findings suggest the association between self-reported hearing and SCD may be due to correlated measurement error.

HEARING LOSS AND FRAILTY: LONGITUDINAL ASSOCIATIONS

Nicholas Reed[1], and Kening Jiang[2], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States*

Hearing Loss (HL) is common among older adults and is associated with factors (e.g., walking speed and social isolation) that may mediate an association with frailty. In the National Health and Aging Trends Study (NHATS) 2011-2018 data, frailty was defined by the physical frailty phenotype composite (exhaustion, low physical activity, weakness, slowness, and shrinking) while HL was self-report. Among, 6897 baseline participants in 2011, 1132 (16%) were frail. In a cox proportional hazard model adjusted for demographic, socioeconomic, and clinical risk factors, HL (n=1607; Hazard Ratio[HR]=1.15; 95% Confidence Interval[CI]=1.00-1.32) was associated with higher risk of incident frailty relative to those with no HL (n=5290). In a generalized estimating equation longitudinal model (2011-2018), HL was associated with higher odds of frailty at baseline (Odds Ratio[OR]=1.52; 95%CI=1.49-1.96) and a 1.06 (95%CI=1.04-1.09) annual increase in odds of frailty. Future research should focus on mechanisms underlying association and determine the impact of HL treatment.

MIDLIFE PHYSICAL ACTIVITY AND HEARING IMPAIRMENT IN LATE LIFE: ATHEROSCLEROSIS RISK IN COMMUNITIES (ARIC) STUDY

Pablo Martinez-Amezcua[1], Erin Dooley[2], Emmanuel Garcia Morales[3], Nicholas Reed[1], Frank Lin[4], Jennifer Schrack[1], Jennifer Deal[5], and Priya Palta[6], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. Epidemiology, Birmingham, Alabama, United States, 3. Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 4. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 5. Johns Hopkins University, Baltimore, Maryland, United States, 6. General Medicine, New York City, New York, United States*

Background: Cardiovascular risk factors are associated with worse hearing, but the role of mid-life physical activity (PA) on hearing loss at older ages is yet to be investigated.

Methods: Among 3,198 participants of the Atherosclerosis Risk in Communities study, we investigated the association between self-reported mid-life PA (meets PA recommendations [≥150 minutes of moderate-to-vigorous PA/week] vs. not) and hearing loss (audiometric battery [pure-tone and speech-in-noise]) at older ages. We estimated differences in hearing between those who met and did not meet PA recommendations at mid-life and at late life adjusting for demographics, medical conditions, and noise exposure.

Results: 43.3% participants met PA recommendations at mid-life. These participants, compared to those who did not meet recommendations, had lower better hearing by 1.51 (0.46, 2.55) decibels, and 0.37 (0.01, 0.74) more words identified in the speech-in-noise test.

Conclusions: Meeting PA recommendations in mid-life was associated with better hearing at older ages.

SESSION 4060 (PAPER)

INTERVENTIONS (BSS)

A MIXED-METHODS, RANDOMIZED, CONTROLLED EVALUATION OF REMOTE ACTIVITY MONITORING FOR PERSONS LIVING WITH DEMENTIA

Joseph Gaugler[1], Christina Rosebush[1], Rachel Zmora[2], and Elizabeth Albers[3], *1. University of Minnesota, Minneapolis, Minnesota, United States, 2. Boston University, Boston, Massachusetts, United States, 3. University of Minnesota School of Public Health, Minneapolis, Minnesota, United States*

Remote activity monitoring (RAM) technology has the potential to allow at-home caregivers to track the behaviors and activities of persons with dementia in real-time, thus facilitating more proactive symptom management. The aim of the present study was to assess whether RAM technology was associated with reductions in negative health transitions and service utilization for persons with Alzheimer's disease or related dementias (ADRD). An embedded experimental mixed methods design was used that included 179 caregivers who were followed over a 1.5 year study period. Participants were randomly assigned to receive the RAM technology system or usual care. Follow-up surveys were administered on a bi-annual basis over an 18-month period that collected information on dementia caregiver and care recipient characteristics and outcomes. We developed multilevel mixed effects models to estimate odds ratios for binary outcomes (falls, wandering, health care admissions) and categorical outcomes (frequency of falls and wandering). In adjusted models, RAM technology use was statistically and significantly associated with lower odds of emergency department visits (p<.05) and less frequent falls (p=.05) for people living with dementia over the 1.5 year study period. Technologies that prevent or delay the onset of negative health events via improved care management and monitoring may enhance the care of persons with dementia. As dementia continues to pose an array of challenges for someone living with ADRD, RAM or similar technologies may offer a solution to the conundrum of dementia care.

EFFECTIVENESS OF SMOKING CESSATION INTERVENTIONS WITH LDCT LUNG CANCER SCREENING AMONG AFRICAN AMERICAN SMOKERS

Tung-Sung Tseng, Yu Hsiang Kao, and Mirandy Li, *LSUHSC, New Orleans, Louisiana, United States*

Low dose computed tomography (LDCT) screening can detect lung cancer early and decrease lung cancer-specific mortality for current smokers but remains under-utilized among these populations. Although African-American smokers tend to smoke less and have lower smoking pack-year histories, they have lower quit rates, higher rates of mortality from lung cancer than other racial/ethnic groups. This study examined the effectiveness of a smoking cessation intervention integrating LDCT screening among African-American smokers. This study recruited 60 African-American daily smokers over the age of 55 who qualified for LDCT screening. Participants were randomly and equally assigned into two groups (intervention and control). Overall, the mean age was 61.0 years old (standard deviation, 5.5), 61.7% of the participants were female and, 91.7% had lower incomes (<$20,000). Descriptive statistics were used to summarize demographics, smoking status, knowledge, attitudes, and stage of change for smoking cessation. The findings showed that participants in the intervention group had a lower number of daily cigarettes smoked (9.5 vs. 11.0) and a higher reduction in the number of daily cigarettes smoked (-2.3 vs. -0.9) than those in the control group. Participants in the intervention group were more likely to be in the preparation stage of the stages of change model (50.0% vs. 40.0%), progress in the stage of change (36.7% vs. 16.7%), or report already having had quit smoking (10.0% vs. 3.3%) than those in the control group. LDCT screening represents a potential "teachable moment" for African-American smokers, which may encourage them to consider these strategies for smoking cessation.

HOLISTIC WELLNESS COACHING INTERVENTION FOR OLDER ADULTS IN RESIDENTIAL COMMUNITIES

Philip Clarke[1], Matthew Fullen[2], and Jennifer Smith[3], *1. Wake Forest University, Winston-Salem, North Carolina, United States,*
2. Virginia Tech, Blacksburg, Virginia, United States, 3. Mather Institute, Evanston, Illinois, United States

Many wellness programs for older adults focus on physical health or specific conditions, such as heart disease prevention or diabetes management. To supplement these efforts, there is a need for holistic wellness programming to enhance well-being in later life. We developed and piloted a novel wellness coaching program for residents of senior living communities to address this need. The theoretical framework of the program is based on a holistic, multidimensional wellness model and self-determination theory. Staff members from eight residential communities were trained on wellness coaching techniques, such as motivational interviewing, active listening, and group facilitation skills, before they led the 9-week resident wellness coaching program. A total of 79 residents, ages 71 to 97 (M = 84.3, SD = 6.5), completed the pilot program. The resident wellness coaching program included a mixture of individual and group coaching sessions. The coaching sessions provided wellness education, social support, and space to share progress on wellness goals. Participants completed surveys at three time points: pre-program, post-program, and 1-month follow-up. Residents reported high satisfaction with the overall program and its components. Repeated measures ANOVAs were conducted to examine changes in wellness over time. Comparison of pre- and post-test scores revealed significant improvements in health satisfaction, physical and psychological quality of life, purpose, loneliness, relatedness, and competence. Some of these changes, such as increases in psychological quality of life and decreases in loneliness, persisted at the one-month follow-up. These findings have implications for the development and implementation of wellness coaching programs with older adults.

IMPACT OF AN ONLINE SOCIAL INTELLIGENCE TRAINING PROGRAM ON CUSTODIAL GRANDMOTHERS' WELL-BEING

Megan Dolbin-MacNab[1], Gregory Smith[2], Frank Infurna[3], Britney Webster[4], Luxin Hu[4], Saul Castro[3], Max Crowley[5], and Carol Musil[6], *1. Virginia Tech, Blacksburg, Virginia, United States, 2. Kent State University, Stow, Ohio, United States, 3. Arizona State University, Phoenix, Arizona, United States, 4. Kent State University, Kent, Ohio, United States, 5. Pennsylvania State University, University Park, Pennsylvania, United States, 6. Case Western Reserve University, Cleveland, Ohio, United States*

Despite widespread evidence that the circumstances leading to care, combined with the stress of full-time parenting, have profound effects on psychological, physical, and social functioning of custodial grandmothers (CGM) and their adolescent grandchildren (GC), evidence-based interventions for these families are scarce. To address this gap, we conducted a randomized clinical trial (RCT) with 349 nationally recruited CGMs which compared an online social intelligence training intervention (SIT; n=185) to an attention-control (AC; n=164) condition. The SIT focused on enhancing CGMs' capacity to develop and sustain positive social ties; an important goal since working models of attachment and caregiving are challenged and re-shaped by the off-time and demanding nature of parenting a GC. To investigate initial impact of SIT, we conducted multi-domain latent difference score models (Mplus 8) on a full intent-to-treat basis comparing the two RCT conditions on changes across key outcomes from baseline to immediate post-intervention. In comparison to AC, SIT yielded statistically significant improvement in CGMs' depressed affect, self-esteem, relationship quality with the GC, and attachment avoidance and attachment anxiety with GC. Contrary to expectations, no significant differences were found between the two conditions on outcomes indicative of social competence (e.g., perspective taking, social awareness, social information processing, social self-monitoring). We conclude that CGMs may have applied information obtained from the SIT primarily to their relationship with GC. Our findings point to the potential benefits of the self-guided SIT, given that it can be delivered online and therefore has widespread reach to a vulnerable population. [Funded by R01AG054571]

SESSION 4070 (SYMPOSIUM)

JOURNAL OF GERONTOLOGY SOCIAL SCIENCES: FEATURED 2021 EDITOR'S CHOICE ARTICLES

Chair: Jessica Kelley

Social science inquiry on age, aging, and the life course spans many topics and methodologies. This symposium highlights papers that were selected as Editor's Choice articles in the Journal of Gerontology Social Sciences in 2021. These papers highlight methodological innovations, important advancements in our state of knowledge in an area, or emerging issues in the study of aging and older adults. Nguyen et al. discuss a qualitative study of the causes and consequences of financial exploitation of older adults. Newmyer et al. present a 31-country comparative study of measures of loneliness with their reliability and validity. Rurka et al. present a mixed-methods study of sibling dynamics and tensions when caring for an older parent. Dennison and Lee provide a novel method for studying intergenerational selection effects of education and older adult health. Lin and Brown demonstrate gender differences in the economic consequences of later-life divorce and potential impact of repartnering versus staying single.

PERCEIVED TYPES, CAUSES, AND CONSEQUENCES OF FINANCIAL EXPLOITATION: NARRATIVES FROM OLDER ADULTS

Annie Nguyen, and Duke Han, *University of Southern California, Alhambra, California, United States*

We investigate the perception of financial exploitation and its causes and consequences by older adults who have firsthand experience of being exploited. Thirty-one cognitively healthy older adult participants aged 50 or older were drawn from the Finance, Cognition, and Health in Elders Study. In-depth, one-on-one interviews were conducted. Interview transcripts were analyzed using an iterative, data-driven, thematic coding scheme and emergent themes were summarized. Categories of financial exploitation included (a) investment fraud, (b) wage theft/money owed, (c) consumer fraud, (d) imposter schemes, and (e) manipulation by a trusted person. Themes emerged around perceived causes: (a) element of trust, (b) promise of financial security, (c) lack of experience or awareness, (d) decision-making, and (e) interpersonal dynamics. Perceived consequences included negative and positive impacts around (a) finances, (b) financial/consumer berhaviors, (c) relationships and trust, (d) emotional impact, and (e) future outlook. These narratives provide important insights into perceived financial exploitation and experiences.

THE CAREGIVER IDENTITY IN CONTEXT: CONSEQUENCES OF IDENTITY THREAT FROM SIBLINGS

Marissa Rurka[1], J Jill Suitor[2], and Megan Gilligan[3], *1. University of Michigan - Center for Health and Research Transformation, Superior Charter Township, Michigan, United States, 2. Purdue University, West Lafayette, Indiana, United States, 3. Iowa State University, Ames, Iowa, United States*

We draw from theories of identity and stress to examine the impact that siblings have on caregivers' psychological well-being. Using data collected from 404 caregivers nested in 231 families as part of the Within-Family Differences Study, we conduct mediation analyses to examine whether perceived sibling criticisms are associated with caregivers' depressive symptoms (a) directly and/or (b) indirectly through sibling tension. Qualitative data from the same caregivers give insight into the processes underlying statistical associations. We found an indirect relationship whereby perceived sibling criticisms were associated with greater sibling tension, which in turn was associated with higher depressive symptoms. Qualitative interviews show that efforts to mitigate the negative impact of sibling criticisms can lead to caregiver strategies that fuel sibling tension. These findings demonstrate how identity processes, as well as the family networks in which caregiving takes place, shape the experiences and consequences of parent care.

ADULT CHILDREN'S EDUCATIONAL ATTAINMENT AND PARENT HEALTH IN MID- AND LATER LIFE

Christopher Dennison, and Kristen Schultz Lee, *University at Buffalo, SUNY, Buffalo, New York, United States*

While intergenerational models of adult health contend that children's educational attainments influence the health of their parents, background characteristics that predict both can confound the results. Data from the National Longitudinal Study of Adolescent to Adult Health Parent Study are used to examine how having no children who completed college influences parents' self-rated health and depressive symptoms. We use propensity scores to assess this relationship net of potential confounders and test for heterogeneity in the consequences associated with having no children who completed college. Having no children who completed college is negatively associated with parents' self-rated health and positively associated with depressive symptoms. Among parents with the highest propensity for having no children who complete college, the consequences on depressive symptoms are greatest. These findings are important given the call for investments in children's educational opportunities as a vehicle for promoting health among adults and their older parents.

THE ECONOMIC CONSEQUENCES OF GRAY DIVORCE FOR WOMEN AND MEN

I-Fen Lin, and Susan Brown, *Bowling Green State University, Bowling Green, Ohio, United States*

Surprisingly little is known about the consequences of gray divorce (after age 50) and how women and men fare economically during the aftermath. Using longitudinal data from the 2004-2014 Health and Retirement Study, we estimated hybrid fixed/random effects models comparing women's and men's economic well-being prior to, during, and following gray divorce and subsequent repartnering. Women experienced a 45% decline in their standard of living, whereas men's dropped by just 21%. These declines persisted over time for men, and only reversed for women following repartnering, which essentially offset women's losses associated with gray divorce. Both men and women experienced roughly a 50% drop in wealth. Although repartnering seems to reverse most of the economic costs of gray divorce for women, few form new co-residential unions after divorce. This study offers insight about the financial aftermath of gray divorce, which is likely to contribute to growing economic disadvantage among older adults.

MEASURING OLDER ADULT LONELINESS ACROSS COUNTRIES

Lauren Newmyer[1], Ashton Verdery[1], Rachel Margolis[2], and Lea Pessin[1], *1. The Pennsylvania State University, University Park, Pennsylvania, United States, 2. Western University, London, Ontario, Canada*

The topic of older adult loneliness commands increasing media and policy attention around the world. Are surveys of aging equipped to measure it? We assess the measurement of loneliness in large-scale aging studies in 31 countries. In each country, we document available loneliness measures, examine correlations between different measures, and assess how these correlations differ by gender and age group. There is substantial heterogeneity in available measures of loneliness across countries. Within countries with multiple measures, the correlations between measures are high (range .38-.78). Differences by age and gender group are relatively small. Correlations between loneliness measures and living alone and being without a spouse are positive and similar in magnitude across countries, supporting construct validity. We establish that even single-item measures of loneliness contribute meaningful information in diverse contexts, with reliable and consistent measurement properties within many countries.

SESSION 4080 (SYMPOSIUM)

MULTIDIMENSIONAL CONSTRUCTS OF SLEEP IN OLDER ADULTS

Chair: Christopher Kaufmann Discussant: Katie Stone

Sleep disturbances are common in older adults and are associated with a variety of adverse mental and physical health outcomes. While most studies have characterized sleep based on a single dimension of sleep (typically sleep duration or self-reported sleep quality), there is a growing paradigm shift to characterize "Sleep Health" as multidimensional. More research is needed to identify the clinical utility of a multidimensional approach to characterizing sleep specifically in older adults. In this symposium, we will present five studies that explore how multidimensional Sleep Health relates to age-related health outcomes (e.g., fall risk). Our first presentation will identify associations between subjective/objective sleep quality and physical activity, and examine the moderating role of chronotype. Second, we will examine the extent to which a multidimensional index of Sleep Health and its individual dimensions relate to fall risk. Third, we will ascertain the impact of mindfulness on various Sleep Health dimensions. Fourth, we will identify the extent to which discordance in subjective and objective sleep metrics are related to cognitive functioning. Finally, we will explore how the accumulation of disturbances in Sleep Health may increase risk for early mortality. Findings from this symposium will highlight the clinical relevance of a multidimensional approach to Sleep Health in older adults, and identify the ways in which sleep interventions can be tailored to specific sleep dimensions to promote health in later life.

THE ASSOCIATION OF SLEEP AND PHYSICAL ACTIVITY AMONG OLDER ADULTS AND THE MODERATION OF CHRONOTYPE

Jing Huang[1], Mengchi Li[2], Miranda McPhillips[3], Nada Lukkahatai[1], and Junxin LI[1], *1. Johns Hopkins University, Baltimore, Maryland, United States, 2. Johns Hopkins, University, Baltimore, Maryland, United States, 3. University of Pennsylvania, Philadelphia, Pennsylvania, United States*

This study aimed to examine the associations of both subjectively and objectively measured sleep with self-reported level of physical activity among older adults, and explore the possible moderative role of chronotype in these associations. Baseline data of 116 community-dwelling older adults without dementia from three prior studies were included. Pittsburgh Sleep Quality Index and Actigraphy were used as subjective and objective sleep measures respectively. The Morningness-Eveningness Questionnaire was used to measure chronotype, which was further dichotomized into morning type and non-morning type. Physical activity was assessed by the Physical Activity Scale for Elderly. Multiple linear regressions were performed to examine the associations, controlling for demographic and health characteristics. We found better subjective sleep quality, shorter actigraphy sleep duration, and higher sleep efficiency were independently associated with greater physical activity. Being morning type might alleviate the association between poor subjective sleep quality and physical activity among older adults.

MULTIDIMENSIONAL SLEEP HEALTH AND RECURRENT FALLS: THE OSTEOPOROTIC FRACTURES IN MEN STUDY (MROS)

Jane Cauley[1], Stephanie Harrison[2], Peggy Cawthon[3], Andrew Kubala[4], Kristine Ensrud[5], Carolyn Crandall[6], Daniel Buysse[7], and Katie Stone[8], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. California Pacific Medical Center, Research Institute, San Francisco, California, United States, 3. California Pacific Medical Center Research Institute, San Francisco, California, United States, 4. Sleep, Tactical Efficiency, and Endurance Lab (STEEL) Research Group, San Diego, California, United States, 5. University of Minnesota Medical School and Minneapolis VA Health Care System, Minneapolis, Minnesota, United States, 6. University of California, Los Angeles, Los Angeles, California, United States, 7. UPMC, Pittsburgh, Pennsylvania, United States, 8. University of California, San Francisco, Castro Valley, California, United States*

Prospective studies have reported associations between individual dimensions of sleep and subsequent falls. Considering sleep as a multidimensional construct may provide a more comprehensive assessment. Using data from the MrOS Sleep study, we calculated a multidimensional index of sleep, operationalized as the number of disturbances in 5 dimensions of sleep (self-reported "poor": satisfaction, duration, daytime sleepiness, latency and sleep midpoint) and categorized as: 0, 1-2, >=3. A total of 3111 men, mean age 76.4 years, were studied. Logistic regression generalized estimating equations were used to model repeated measures of annually self-reported recurrent falls (≥2 falls) over 4 years of follow-up. Compared to men with no poor sleep dimensions, the Odds Ratio (OR) of recurrent falls in men with scores of 1 or 2 was 1.13 (95% Confidence Intervals, 0.96, 1.34), and in men with scores >3, the OR was 1.46(1.15, 1.84). Worse multidimensional sleep health was associated with recurrent falls.

FOCUS ON PRESENT MOMENT FOR YOUR SLEEP: MINDFULNESS PROMOTES MID-LIFE ADULTS' SLEEP HEALTH

Claire Smith, Christina Mu, Angelina Venetto, Arooj Khan, and Soomi Lee, *University of South Florida, Tampa, Florida, United States*

Sleep health during midlife sets the stage for health over the lifespan. Mindfulness, or present-moment awareness and attention, is shown to benefit sleep, yet mechanisms explaining these benefits are missing. Applying self-regulation theory, we test affective and cognitivemechanisms linking mindfulness to quantitative and qualitative sleep health. Across two independent samples of nurses (N1=60; N2=84), ecological momentary assessment (measuring mindfulness, sleep quality and sufficiency, positive and negative affect, and rumination) and actigraphy (sleep duration and wake-after-sleep-onset [WASO]) were collected over fourteen days. Multilevel mediation revealed that, between people, mindfulness generally associated with better sleep quality and sufficiency, mediated by lower rumination and negative affect. Within people, daily mindfulness associated with better sleep sufficiency, mediated by higher positive affect. Our findings position mindfulness as an emotional and cognitive self-regulation strategy that promotes midlife adults' qualitative – but not quantitative -- sleep health. Results may inform health interventions during this pivotal life stage.

CON/DISCORDANCE BETWEEN SUBJECTIVE AND OBJECTIVE SLEEP PARAMETERS AND THEIR ASSOCIATION WITH COGNITIVE FUNCTION

Kristin Calfee, and Soomi Lee, *University of South Florida, Tampa, Florida, United States*

Studies report that subjective and objective sleep parameters often do not agree with each other. This study examined if discordance between subjective and objective sleep measures are associated with cognition. Participants from the Midlife in the United States study (n=627) provided subjective (self-report) and objective (actigraphy) sleep duration and sleep quality. Discordance was assessed by absolute difference between subjective and objective z-scores in each sleep variable. Cognitive function was measured by the Brief Test of Adult Cognition by Telephone (BTACT). The correlations between subjective and objective sleep measures were weak-to-moderate (r=.43, .18 for duration and quality, respectively). Discordance scores in sleep duration and quality were each significantly associated with BTACT, such that greater discrepancy was associated with poorer cognitive function. These associations remained persistent after adjusting for sociodemographic differences. Results suggest that discordance between subjective and objective sleep parameters may relate to cognitive abilities needed to accurately monitor sleep characteristics.

A LONGITUDINAL INCREASE IN SLEEP HEALTH PROBLEMS IN MIDDLE ADULTHOOD PREDICTS EARLY MORTALITY

Soomi Lee[1], Christina Mu[1], Meredith Wallace[2], Ross Andel[1], David Almeida[3], Orfeu Buxton[3], and Sanjay Patel[4], *1. University of South Florida, Tampa, Florida, United States, 2. University of Pittsburgh, Pittsburg, Pennsylvania, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Negative consequences of sleep health problems are common in middle-age but poorly understood. This study investigated multidimensional sleep health in middle adulthood and mortality risk. Participants from the Midlife in the United States Study reported sleep characteristics in 2004-2006 (T1; n=9,640, Mage=52.72) and again in 2013-2016 (T2; n=4,334). Deaths since each survey were logged. Multidimensional sleep health composite captured Regularity, Satisfaction, Alertness, Efficiency, and Duration. Cox regression adjusted for sociodemographics and known risk factors (BMI, smoking, depression/anxiety, diabetes, and hypertension) indicated that each unit higher sleep health problems at T1 was associated with 245% and 324% increase in hazard rates for all-cause (Hazard Ratio; HR=3.45, p<.001) and heart disease (HR=4.24, p<.001) mortality, respectively. Those with an increase in sleep health problems at T2 compared to T1 had a 182% increase in all-cause mortality risk (HR=2.82, p<.05), but not heart disease mortality risk. Improving sleep health may reduce early mortality risk.

SESSION 4090 (PAPER)

OLDER ADULT PROTECTION AND ABUSE

A SCOPING REVIEW OF OUTCOMES IN ELDER ABUSE INTERVENTION RESEARCH: THE CURRENT LANDSCAPE AND WHERE TO GO NEXT

David Burnes[1], Andie MacNeil[1], Aliya Nowaczynski[1], Christine Sheppard[2], Erica Nekolaichuk[3], Mark Lachs[4], and Karl Pillemer[5], *1. University of Toronto, Toronto, Ontario, Canada, 2. Wellesley Institute, Toronto, Ontario, Canada, 3. University of Toronto Libraries, Toronto, Ontario, Canada, 4. Weill Cornell Medicine, New York, New York, United States, 5. Cornell University, Ithaca, New York, United States*

Researchers, practitioners, and policy-makers worldwide recognize elder abuse (EA) as a major threat to the health and well-being of older adults, but rigorous intervention research has greatly lagged behind this interest. A major weakness is the lack of cohesive understanding of appropriate program outcomes to be measured. To address this knowledge gap, we conducted a scoping review of the EA intervention research literature to understand the range of outcomes considered to date and to provide guidance for future research. We searched Ovid MEDLINE, Ovid Embase, Ovid PsycInfo, Ovid Social Work Abstracts, Ebsco AgeLine, Ebsco CINAHL, Wiley Cochrane Central, and Proquest Sociological Abstracts for studies evaluating community-based EA response programs. Two independent reviewers completed record search, screening, and data extraction procedures. We identified 52 eligible studies (1986-2019) that employed a total of 184 outcomes (range: 1–16, mean = 3.5). This study revealed that a large range of outcomes has been employed in EA intervention studies to date, mostly attached to victims or the intervention process itself, with inconsistent operational definitions and measurement procedures. Several key recommendations for future EA intervention research are: 1) implementing intervention outcomes that reflect multiple levels of eco-systemic influence, 2) heightening the analysis of intervention process outcomes beyond description toward identifying factors that mediate or moderate successful case outcomes, 3) conducting qualitative research with EA victims and other relevant stakeholders to understand meaningful intervention outcomes from their perspectives, and 4) establishing common EA outcome measures for implementation across studies to facilitate greater data pooling and synthesis.

FINANCIAL FRAUD EXPERIENCES AT AGE 85+: AN EXPLORATORY STUDY WITH THE MIT AGELAB 85+ LIFESTYLE LEADERS PANEL

Taylor Patskanick[1], Sophia Ashebir[2], Julie Miller[2], Lisa D'Ambrosio[2], and Joseph Coughlin[2], *1. Massachusetts Institute of Technology, Somerville, Massachusetts, United States, 2. Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

Financial exploitation of older adults has emerged as one of the most common and costly forms of elder abuse. While prior research has examined the risk and protective factors that contribute to older adults' experiences of being defrauded, less has specifically explored the prevalence of these factors among the 85+ age demographic. This not only includes hearing from the 85+ directly about the factors that have contributed to successful financial exploitation, but also the factors that contributed to their experiences of unsuccessful and 'near miss' exploitation. This paper shares findings from a mixed methods study with the MIT AgeLab 85+ Lifestyle Leaders, a U.S.-based panel of octogenarians and nonagenarians. Leveraging an online survey (n=32) and virtual focus groups (n=18) conducted in September 2021, findings distinguish among three categories of experiences with financial fraud – those had been, almost were, or have never been a victim of financial fraud within the past five years.

In particular, 'almost victims' frequently scored in between 'have been' and 'have never been' victims with regard to several questionnaire variables. Six perceived risk factors for financial fraud victimization emerged from both data sources, including being older, cognitive decline, misplaced trust and a lack of knowledge, loneliness, technology use, and stereotypes of older adults. The majority of Lifestyle Leaders identified protective factors including, knowledge about protecting oneself from financial scams, a lifetime of experience and one's social network. These findings will be discussed in further detail along with their implications for multidisciplinary professionals working with older adults.

FINANCIAL SCAMS TARGETING OLDER ADULTS DURING COVID-19

Scott Beach[1], Sara Czaja[2], Richard Schulz[3], David Loewenstein[4], and Peter Lichtenberg[5], *1. University Of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. Weill Cornell Medicine, New York City, New York, United States, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 4. University of Miami, Miami, Florida, United States, 5. Wayne State University, Detroit, Michigan, United States*

The COVID pandemic afforded financial scammers with new opportunities to target older adults. This paper presents data from a telephone survey conducted June–September, 2020 with 380 participants from a larger National Institute of Aging study examining financial exploitation among older adults. The survey assessed COVID-related scams in three areas: (1) products, testing, treatments; (2) financial assistance (e.g., stimulus checks); and (3) charities. Questions focused on scam exposure / attempts, mode of contact, responses, and whether the older adult reported it to someone. The sample (284 Pittsburgh; 96 New York City) was 64% female; mean age = 73.6; and 47% White, 41% African American, 12% Hispanic. Across all scam types, 18.4% reported scam attempts / exposure; 24% of those exposed engaged / responded without getting scammed (11%); or were actually scammed (13%); and 40% told someone about it. The most frequent modes of contact were: telephone (54%), internet / email (40%), or mail (29%). Controlling for sociodemographics, participants from NYC were more likely to be exposed (OR = 1.91; p=.036); as were those reporting more loneliness (8-item UCLA scale; OR = 1.06; p=.042); and those reporting that COVID had worsened their emotional well-being to a greater extent (OR = 1.57; p=.032). Older adults who were more socially isolated / lonely were also more likely to have been scammed and less like to tell anyone about it. Psychosocial factors play an important role in exposure and response to scams during pandemics. Implications for policy, intervention, and general scam susceptibility are discussed.

RESIDENT-TO-RESIDENT AGGRESSION: PREVALENCE AND RISK FACTORS

Elsie Yan[1], Daniel WL Lai[2], Vivian Wei Qun Lou[3], Habib Chaudhury[4], Karl Pillemer[5], and Mark Lachs[6], *1. The Hong Kong Polytechnic University, Hong Kong, Hong Kong, 2. Hong Kong Baptist University, Hong Kong, Hong Kong, 3. The University of Hong Kong, Hong Kong, Hong Kong, 4. Simon Fraser University, Vancouver, British Columbia, Canada, 5. Cornell University, Ithaca, New York, United States, 6. Weill Cornell Medicine, New York, New York, United States*

This study examines the rates and risk factors of resident-to-resident aggression in long term care facilities in Hong Kong. A total of 800 personal care worker participated. Participants averaged 42.03 years of age (SD=7.63), were mostly female (92.7%), married (79.1%) and reported an average of 6.28 years of experience in long term care. 96.9 percent of the participants provided care to residents with dementia but 58.9% considered the training they received insufficient. Resident-to-resident aggression was common: All participants reported having witnessed verbal aggression (100%), 18% disruptive behaviors, 11.8% physical violence, and 3.1% sexual aggression.Resident-to-staff aggression was commonly reported with verbal aggression being the most common (97.6%) following by other disruptive behaviors (13.7%), physical violence (10.7%), and sexual aggression (8.5%). Logistic regression analysis indicated that disruptive behaviors and physical violence were associated with perpetrator male gender, dementia, and neuropsychiatry symptoms, as well as staff prior and current experience of taking care of persons with dementia, not having received training in dementia care, and perceived insufficiency of training. Sexual aggression was associated with perpetrator male gender and staff female gender. There is an urgent need to provide supportive services to prevent and intervene resident-to-resident aggression in long term care facilities. Improving management of behavioral and psychological symptoms of dementia through sufficient staff training and adequate staffing ration may be helpful in this aspect.

USE OF MOTIVATIONAL INTERVIEWING IN THE CONTEXT OF ELDER ABUSE INTERVENTION: THE RISE PROJECT

Andie MacNeil[1], David Burnes[1], Marie-Therese Connolly[2], Erin Salvo[3], Patricia Kimball[4], Geoff Rogers[5], and Stuart Lewis[6], *1. University of Toronto, Toronto, Ontario, Canada, 2. University of Southern California, Los Angeles, California, United States, 3. Department of Health and Human Services, Augusta, Maine, United States, 4. Elder Abuse Institute of Maine, Brunswick, Maine, United States, 5. Silberman School for Social Work of Hunter College, New York, New York, United States, 6. Geisel School of Medicine, Hanover, New Hampshire, United States*

Despite the increasing number of elder abuse (EA) cases, many EA victims are reluctant to engage with formal support services, such as Adult Protective Services (APS). For EA interventions to be effective, it is important to overcome this client reluctance. This study examined the use of motivational interviewing (MI) by elder advocates, as a component of a larger EA intervention model, RISE (Repair Harm, Inspire Change, Support Connection, Empower Choice), developed in partnership with Maine APS and the Elder Abuse Institute of Maine. The advocate role was developed, in part, to increase service acceptance/utilization among EA victims. Advocates are trained in MI, a collaborative, client-centered approach designed to help individuals explore and resolve ambivalence around making a change. This study conducted qualitative interviews and a focus group interview with all advocates (n = 4) working within the RISE model to understand how MI is applied in the context of an EA intervention. Three domains were identified: (1) therapeutic relationship, which describes the importance of foundational relationship building to support EA victims; (2) techniques, which refers to the MI strategies that advocates apply and adapt in the context of EA intervention; and (3) implementation challenges, which discusses the difficulties that advocates encounter when using MI with victims of EA. Overall, the experiences of advocates suggest MI is a beneficial and amenable approach to help EA victims navigate feelings of ambivalence and explore their motivation for change. This study represents the first in-depth exploration of MI in the context of EA intervention.

SESSION 4100 (PAPER)

OUTPATIENT CARE AND ER VISITS

CHARACTERIZING AVOIDABILITY OF NURSING HOME RESIDENTS: COMPARING THE CLAIMS-BASED ALGORITHM AND NURSE ASSESSMENT

Justin Blackburn[1], Jennifer Carnahan[2], Susan Hickman[3], Greg Sachs[4], and Kathleen Unroe[2], *1. IU Richard M. Fairbanks School of Public Health at IUPUI, Indianapolis, Indiana, United States, 2. Indiana University Center for Aging Research, Regenstrief Institute, Inc., Indianapolis, Indiana, United States, 3. Indiana University School of Nursing, Indianapolis, Indiana, United States, 4. Indiana University (IU) Center for Aging Research, Regenstrief Institute, Inc., Indianapolis, Indiana, United States*

The elevated risks associated with transferring nursing home residents to the hospital are problematic, but identifying which transfers can be avoided is complex. Using billing claims to determine "avoidability" based on hospital discharge diagnostic codes ignores resource constraints, clinical comorbidities, and asymmetrical information between nursing home staff making the transfer decision at the onset of clinical changes and hospital billing departments following treatment and diagnostic procedures. Conversely, relying on clinical staff assessments at the time of transfer may be an impractical and resource-intensive strategy to drive payment reform and improve quality. Using Medicare claims data representing emergency department and hospitalization transfers from 38 nursing facilities in Indiana from 2016-2020, we compared classification of transfers using a claims-based algorithm and trained nurse assessments of avoidability. Among 960 transfers, nurses judged 48.4% were potentially avoidable while 30.8% were classified as such using claims data. Of concordant assessments, 15.3% were avoidable and 36.0% as not avoidable. Of discordant assessments, 33.1% were judged avoidable by nurses only and 15.5% via the claims-based algorithm (Kappa=0.0153). Discordance was most frequent among transfers with heart failure (64%, n=42), psychosis (74.5%, n=34), acute renal disease (50%, n=28); and lowest among urinary tract infections (31.3%, n=64). No resident demographic or clinical characteristics were associated with discordance (age, race, sex, cognitive function scale, activities of daily living, or CHESS scale). High discordance in determining avoidability may be driven by presentation of symptoms or other condition-specific factors. Policies to reduce avoidable hospitalizations must not rely on overly simplistic approaches for identification.

HEALTH RISKS AMONG OLDER ADULTS ACCORDING TO PRIMARY LANGUAGE: EVIDENCE FROM MEDICARE ANNUAL WELLNESS VISITS

Amjed Alsulaily[1], Kristen Berg[2], Lorella Luezas-Shamakian[2], Douglas Einstadter[2], and Adam Perzynski[3], *1. Case Western Reserve University, Qatif, Ash Sharqiyah, Saudi Arabia, 2. The MetroHealth System, Cleveland, Ohio, United States, 3. MetroHealth and Case Western Reserve University, Cleveland, Ohio, United States*

Emerging evidence suggests that older adults benefit from the Medicare Annual Wellness Visit (AWV). Lind and colleagues found that between 2011 and 2016, utilization of the AWV increased from 8.1% to 23.0%. However, compared with non-Hispanic whites, AWV utilization is 11.6% points lower for Hispanic/Latinos and 10.2% lower for non-Hispanic Blacks. AWV differences by primary language have not been previously reported. We examined the rate of AWV utilization for older adults with English vs. Limited English Proficiency (LEP) among patients seen at a large urban health system in northeastern Ohio. Using Bonferroni-corrected chi-square and t-tests, we also evaluated the association between LEP and health risks (e.g., depression, falls, activities of daily living, cognitive status) assessed during the AWV. Using the electronic health record, we identified 41,262 Medicare patients aged 65+ who were eligible for the AWV. Of those identified, 42.8% completed an AWV between 2019 to 2021. Persons who were white (41.7%), Hispanic (37%), male (39.9%), Spanish-speaking (37.2%) or other LEP (41.2%) had lower utilization of AWVs (p<.001). Pain and fatigue ratings, depressive symptoms, and oral health problems and were similar between language groups, while cognitive impairment (p<.001), functional independence (p<.001), and self-rated health (p<.001) were substantially worse among non-English speakers. LEP is associated with a lower rate of AWV utilization and worse self-rated health. A clearer understanding of how speaking a different language from that in which the AWV is conducted is important for clarifying discrepancies and disparities in minority population health.

IMPACT OF NON-NATIVE ENGLISH SPEAKING ON MEDICATION PROBLEMS AND ER VISITS AMONG COMMUNITY-DWELLING OLDER ADULTS

YUJUN ZHU[1], and Susan Enguidanos[2], *1. University of Southern California, SOUTH PASADENA, California, United States, 2. University of Southern California, Los Angeles, California, United States*

Older adults have higher risk of experiencing medication related problems (MRPs), leading to increased morbidity, healthcare utilization, and mortality. Few studies have examined the relationship between non-native English speaking (NNES) and MRPs and their association with health service use. This study aimed to explore language disparities in MRPs and their relationship to emergency room (ER) visits among community-dwelling older adults. We used secondary enrollment data from a community medication program for older adults (N=180). We conducted linear regression to examine the relationship between NNES and MRPs, and logistic regression to explore the association between MRPs and ER visits. Generalized structural equation modeling (GSEM) with bootstrapping was used to test the indirect effect between NNES through MRPs to ER visits. The sample was diverse with 40% White, 30% Hispanic, 22% African American, and 8% of other races; 18% were non-native English speakers. Analysis showed NNES was associated with having 2.7 more MRPs than native English-speaking participants, while race was not significant, after controlling for covariates. Each additional MRP was associated with a 9% increased probability of having an ER visit. The GSEM results found a significant indirect effect between NNES through MRPs to ER visits (β, 0.27; 95% CI, 0.07 to 0.61). Although NNES was not directly related to ER visits, it may have inhibited the ability of Hispanics to read important medication instructions, contributing to their elevated risk of experiencing MRPs, thus indirectly increasing potential risks leading to ER visits. Further research is needed to better understand this relationship.

TRENDS IN FALL-RELATED EMERGENCY DEPARTMENT VISITS INVOLVING ALCOHOL AMONG OLDER ADULTS: 2011–2020

Yara Haddad[1], Gwen Bergen[1], Iju Shakya[2], Keming Yuan[1], Royal Law[1], Briana Moreland[3], and Tadesse Haileyesus[1], *1. Centers for Disease Control and Prevention, Atlanta, Georgia, United States, 2. Oak Ridge Institute for Science and Education, Oak Ridge, Tennessee, United States, 3. Cherokee Nation Operational Solutions, Atlanta, Georgia, United States*

Falls disproportionately affect older adults (≥65) resulting in three million emergency department (ED) visits annually. The relationship between alcohol and falls is unclear, but side effects of alcohol consumption include gait and balance impairments, which are risk factors for falls. This study examined trends of older adult fall-related ED visits involving alcohol from 2011-2020. Alcohol data are not routinely collected during ED visits. Alcohol involvement was identified from National Electronic Injury Surveillance System-All Injury Program free-text narratives using natural language processing and text analytic techniques. Joinpoint regression was used and cross-validated with SAS to determine significant older adult fall changes from 2011-2020 by sex and to compare older adult trends to adults < 65 (20-34, 35-54, 55-64). From 2011-2020, 2.2% of all ED visits for older adult falls involved alcohol. Alcohol-involved fall ED visit rates for older adults increased annually by 7.2% (95%CI:6.1%-8.4%). These older adult ED visit rates increased by 6.8% (95%CI:5.4%-8.2%) for males and 7.4% (95%CI:6.0%-8.9%) for females annually. For adults aged 20-34 and 35-54, alcohol-involved fall ED visit rates increased annually by 1.3% (95%CI:0.1%-2.6%) and 3.8% (95%CI:2.7%-5.0%), respectively, until 2017 and then decreased by 4.4% (95%CI:1.2%-7.5%) and 4.0% (95%CI:0.3%-7.5%). For adults aged 55-64, ED visit rates increased annually by 8.5% (95%CI:6.8%-10.2%) until 2018 and then stabilized. Documenting alcohol use when treating falls is important for monitoring trends. Assessing alcohol use in conjunction with assessments for other fall risk factors can inform healthcare providers on effective strategies to recommend to reduce fall risk.

SESSION 4110 (SYMPOSIUM)

PANDEMIC VULNERABILITY AND RESILIENCE: QUANTITATIVE AND QUALITATIVE FINDINGS FROM THE COVID-19 COPING STUDY

Chair: Jessica Finlay Co-Chair: Lindsay Kobayashi

The COVID-19 Coping Study aims to investigate social, behavioral, health, and economic impacts of the pandemic on the health and wellbeing of aging Americans. A total of 6,938 adults aged ≥55 were recruited from all 50 US states, the District of Columbia, and Puerto Rico from April-May, 2020, using a multi-frame online recruitment strategy. Participants completed a 20-minute baseline survey and a subset were recruited to complete monthly follow-up surveys for one year. A random subsample of 57 participants completed semi-structured interviews in May-July, 2021. This symposium will share novel mixed-methods insights into the ongoing experiences, perspectives, significant life events, and mental health changes among aging US adults during the COVID-19 pandemic. First, Kobayashi will describe the dynamic, longitudinal relationships between loneliness, anxiety, and COVID-19 worry with cognitive function and abilities. Second, Abrams investigates long-term employment outcomes and mental health trajectories among a particularly vulnerable group of older adults: those who experienced work disruptions and job loss early in the pandemic. Third, Meltzer will share how particular groups of older adults were more likely to report greater closures of key places to socialize in their neighborhoods since the pandemic onset. Fourth, Finlay will present a qualitative thematic analysis of ongoing pandemic sources of risk and vulnerability among marginalized and underserved aging adults. The symposium highlights diverse strengths and resiliencies to cope with adversities of the pandemic. Findings may inform individual-strategies and community-level policies to support aging adults during times of collective stress and trauma.

ACUTE RELATIONSHIPS BETWEEN MENTAL HEALTH AND COGNITIVE FUNCTION AMONG AGING ADULTS DURING THE COVID-19 PANDEMIC

Lindsay Kobayashi[1], Brendan O'Shea[1], Carly Joseph[2], and Jessica Finlay[1], *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Central Michigan University, Ann Arbor, Michigan, United States*

The acute impacts of COVID-19-related mental health concerns on cognitive function among aging adults are unknown. We investigated whether between-person (BP) differences and within-person (WP) changes in loneliness, anxiety, and COVID-19 worry were related to cognitive function and abilities in the COVID-19 Coping Study over nine months from August/September 2020 through April/May 2021 (n=2,262). Marginal structural models accounting for depression as a time-varying confounder and incorporating attrition and sampling weights estimated the BP and WP relationships of loneliness, anxiety, and COVID-19 worry with PROMIS cognitive function and abilities scores over time. In any given month, experiencing a loneliness or anxiety score higher than the sample mean (BP difference) as well higher than one's personal mean across the nine-month period (WP change) were negatively associated with cognitive function and abilities in that month. Future research should explore long-term impacts of loneliness and anxiety experienced during the pandemic for population cognitive aging.

OLDER ADULTS' WORK DISRUPTIONS IN APRIL/MAY 2020: IMPLICATIONS FOR WORK STATUS AND MENTAL HEALTH OVER 6 MONTHS

Leah Abrams[1], Jessica Finlay[2], and Lindsay Kobayashi[2], *1. Tufts University, Department of Community Health, Medford, Massachusetts, United States, 2. University of Michigan, Ann Arbor, Michigan, United States*

Using the COVID-19 Coping Study, we sought to determine how work disruptions for older adults in April/May 2020 related to labor force status in September/October 2020 and mental health throughout those six months (N=2,367). One-third of respondents who lost their job in April/May were unemployed at the end of follow-up, while 15% were unemployed after furloughs and 9% after reduced hours/income. One-quarter of those furloughed in April/May were out of the labor force at follow-up – evidence of a potential pathway from furloughs into retirement. Being employed at follow-up was most common after work-from-home in April/May (90%). Multi-level models revealed differences in mental health trajectories over six months according to baseline work disruptions, including persistently high anxiety following job loss and delayed upticks in anxiety and depressive symptoms when working from home. This research provides insights into longer-term economic and mental health ramifications of pandemic-related work disruptions among older workers.

SOCIAL PLACES: SHIFTING NEIGHBORHOOD PERCEPTIONS AMONG AGING AMERICANS DURING COVID-19

Gabriella Meltzer[1], Brendan O'Shea[2], Michael Esposito[3], Lindsay Kobayashi[2], Ashly Westrick[2], and Jessica Finlay[2], *1. Columbia University, New York, New York, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Washington University in St. Louis, St. Louis, Missouri, United States*

This study examines individual and community factors related to older adults' perceived losses in places to socialize with people of similar and different ages in their neighborhoods during COVID-19. In the 11-month wave of the COVID-19 Coping Study from March-April 2021, responses to perceived availability were "Less," "About the Same," or "More." Most respondents reported less availability in places to socialize with those of similar (68.0%) or different (68.4%) ages. Ordinal logistic regressions showed respondents who lived alone perceived less availability in places to socialize with those of similar or different ages than those living with others (ORs 0.67, 95% CI 0.47, 0.97). Those living in metropolitan compared to non-metropolitan areas also perceived less availability in places to socialize with those of similar ages (OR 0.62, 95% CI 0.39, 0.98). These findings enhance our understanding of COVID-19-related losses in community resources that facilitate healthy aging in place.

STRUGGLES AND STRENGTH: A QUALITATIVE STUDY OF DIVERSE VOICES FROM THE COVID-19 COPING STUDY

Jessica Finlay, Marisa Eastman, and Lindsay Kobayashi, *University of Michigan, Ann Arbor, Michigan, United States*

This paper aims to explore complex realities and nuanced lived experiences in how diverse older adults are making sense of and dealing with the COVID-19 pandemic. We conducted semi-structured video and phone interviews with 57 COVID-19 Coping Study participants (average age 70.7 years, 44% female, 49% white) from May-July 2021. Qualitative thematic analysis identified physical, mental, social, and economic struggles. These included heightened COVID-19 risk given comorbidities, difficulties accessing healthcare, distressing political events, diminished sense of safety, distance to family and support networks, inability to collectively mourn, and exacerbated financial instability. Coping strategies included exercise, hobbies, spirituality, online activities, engaging with family and friends, and self-care practices. Community-level sources of resilience included vaccines, telemedicine, stimulus checks, and community groups/services. These results highlight profound resiliency and strength to cope with adversities of the pandemic and may inform strategies to support underrepresented and underserved older adults during and after the pandemic.

SESSION 4120 (PAPER)

PHYSICAL FUNCTION AMONG OLDER ADULTS AND CAREGIVERSARTHRITIS AMONG CAREGIVERS—BRFSS 2017, 2019

Eva Jackson[1], Michael Boring[2], Lisa McGuire[2], John Omura[2], Benjamin Olivari[2], Erica Odom[2], and Janet Croft[2], *1. Alzheimer's Association, Chicago, Illinois, United States, 2. CDC, Atlanta, Georgia, United States*

Unpaid caregivers are people who provide support to a family member or friend with a health condition or disability. While there are benefits to caregiving, it can negatively affect caregivers' physical and mental health. Arthritis and caregiving affect 58.5 million and 53 million U.S. adults, respectively, and these numbers are expected to increase with increasing numbers of older adults. Little is known about the experience of caregivers with arthritis. Data from the 2017 and 2019 BRFSS were combined for all states that administered the optional Caregiving and the core Arthritis modules (17 states; n=91,224). Analyses accounted for the complex sampling design using SUDAAN (version 11.0; RTI International). Statistical significance was determined at $\alpha=0.05$.Overall, 20.6% of respondents were caregivers, among whom 35.1% had arthritis compared with 24.5% of non-caregivers ($p < 0.001$). Arthritis among caregivers was higher in all 17 states compared to non-caregivers. Among adults with arthritis, caregivers were more likely to be younger, female, White, and more physically active than non-caregivers. Caregivers were also more likely to experience arthritis-related activity and work limitations than non-caregivers. Arthritis-related limitation outcomes varied at the individual state levels.Among caregivers, those with arthritis provided more care in weekly hours and duration (years) and were more likely to report difficulty walking or climbing stairs, dressing or bathing, and doing errands alone than caregivers without arthritis. Given the disparities between caregivers with and without arthritis, it is crucial for public health to collect data on the experience of caregivers with arthritis.

ASSOCIATIONS OF GAIT CHARACTERISTICS AND VARIABILITY WITH WALKING EFFICIENCY IN OLDER ADULTS

Fangyu Liu[1], Yurun Cai[2], Laura Skow[1], Amal Wanigatunga[1], Qu Tian[3], Eleanor Simonsick[4], and Jennifer Schrack[1], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 3. National Institutes on Aging, Baltimore, Maryland, United States, 4. National Institute on Aging, Baltimore, Maryland, United States*

Higher energetic cost of walking per unit distance has been linked to many adverse health outcomes in older adults. Aging-related changes in gait characteristics have been postulated to contribute to energetic inefficiency, but previous studies focused on younger adults, and/or examined only a few gait characteristics. In the Baltimore Longitudinal Study of Aging, 507 older adults ≥50 years (72.3±9.8 years, 48.3% women, 48.3% black) without stroke and Parkinson disease had concurrent measurements of usual-paced gait characteristics using 3D motion analysis and energetic cost of walking using indirect calorimetry during a 2.5-min usual-paced overground walk. We tested the associations of the mean and the coefficient of variance (CV) of cadence (steps/min), swing time (ms), double support time (ms), stance time (ms), step time (ms), step length (cm), and step width (cm) with energetic cost of walking using linear regression models, adjusting for demographics, body composition, comorbidities, and gait speed. We found that a 5-cm shorter step length was associated with 0.40 ml/kg/100m higher cost of walking (p< 0.001). A 1% higher CV in swing time and 1% lower CV in step width was associated with 0.152 ml/kg/100m higher (p=0.044) and 0.023 ml/kg/100m lower (p=0.022) cost of walking, respectively. Our results suggest that mean step length and variability in swing time and step width could potentially contribute to the rising cost of walking in older adults. Future longitudinal studies are needed to understand whether changes in gait variability can predict increased energetic cost of walking and can be intervened to preserve energy efficiency.

STAIR CLIMB TIME AND FUNCTIONAL POWER ASSOCIATIONS TO MUSCLE FUNCTION AND PHYSICAL PERFORMANCE

Elsa Strotmeyer[1], Li-Yung Lui[2], Nancy W. Glynn[1], Adam Santanasto[3], Stephen Kritchevsky[4], Peggy Cawthon[5], Anne Newman[6], and Jane Cauley[6], *1. School of Public Health, University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. University of California at San Francisco, San Francisco, California, United States, 3. School of Public Health, University of Pittsburgh, Oakmont, Pennsylvania, United States, 4. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 5. California Pacific Medical Center Research Institute, San Francisco, California, United States, 6. University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Repeated stair climbing assesses sustained performance and neuromuscular components of movement, including functional muscle power (force*velocity). However, repeated stair climb associations to standard muscle and physical function measures are not established in older adults. We hypothesized that stair climb time (sec), and ascend power (peak and average; Watts=W) over 3 stair climb laps were associated with standard muscle function, physical function and risk factors in the Study of Muscle, Mobility and Aging (SOMMA; preliminary baseline N=455; 76.9+/-5.3 years; 58.0% women; 85.7% White). Adjusting for age, sex, race, and BMI using multivariate linear regression, stair climb time, peak power and average power were significantly associated with all standard muscle (Keiser leg press 1-RM strength and power; grip strength) and physical function (400m walk speed, SPPB and components) measures. Women had worse stair climb performance vs. men (all p< 0.01) including: longer total time (29.6+/-8.1 vs. 27.4+/-6.7 sec), lower peak power (121.9+/-34.5 vs. 161.4+/-39.0 W), and lower average power (94.9+/-24.3 vs. 124.1+/-28.4 W). Adjusting for age, sex, race, BMI, CHAMPS total physical activity/week, CES-D depressive symptoms, and comorbidity count using multivariate linear regression, older age was related to slower stair climb time and lower peak/average power. Other known risk factors were also associated with worse stair climb performance: non-White race (average power only), lower physical activity (peak/average power only), BMI, depressive symptoms, and higher comorbidity (time only). Repeated stair climb time and power may capture unique aspects of functional decline with aging and are associated with standard muscle and physical function measures.

TILT TEST TOLERANCE AFTER TWO-WEEKS BED REST IN OLDER ADULTS IS NOT PROTECTED BY DAILY AEROBIC AND RESISTANCE EXERCISE

Andrew Robertson[1], Richard Hughson[2], Eric Hedge[2], Carmelo Mastrandrea[2], and Federico Granados Unger[2], *1. University of Waterloo, Waterloo, Ontario, Canada, 2. Schlegel-UW Research Institute for Aging, Waterloo, Ontario, Canada*

Bed rest is associated with increased risk of orthostatic intolerance on return to upright posture and, at least in young adults, regular exercise during bed rest is proposed as protective. 22 older adults (55-65 years, half women) participated in a randomized trial with 14-days of continuous 6-degree head-down bed rest. Half completed 60 min/day of aerobic and high-intensity interval cycling plus resistance exercises (Ex) while the other half were control (Con). A passive 80-degree head-up tilt (HUT) to a maximum of 15-min assessed orthostatic tolerance while cardio- and cerebrovascular responses were monitored to a pre-syncopal level of systolic blood pressure < 90 mmHg. In pre-bed rest baseline, all but 3 women (Ex) completed 15-min HUT. After 14-days bed rest, only 3 men (1 Ex) and 1 woman (Ex) completed 15-min with no differences in tolerance between men and women or Ex and Con. Vasovagal syncope presented in 5 participants (2 M-Con, 1 M-Ex, 1 F-Con, 1 F-Ex), most other non-finishers had progressive reduction in stroke volume without adequate vasoconstriction. Reductions in cerebral blood velocity measured during HUT by Doppler ultrasound revealed strong linear relationships to both end-tidal PCO2 and mean arterial pressure across all participants. These data indicate that neither older men nor older women were protected from orthostatic intolerance by 60-min per day exercise including high-intensity interval training. These data contrast with previous findings in younger adults in controlled trials of bed rest pointing to the need for greater understanding of mechanisms regulating blood pressure and brain blood flow.

SESSION 4130 (SYMPOSIUM)

PRESIDENTIAL SYMPOSIUM: RACIAL AND ETHNIC HEALTH DISPARITIES ACROSS THE LONG-TERM SERVICES AND SUPPORTS CONTINUUM: NEED FOR POLICY AND ACTION

Chair: Debra Dobbs Discussant: Larry Polivka

The pandemic further exacerbated racial and ethnic health disparities with BIPOC (Black, Indigenous and People of Color) communities experiencing significantly higher infection rates and higher hospitalization rates compared to White populations. Underlying medical conditions that disproportionately affect BIPOC populations (e.g., cardiovascular disease, diabetes, COPD) and social determinants of health (income, community and environmental factors, access to health care and job security) can account in large part for increased rates of morbidity and mortality. Within the long term services and supports (LTSS) continuum, health disparities exist in both who receives and provides care. The four papers in this Social Research Policy and Practice Presidential Symposium will highlight factors that result in health disparities across the LTSS continuum and propose possible policy and practice solutions to address the disparities. The first paper presented will be an overview of existing nursing home workforce issues that continue to impact disparities in the quality of resident care. The second paper presented examines nursing home resident quality of life disparities from a measurement perspective. The third paper will highlight issues on elder abuse and mistreatment of rural elders, American Indian and Alaskan Natives. The fourth paper will present recommendations from key stakeholders of the RAISE Family Caregiving Advisory Council on how to meet the needs of underrepresented groups (AAPI, BIPOC, Indigenous peoples) of family caregivers. Policy and practice solutions to reduce disparities will be discussed.

REBUILDING THE NURSING HOME WORKFORCE: A TIME FOR CHANGE

Louisa Holaday[1], and Jasmine Travers[2], *1. Icahn School of Medicine at Mount Sinai, New York, New York, United States, 2. New York University, New York, New York, United States*

The COVID-19 pandemic magnified several long-standing problems in nursing homes, including issues within the nursing home workforce. Issues include staffing shortages, high turnover, low pay, inadequate training, poor treatment and limited access to resources. Research suggests that workforce issues of these kinds have the potential to significantly threaten and further increase disparities in the quality of care for nursing home residents. Thus, solutions are needed that ensures the nursing home workforce receives adequate investment so that these critical personnel are able to more effectively do the work that they do. In this presentation, workforce issues salient within the nursing home setting will be elaborated and potential solutions to mitigating these issues will be discussed.

MECHANISMS TO ADDRESS RACIAL/ETHNIC DISPARITIES IN NURSING HOME QUALITY OF LIFE

Tetyana Shippee, *University of Minnesota, Minneapolis, Minnesota, United States*

Evidence documents racial/ethnic disparities in access, quality of care, and quality of life (QoL) among nursing home (NH) residents who are Black, Indigenous and persons of color. Yet, little is known about mechanisms for these disparities. This presentation examines the mechanisms for racial/ethnic disparities in QoL in high-proportion BIPOC facilities while highlighting variability in QoL disparities across these facilities. The presentation uses data from a 5 year mixed-methods project involving 96 resident interviews; 61 staff interviews; and 614 hours of observations in high proportion BIPOC facilities in MN, coupled with resident clinical Minimum Dataset assessments linked with survey data on residents' QoL. The findings show significant racial/ethnic disparities in QoL with need for system level changes. Given the increasing racial/ethnic diversity of NHs, ensuring equity in QoL for BIPOC residents is an urgent priority for NHs to remain relevant in the future.

ELDER ABUSE IN SPECIAL POPULATIONS IN THE US: AMERICAN INDIANS AND ALASKA NATIVES AND THOSE LIVING IN THE RURAL SOUTH

Pamela B. Teaster Teaster, *Virginia Polytechnic Institute & State University, BLACKSBURG, Virginia, United States*

The number of older adults who experience abuse, neglect, and exploitation as well as the complexities of the cases continue to increase, despite advances in prevention and intervention of the problem. At once a multifaceted problem that involves intertwining individual, relational, community, and societal contexts, issues related to elder abuse become even more complicated among special populations, which require a nuanced understanding and approach to prevention, detection, and intervention. This presentation is a compilation of the findings from studies of the mistreatment of older American Indians and Alaska Natives (AIANs) and adults living in the rural south, all populations that are understudied. Both research and practical policy and practice solutions that have the potential to resolve disparities in these populations will be discussed.

SUPPORTING DIVERSE FAMILY CAREGIVERS

Pamela Nadash, *University of Massachusetts Boston, Boston, Massachusetts, United States*

The RAISE Family Caregiving Advisory Council, created under the Recognize, Assist, Include, Support, and Engage (RAISE) Family Caregivers Act (2018) has been tasked to support the Secretary of Health and Human Services in developing a national family caregiving strategy. This presentation reports on research commissioned to support the activities of the Council, which aimed to engage a broad range of stakeholders in identifying concrete strategies to carry out the Goals identified as critical to supporting family caregivers. One priority was to engage with organizations representing the diversity of family caregivers, including groups working with Blacks, Indigenous people, Asian-Americans, Pacific Islanders, and other people of color, along with groups such as faith organizations that work with under-resourced communities. Respondents had much to say regarding mechanisms for ensuring access to services and supports among diverse family caregivers, most notably identifying support for "community ambassadors" as key, as well as targeted awareness campaigns.

SESSION 4140 (SYMPOSIUM)

REACHING THE LIMIT: CENTENARIANS IN THE HEALTH AND RETIREMENT STUDY

Chair: Peter Martin Discussant: Jennifer Ailshire

Although life expectancy has increased significantly over the last century, it is still unlikely that individuals reach the century mark of their lives. As a result, it is difficult to study a large enough sample of centenarian survivors; it is even more difficult to follow developmental trajectories of those who survive into very late life. The AHEAD sample of the Health and Retirement Study (HRS) contains longitudinal data of older adults who first participated in 1993. More than 500 HRS participants survived to at least 98 years of age. In this symposium, we present three uses of the data: first, we compare centenarians to older adults who did not survive into their nineties. Second, we compare different cohorts of centenarians with regard to health and psychosocial behavior. Third, we follow participants from their eighties to 100 years of age. The first presentation provides an overview of the HRS subsample. The second presentation highlights the personality profiles of centenarians. The third presentation traces health and psychological well-being among centenarians in the HRS. Finally, we discuss trajectories of cognition and functional limitations for three cohorts of centenarians. The results provide important information for policies and practical implications for families and service providers to older adults, highlighting available resources and health and well-being changes in very late life.

INTRODUCING THE CENTENARIANS IN THE HEALTH AND RETIREMENT STUDY

Peter Martin[1], Gina Lee[1], Rotem Arieli[2], and
Yeon Ji Ryou[1], *1. Iowa State University, Ames, Iowa, United States, 2. Iowa State University, Bellevue, Washington, United States*

The Health and Retirement Study (HRS) is a nationally representative sample of older adults, and data are available for 15 waves. This presentation presents an overview of the oldest cohort of the HRS (the AHEAD sample) as they become centenarians. Basic characteristics of these centenarians and near centenarians (98 years and older, N = 516) indicate that they are primarily female (77 percent), White (82 percent) with on average 10.6 years of education. The average age was 84.2 years at baseline and 98.3 years at wave 14. We analyze data by comparing centenarian survivors to nonsurvivors, by following them longitudinally, and by comparing different cohorts of centenarians over historical time. Results indicate that centenarians continue to enjoy life, and they have special survivorship characteristics. Newer cohorts, however, show a more compromised quality of life. The results are relevant to family members of oldest-old adults and to community service providers.

PERSONALITY PROFILES OF CENTENARIANS AND NEAR-CENTENARIANS IN THE HEALTH AND RETIREMENT STUDY

Yeon Ji Ryou, *Iowa State University, Ames, Iowa, United States*

Centenarians are typically considered exceptional survivors who maintain their general health. The current study aims to track the change of personality over time and examine the differences between centenarians (defined as 98+ years; n = 516) and a group of non-survivors (died before 98; n = 6,771) using data from the Health and Retirement Study. Findings demonstrated that extraversion, agreeableness, conscientiousness, and openness decreased in 2012 and climbed again in 2014. Conversely, however, neuroticism increased in 2012 and then decreased in 2014. Interestingly, a pattern similar to that of 2012 appeared in 2020. Significant differences between centenarians and non-survivals were found in 2006 and 2010. Centenarians were more extraverted, agreeable, conscientious, and open-minded than non-survivors in 2006. Similarly, centenarians were more extraverted, agreeable, and open-minded than their counterpart in 2010. These findings provide a cornerstone for future research investigating the change of personality and its role in longevity among centenarians.

EXAMINING PHYSICAL HEALTH AMONG COHORTS OF CENTENARIAN SURVIVORS IN THE HEALTH AND RETIREMENT STUDY

Rotem Arieli, *Iowa State University, Bellevue, Washington, United States*

This research highlights cohort differences in physical health among centenarians/near-centenarians in the Health and Retirement Study. Across 14 waves, participants aged 98 or older (n=494) were compared by three cohorts (i.e., 1890-1900, 1901-1910, and 1911-1920). Cohorts were examined at respective waves where participants were 96, 98, and 100 years of age. One-way ANOVA results presented significant differences in functional health at age 96 ($F[2,324]=5.01$, $p<.01$), subjective health at age 98 ($F[2,212]=7.94$, $p<.001$), and health conditions at ages 98 ($F[2,213]=12.52$, $p<.001$) and 100 ($F[2,115]=3.45$, $p<.05$). The oldest cohort had significantly better functional health than the youngest cohort (age 96), better subjective health than the two younger cohorts (age 98), and fewer health conditions than the youngest cohort (ages 98 and 100). Consistently, the oldest cohort performed better on subjective and objective health markers, providing implications for health care, disease prevention, and policy related to the shrinking "healthspan" among exceptional agers.

THE TRAJECTORIES OF COGNITION AND FUNCTIONAL LIMITATIONS OF CENTENARIAN SURVIVORS

Gina Lee, *Iowa State University, Ames, Iowa, United States*

The purpose of this study is to explore cohort differences in the trajectories of cognition and functional limitations among oldest-old adults. Using 1992-2018 data from the Health and Retirement Study, participants included those who survived to at least 98 years (N=494). The study included three cohorts (i.e., 1890-1900, 1901-1910, and 1911-1920) predicting intercept and slope of cognition and functional limitations. Two separate latent growth curve models were computed, and models of cognition, χ2(5)=6.935, p=.226 and functional limitation, χ2(7)=7.743, p=.35 fit the data well. There was a significant decline in cognition levels and a significant increase in functional limitation over time. When adding cohort, results indicated that older cohorts were more likely to have a decrease in cognition and increase in functional limitations compared with the younger cohort. Future research should investigate trajectories of other health variables for a better understanding of health changes of centenarians.

SESSION 4150 (SYMPOSIUM)

RECRUITMENT FOR A MULTISITE PRAGMATIC TRIAL OF DEMENTIA CARE STRATEGIES: BARRIERS AND SUCCESS DURING COVID-19

Chair: David Reuben Discussant: Katie Maslow

With 2176 participants recruited, D-CARE is the largest pragmatic clinical trial of dementia care strategies, to date. At four clinical trial sites (CTS), D-CARE will compare the effectiveness of three dementia care strategies over 18 months: 1) by nurse practitioners or physician assistants within a health care system, 2) by social workers or nurses at community-based service organizations (CBO), or 3) usual care. Primary outcomes include person with dementia (PWD) behavioral symptoms and caregiver strain. Other outcomes include the PWD quality of life and ability to reach personal goals, and caregiver self-efficacy, distress, and depressive symptoms. Recruitment began in June 2019 with a basic protocol in which participating providers reviewed lists generated from the electronic health records (EHR) of patients who had a diagnosis of dementia, allowing the removal of patients who should not be contacted and giving an opportunity to provide information about the family caregiver. Some practices gave "blanket" referral allowing research staff to recruit participants directly. Other practices provided direct referrals via EHR communications to the research team. Self-referrals triggered by public postings in clinics and CBOs, social media, and media coverage were also accepted if a dementia diagnosis was confirmed in the EHR. By March 16, 2020, all in-person recruitment visits were suspended due to COVID-19. In response, informed consent was switched to telephone with verbal consent as permitted by State and Institutional regulations. This symposium describes the creative approaches employed by CTS' to respond to these challenges and reach the recruitment goal in January 2022.

ELECTRONIC HEALTH RECORD SCREENING FOR PERSONS LIVING WITH DEMENTIA IN D-CARE

Mia Yang[1], Kristin Lenoir[2], Darcy McCurry[3], Katherine Currie[3], Nicholas Pajewski[3], and Jeff Williamson[1], *1. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States, 2. Center for Healthcare Innovation, Wake Forest School of Medicine, Winston Salem, North Carolina, United States, 3. Department of Internal Medicine-Section on Gerontology & Geriatric Medicine, Wake Forest School of Medicine, Winston Salem, North Carolina, United States*

Pragmatically identifying persons living with dementia (PLWD) for research is a persistent challenge, reflecting limitations in data elements. As part of the D-CARE study, the recruitment coordinator and analyst collaborated to create a screening algorithm to identify potentially eligible patients. A combination SAS/R script was applied on a monthly basis (Oct 2020-Dec 2021) to a clinical data warehouse, identifying living patients 50 years or older with ICD-10 codes for dementia or related conditions within the past two years, and an encounter within the past year. This process identified 6,478 unique patients, leading to the recruitment of 837 PLWD into the study (22% Black or Hispanic). Algorithmic components that enhanced recruitment efforts included the incorporation of data elements necessary to contact and enroll patients, formatting data consistent with reporting requirements, and tracking information on primary care provider, diagnosis dates with the set of providers that agreed to recruit for the trial.

FOCUSING ON DIVERSITY: UTMB RECRUITMENT STRATEGY FOR THE D-CARE STUDY

Rafael Samper-Ternent[1], Alice Williams[2], Roxana Hirst[2], Rebecca Galloway[2], and Elena Volpi[1], *1. University of Texas Medical Branch, Galveston, Texas, United States, 2. Sealy Center on Aging, University Of Texas Medical Branch, Galveston, Texas, United States*

The University of Texas Medical Branch (UTMB) is the main healthcare system in Galveston County where about 15% of older adults identify as Hispanic. Our recruitment efforts for the Dementia (D-CARE) study included adapting and translating in Spanish the screening, recruitment, and intervention materials. The study is being conducted by a bilingual team, and actively engages a highly diverse Local Patient and Stakeholder Council. After obtaining a partial HIPAA waiver from the Institutional Review Board, we created a dementia registry in the UTMB Epic (TM) electronic health record which captured patients diagnosed with ICD-9/10 codes of dementia. Referral letters from UTMB primary care and neurology providers authorized us to contact eligible patients. We utilized outpatient clinic appointment schedules, direct referrals, and community outreach to meet our enrollment goal. This recruitment strategy resulted in inclusion of 478 patient-caregiver dyads with 27.4% of participants identifying as Hispanic and 17% as Black.

ENROLLING PARTICIPANTS WITH DEMENTIA IN A RURAL SETTING: GEISINGER RECRUITMENT STRATEGIES FOR D-CARE

Maya Lichtenstein[1], Pamela Borek[2], and Ilene Ladd[3], *1. Geisinger Health System, Wilkes Barre, Pennsylvania, United States, 2. Office of Clinical Research Operations, Geisinger Wyoming Valley, Wilkes Barre, Pennsylvania, United States, 3. Genomic Medicine Institute, Geisinger Health System, Danville, Pennsylvania, United States*

Geisinger Health System serves a large, geographically stable population in central and northeast Pennsylvania and was chosen to participate in D-CARE due to its rural population, which is often under-represented. To reach potential participants, we used a multi-pronged recruitment approach including local radio, television, and newspaper advertisement; publication in a health system newsletter targeted to 55+; outreach to senior-care managers and primary care providers to encourage referrals; and leveraged an extensive electronic health record (EHR) database to identify a pool of almost 9,000 potential participants. Initial barriers to enrollment stemmed from geographic challenges and the dyad's inability and/or unwillingness to travel long distances to lengthy in-clinic appointments. A post-pandemic transition to virtual visits helped ease the travel burden and increase study enrollment. Despite varied recruitment strategies, by far the most effective recruitment method remained direct referrals of patients and caregivers with whom the provider had discussed the D-CARE study.

CLINIC-BASED RECRUITMENT STRATEGIES WITHIN AN INTEGRATED HEALTH CARE SYSTEM FOR THE DEMENTIA CARE STUDY (D-CARE)

Alan Stevens, Aval-Na'Ree Green, Sitara Abraham, and Jordan Reese, *Baylor Scott and White Health, Temple, Texas, United States*

At Baylor Scott and White Health (BSWH), 4,564 patients with a diagnosis of dementia were identified via search in the EHR, direct referrals from BSWH Providers and self-referrals. Of 2,296 potential participants (dyads of person with Dementia [PWD] and their family caregivers) screened, 2,034 were deemed eligible, and 626 dyads were enrolled. The BSWH D-CARE leadership team provided a 20-minute presentation to Medical Directors and Providers of 32 BSWH primary care clinics followed by a request to review Provider-specific patient lists. After Provider review, research team members sent letters and/or made phone calls to dyads. Providers were also invited to make direct referrals using an EHR referral link and the research team pinned appointment notes to upcoming PWD clinic appointments to remind Providers of the project. Recruitment strategies shared during monthly meetings of the Recruitment & Retention Committee also proved helpful in the identification of successful outreach and recruitment activities.

SESSION 4160 (SYMPOSIUM)

REIMAGINING AGING WITH DISABILITY THROUGH TECHNOLOGY

Chair: Elena Remillard Discussant: Margaret Campbell

Individuals aging with long-term disabilities are likely to require support for managing challenges with everyday activities. To effectively promote independence and aging-in-place for this population, we must consider innovative technology solutions that go beyond traditional direct care services. This symposium will highlight technology research and development efforts from the Rehabilitation Engineering Research Center on Technologies to Support Aging-in-Place for People with Long-Term Disabilities (RERC TechSAge). TechSAge is an interdisciplinary collaboration between Georgia Tech, the University of Illinois Urbana-Champaign, and Georgia State University, dedicated to understanding the needs of, and developing supportive technologies for people aging with long-term vision, hearing, and mobility disabilities. First, Remillard et al., will present interview findings from individuals aging with long-term vision loss on challenges performing instrumental activities of daily living. Next, Mitzner et al., will describe TechSAge research-driven guidelines for designing and delivering wellness classes via video-conferencing to older adults with and without disabilities. Blocker et al., will highlight a field trial evaluating how digital home assistants (e.g., Amazon Echo devices) and smart home devices, along with user-friendly support guides, can support older adults with mobility disabilities at home. Finally, Jones et al., will describe the latest feature of the SmartBathroom laboratory – a SmartBathing Transfer Testbed prototype that will enable us to study of how different bathing environment configurations can impact transfer performance. Margaret Campbell (Retired Senior Scientist for Planning and Policy Support, National Institute on Disability, Independent Living, and Rehabilitation Research) will serve as the discussant for the symposium.

AGING WITH VISION LOSS: EXPLORING EVERYDAY ACTIVITY CHALLENGES AND OPPORTUNITIES FOR TECHNOLOGY INNOVATION

Elena Remillard[1], Lyndsie Koon[2], Tracy Mitzner[3], and Wendy Rogers[4], *1. Georgia Institute of Technology, Atlanta, Georgia, United States, 2. University of Kansas, Lawrence, Kansas, United States, 3. Georgia Institute of technology, Atlanta, Georgia, United States, 4. University of Illinois Urbana Champaign, Champaign, Illinois, United States*

Vision loss can impact the health of older adults on multiple domains, including physically (e.g., mobility challenges), psychologically (e.g., depression), and socially (e.g., isolation). Older adults with vision loss, and particularly those with long-term vision loss, are likely to experience challenges in performing Instrumental Activities of Daily Living (IADLs), as these activities often require abilities like reading, fine motor movements, and navigating. We conducted structured interviews with 60 older adults aged 60-79 with vision loss for at least 10 years about their challenges with select IADLs (e.g., household tasks, transportation, shopping, finances, and managing health). An analysis of in-depth interview data revealed specific challenge themes associated with engaging in different IADLS, such as challenges with accessibility, physical limitations, assistance from others, communication, and finances. Findings highlight opportunities for technology solutions to support IADL participation and independence for people aging with vision loss.

TECHSAGE TELEWELLNESS TOOL: GUIDELINES FOR DELIVERING INCLUSIVE WELLNESS CLASSES VIA VIDEO-CONFERENCING

Tracy Mitzner[1], Elena Remillard[2], Kara Mumma[2], and Lelah Cochran[2], *1. Georgia Institute of technology, Atlanta, Georgia, United States, 2. Georgia Institute of Technology, Atlanta, Georgia, United States*

Many older adults, particularly those with mobility disabilities, experience barriers to participation in exercise classes, including lack of accessibility and transportation. Tele-technologies (e.g., Zoom) provide an opportunity to facilitate both physical and social wellness through remote group classes. We developed the TechSAge Telewellness tool to provide guidelines for designing wellness classes delivered via video-conferencing for older adults with and without disabilities. The protocols and guidelines presented within it have been tested for usability and acceptance with older adults with long-term mobility disabilities. Throughout the tool, we present examples from the TechSAge Tele Tai Chi study as a case study to provide helpful insights on developing a Telewellness program. The tool includes guidance on selecting a software, safety considerations, class organization and logistics, social time, and tech support. The contents of the tool provide insights for research and design regarding telehealth technology, as well as health and wellness interventions.

ASSESSING THE POTENTIAL OF DIGITAL HOME ASSISTANTS TO SUPPORT OLDER ADULTS WITH MOBILITY DISABILITY

Kenneth Blocker[1], Ki Lim[1], Husna Hussaini[1], Kyreon Williams[2], Ramavarapu S. Sreenivas[1], and Wendy Rogers[3], *1. University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 2. university of Illinois Urbana-Champaign, Champaign, Illinois, United States, 3. University of Illinois Urbana Champaign, Champaign, Illinois, United States*

Digital home assistants (e.g., Amazon Echo devices) hold great potential for supporting older adults in completing a wide range of daily living activities and improving their overall quality of life. As these devices can wirelessly connect with other smart technologies to increase their capabilities (e.g., environmental control), digital assistance technologies may benefit older adults who need support within their home such as those living with mobility disabilities. However, research is needed to better understand the facilitators and barriers of using these technologies by these individuals, as well as the resources that best support their onboarding and continued use. To assess the potential efficacy of integrating smart and connected technologies into the homes of older adults with mobility disability, we are conducting a field trial to understand how best to introduce these devices and support their use. Design considerations and initial findings are discussed.

SMARTBATHROOM 102: STUDYING BATHING TRANSFER PERFORMANCE

Brian Jones[1], Jon Sanford[2], Peter Presti[1], Susan Lee[2], Sutanuka Bhattacharjya[2], and Kyle Murphy[3], *1. Georgia Institute of Technology, Atlanta, Georgia, United States, 2. Georgia State University, Atlanta, Georgia, United States, 3. Georgia Institute Of Technology, Atlanta, Georgia, United States*

Age-related changes in functional ability, particularly among people aging with long-term disabilities, can impact safe performance of toilet and bathtub transfers and severely limit their ability to successfully age-in-place. The SmartBathroom is a state-of-the-art bathroom laboratory that features mechanically adjustable features and an array of sensors that can measure walking performance, location of feet and hands, and forces applied to the bathroom surfaces and fixtures. To complement the SmartToilet system, TechSAge recently developed the SmartBathing Transfer Testbed prototype that will enable us to study how different bathing environment configurations can impact transfer performance. The testbed consists of a height adjustable tub wall and three-wall, height and angle adjustable grab bars with integrated sensors to measure hand location and grip and load forces. This session will describe the SmartBathing Testbed and present results of studies with individuals both with and without ambulatory impairments performing simulated transfers within the testbed.

SESSION 4170 (PAPER)

SOCIAL SUPPORT

OLDER INDONESIAN WOMEN'S EXPERIENCE TO MAINTAIN INDEPENDENCE IN FOOD-RELATED ACTIVITIES

Widya Ramadhani[1], and Lynne Dearborn[2], *1. University of Illinois Urbana-Champaign, Urbana, Illinois, United States, 2. University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

The ability to conduct food-related activities such as cooking, eating, and cleaning are central to older adults' health. Such ability is especially critical for older women who are more likely to live alone or become caregivers for their spouses and other family members. We investigated the experience of older Indonesian women, an understudied population in aging research, when engaging in food-related activities. Using the grounded theory approach, we examined the challenges and adaptive behavior of twelve community-dwelling older women in Indonesia (60+) when conducting food-related activities at home. We employed two data collection strategies: photo and video elicitation, followed by an interview. Through photo and video elicitation, participants took photos and videos of the space where they conducted food-related activities to provide physical environmental data. In the interview, participants explained their routine, activity challenges, and adaptation strategies in food-related activities. We discovered that participants' view of their role in cooking food for the family is central to their sense of identity. When faced with age-related challenges, participants accepted assistance from others for activities less connected to food production, such as sweeping, mopping, or cleaning the kitchen. However, they are less likely to accept assistance for cooking activities. Instead, they adapted by modifying the physical environment, simplifying the tasks, and adjusting the method to remain engaged in cooking. Older Indonesian women's cultural identity influenced their strategy to face age-related challenges and maintain independence. This finding highlights the importance of a culturally sensitive approach when planning support for older adults.

TRANSITIONS IN SOCIAL SUPPORT EXCHANGE PROFILES OVER TIME AMONG OLDER ADULTS

Pildoo Sung[1], Rahul Malhotra[2], Grand Cheng[3], and Angelique Chan[2], *1. Centre for Ageing Research and Education, Duke-NUS Medical School, Singapore, Singapore, 2. Duke-NUS Medical School, Singapore, Singapore, 3. National University of Singapore, Singapore, Singapore*

Despite increasing interest in social support exchanges among older adults, little is known about the interplay between giving and receiving social support, how social support exchanges change over time, and factors associated with such change. Using data on 1,305 older Singaporeans participating in two waves of a national, longitudinal survey conducted in 2016-2017 and 2019, we investigated (1) distinct social support exchange profiles that comprise different types of giving and receiving social support, (2) transitions in social support exchange profiles over time, and (3) association of sociodemographic characteristics and health status with such transitions. Gender-stratified random intercept latent transition analysis (RI-LTA) produced three main findings. First, we identified four social support exchange profiles—multi-exchange, provider, receiver, and low exchange—for both males and females at both waves, although the distribution of profiles varied by gender and waves. Second, males were more likely to transition from the multi-exchange profile to other types, whereas females were relatively more likely to transition into the multi-exchange profile over time. Third, among males, those older, of ethnic minority, unmarried, employed, and with depressive symptoms were more likely to transition into the receiver profile from other types. Females who were younger, of ethnic majority, married, and less educated were more likely to transition into the multi-exchange type from low or receiver profiles. The findings capture the temporal dynamics in social support exchange profiles and their gendered characteristics. Policy interventions should focus on older adults who lack social support exchanges and those who lose social support exchanges over time.

WHEN LOVE HURTS: AMBIVALENT TIES INFLUENCE THE LINK BETWEEN FUNCTIONAL LIMITATIONS AND WELL-BEING

Misha Haghighat[1], and Meng Huo[2], *1. University of California, Davis, Davis, California, United States, 2. University of California, Davis, DAVIS, California, United States*

Functional limitations may co-occur with worse emotional well-being in older adulthood. Research has found that this association likely varies by social factors, with social support buffering well-being from physical declines, and strain exacerbating it. Yet, older adults' functional limitations may contribute to more ambivalence in their social relationships, which involves both support and strain. Such ambivalence may exacerbate older adults' emotional well-being in the face of physical limitations, but we know little about whether and how this occurs. The current study innovatively examined how older adults' overall ambivalence moderates the association between functional limitations and depressive symptoms, and captured emotional mood among older adults with functional limitations when they had encounters with ambivalent partners throughout the day. Study participants (N = 313; ages 65+) were from the Daily Experiences and Well-being Study. Participants reported on functional limitations, depressive symptoms, and relationship quality with each social partner in a 2-hour in person interview, followed by reports of social encounters every 3-hours across 5-6 days. We observed a significant moderating effect of overall ambivalence on the association between functional limitations and depressive symptoms, such that this association was more salient among older adults with more ambivalent social networks. Further, only unpleasant encounters with ambivalent social partners, but not those with non-ambivalent social partners, compromised mood among older adults with functional limitations. These findings may advance our understanding of older adults' ambivalent ties in the context of physical declines, and help identify therapies that may enhance well-being for older adults with health limitations.

WITHIN-FAMILY DIFFERENCES IN INTERGENERATIONAL CONTACT: THE ROLE OF GENDER NORMS IN A PATRILINEAL SOCIETY

Jeremy Lim-Soh[1], Dahye Kim[2], and Kyungmin Kim[3], *1. Duke-NUS Medical School, National University of Singapore, Singapore, Singapore, 2. National University of Singapore, Singapore, Singapore, 3. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Intergenerational contact is important for older adults' quality of life. However, few studies have examined older adults' patterns of intergenerational contact across multiple children and whether these patterns are gendered within families, which has been a distinct characteristic in countries with patrilineal traditions. A sample of older adults aged 65 and above with mixed-gender children (N = 3,228) from the 2006 Korean Longitudinal Study of Ageing reported the frequency of meeting and communication with each of their children (N = 14,110). To identify "within-family" patterns of contact, we applied latent profile analysis to three family-level indicators of contact across children: (a) family means, (b) family standard deviations, and (c) gender differences between sons and daughters. Multinomial logit regression was estimated to examine differences in parents' characteristics between the derived patterns. Nearly half of parents exhibited gender-balanced patterns of meeting across children: "equally high contact" (14%) and "equally low contact" (34%). We also found two gendered patterns of contact: "more frequent contact with daughters" (13%) and "more frequent contact with sons" (39%). Communication also exhibited similar four patterns across children with a higher proportion of "equally high contact" (77%). The derived patterns of contact differed by parents' age, education, marital status, employment situation, and depressive symptoms. The results highlighted substantial within-family differences in older parents' contact with their children, revealing more frequent contact with sons. This points to the enduring nature of patrilineal traditions as well as the lack of frequent physical contact in some Korean families.

SESSION 4180 (SYMPOSIUM)

STORIES FROM THE INSIDE OF DEMENTIA: CONSTRUCTING IDENTITIES AND RELATIONSHIPS THROUGH THE DISCOURSE OF EXPERIENCE

Chair: Kate de Medeiros Co-Chair: Pamela Saunders

Dementia is often characterized as a time of decline and loss. The grand narrative (i.e., the biomedical narrative) of dementia describes it as a time of meaninglessness given the inevitable loss of memory and language, fraught with difficulties recognizing familiar faces, recalling autobiographical events, and orienting to time and place. This unfortunate depiction negatively positions people living with dementia as living a 'social death' and overlooks the potential of forming meaningful relationships and experiencing a sense of community. Elements often overlooked can be found in the careful reading and analysis of individual interactions that make up constructions of identity, relationships, and community. In this symposium, we draw data from the "Friendship Study," a 6-month ethnographic study on the social environments of people living with dementia in long-term care to consider meaning-making in dementia through three perspectives: phenomenological, gerontological, and discursive. The first paper considers the phenomenology of friendship, moving away from linear narratives to look at micro-constructions of identity. The second considers the co-construction of friendship through discursive elements found in conversational interactions. The third challenges staff's construction of residents, highlighting how negative assumptions about resident capabilities can affect personal relationships and the social environment.

EXPERIENCE BEYOND NARRATIVE: A PHENOMENOLOGICAL ACCOUNT OF MEANING-MAKING WHILE LIVING IN THE WORLD WITH DEMENTIA

MaryKatherine Gaurke, *Georgetown University, Washington, District of Columbia, United States*

Narrative-based approaches in dementia care emphasize the importance of understanding humans as beings who make sense of themselves and others through constructing life narratives, taking this process to be morally significant for constituting or characterizing identities (and for holding others into their identities) (Kitwood, 1997). Yet, placing too much emphasis on the formation of a cohesive life narrative risks dismissing or otherwise failing to acknowledge the activities of meaning-making and narrative-sharing/constructing that those with dementia engage outside of, or even counter to, a unified narrative. This paper offers a Heideggerian-inspired phenomenological analysis of interactions detailed in the Friendship Study (de Medeiros et al. 2011) and from supporting published accounts and personal observation in clinical settings. This account reveals significant meaning-making possibilities engaged and shared among those living with dementia in long-term care settings that may be left unexamined in traditional narrative-based approaches suggesting that micro-narrative construction needs further attention.

FRIENDSHIP IS IN THE DETAILS: CO-CONSTRUCTION OF RELATIONSHIPS AMONG PERSONS WITH DEMENTIA IN LONG-TERM CARE

Pamela Saunders, *Georgetown University, Washington, District of Columbia, United States*

Friendships have been linked to psychological and emotional wellbeing and better physical functioning in older adults. Conversely, negative consequences (e.g., depression) are associated with losing friendships and shrinking social networks. While cognitive decline might be a limiting factor for persons with dementia (PWD) to establish friendships, this has not been proven in the literature. This paper reports on 20 interactions between PWD collected during the Friendship Study (de Medeiros et al. 2011), an ethnographic study of friendship in long-term care (LTC). Participants are male and female residents in an LTC community. Diagnoses range from mild to severe Alzheimer's disease. Conversational interactions were transcribed and coded for linguistic and discursive devices signaling friendly interactions. Findings reveal that friendships are co-constructed by PWD using 4 primary linguistic discursive devices, including topic (meals, religion, medication, furniture, directions, baking), co-constructed narrative, repetition, and alignment. Implications for future research on friendship among PWD are discussed.

NONE OF THEM ARE REALLY FRIENDS: STAFF PERCEPTIONS OF THE SOCIAL WORLD OF PEOPLE LIVING WITH DEMENTIA IN LONG-TERM CARE

Kate de Medeiros, *Miami University, Oxford, Ohio, United States*

Nursing homes are charged with the care and protection of residents. Consequently, staff exercise tremendous control over residents' day-to-day lives, including their social worlds. This is especially true for people living with dementia who may have challenges with communication. This paper examined how staff viewed friendships among dementia residents. Eleven staff members were asked to describe the friendship among the 20 residents in their charge to include who was friends with whom and what were the key features of the friendships. Results revealed that nearly all staff viewed residents as incapable of forming friendships among other residents. One exception was that many staff viewed felts that the male residents enjoyed a level of friendship that female residents did not. Overall, the findings point to the need to help staff move beyond a limited view of residents' capabilities and discover ways to help foster a rich social environment

SESSION 4190 (SYMPOSIUM)

TECHNOLOGY TO SUPPORT OLDER ADULTS' HEALTH, SAFETY, AND WELLBEING

Chair: Walter Boot

Technology has revolutionized the ability to deliver interventions to support older adults' health, safety, and wellbeing, and technology-based solutions have become increasingly important in the delivery of remote care during the COVID-19 pandemic. However, these interventions and novel approaches require a careful understanding of older adults' needs, preferences, and abilities, and need to undergo tests of feasibility, acceptability, and efficacy. This session will present a sampling of research examining the development, testing, and implementation of technology-based solutions to support older adults. R. Azevedo will present on the development of a novel digital therapeutic for the self-management of hypertension medication adherence among older adults. S. Kwon will present on the initial efficacy of an app-based mindfulness-meditation intervention to alleviate stress and depressive symptoms among bereaved older adults. Y. Du will discuss the use of a commercial fitness tracker to facilitate activity self-monitoring among overweight diabetic older adults with and without kidney disease. S. Dimmick will discuss the development of a novel augmented reality (AR) safety checklist to reduce fall risk among older adults. Finally, F. Jain will present on the development of a new mobile application platform to meet the needs of family dementia caregivers informed by focus groups and an inductive and deductive mixed method analytic approach. Themes of the necessity of a user-centered design approach in the development of technology-solutions will be emphasized.

A TRANSDISCIPLINARY TEAM APPROACH TO TECHNOLOGY DEVELOPMENT TO SUPPORT HEALTH AND WELL-BEING

Renato Ferreira Leitao Azevedo[1], Jennifer Nicholas[2], Jeannie Lee[3], Kathleen Insel[3], and Wendy Rogers[4], *1. University of Illinois Urbana-Champaign (UIUC), Urbana Champaign, Illinois, United States, 2. The University of Arizona, Tucson, Arizona, United States, 3. University of Arizona, Tucson, Arizona, United States, 4. University of Illinois Urbana Champaign, Champaign, Illinois, United States*

Diverse disciplinary and experiential knowledge is required to understand the challenges and develop workable solutions to support the health and wellbeing of a rapidly aging population. We are developing a theory-based, digital therapeutic for self-management of hypertension medication adherence for older adults; namely, the Medication Education, Decision Support, Reminding, and Monitoring (MEDSReM) system. This development process has necessitated a transdisciplinary approach with members co-learning and working collaboratively to advance the MEDSReM system. Our group includes complementary expertise in pharmacy, nursing, human factors, cognitive aging, gerontology, and technology development. We describe the challenges of transdisciplinary teamwork, our collaborative processes, and strategies that led to successful integration of expertise in advancing MEDSReM. Lastly, we discuss useful approaches to technology conceptualization, and digital therapeutic development and implementation, as well as lessons learned in effective communication and coordination among the diverse team members to ensure that the MEDSReM goals are achieved.

INITIAL EFFICACY OF AN APP-BASED MINDFULNESS MEDITATION FOR BEREAVED KOREAN OLDER ADULTS DURING THE PANDEMIC

Soonhyung Kwon[1], and Jaesung An[2], *1. University of Illinois Urbana Champaign, Urbana Champaign, Illinois, United States, 2. California State University East Bay, Cupertino, California, United States*

Given the onset of COVID-19, older adults who recently lost their significant others feel more stressed. There yet exist a study utilizing smartphones for web-based delivery of mindfulness intervention among bereaved older adults. Therefore, this study aimed to test the initial efficacy of an app-based mindfulness-meditation (AMM) to alleviate stress and depressive symptoms and improve stress resistance, social support, and self-esteem in Korean older adults experiencing bereavement. Participants included 22 Korean older adults who had been bereaved within the preceding year. AMM involved sound therapy, breathing exercises, and narrated meditation sessions, and the program was conducted over eight weeks. The linear regression results showed that stress level among participants was significantly lower after the intervention, with decreased scores from the baseline. By confirming that AMM is an effective way of reducing stress, more active usage of devices like smartphones should be promoted to develop mental health interventions for older adults.

SELF-MONITORING OF LIFESTYLES FOR DISEASE MANAGEMENT IN OVERWEIGHT DIABETIC SENIORS WITH/WITHOUT KIDNEY DISEASE

Yan Du[1], Sharma Kumar[1], Valerie Ramirez[2], Dennis Brittany[2], Shiyu Li[2], Chengdong Li[3], and Jing Wang[3], *1. UT Health San Antonio, San Antonio, Texas, United States, 2. Center On Smart And Connected Health Technology, School Of Nursing, UT Health San Antonio, San Antonio, Texas, United States, 3. College of nursing, Florida State University, Tallahassee, Florida, United States*

Overweight/obesity, diabetes, and chronic kidney disease (CKD) are common multiple chronic conditions (MCCs) in seniors. Fitbit fitness trackers were used to track physical activity and food intake over 12-week in 15 overweight/obese diabetic seniors (age=70.5±4.8) with/without CKD. The associations of percentage of days with tracked steps (PDWTS), percentage of days with food logs (PDWFL) and 7-day mean step count with body mass index, fasting glucose, HbA1c and renal function were examined using Pearson Correlation analysis. Qualitative data assessing perceived factors related to self-monitoring and lifestyle behaviors was collected and analyzed using content analysis. At week 12, PDWTS and PDWFL was positively and negatively associated with renal function ($P<0.05$) and HbA1c ($P<0.05$), respectively. Motivation and perceived benefits of self-monitoring were frequently cited facilitators for self-monitoring. Self-monitoring might help seniors manage MCCs. Motivating self-monitoring and providing health education on the benefits of self-monitoring in lifestyle interventions to manage MCCs are warranted.

MOBILE INTERVENTION FOR FAMILY DEMENTIA CAREGIVERS: FROM FOCUS GROUPS TO SMARTPHONE PLATFORM

Felipe Jain[1], Saira Madarasmi[2], DJ Ursal[2], Paulina Gutierrez-Ramirez[2], Abu Sikder[3], Sreya Banerjee[2], and Liliana Ramirez Gomez[4], *1. Depression Clinical Research Program / Massachusetts General Hospital / Harvard Medical School, Boston, Massachusetts, United States, 2. Massachusetts General Hospital, Boston, Massachusetts, United States, 3. Innovation Studio, Children's Hospital, Los Angeles, Los Angeles, California, United States, 4. Massachusetts General Hospital, Harvard Medical School, Boston, Massachusetts, United States*

There is growing recognition that in-person delivery of caregiver interventions limits scalability due to distance from locations where interventions are available, and costs associated with locating substitute care for the person living with dementia. Internet-based interventions are often not optimized for smartphones, which are more accessible than desktops to minoritized populations and those of lower socioeconomic status. In this study, focus groups were conducted with 17 English language and 12 Spanish language family dementia caregivers regarding needs for smartphone-based technological intervention. We employed an inductive and deductive driven mixed method analytic approach. Identified needs included psychoeducation regarding dementia, provision of caregiver skills information, activities for the person living with dementia, and relaxation techniques. Similarities and differences among preferences between the two populations were identified. Family dementia caregivers endorsed several needs for mobile intervention. The development of a new mobile application platform to meet these needs will be described.

SESSION 4200 (SYMPOSIUM)

THE BALTIMORE LONGITUDINAL STUDY OF AGING: READY TO SHARE

Chair: Eleanor Simonsick Discussant: Luigi Ferrucci

Beginning January 2023, the new National Institutes of Health (NIH) Data Sharing Policy for NIH-funded and conducted research is scheduled to go into effect. In anticipation of this requirement, scientists and staff of the Baltimore Longitudinal Study of Aging (BLSA) launched a comprehensive effort to create a user friendly well-documented accessible database scheduled for a "soft" release just in time for GSA. The BLSA, established in 1958 to study normative aging, continues to advance knowledge and understanding of aging mechanisms and their impact on and response to disease processes. During a 3-day clinic visit, the 1200+ BLSA participants undergo comprehensive evaluation covering the full range of physical functional and cognitive performance capacity as well as extensive imaging studies, biological sample collection and clinical examination. In this symposium, Dr. Griswold will introduce the data sharing platform and demonstrate its facility. Dr. Simonsick will elaborate on development of a fitness percentile-based approach to define exceptional aging and the factors associated with maintaining exceptional status. Dr. Moore will provide findings on life-course physical activity and CT derived muscle parameters and homeostatic regulation in later life. Dr. Tian will share her ongoing work aimed at identifying metabolomic signatures of brain atrophy and Alzheimer's disease risk. Dr. Tanaka will report on her work analyzing the metabolomic profile of different dietary patterns and their association with frailty. Our Discussant, Dr. Ferrucci will briefly share future directions for the BLSA and then invite attendees to comment on the BLSA data sharing platform and scientific priorities.

FAIR SHARING OF THE BLSA DATA ECOSYSTEM

Michael Griswold[1], James Henegan[2], Chad Blackshear[2], Ann Moore[3], Thomas Smith[4], Deric McGowan[4], Eleanor Simonsick[5], and Luigi Ferrucci[5], *1. The MIND Center at UMMC, Jackson, Mississippi, United States, 2. UMMC MIND Center, Jackson, Mississippi, United States, 3. TGB NIA NIH, Baltimore, Maryland, United States, 4. NIA, Baltimore, Maryland, United States, 5. National Institute on Aging, Baltimore, Maryland, United States*

The BLSA is an invaluable resource for the study of human aging with uniquely rich measures taken longitudinally on a continuous replenishment cohort since 1958. Tremendous interest has been expressed by the United States and international research communities in expanded access to and use of BLSA data to address emerging scientific questions. Here, we will describe recent study leadership initiatives into: (1) making the BLSA data more FAIR (Findable, Accessible, Interoperable, and Reusable), (2) growing a BLSA data ecosystem that enables scalable sharing, and (3) leveraging and developing platforms for accessing the ecosystem. Lastly, we will demonstrate current platform functions that empower researchers to find and access BLSA data, metadata, protocols, code and supporting materials to make new discoveries.

CORRELATES OF PHYSICAL ACTIVITY HISTORY IN PARTICIPANTS OF THE BALTIMORE LONGITUDINAL STUDY OF AGING

Ann Moore[1], Eleanor Simonsick[2], Bennett Landman[3], and Luigi Ferrucci[2], *1. TGB NIA NIH, Baltimore, Maryland, United States, 2. National Institute on Aging, Baltimore, Maryland, United States, 3. Vanderbilt University, Nashville, Tennessee, United States*

Physical activity across the life course contributes to physical function and health in later life. Here we characterize a measure of physical activity history, newly implemented in participants of the Baltimore Longitudinal Study of Aging (n = 690). Participants selected one of four levels to describe activity during each decade of life from age ten to the present. Recalled levels of physical activity are positively associated with activity assessed in current and prior decade study visits, suggesting that the recalled estimates are consistent with historic activity. A summary measure based on ranking activity patterns was associated with measures of physical performance, muscle and fat areas quantified from computed tomography images as well as some indicators of homeostatic dysregulation ($p < .05$). The observed associations suggest that an estimate of physical activity across decades provides complementary information to estimates of current activity and reemphasizes the importance of consistently engaging in physical activity.

METABOLOMIC SIGNATURES OF BRAIN ATROPHY PATTERNS IN AGING AND ALZHEIMER'S DISEASE

Qu Tian[1], Brendan Mitchell[2], Guray Erus[3], Christos Davatzikos[3], Susan Resnick[2], and Luigi Ferrucci[2], *1. National Institutes on Aging, Baltimore, Maryland, United States, 2. National Institute on Aging, Baltimore, Maryland, United States, 3. University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Can plasma metabolomics reveal mechanisms of brain aging? We investigated metabolomic signatures of brain atrophy patterns related to cognitive decline and Alzheimer's disease(AD) risk. Relationships between metabolomics(Biocrates-p500) and annual rates of change in two neuroimaging-based brain atrophy patterns(SPARE-BA indexing brain aging, SPARE-AD indexing AD-related atrophy) were examined using multivariable linear regression in 477 Baltimore Longitudinal Study of Aging participants aged 60+, adjusted for demographic variables and BMI. Higher concentrations of sarcosine, triglycerides, diglycerides, and ceramides and lower concentrations from phosphatidylcholines and cholesteryl ester were associated with faster rates of SPARE-BA increase longitudinally. Higher concentrations of diglyceride and alpha-amino-butyric acid and lower concentrations of tryptophan, hippuric acid, cholesteryl ester, phosphatidylcholine and sphingomyelin were associated with faster rates of SPARE-AD. Metabolites have differential associations with age-related and AD-related brain atrophy patterns, which may provide new insights into preventive and therapeutic interventions.

Future studies should examine whether metabolite changes precede brain atrophy patterns.

METABOLOMIC PROFILE OF DIFFERENT DIETARY PATTERNS AND THEIR ASSOCIATION WITH FRAILTY

Toshiko Tanaka[1], Sameera Talegawkar[2], Yichen Jin[3], Qu Tian[4], Eleanor Simonsick[1], and Luigi Ferrucci[1], *1. National Institute on Aging, Baltimore, Maryland, United States, 2. Department of Exercise and Nutrition Sciences, Milken Institute School of Public Health, The George Washington University, Washington, District of Columbia, United States, 3. Nutrition Sciences, Milken Institute School of Public Health, The George Washington University, Washington, District of Columbia, United States, 4. National Institutes on Aging, Baltimore, Maryland, United States*

Diet quality is an important behavioral determinant of healthy aging, however the mechanisms underlying the protective effect of diet are not fully understood. To address this question, we explored whether plasma metabolites mediate the relationship between diet and frailty index (FI) in the Baltimore Longitudinal Study of Aging. Adherence to different dietary patterns was evaluated using the Mediterranean diet score (MDS), Mediterranean-DASH Diet Intervention for Neurodegenerative Delay (MIND), and Alternate Healthy Eating Index 2010 (AHEI). Higher adherence to the dietary patterns was associated with lower FI. There were 127 plasma metabolites that were associated with all three dietary patterns including lipids, fatty acids, ceramides, amino acids, and bile acids. Metabolomic signatures of diet mediated 42%, 70%, and 61% of the association between MDS, MIND, and AHEI with FI, respectively. Overall, we found common metabolomic biomarkers of dietary patterns that explain part of the relationship between diet and frailty.

DEVELOPING A FITNESS AGE-NORMALIZED PERCENTILE-BASED APPROACH TO DEFINE EXCEPTIONAL AGING

Eleanor Simonsick[1], Ann Moore[2], Toshiko Tanaka[1], Qu Tian[3], and Luigi Ferrucci[1], *1. National Institute on Aging, Baltimore, Maryland, United States, 2. TGB NIA NIH, Baltimore, Maryland, United States, 3. National Institutes on Aging, Baltimore, Maryland, United States*

An operational definition of ‘well-aged’ is integral to research identifying biological, psychological and behavioral parameters that predict and/or support healthy aging but remarkably few measures exist. A major challenge is incorporating age-related physiologic decline – a normal feature of healthy aging. We defined well-aged using fast 400m walk performance, a measure of cardiovascular fitness and hallmark of healthy aging. We determined the sex-specific, age-normalized 75th percentile using 4000+ observations collected over 15 years from BLSA participants aged 50-96y (51% women). In 1257 BLSA participants mean age 68.9y (52% women) we compared well-aged to average-aged (25th-75th percentile) adjusting for age, sex and race, and found more favorable WBC, triglycerides, CRP, depressive symptoms, waist/height ratio, eGFR and FEV1 z-score distinguished concurrent well-aged status (all p<.003). Waist/height ratio and pulse-wave velocity (both p<.001) predicted retained well-aged status 2-plus years later. Future work aims to identify physiologic and behavioral facilitators of healthy aging.

SESSION 4210 (SYMPOSIUM)

THE INFLUENCE OF NURSING HOME CONTEXT ON IMPLEMENTATION: EARLY FINDINGS

Chair: Carole Estabrooks Co-Chair: Anna Beeber
Discussant: Amy Vogelsmeier

Evidence suggests that organizational context, including context of care in nursing homes (NHs) is associated with implementation and improvement success and that optimized context contributes to improved resident and staff outcomes. However, evidence on mechanisms of these influences is scarce. The longitudinal Translating Research in Elder Care program (2007 to present) is our data source. This symposium reports findings of a secondary analysis of longitudinal organizational structural and contextual, staff worklife, and resident care quality data collected in nursing homes from 2007-2021, in a cohort of 94 Canadian nursing homes. Our data include continuously collected administrative data (RAI-MDS 2.0), 5 waves of primary surveys from multiple care providers in NHs (15,000 cases to date), extensive qualitative case study data, and data from two large scale pragmatic trials. The TREC program was framed originally and continues to be, using the Promoting Action on Research Implementation in Health Services (PARiHS) framework. Each of our 5 papers will report on a critical aspect of the findings. The symposium will conclude with a discussion of implications of these findings of phase one and a description of phase two and how it is shaped by our interactions with expert panels (context and implementation experts, policymakers, NH managers, paid care providers, and residents and families). Early implications of this work for future research in nursing homes and for practice and policy will be mentioned.

DEVELOPMENTAL ADVANCES OF THE PARIHS FRAMEWORK OVER THE LAST DECADE: A CRITICAL INTERPRETIVE SYNTHESIS

Whitney Berta[1], Yinfei Duan[2], Alba Iaconi[2], Jing Wang[3], Janelle Perez[4], Yuting Song[5], Stephanie Chamberlain[2], and Carole Estabrooks[2], *1. University of Toronto, Toronto, Ontario, Canada, 2. University of Alberta, Edmonton, Alberta, Canada, 3. University of North Carolina, Chapel Hill, North Carolina, United States, 4. University of North Carolina Chapel Hill, Chapel Hill, North Carolina, United States, 5. Qingdao University, Qingdao, Shandong, China (People's Republic)*

The original Promoting Action on Research Implementation in Health Services (PARiHS) and i-PARiHS frameworks contend that the successful implementation of evidence-based practices is a function of the core elements evidence, context, facilitation, and the capacity of intended recipients to apply research to practice. While applied widely, a number of theoretical and practical challenges associated with the framework’s application have been identified. Our critical interpretive synthesis examines how the last decade of research has advanced understanding of the conceptualizations of, relationships between, and dynamics amongst, PARiHS core elements. We find that work over the past decade affords more nuanced conceptualizations of context and facilitation; reveals myriad conceptualizations of implementation success, suggesting the need for a typology; demonstrates contradictory effects of context on facilitation that warrants more study; leads us to question the contextual primacy of leadership; and generally under-examines the interactions and dynamics amongst PARiHS core elements and their sub-elements.

UNDERSTANDING LEADERSHIP IN NURSING HOME CONTEXT THROUGH ADAPTIVE LEADERSHIP FRAMEWORK FOR CHRONIC ILLNESS

Jing Wang[1], Janelle Perez[2], Anna Beeber[3], Ruth Anderson[4], Whitney Berta[5], Holly Lanham[6], and Carole Estabrooks[7], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States, 2. University of North Carolina Chapel Hill, Chapel Hill, North Carolina, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States, 4. UNC Chapel Hill, Chapel Hill, North Carolina, United States, 5. University of Toronto, Toronto, Ontario, Canada, 6. University of Texas Health San Antonio, San Antonio, Texas, United States, 7. University of Alberta, Edmonton, Alberta, Canada*

The case studies were conducted as an early component of a pan-Canada project entitled Translating Research in Elder Care (TREC). This sub-project provided insights into the challenges and leadership of facilitating care model changes, care quality improvement, and quality of work enhancement of three long-term care (LTC) facilities in Canada. Through the lens of Adaptive Leadership Framework for Chronic Illness (ALFCI), leadership emerged as a critical element of their organizational context. Staff reported that contextual factors of high intensity of work and inadequate staff were barriers that added to the complexity of challenges facing them. Data collectors observed that frontline staff exhibited leadership behaviors in knowledge transmission, information sharing, teamwork, and person-centered strategies to address challenges. However, top-down facilitation can lead to misunderstanding and a lack of motivation from the frontline staff to follow the facilitation. The findings also suggested tailored facilitation about including frontline staff in formal interactions.

CONTEXT AND TRUST: DIRECT CARE WORKER RELATIONSHIPS, CARE PRACTICES, FACILITATION, AND IMPLEMENTATION OF INNOVATIONS

Janelle Perez[1], Jing Wang[2], Anna Beeber[3], Ruth Anderson[4], Whitney Berta[5], Holly Lanham[6], and Carole Estabrooks[7], *1. University of North Carolina Chapel Hill, Chapel Hill, North Carolina, United States, 2. University of North Carolina, Chapel Hill, North Carolina, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States, 4. UNC Chapel Hill, Chapel Hill, North Carolina, United States, 5. University of Toronto, Toronto, Ontario, Canada, 6. University of Texas Health San Antonio, San Antonio, Texas, United States, 7. University of Alberta, Edmonton, Alberta, Canada*

This paper examines the relationships between Direct Care Workers (DCW) and other nursing home (NH) staff. Specifically, we examine how trust, and the context in which trust exists, influences care practices and implementation of innovations in NHs. This secondary analysis of interviews and field observations from three separate NHs in different Canadian provinces shows differing levels of trust that between HCAs and other staff. We also analyze the organizational context can mediate trust in these relationships. Specifically, we analyzed trust DCWs have at the interpersonal, institutional, organizational levels and what ways they act as facilitators of programs aimed at improving care practices health outcomes of residents in NHs. Using the Alberta Context Tool's dimensions of organizational context as a framework, this research shows how trust in the relationships between DCWs and other LTC staff influences caregiving practices and the uptake of new innovations.

ORGANIZATIONAL CONTEXT AND QUALITY INDICATORS IN NURSING HOMES: A MICROSYSTEM LOOK

Yinfei Duan[1], Alba Iaconi[1], Yuting Song[2], Matthias Hoben[1], Leslie Hayduk[1], Peter Norton[3], and Carole Estabrooks[1], *1. University of Alberta, Edmonton, Alberta, Canada, 2. Qingdao University, Qingdao, Shandong, China (People's Republic), 3. University of Calgary, Calgary, Alberta, Canada*

This cross-sectional quantitative sub-project assessed the association of organizational context (modifiable elements of work environments) with quality indicators (QIs) at the clinical microsystem (care unit) level. We used TREC data collected 09/2019-03/2020. The sample included 285 care units within 91 Western Canadian nursing homes. Outcomes included thirteen practice-sensitive QIs derived from the Minimum Data Set 2.0. Results from random-intercept logistic regression for each dichotomized QI showed that higher unit-aggregated scores on contextual elements as identified by the Alberta Context Tool, specifically care aide participation in decision-making (OR=3.7-8.4, $p<.05$), care aide perceived staffing (OR=2.6, $p<.05$) and time for completing tasks (OR=5.1-7.0, $p<.05$), and care aide rated unit-level leadership (OR=20.1, $p<.05$), were associated with a better unit-level performance on delirium symptoms, indwelling catheter use, behavioral symptoms, pain, and late-loss physical function. The findings suggest that targeting modifiable contextual elements is an important avenue for quality improvement interventions in nursing homes.

ORGANIZATIONAL CONTEXT'S EFFECT ON CARE AIDES' PSYCHOLOGICAL EMPOWERMENT IN WESTERN CANADA

Alba Iaconi[1], Yinfei Duan[1], Yuting Song[2], Matthias Hoben[1], Leslie Hayduk[1], Peter Norton[3], and Carole Estabrooks[1], *1. University of Alberta, Edmonton, Alberta, Canada, 2. Qingdao University, Qingdao, Shandong, China (People's Republic), 3. University of Calgary, Calgary, Alberta, Canada*

This quantitative cross-sectional sub project investigated the effects of organizational context and individual characteristics on psychological empowerment of care aides working in nursing homes. We analyzed data collected from 3765 care aides from 91 nursing homes across Western Canada between 09/2019 and 03/2020. From the random-intercept mixed effects regression models we identified significant predictors at different levels for each component of psychological empowerment. At the organizational outer context

level: region and home ownership model. At the inner context (care unit) level: formal interactions (β=-0.07, p=0.03; competence), evaluation (β=0.20, p<0.02; self-determination), culture (β=0.20, p<0.02; self-determination), communication (β=0.16, p<0.001; self-determination), and social capital (β=0.22, p=0.01; impact). At the individual level: care aides' sex, language and job satisfaction.These findings suggest important ways in which contextual elements may influence staff quality of work life characteristics and underscore the need to consider context operating at different levels, as well as consider individual and contextual interaction.

SESSION 4220 (PAPER)

TRANSPORTATION AND COMMUNITIES

ASSOCIATIONS BETWEEN LIFE SPACE MOBILITY AND ASPECTS OF HOUSING AND SERVICE INFRASTRUCTURE

Bjorn Slaug, Magnus Zingmark, and Susanne Iwarsson,
Lund University, Lund, Skane Lan, Sweden

To achieve the widespread policy goal of active aging, it is central that older adults can participate and be independent in activities both in and outside the home. Life-space mobility refers to the extent of the area where a person performs different activities, including frequency and level of independence, and is considered an indicator of active aging. There is, however, a lack of studies on the relationship between life-space mobility and aspects of the home and neighborhood environment. The aim of this study was to explore associations between life-space mobility and (a) perceived usability of the home and (b) satisfaction with commercial and societal services in the surrounding neighborhood. We utilized the baseline survey of the Swedish RELOC-AGE project (N=1,964; mean age=69; 45% men), comprising data from adults aged 55+ with an interest for relocation. We found weak but significant correlations between life-space mobility and usability of the home (r=0.10; p< 0.001), and between life-space mobility and satisfaction with service infrastructure (r=0.09; p< 0.001). The correlations were stronger for men and for adults aged 65-74 years, compared to younger and older age groups. Those with their independent life space limited to the home and the close exterior surroundings (balcony, garden etc) assessed the usability of the home significantly lower (p=0.04) than those with more extended independent life space. There was no difference with regard to infrastructure satisfaction. These results suggest that improvement of both the home environment and service infrastructure may be important in supporting extended life space mobility among older adults.

FIT2DRIVE: DEVELOPMENT AND TESTING OF A PREDICTOR OF DRIVING CAPACITY OF OLDER ADULTS WITH COGNITIVE CONCERNS

Ruth Tappen[1], David Newman[1], Monica Rosselli[2], and Joshua Coniff[2], *1. Florida Atlantic University, Boca Raton, Florida, United States, 2. Florida Atlantic University, Davie, Florida, United States*

The decision to stop driving has been reported by caregivers of persons with dementia as one of the most difficult ones they confront. Additionally, primary care providers to whom they often turn for guidance report being unprepared to provide them with evidence-based information. Our aim was to develop and test a predictive model employing 2 or 3 brief, easily administered cognitive tests to predict the individual's likelihood of passing an on road driving test. Participants were licensed drivers recruited from our Memory Center's driver evaluation program and the community to obtain a broadly representative sample of older drivers. A total of 357 drivers age 60 to 97 (mean 81) completed an established on-road driving test and battery of short cognitive tests. Two-thirds of the sample were white, non-Hispanic, one third were Black, African American, 59% male and 41% female, mean MMSE score of 24. Employing Receiver Operating curve analysis, the best set of predictors included participant age, MMSE utilizing world spelled backwards (a better predictor than serial 7's), Trails B time in seconds and participant age yielding 95% AUC (area under the curve). The model was invariant across gender, education and ethnic group. A website with an interactive calculator in which this data is entered and likelihood of passing an on-road driving test prediction is presently under construction and will be available first to providers and later to individuals with a concern about continuing capacity to drive. Funded by Florida Department of Health Ed and Ethel Moore Alzheimer's Disease Initiative.

IMPACT OF COVID-19 MOVEMENT CONTROL ON OLDER ADULTS' HEALTHCARE UTILIZATION

Vanessa Tan[1], Gregory Ang[1], Kim Huat Goh[2], Adrian Yeow[3], Gamaliel Tan[4], and Cynthia Chen[5], *1. National University of Singapore, Singapore, Singapore, 2. Nanyang Technological University, Singapore, Singapore, 3. Singapore University of Social Sciences, Singapore, Singapore, 4. Ng Teng Fong General Hospital, Singapore, Singapore, 5. National University of Singapore, Singapore, Singapore*

Singapore was one of the first countries affected by COVID-19. Measures to contain the spread of COVID-19 include raising the Disease Outbreak Response System Condition (DORSCON) risk assessment to Orange and instituting a movement control order, termed as the Circuit Breaker. These measures have caused significant disruption in primary care and chronic disease management. As the first point of contact in testing suspected cases, primary care providers shifted their focus from non-COVID-19 services. Using an interrupted time series analysis, we examine the associations of DORSON Orange and Circuit Breaker on acute and chronic primary care visits among older adults aged above 50. We found significant reductions in both acute and chronic primary care visits immediately following DORSCON Orange and Circuit Breaker. DORSCON Orange was associated with a drop of 231 mean acute and chronic daily visits (95% CI -356 to -106). Circuit Breaker was associated with a further drop of 268 mean daily visits (95% CI -426 to -111). These reductions were also observed for acute and chronic visits separately. Routine chronic care appointments were deferred or cancelled to reduce the risk of transmission as patients with underlying medical conditions were at higher risk of developing severe complications. Delayed access to primary care can have profound health implications, especially for older adults. Ensuring accessibility to primary care is a key priority in maintaining population health. Understanding the impact of COVID-19 tightening measures on older adults' primary care utilisation will be useful for future public health planning.

PROFILE OF OLDER PUBLIC TRANSPORTATION USERS IN THE UNITED STATES: IMPLICATIONS FOR AGE-FRIENDLY COMMUNITIES

Afnan Gimie[1], Andrea Melgar Castillo[2], C. Daniel Mullins[2], and Jason Falvey[3], *1. University of Maryland School of Medicine, Baltimore, Maryland, United States, 2. University of Maryland School of Pharmacy, Baltimore, Maryland, United States, 3. University of Maryland Baltimore, Baltimore, Maryland, United States*

Public buses, trains, and trams are a growing mode of transportation for older adults in the United States, yet many environmental and health related barriers to use have been reported. Characterizing the population of older public transit users is essential for developing age-friendly communities. We used data from 5696 urban, community dwelling older adults in round 5 of the National Aging and Trends Study (NHATS), an annual nationally representative survey of late-life disability. Using SAS (version 9.4), weighted frequencies were calculated and compared between public transit and non-transit users using procedures that account for the complex design of the NHATS survey. Compared to non-transit users, those who reported using transit within the last month (n=555, 9.8%; weighted n=3,122,583) were significantly more likely to identify their race/ethnicity as Black or Hispanic (50% vs 28%) and reported difficulty meeting financial needs for housing, utility, and food (12% vs 7%), and to speak a language other than English (14% vs 8%). Transit users were significantly less likely to use a walker (9% vs 14%) or wheelchair/scooter (4% vs 9%). Additionally, 15% of transit users did not have a working cell phone and 42% did not have a working computer. Over 20% of transit users (weighted n=658,850) rely on these services to get to their doctor. These findings highlight the clinical, social, and financial barriers that disproportionately affect over 3 million older adult transit users in the United States, and inform initiatives oriented towards improving community access for older adults.

REFINING CARFREEME, A DRIVING RETIREMENT PROGRAM FOR PERSONS WITH DEMENTIA AND THEIR CARE PARTNERS

Colleen Peterson[1], Katie Louwagie[2], Robyn Birkeland[2], Stephanie N. Ingvalson[2], Lauren Mitchell[3], and Joseph Gaugler[2], *1. University of Michigan Transportation Research Institute, Ann Arbor, Michigan, United States, 2. University of Minnesota, Minneapolis, Minnesota, United States, 3. Emmanuel College, Boston, Massachusetts, United States*

Persons living with dementia (PLWD) are at increased risk for roadway crashes and subsequent injury or death. Navigating driving retirement while respecting the PLWD's autonomy and supporting continued independence can be challenging. CarFreeMe™, originally developed in Australia, is a driving retirement intervention providing tailored psychoeducational telecoaching modules to PLWD and/or their care partners. Session topics include living with dementia, balancing independence and safety, adjusting to loss and change, exploring others' experiences with driving retirement, planning for alternative transportation, lifestyle planning, advocacy and support, and problem solving. Phase I enrolled 16 care partners and 11 PLWD. Mixed methods data from Phase I's 1- and 3-month follow-up surveys and post-intervention interviews demonstrated feasibility and acceptance of CarFreeMe™ with a U.S. audience. Phase I participants found the program valuable and would recommend it to others (96% care partners, 100% PLWD). Care partners and PLWD reported improved Readiness of Mobility Transition scores at the 3-month survey. Several felt the program may be most useful early in the decision making process. The program offered strategies and education that facilitated conversations both during and outside of the intervention sessions to support the PLWD's agency and acceptance of driving retirement. Participant feedback and lessons learned from Phase I informed Phase II development and deployment. Phase II is enrolling 50 care partners, PLWD, or dyads and includes 3- and 6-month follow-up surveys. Preliminary CarFreeMe™ Phase II utility, acceptance, and driving related outcomes will be discussed as well as next steps for evaluation.

SESSION 4230 (AWARD LECTURE)

DONALD P. KENT AND ROBERT W. KLEEMEIER AWARD LECTURES

Chair: Peter Lichtenberg

The Donald P. Kent Award lecture will feature an address by the 2021 Kent Award recipient Luigi Ferrucci, MD, PhD, FGSA, of the National Institute on Aging. The Kent Award is given annually to a member of The Gerontological Society of America who best exemplifies the highest standards of professional leadership in gerontology through teaching, service, and interpretation of gerontology to the larger society. The Robert W. Kleemeier Award lecture will feature an address by the 2021 Kleemeier Award recipient Kenneth F. Ferraro, PhD, FGSA, of Purdue University. The Kleemeier Award is given annually to a member of The Gerontological Society of America in recognition for outstanding research in the field of gerontology.

DUAL FUNCTIONALITY IN LATER LIFE

Kenneth Ferraro, *Purdue University, West Lafayette, Indiana, United States*

Longevity and quality of life are core interests in gerontology, but debate has ensued as scholars have sought to integrate the two. I propose the concept of dual functionality to examine how humans reach advanced ages while maintaining both physical and cognitive function. Using a large national sample, my colleagues and I operationalize dual functionality and identify life course factors that predict it. Analyses of 33,310 respondents 50 years or older from the Health and Retirement Study show an estimated median age of 74 for loss of dual functionality. Lifetime stress exposure leads to earlier loss of dual functionality, even after adjustment for socioeconomic status and lifestyle factors.

Estimates of dual-function life expectancy, moreover, reveal greater racial-ethnic disparities than those for life expectancy per se. Dual functionality may be useful for assessing the quality of longevity across societies and social categories and for identifying exceptional longevity.

A JOURNEY FROM GERIATRIC MEDICINE TO GEROSCIENCE

Luigi Ferrucci, *National Institute on Aging, Baltimore, Maryland, United States*

In 1984 LZ Rubenstein group demonstrated that geriatric assessment improved function and QoL in frail in frail, older patients. I heartly joined the international sparkle of enthusiasm generated by these results although later work did not match our expectations. Understanding the complexity of older person is an extraordinary tool for geriatricians, but coding the nuances of making the "best choice" in a randomized trial remains difficult. Frailty is difficult to reverse because it occurs when resilience is exhausted. Geroscience postulates that chronic diseases and frailty stem from the biological mechanism of aging and that interventions that slow down aging will successfully improve resilience. This approach have shown great potential but whether it will lead to prevention or improvement of frailty is unknown. While we continue to provide optimal care to frail older patients, we need to push forward the translation arm of geroscience both in area of prevention and care of older patients.

SESSION 4225 (BSS FLASH POSTERS)

BSS FLASH POSTER SESSION 1: SOCIAL DETERMINANTS OF LATE LIFE HEALTH: A LIFE COURSE PERSPECTIVE

ADVERSE CHILDHOOD EXPERIENCES AND DEPRESSIVE SYMPTOMS AMONG RACIALLY/ETHNICALLY DIVERSE OLDER ADULTS IN THE US

David Camacho[1], Julia Vazquez[2], Laura Vargas[3], Charles Henderson[4], and Brenda J Jones-Harden[2], *1. University of Maryland, Baltimore, Norwalk, California, United States, 2. University of Maryland, Baltimore, Baltimore, Maryland, United States, 3. University of Colorado School of Medicine, Department of Psychiatry, Aurora, Colorado, United States, 4. Cornell University, Ithaca, New York, United States*

Adverse childhood experiences (ACEs) and depression are major public health concerns. However, few studies have examined the relationship between ACEs and mid- and late-life depression among racially/ethnically diverse groups. We explore this relationship among U.S. racially/ethnically diverse community-dwelling midlife and older adults (≥50 years of age). Guided by ACEs and Minority Stress Frameworks, we used general linear models to examine this relationship with data from Wave 3 of the National Social Life, Health, and Aging Project. We created an ACEs composite ranging from 0 to 7 (e.g., violence, health, poverty) and assessed the role of individual ACEs on depressive symptoms (CES-D). Final adjusted models (n:1424) included key demographic, health (e.g., chronic disease), social (living alone, social isolation, loneliness), and minority stress factors (e.g., limited access to healthcare and treatment, perceived discrimination). Results indicated that higher composite score ACEs (particularly childhood violence and poor health) were positively associated with higher levels of depressive symptoms. We found no interactions between race/ethnicity and ACEs. Our results suggest that ACEs contribute to the presence and severity of depressive symptoms into mid- and late-life adulthood. Consistent with Minority Stress Framework, common life-course stressors for minoritized groups may explain a lack of significant interactions in our models. Future research should explore the association of ACEs and other important health outcomes in diverse midlife and older adults. Finally, research is needed to examine if and how culturally appropriate depression interventions can be adapted to address the role of ACEs in later life health.

CHILDHOOD PHYSICAL ABUSE INCREASES THE RISK OF SUBJECTIVE MEMORY IMPAIRMENT

Lauren Roach[1], Tyler Bell[2], and Caitlin Pope[3], *1. University of Kentucky, Holland, Michigan, United States, 2. University of California, San Diego, La Jolla, California, United States, 3. University of Kentucky, Lexington, Kentucky, United States*

Subjective memory impairment, defined as self-reported difficulties in recall and learning, doubles the risk of Alzheimer's Disease and related dementia, despite being weakly related to objective memory decline. Because of its strong stability over time, it may be possible that subjective memory impairment reflects earlier life risk factors for dementia such as adverse childhood experiences. It is reported that over a fifth of older adults worldwide experienced physical abuse during childhood. Previous cross-sectional studies suggest physical abuse is associated with later cognitive impairment. Still unclear, are the longitudinal associations between childhood abuse and subjective memory impairment in later life. Using a sample of adults drawn from the Health and Retirement Study (n = 19,185, Mage = 67.05, SD = 11.33) we assessed associations between reported physical abuse by a parent before the age of 18 and subjective memory impairment (current memory problems and perceived memory decline) over periods of up to 18 years. Generalized linear mixed models examined longitudinal associations between childhood physical abuse and subjective memory impairment while controlling for depressive symptoms and other empirically relevant covariates. Experiencing childhood physical abuse was associated with increased likelihood of reporting more current memory problems (OR = 1.17, 95% CI 1.04, 1.33) and perceived memory decline in later life (OR = 1.27, 95% CI 1.13, 1.43). Findings suggest childhood physical abuse is associated with subjective memory impairment, a strong predictor of dementia. Understanding early life conditions, including adverse childhood experiences may help explain associations between subjective memory impairment and dementia risk.

SEQUENCING OF PLANNED AND UNPLANNED BIRTHS AND IMPLICATIONS FOR MID- AND LATER-LIFE HEALTH AMONG NLSY79 WOMEN

Mieke Thomeer[1], Clifford Ross[1], Rin Reczek[2], and Christina Bijou[2], *1. University of Alabama at Birmingham, Birmingham, Alabama, United States, 2. Ohio State University, Columbus, Ohio, United States*

Existing studies demonstrate that unplanned births (e.g., unwanted, mistimed) are associated with worse health for mothers in the short-term and—according to some preliminary evidence—in mid- and later-life. Yet as life course and reproductive career frameworks highlight, childbearing experiences often unfold over a number of years, with a considerable amount of diversity in pregnancy and birth experiences even for the same individual. For example, a person may have an unplanned birth in late adolescence followed by only planned births in early adulthood. In order to provide a more holistic understanding of how birthing experiences births are associated with midlife health, we use Sequence Analysis (SA) on the 1979 National Longitudinal Survey of Youth (NLSY79; N=3,992) to examine how patterning of planned and unplanned births is associated with physical and mental health at ages 50 and 60 (SF-12). Preliminary analysis indicates that compared to respondents with only planned births, respondents with unplanned birth(s) followed by planned birth(s) have worse physical and mental health at midlife, but there is no difference in health for respondents with only planned births, only unplanned births, and planned birth(s) followed by unplanned birth(s). Future analysis with SA will consider how more detailed sequences (e.g., timing, number and type, ordering, spacing) are associated with these mid- and later-life health outcomes, taking into account selection factors such as childhood SES and educational attainment. This project demonstrates the need for life course perspectives on the long-term health implications of unplanned births, recognizing diversity within and between individuals.

CHILDHOOD MALTREATMENT AND PROSOCIAL BEHAVIOR: A QUALITATIVE COMPARATIVE STUDY OF IRISH OLDER ADULT SURVIVORS

Shauna Rohner[1], Aileen Salas[2], Alan Carr[3], and Myriam Thoma[4], *1. University of Zürich, Zürich, Zurich, Switzerland, 2. University of Zürich, Zurich, Zurich, Switzerland, 3. University College Dublin, Dublin, Dublin, Ireland, 4. University of Zurich, Zurich, Zurich, Switzerland*

Although childhood maltreatment can have lasting effects into later life, positive outcomes have also been observed, including an increased tendency towards prosocial behavior. However, little is known about the link between childhood maltreatment and later life prosocial behavior. Therefore, this study aimed to explore older adult's experiences of childhood maltreatment and identify mechanisms linked to prosocial behavior in later life. The individual level, but also broader cultural and contextual mechanisms, were considered by comparing two adversity contexts and applying conceptual frameworks (socio-interpersonal framework model of trauma and recovery, motivational process model of altruism born of suffering). Semi-structured interviews (60-120 minutes) were conducted with 29 Irish (older) adult survivors of childhood maltreatment: 17 institutional (welfare care) abuse survivors (mean age: 61 years, range: 50-77), 12 familial abuse survivors (mean age: 58 years, range: 51-72). Interviews were analyzed using Framework Analysis. In both groups at the individual level, enhanced empathy, amelioration, and identity-related mechanisms were linked to prosocial behavior, with connections to caring roles and coping strategies from childhood. On a social contexts level, the limited resources or opportunities for help in childhood, and the social norms and beliefs of that time, influenced participants' motivation to help others in later life. Group-specific mechanisms were also observed, such as compassion fatigue in the familial sample; and denouncing detrimental societal values in the institutional sample. The identification of individual, adversity-context, and culture-specific mechanisms linked to later-life prosocial behavior can promote a greater understanding of resilience and adaptability in older adult survivors of childhood maltreatment.

THE NEIGHBORHOOD CONTEXT AND ALL-CAUSE MORTALITY AMONG OLDER ADULTS IN PUERTO RICO

Catherine Garcia[1], Mary McEniry[2], and Michael Crowe[3], *1. Syracuse University, Syracuse, New York, United States, 2. University of Wisconsin-Madison, Madison, Wisconsin, United States, 3. University of Alabama-Birmingham, Birmingham, Alabama, United States*

The neighborhood contexts in which older adults live are increasingly being recognized for their role in influencing disease processes and risk of death among the U.S. population. However, few studies have focused on neighborhood impacts among older populations residing in Puerto Rico– a U.S. territory –who are especially vulnerable to the effects of the environment as they "age in place" in the context of a budget crisis, the great recession, the debt crisis, and Hurricanes Irma and María. The combination of these events can obstruct access to neighborhood resources, services, and contexts considered necessary for promoting healthy aging. Thus, it is warranted to understand the effects of place on mortality in Puerto Rico, whose social and economic contexts differ from the U.S. and are more similar to that of other Latin American and Hispanic-Caribbean countries. We used 2000 U.S. Census data at the block-group level linked to the 2002 Puerto Rican Elderly Health Conditions Project with mortality follow-up to 2021 to examine neighborhood characteristics that are conceptualized as influencing mortality (e.g., residents without a high school degree; households receiving public assistance income; residents living below the poverty level; unemployed residents; residential stability; age structure). Multilevel mixed-effects parametric survival models with a Weibull distribution were estimated. Overall, results show that neighborhood socioeconomic disadvantage is associated with an increased risk of mortality among older Puerto Ricans. This suggests that older Puerto Ricans clustered in disadvantaged communities are more likely to experience a cumulative burden of social disadvantages that adversely impacts their longevity.

IS THE HEALTH OF OLDER AMERICANS WITH A GED EQUIVALENT TO THEIR PEERS WITH A HIGH SCHOOL DIPLOMA?

Esme Fuller-Thomson, Robin Grossman, and Andie MacNeil, *University of Toronto, Toronto, Ontario, Canada*

Previous research has found higher levels of educational attainment to be strongly associated with better health outcomes in later life, such as better cognitive functioning and fewer functional and sensory impairments. However, most studies have grouped General Educational Development (GED) recipients with high school graduates, neglecting potential differences in socioeconomic status, health behaviours, and health outcomes among these two groups. The aim of the current study is to identify differences in the age-sex-race-poverty adjusted prevalence and odds of cognitive impairment, hearing impairment, vision impairment, limitations in activities of daily living (ADLs), and ambulation limitations among three groups of older American adults: high school dropouts, GED recipients, and high school graduates with no post-secondary education. The present study uses secondary analysis of the 2017 American Community Survey, a nationally representative survey of community-dwelling and institutionalized older adults aged 65 years and older, of whom 20,489 were GED recipients, 154,892 had a high school diploma and 49,912 had finished grade 8 but had not completed high school. Our findings indicate that there is a gradient in health outcomes among Americans aged 65-84, with the highest prevalence and odds of cognitive impairment, hearing impairment, vision impairment, ADL limitations, and ambulation limitations occurring among high school dropouts, followed by GED recipients, and the lowest prevalence among high school graduates. These findings suggestion that although GED recipients have better health outcomes than high school dropouts, there is still a significant disparity in health status between GED recipients and high school graduates.

COHORT DIFFERENCES IN EARLY-LIFE SOCIOECONOMIC STATUS AND LATE-LIFE COGNITIVE IMPAIRMENT IN MEXICO

Brian Downer[1], Mariela Gutierrez[1], Silvia Mejia Arango[2], and Rebeca Wong[1], *1. University of Texas Medical Branch, Galveston, Texas, United States, 2. Colegio de la Frontera Norte, Tijuana, Baja California, Mexico*

Socioeconomic characteristics over the life course are associated with late-life cognitive impairment. However, evidence is lacking from countries like Mexico where population aging is occurring in the context of rapidly changing socioeconomic conditions. We used the Mexican Health and Aging Study to investigate differences between participants aged 60-76 in 2001 (n=5085) and 2018 (n=5947) in childhood (home with indoor toilet, parents' education) and midlife (education, longest held occupation) socioeconomic characteristics and late life cognitive impairment. Cognitive impairment was defined as a low score on >2 out of five assessments. Most participants in the 2018 cohort lived in a home with an indoor toilet as a child (58.1%) and 36.9% had parents who both completed at least some education compared to 41.9% and 28.7% of participants in the 2001 cohort, respectively. Men and women in 2018 had on average 2.34 and 1.83 more years of education than men and women in 2001, respectively. The percentage of women with no main job and men who worked in agriculture were lower in 2018 than 2001 (women: 27.0% vs. 34.6%; men: 23.3% vs. 30.4%). The 2018 cohort had lower odds for cognitive impairment when adjusting for age, sex, marital status, and living in a rural/urban community (OR=0.67 95% CI=0.56-0.81). This difference was reduced after adjusting for childhood socioeconomic measures (OR=0.76 95% CI=0.67-0.86) and was no longer statistically significant after adding midlife socioeconomic measures (OR=0.98 95% CI=0.86-1.12). These findings suggest that improved early-life socioeconomic conditions in Mexico contribute to birth-cohort differences in late-life cognitive impairment.

SESSION 4240 (PAPER)

COVID-19 AND MENTAL HEALTH AND WELL-BEING OF OLDER ADULTS

AN ACTION PLAN FOR ORGANIZATIONS SERVING OLDER ADULTS AND THEIR CAREGIVERS DURING PUBLIC HEALTH EMERGENCIES

Alycia Bayne[1], Lauren Isaacs[2], Jessica Fox[1], Rachel Singer[1], Roy Ahn[3], Desirae Leaphart[2], Felicia Cerbone[4], and Madeleine Liotta[1], *1. NORC at the University of Chicago, Bethesda, Maryland, United States, 2. NORC at the University of Chicago, Chicago, Illinois, United States, 3. NORC, Chicago, Illinois, United States, 4. NORC, Bethesda, Maryland, United States*

During public health emergencies, it is critical to maintain the continuity of services and resources essential to health and safety. Public health emergencies can disproportionately affect older adults and their caregivers. Organizations, including community-based, faith-based, rural, and tribal organizations, can play a vital role during a public health emergency response given their familiarity with the community's unique needs and resources. With support from the CDC Foundation and technical assistance from the Centers for Disease Control and Prevention, NORC at the University of Chicago conducted a study to identify public health interventions to meet the needs of older adults and their caregivers during public health emergencies. Methods included an extensive search of peer-reviewed and grey literature in Spanish and English to identify interventions on six topics: deconditioning; deferral of medical care; elder abuse and neglect; management of chronic conditions; social isolation; and caregiving. NORC identified 300 public health interventions to support older adults and their caregivers during public health emergencies with a focus on underserved populations, including programs to support racial and ethnic minority populations, people with disabilities, and rural and tribal communities. NORC developed Search. Find. Help., a virtual resource library, and an Action Plan to support organizations in using these interventions. Search. Find. Help., which houses the Action Plan, has had 34,000 unique users. This session focuses on how organizations that serve older adults and caregivers can use the Action Plan's four phases to select, adapt, implement, and evaluate public health interventions before or during a public health emergency.

OLDER ADULT PERSPECTIVES ON AGEISM DURING COVID-19: A QUALITATIVE STUDY

Carson De Fries[1], Pilar Ingle[2], Matthew Schilz[1], Andrew Steward[3], Emma Baker[1], and Leslie Hasche[1], *1. University of Denver, Denver, Colorado, United States, 2. University of Denver, Lakewood, Colorado, United States, 3. University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, United States*

Since the COVID-19 pandemic began, there has been a reported surge of ageism toward older adults. Research demonstrates that events perpetuating negative attitudes towards older adults can increase ageism and associated negative outcomes. The purpose of this phenomenological qualitative study was to explore how older adults navigated experiences of ageism and their social relationships during the COVID-19 pandemic. Semi-structured interviews with adults ages 60 and older were conducted between February and April of 2021 over Zoom. Data were coded using an iterative, inductive approach and thematic analysis was performed to draw themes from the data. A total of 24 participants ages 61-80 (mean = 70.6) were interviewed. Most participants identified as white (n = 19) female (n = 14), retired (n = 21) and had at least a bachelor's degree (n = 22). Findings showed that participants experienced ongoing ageism but did not report ageist experiences associated specifically with COVID-19. Ageist experiences, unrelated to COVID-19, as shared by participants included assumptions about older adults' (in)ability to use technology, ageism in professional settings, and feelings that ageism is an inevitable part of growing older. Future research should examine the impact of intersectionality on this topic within more diverse populations and explore potential differences that may have occurred throughout different stages of the pandemic.
